Evidence and Intuition

Preprint, please cite the published version

Many philosophers accept a view—what I will call the intuition picture—according to which intuitions are crucial evidence in philosophy. Recently, Williamson (2004, 2007 Ch, 1) has argued that such views are best abandoned because they lead to a psychologistic conception of philosophical evidence that encourages scepticism about the armchair judgments relied upon in philosophy. In this paper I respond to this criticism by showing how the intuition picture can be formulated in such a way that it: (I) is consistent with a wide range of views about not only philosophical evidence but also the nature of evidence in general, including Williamson's famous view that E=K; (II) can maintain the central claims about the nature and role of intuitions in philosophy made by proponents of the intuition picture; (III) does not collapse into Williamson's own deflationary view of the nature and role of intuitions in philosophy; and (IV) does not lead to scepticism.

1. The Intuition Picture

Intuitions are widely assumed to play a crucial epistemic role in philosophy. In particular, intuitions are thought to play a crucial evidential role in the testing of philosophical theories by the method of cases, for instance Gettier counterexamples to the JTB theory of knowledge. Thus, many philosophers assume:

_E1_ Intuitions are assigned an important evidential role in philosophy.

The assumption that E1 is true is usually common ground between sceptics and defenders of armchair philosophy, who go on to disagree about the further claim that intuitions should be assigned this role:

_E2_ Intuitions should be assigned this evidential role in philosophy.

Philosophers who endorse E1 and E2 typically endorse the claim that intuitions are distinct from mere beliefs:
E3) The intuitions that are assigned this evidential role in philosophy are importantly distinct from any mere belief or inclination to believe.

Some hold that intuitions are a special kind of doxastic state with certain distinctive properties (e.g. Ludwig (2007) and Sosa (2007)). Others hold that intuitions are *sui generis* and cannot be analysed in terms of more familiar mental states (e.g. Bealer 1998). However, proponents of both kinds of views will often attribute many of the same properties to philosophical intuitions and, in particular, endorse closely related versions of the following claim:

E4) The intuitions that are assigned this evidential role in philosophy are *rational intuitions*.

I will label the view shared by those philosophers who endorse all of E1—E3 the *intuition picture of philosophical methodology*—and in the discussion to follow I will be concerned with versions of this view that also endorse E4. I call this view a "picture" because it is obviously under-described and could be developed in many different ways, depending on how one conceives of this supposed evidential role and the nature of the intuitions that play that role. However, the intuition picture does capture key commitments of a number of important accounts of philosophical methodology, including those given by Bealer (1998), Chudnoff (2010), Goldman and Pust (1998), Grundmann (2007), Huemer (2005), Ludwig (2007), Pust (2001) and Sosa (2007). And, arguably, the intuition picture is implicitly endorsed by many of the numerous philosophers who employ the method of cases.

---

1 Some of these authors talk more of justification or warrant, rather than evidence, when characterizing the epistemic role of intuitions in philosophy. However, I think these authors still accept E1-E4 the only difference being that they hold that the evidential role of intuitions is grounded in those properties of our intuitions in virtue of which they themselves are justified or warranted (on a doxastic view of intuitions) or, alternatively, those
Importantly, not all defenders of armchair philosophy embrace the intuition picture, with perhaps the most notable exception being Williamson (2004, 2007). Williamson’s most central objection to intuition-based accounts of philosophical methodology is that they are committed to a psychologistic conception of philosophical evidence that encourages scepticism about the armchair judgments relied upon in philosophy. The purpose of this paper is to defend the intuition picture against this psychologization objection. (There are other less direct objections to the intuition picture suggested by Williamson’s work on philosophical methodology. For reasons of space I will not examine these objections here, although see below for an indication of how I think they can be addressed.2)

2. The Psychologization Objection

What do philosophers mean when they claim that one’s evidence that the JTB theory is false is one’s intuition that the Gettier subject has non-knowledgeable justified true belief (henceforth, ‘NKJTB’)? Williamson holds that when philosophers say such things what they

properties of our intuitions in virtue of which they provide us with justification or warrant for our corresponding beliefs (on a non-doxastic view of intuitions).

