Abstract

Lately in the past couple of years, there are an increasing in the normal rate of playing computer games or video games compared to the E-learning content that are introduced for the safety of our children, and the impact of the video game addictiveness that ranges from (Musculoskeletal issues, Vision problems and Obesity). Furthermore, this paper introduce an intelligent tutoring system for both parent and their children for enhancement the experience of gaming and tell us about the health problems and how we can solve them, with an easy user interface that way can our children be happy and excited about the information and their health.

Keywords: tutoring system; e-learning; expert systems; video games; health; video game addiction

1. Introduction

A lot of different views of the video gaming industry arguments about how that industry is responsible about the majority of our children problems in there societal, scientific and healthcare and their negative behaviors and attitudes in the normal life [3].

In spite of starter of games development industry from the 1980s, different researches confirmed the negative effects that link addiction of video games, violence, aggression and other issues that appeared especially for specific video game genres [4] even if used as an educational tool in the schools.

After gathering data from more than 4,000 households and surveyed their opinion about the video game playing of his children [5]; The Entertainment Software Association (ESA) published on 2016 about the Computer and Video Game Industry; and inference that every house contain at least one person who play games for at least 3 hours/week with average of 13 years from his life. About half of this is female (48%), with high percent of 21% of the total ages of 18 or younger, and a majority of parents (91%) say it must be present on purchasing video games and want to check Entertainment Software Rating Board (ESRB) [17] before letting their child to play the game.

In spite of this result, we introduce our intelligent tutoring system to help raid of the most problems of extra time games playing like Musculoskeletal [18], Vision problems [19] and the increase BMI for our children over the time spent on playing games [20].

2. Intelligent Tutoring Systems (ITS)

Intelligent Tutoring Systems is using computer system to provide E-Learning content to the user without the need of expert teacher like class in any traditional school or university. This programs allow using and provide enhance experience to the learner and immediate feedback to them on organizational way like the expert teacher [6-14, 21-38] see figure 2 for details. ITS have four essential components:

- **Domain model**: the lessons that present the learning content to the learner.
International Journal of Advanced Scientific Research

- **Student model:** the student-like experience and data on our system.
- **Teaching model:** this software-like teacher model that matches the learner experience with the knowledge base to reach appropriate feedback and related score. This is accomplished using the Knowledge tracing unit.
- **User Interface model:** represent both components of student and the teacher UI for using the tutor.

### 3. Authoring System
A program that helps in creating more than ITS with relatively easy way and provide the experience of creating ITS without the need of expert programmer to make it.

Our Intelligent Tutoring System was implemented using used ITS Builder authoring tool that stands for Intelligent Tutoring System Builder [1]. It is a two-language supported system (English and Arabic) and easy to manage through their student UI and the Teacher UI screens. The ITS Builder implemented in Delphi Embarcadero RAD Studio XE8 [2]. ITS is easy for the domain expert to build the ITS system and for the end users when they use it, without any requirement of programming of use.

### 4. Literature Review
Many of ITS systems published over the couple years [6-14,21-37]; ranging from learning programming languages (C++, java), the Spoken language (Arabic, English), Mathematical equations or operations, and the addition of this system is mainly increasing over the past years; but there is no specialized tutoring system for teaching games health problems.

A recent ITS is called COMET [15] that are used for medical problem-based learning; Another one is for Mentoring Diabetes [16]; The Major of these ITS are specialized in one specific disease and other in a few diseases. However, the current proposed ITS system is specialized in the video games playing health problem.

### 5. Materials and Content
The proposed ITS provide a leaning content about the video games playing health problem for:

- **Musculoskeletal issues:** ranging from pain in the hands, wrists and the thumb of the controller that used on the rapid gaming experience of the players [18].
  - **Video Game Benefits:** A proposed solution to the problem to tell children to play slowly.
- **Vision problems:** ranging from eye strain on cornea to the iris that can lead to headaches, dizziness, and even chances of vomiting from focusing on a screen [19].
  - **Protecting Your Vision:** A proposed solution to the problem.
- **Obesity problems:** ranging from the extra weight to the BMI change in faster way over the game playing time [20].
  - **To combat weight problems, get the whole family involved:** A proposed solution to the problem.

After the learner finishes each chapter he can proceed to the questions that are ranging from asking questions that require True/False answers to a physical content (Videos and Images) of players that play on some specific scenario and give the user the ability to choose the correct symptoms based on the information that are given. The proposed ITS will ask the user to choose the correct answer in each question window. At the end of the chapter session, there is a proposed recommendation for each symptom that can happen to the users. Figure 3 shows the first screen of the ITS session. Figure 4 shows an example of lessons on the main teacher screen. Figure 5 shows question window that we can add, remove or modify them. Figure 6 shows the main user window with lesson selected. Figure 7 shows user window with example to the lesson selected. Figure 8 shows user question main window. Figure 9 shows question with the check result option. Figure 10 shows question window with hint added to the question. Figure 11 shows feedback to the user to re-study specific lesson after failing on questions. Figure 12 feedback to the user after complete specific lesson with his score. In addition, Figure 13 shows tutor status for all students with the ability to see his current score, difficulty and his overall section.

6. Conclusion
In this paper, intelligent tutoring system solution developed for aiding learner to diagnosing patients with possible Games Health Problems. This ITS does not require extra training to be used; it has a straightforward and user-friendly interface with support of videos and images to enhance the experience of any user can use it. It was developed using ITSB authoring tool. Moreover, the results of the preliminary testing of this system showed potential and noticeable enhancement to the user level of learning based on its content.

7. Future Work
This ITS considered the first released of our system; more aureate synonyms will be handled and treated to be added in an easy way to learn for more users from anywhere at any time. In addition, more questions will be added and more question scenarios for aiding the content will generated.