2 There are objections related to Williamson’s work on (i) the epistemology of thought experiments (2005, 2007 Ch. 6), (ii) his critique of epistemic conceptions of analyticity (2006, 2007 Ch. 5), and (iii) the ontology of intuitions (2004, 2007 Ch. 7). See fn. 18 and fn. 23 for discussion related to (ii) and (iii). On (i), Williamson frequently suggests that, if correct, his idea that thought-experiment judgments are based on a general capacity to handle counterfactuals undermines the idea that rational intuitions have a crucial role to play in the epistemology of such judgments. However, I think Malmgren (2011) and Nimtz (2010) have shown that this is incorrect because (roughly) this idea is still consistent with there being very different cognitive processes or resources involved in the formation of different counterfactual judgments. In which case, the correctness of this idea cannot be used to support the conclusion that any particular kind of cognitive capacity or resource—for example, rational intuition—is not required to explain the formation or epistemic properties of some class of counterfactual judgments. Similar problems also undermine Williamson’s attempts to argue from the correctness of this idea to the insignificance of the a priori versus a posteriori distinction, see Nimtz (2010, pp. 201–203). Williamson’s specific view of what counterfactual captures the content of the Gettier intuition is inconsistent with E4 because he identifies this content with a clearly contingent and a posteriori counterfactual. But, as Ichikawa and Jarvis (2009) and Malmgren (2011) have shown, Williamson’s account of the Gettier proposition has deeply implausible consequences related to the possibility of ‘bad’ Gettier cases. Williamson is aware of these worries (see 2007, pp. 200–204) but I take his response to them to be inadequate for the kind of reasons given by Ichikawa (2009, pp. 437–443).
mean is that one's evidence consists in the psychological fact that one has the intuition that
the Gettier subject has NKJTB. More generally, Williamson (2004, p. 119) says that this:

… is the uneasy conception which many contemporary analytic philosophers have of their own
methodology. They think, that, in philosophy, our ultimate evidence consists only of intuitions. Under
pressure, they take that not to mean that our ultimate evidence consists of the mainly non-psychological
putative truths that are the contents of those intuitions. Rather, they take it to mean that our ultimate
evidence consists only of intuitions.

According to Williamson, this psychologistic view arises in response to a sceptical
challenge to the judgments that philosophers rely on. Williamson (2004, pp. 117–18) draws
a close analogy between this challenge and traditional challenges to our perceptual
knowledge of the external world. The sceptic about perception tries to narrow one’s
evidential base to one’s current mental state. Suppose one looks outside and see that it is
raining. One might think that one’s evidence now includes the fact that it is raining. However, the sceptic contends that one’s evidence only includes a fact about one’s own
mind, namely, that it perceptually appears to one that it is raining, for sometimes what
perceptually appears to be is not the case. The sceptic challenges one to justify one’s taking
this psychological fact to be good evidence that it is raining. Similarly, after reading
Gettier’s article one might think that one’s evidence includes the fact that the Gettier subject
has NKJTB. However, the judgment sceptic contends that one’s evidence only includes the
fact that it intellectually appears to us (perhaps the members of some restricted group) that
this is so, for sometimes what intellectually appears to us is not the case. The sceptic
challenges one to justify one’s taking this psychological fact to be good evidence that the
Gettier subject has NKJTB.

One way of responding to the perceptual sceptic would be to agree that one’s evidential base
is merely the fact that it appears to one that it is raining, and then try to meet their challenge
of showing how one can reason outwardly from this psychological fact to the proposition that it is raining. Williamson (2004, p. 17) thinks that proponents of the intuition picture like Bealer are making the parallel response to the judgment sceptic: “If scepticism about judgement is treated by analogy with scepticism about perception, then its evidential base will be described as intellectual appearances, somehow analogous to perceptual appearances. George Bealer has defended just such an account of intuitions as intellectual seemings.”

Williamson holds that in both cases this kind of response encourages the very scepticism it seeks to avoid. In the case of the judgment sceptic philosophers are left with the unenviable task of trying to argue for the “hoped-for correlation between having an intuition that P and its being true”. For example, in the Gettier case they are left with “the challenge of arguing from a psychological premise, that I believe or we are inclined to believe the Gettier proposition, to an epistemological conclusion, the Gettier proposition itself. That gap is not easily bridged” (2007, p. 211).

According to Williamson (2004, p. 118), philosophers psychologize their evidence because they are committed to an operational standard of evidence, according to which one must always be in a position to know what one’s evidence is. This commitment leads philosophers to conclude that our evidence must be the same in both the ‘good case’ (where it perceptually or intellectually seems to one that \( p \) and \( p \) is true) and the ‘bad case’ (where it still seems to one that \( p \) but \( p \) is false) because: “typically, if one is in a sceptical scenario, one is in no position to know that one is not in the corresponding non-sceptical scenario, and is therefore in no position to know that one’s evidence differs from what it would have been

---

3 Williamson (2007) identifies the problem as originating from a commitment to a related, but still importantly distinct, principle he calls Evidence Neutrality. For reasons of space I will not discuss this principle here.
in that non-sceptical scenario.” (2004, p. 118) The proper response to both challenges is to resist the operational standard. Once we acknowledge that we are not always in a position to know what our evidence is, we can hold that in the good case one’s evidential base can include the non-psychological content of one’s perceptual/intellectual seeming even if one would lack that evidence in the bad case.

Suppose proponents of the intuition picture do endorse a psychologistic view of the evidential role of intuitions. Furthermore, suppose this view does encourage scepticism about the armchair judgments that proponents of the intuition picture hope to defend. Given these assumptions one might be tempted to press the following argument against the intuition picture:

**The Psychologization Argument**

1. *The Psychologization Premise:* Proponents of the intuition picture psychologize our evidence in philosophy (in an attempt to answer the judgment sceptic’s challenge).

Therefore,

3. *The Sceptical Conclusion:* Proponents of the intuition picture encourage scepticism about the armchair judgments relied upon in philosophy.

The argument is valid, and no proponent of the intuition picture will want to embrace its conclusion, or at least they will want to claim that their version of the intuition picture does not encourage scepticism about the armchair judgments relied upon in philosophy. Faced with this argument then, a proponent of the intuition picture will want to do one of two
things. First, they could resist the psychologization premise by claiming that at least their version of the intuition picture does not psychologize our evidence in philosophy. Or, alternatively, they could accept the psychologization premise whilst denying the gap premise. That is, they could embrace a psychologistic view of the relevant philosophical evidence, but then contest Williamson’s claim that if true such a view would have sceptical consequences for armchair philosophy. The latter response is worthy of exploration but I will not develop such a response here. Rather, I shall contest the psychologization premise. More precisely, I will argue that there is no strong connection of any kind between endorsing the intuition picture and adopting a psychologistic conception of philosophical evidence.

3. Resisting the Psychologization Premise

Let us distinguish two questions: Does a proponent of the intuition picture need, in principle, to psychologize philosophical evidence? Do actual proponents of the intuition picture psychologize philosophical evidence? The answer to the first question is clearly no. Take the claim that, after reading Gettier’s article, one’s evidence that the JTB theory is false is one’s intuition that the Gettier subject has NKJTB. This claim, as many have noted, is ambiguous. It could be interpreted as saying either: (i) that one’s evidence consists in the psychological proposition I have the intuition that the Gettier subject has NKJTB; or (ii) that one’s evidence is the non-psychological content of one’s intuition, namely the proposition

\[ \text{I have the intuition that the Gettier subject has NKJTB} \]

See Brown (2011) for a response of this kind to Williamson.

For example, see Ichikawa (ms), Lycan (1998), and Earlenbaugh and Molyneux (2009).
The second interpretation is perfectly legitimate, and what it shows us is that the intuition picture can, in principle, be interpreted in a way such that it does not psychologize our evidence in philosophy.

As we have seen, Williamson implicitly acknowledges the possibility of a non-psychologistic interpretation of the idea that intuitions are evidence in philosophy but he thinks that in fact proponents of the intuition picture are endorsing (i), and not (ii), when they say that our evidence in the Gettier case is our intuition that the Gettier subject has NKJTB. This brings us to our second question. Do actual proponents of the intuition picture endorse the psychologistic interpretation?

Bealer is Williamson’s sole example of a philosopher who supposedly endorses a psychologistic view of philosophical evidence in response to pressure from the judgment sceptic. Williamson is right that on Bealer’s view the intuitions that play an evidential role in philosophy are intellectual appearances or seemings. But Bealer (1998) couldn’t be clearer in explicitly disavowing a psychologistic interpretation of this evidential role: “When I say that intuitions are used as evidence, I of course mean that the contents of the intuitions count as evidence” (Bealer 1998, p. 205, emphasis original). More generally, it is quite hard to identify proponents of the intuition picture that commit themselves to a psychologistic view of philosophical evidence—Goldman and Pust (1998) being a notable exception. What one often finds instead is that when proponents of the intuition picture

---

6 A further possible interpretation is that one’s evidence is not a proposition at all but is one’s mental state of intuiting that the Gettier subject has NKJTB. This would be a different way of having a ‘psychologistic’ view of one’s evidence in the Gettier case. But for my purposes I will assume with Williamson that evidence is always propositional.

7 I will unpack Bealer’s account of what he calls ‘rational intuitions’ or ‘intellectual seemings’ in §5 but for now these details are not needed.

8 Even Pust now appears to reject the ‘mentalist’ view of the evidential role of intuitions advocated in Goldman and and Pust, see Goldman and Pust (2001 fn. 14) and Pust (2000, Chs. 3 and Ch. 4). Goldman, however, has continued to strongly defend this view.
make claims like “intuitions are used as evidence in philosophy”, they simply do not clarify whether these claims should be interpreted in a psychologistic or a non-psychologistic way.

There are also reasons for thinking that a psychologistic interpretation of such claims would be uncharitable. This is because most proponents of the intuition picture hold that the knowledge one gains on the basis of having the Gettier intuition is a priori. But how could this be if it is based on evidence consisting of a contingent fact about one’s psychology? Presumably such evidence will typically be gained via introspection, which is normally thought to be a source of a posteriori not a priori knowledge. Indeed, we will see in §5 that when proponents of the intuition picture characterize rational intuitions they usually stipulate that they are not based on introspection.

The situation then is this. The psychologization premise is false if it is interpreted as a claim about all possible versions of the intuition picture, as Williamson in effect acknowledges. It is also false if it is interpreted as a claim about all actual versions of the intuition picture, as the Bealer quote demonstrates. The premise also looks implausible if it is interpreted as a generalization. For often proponents of the intuition picture do not explicitly commit themselves to either a psychologistic or a non-psychologistic interpretation of their claims about the evidential role of intuitions, and there are reasons to think that they are implicitly committed to a non-psychologistic interpretation of such claims. All we are left with is the fact that the premise is true if it is interpreted as the mere claim that some proponents of the intuition picture psychologize philosophical evidence. But the truth of the existential claim gives us no reason to think that there is any strong connection between accepting the intuition picture and endorsing a psychologistic conception of philosophical evidence.

4. The Partiality and Revenge Problems
Can we now dismiss the psychologization argument? Yes, but at this point Williamson might well argue that there will be new and serious objections to be made against the non-psychologistic interpretation of the intuition picture. To see why, we need to think about how a non-psychologistic version of the intuition picture might be developed. We know that the proponent of such a view will say that, after reading Gettier’s article, the propositional content of the Gettier intuition will be a part of one’s evidence, and that this evidence can be used as part of an argument against the JTB theory. But the mere claim that the contents of our intuitions are used as evidence in philosophy is close to a trivial truth. Presumably, any proponent of the intuition picture will want to add that there is a substantive connection, of some kind, between the fact that after reading Gettier’s article one comes to have the Gettier intuition and the fact that the content of that intuition also comes to be part of one’s evidence.

On a psychologistic interpretation of the intuition picture it is obvious what the connection is: the fact that one has the intuition that the Gettier subject has NKJTB is one’s evidence for the truth of the proposition that the Gettier subject has NKJTB. But what is the connection on a non-psychologistic interpretation of the intuition picture?

Probably the most obvious suggestion to make would be to offer a view according to which simply having an intuition that \( p \) is itself a sufficient condition for one’s having the proposition that \( p \) as a part of one’s evidence, as opposed to being one’s evidence for the proposition that \( p \). That is, one could endorse the following claim:
I→E: If S (rationally) intuits that \( p \), S’s evidence includes \( p \).  

My impression is that Bealer is tempted to endorse something like I→E, although he never explicitly does so. Suppose, for the sake of argument, that Bealer did endorse I→E. Given Bealer’s views on the nature of intuitions it would follow that he is committed to denying the following claims:

E→T: If S’s evidence includes \( p \), \( p \) is true

E→B: If S’s evidence includes \( p \), S believes that \( p \)

The reason Bealer would have to reject E→T and E→B is that he holds that one can have an intuition that \( p \) even when \( p \) is false and that one can have an intuition that \( p \) even when one does not believe \( p \). And most proponents of the intuition picture join Bealer in endorsing at least the first of these two claims. But if non-psychological versions of the intuition picture are committed to denying that evidence is factive and belief-entailing, Williamson should take this to be a reductio of such views, given that knowledge is factive and belief-entailing and his view that E=K:

E=K: S knows that \( p \) if, and only if, S’s evidence includes \( p \).

---

9 I→E is obviously reminiscent of Huemer’s (2001, 2005) principle of Phenomenal Conservatism (PC). The main difference between the two principles is that I→E concerns the possession of evidence whereas phenomenal conservatism concerns the possession of propositional justification.

10 For example, Bealer (1998, p. 208) uses the following case to illustrate his view that intuitions are both non-factive and do not entail belief: “I have an intuition—it still seems to me—that the naïve comprehension axiom of set theory is true; this is so despite the fact that I do not believe that it is true (because I know of the set-theoretical paradoxes)”.

11 Williamson (2007, p. 217) appears to point to something like this concern when he writes: “Epistemologically, the most significant feature of the [Gettier] example may be that many of us know the truth of the Gettier proposition. But those trying to demarcate a distinctive category of intuition usually insist that there are false intuitions as well as true ones; they do not project truth from the Gettier example to other cases”.

The non-psychologistic interpretation of the intuition picture (henceforth, simply ‘the intuition picture’) appears then to be committed to very controversial theses about the nature of evidence and evidence possession—what I will call the *partiality problem*. Importantly, the problem is not merely that the intuition picture is inconsistent with the views of one particular philosopher. For one thing, Williamson’s views on evidence have been highly influential and have lead other philosophers to accept E=K. And, more generally, many philosophers who reject E=K still accept E→T and/or E→B.

Furthermore, if a proponent of the intuition picture endorses I→E Williamson should think that the resulting view will still encourage the judgment sceptic—I will call this the *revenge problem*. This is because Williamson’s response to the judgment sceptic rests on the claim that one’s evidence in the good case (where one intuits that *p* and *p* is true) is different from one’s evidence in the bad case (where one intuits that *p* and *p* is false). It is only in the good case that one’s evidence includes the non-psychological proposition that is the content of one’s intuition, but if I→E is true it follows that one’s evidence includes this proposition *in both cases*. In which case, a proponent of I→E cannot join Williamson in appealing to an asymmetry in one’s evidence between the good and bad cases to support the claim that one knows that *p* in the good but not the bad case.

How should proponents of the intuition picture respond to the partiality and revenge problems? They could dismiss these supposed problems by providing arguments against E→T, E→B, and Williamson’s response to the judgment sceptic. And this would be a reasonable strategy, given that the plausibility of Williamson’s response to the perceptual sceptic (on which his response to the judgment sceptic is modeled), and the status of theses like E→T and E→B, are themselves issues that are (at least) as controversial as the intuition
picture itself is. However, other things being equal, it would surely be preferable for proponents of the intuition picture to show that the intuition picture is not committed to any particular stance on these highly contested matters. Furthermore, if this can be done, I think it would deepen our understanding of the intuition picture to see that, while individual proponents of this view often appear to be committed to rejecting E=K and Williamson’s response to the judgment sceptic, there is actually no tension between the intuition picture and the central tenets of his ‘knowledge-first’ epistemology.

For these reasons, in §6 I will respond to the partiality problem by showing how proponents of the intuition picture can (if they choose) endorse E→T and E→B. My strategy will be to assume that E=K is true and then show how a version of the intuition picture can be made consistent with this assumption. In which case, it will follow that the resulting version of the intuition picture will also be consistent with E→T and E→B. It will also be clear that a proponent of this view can employ Williamson’s strategy for responding to the judgment sceptic, hence, avoiding the revenge problem. However, before turning to this response to the partiality and revenge problems it will be useful to first take a closer look at what proponents of the intuition picture mean when they claim that philosophy relies not just on intuitions but on rational intuitions.

---

12 See Greenough and Pritchard (2009) for a recent collection of essays on Williamson’s epistemeological views including a number of essays that criticise his response to the sceptic and/or E=K, as well as replies from Williamson. In particular, see Goldman (2009) for criticisms of Williamson’s arguments for both E→T and E→B and Schiffer (2009) for criticisms of Williamson’s response to scepticism.

13 As indicated in §1, some proponents of the intuition picture think that a rational intuition is a special kind of belief, in which case they can endorse E→B. For this reason, I think the more fundamental version of the partiality problem is the apparent conflict with E→T. But the response I will give to the partiality problem will not assume that intuitions are beliefs.

14 It might be useful to distinguish a different strategy that I will not pursue here. On this approach one argues that having an intuition that p and certain other conditions together constitute a sufficient condition for p being included in one’s evidence. In which case, having an intuition that p plays an evidential role in the sense that it is one of a set of conditions that together constitute a sufficient condition for p being included in one’s evidence. One obvious worry with this strategy is that it will be hard to identify a sufficient condition of this kind where the intuition condition does not turn out to be redundant, given that no one thinks that having an intuition that p is a necessary condition on the possession of evidence.
5. Rational Intuition

My aim now is to unpack the notion of a rational intuition using Bealer’s prominent view as our starting point. Bealer claims that “For you to have an intuition that A is just for it to seem to you that A” (2000: 30), where these seemings are sui generis and cannot be reduced to any kind of doxastic state.15 Bealer qualifies this claim by saying, “of course, this kind of seeming is intellectual, not sensory or introspective (or imaginative).” This claim in turn is also qualified as applying only to rational intuitions which are distinguished from physical intuitions like one’s “intuition that, when a house is undermined, it will fall” (1998, p. 207).

Putting these ideas together we get the following claim:

To have a rational (as opposed to physical) intuition that \( p \) just is to have an intellectual (as opposed to sensory, imaginative, or introspective) seeming that \( p \).

The idea that philosophical intuitions are rational intuitions (or intellectual seemings), and the negative etiological characterization of these as intuitions that do not have their source in perception or memory or introspection etc, can be found in the work of a number of theorists. A positive etiological characterization is also usually added, namely, that rational intuitions are based on one’s understanding of the intuited content, perhaps together with some process of reasoning or thinking about that content.16

15 For Bealer his use of ‘seems’ should be ‘understood not in its use as a cautionary or “hedging” term, but in its use as a term for a genuine kind of conscious episode’ (1998: 207).

16 For example, one can find both characterizations in Huemer’s (2005, 101–2) account of intuitions as intellectual seemings. Similarly, Grundmann (2007) outlines what he takes to be a traditional rationalist notion of intuitions according to which they are negatively characterized as “independent of empirical reasons”, and positively characterized as having their origin in one’s understanding of the intuited content or proposition. Grundmann contrasts this with a notion according to which any spontaneous judgment that is not consciously inferential is an intuition, regardless of its source.
Importantly, these characterizations are also endorsed by proponents of the intuition picture who hold that intuitions are a special kind of doxastic state. Sosa (2007), for example, holds that intuitions are a special sort of intellectual seeming where, unlike Bealer, this is simply an attraction to assent, as opposed to an experiential-type state that attracts one to assent. But Sosa does offer etiological characterizations of rational intuitions that are closely related to those given by Bealer. On Sosa’s view intuitions are distinguished from other attractions to assent by the fact that the “rational basis for attraction to assent to the propositional content lies in nothing more than [one’s] conscious entertaining of that content” (2007, p. 53). Furthermore, an intuition is a rational intuition only if it has no “reliance on introspection, perception, memory, testimony or inference” (2007, p. 61).

Rational intuitions are sometimes also characterized in terms of their phenomenology. Bealer, for example, holds that seemings, unlike guesses or hunches, in some sense “present” their propositional contents as being true.¹⁷ Bealer also suggests that rational intuitions present themselves as not merely true but necessarily true.¹⁸

To sum up, we have identified four key claims that Bealer uses to characterize the nature of rational intuitions/intellectual seemings:

**The Negative Etiological Thesis:** Rational intuitions are not based on perception, testimony, memory or introspection.

---

¹⁷ This is an idea that a number of authors have developed in different ways, for example, see Chundnoff (2009), and Tolhurst's (1998) related claim that seemings have the property of “felt veridicality”.

¹⁸ See Bealer (1998, p. 207) and Pust (2001, Chapter 1) for discussion of how to interpret this claim.
**The Positive Etiological Thesis:** Rational intuitions are based on one’s understanding of the intuited content (perhaps together with some process of reasoning or thinking about that content).\(^1\)

**The Presents as True Thesis:** Rational intuitions, like all intuitions or seemings, have a presentational phenomenology.

**The Presents as Necessarily True Thesis:** Rational intuitions present their contents as being necessarily true.

The etiological theses are endorsed by most, if not all, proponents of the intuition picture. But proponents of doxastic versions of the intuition picture, like Ludwig and Sosa, tend to

---

\(^1\) Williamson (2007, p. 218) can be read as suggesting that his critique of epistemic analyticity (2007, Ch. 5) would show us that no intuitions satisfy this constraint. The target of Williamson’s critique can be construed in a narrow or a broad way. The narrow target is the idea that there are some truths such that merely understanding them is sufficient for knowledge—call this the sufficiency thesis (ST). The broad target is the idea that there are some truths that we can know solely on the basis of understanding those truths—call this the basis thesis (BT). Williamson’s case against ST rests mainly on two cases that are meant to show that it is possible to grasp even a basic logical truth like *every vixen is a vixen* without even being disposed to assent to it. There are a lot of concerns one might raise with Williamson’s arguments against ST (see e.g. Nimtz 2009) but even if these arguments succeed it is far from obvious what their import is for BT. Williamson (2007: 130–133) appears to assume that if one’s understanding of a truth is not sufficient for assent then one’s understanding cannot be the basis of one’s assent to that truth and, hence, cannot in turn be the basis of one’s knowledge of that truth. But one should resist this implication if one accepts the plausible distinction between those features that play a given role—like the role of being the basis of something—versus those features that merely enable those contributors to play that role (see e.g. Dancy 2004: 45-49). The import of this distinction is that one’s grasp of the thought *every vixen is a vixen* could be a basis for one’s assent to it (and in turn one’s knowledge) even if the former is not sufficient for the latter. One might object that the mere existence of this distinction does not tell us how one’s grasp of the Gettier proposition could be a basis for one’s knowledge of it. The observation is right but it only constitutes an objection if we presuppose that a proponent of BT would need ST to be true in order to answer the how-question. But why think that? Take Williamson’s own view, according to which the basis of such knowledge is a capacity to handle counterfactuals. The possession of this capacity is surely not a sufficient condition for being inclined to assent to this truth. As there will no doubt be numerous kinds of possible cases in which someone entertains this truth and possesses the extra-conceptual capacities that Williamson appeals to and yet is still not inclined to assent to this truth because, for example, they are convinced of the authority of misleading evidence to the contrary (perhaps testimony from a normally reliable Oracle). Should we thereby reject Williamson’s account of the basis of our knowledge of the Gettier proposition? No, as the mere fact that it is possible to possess certain capacities whilst failing to assent to some truth is not a good reason to reject the hypothesis that those capacities are the basis for our knowledge of that truth in the ordinary case. But this point also applies to competing views according to which the relevant basis consists only of conceptual capacities.
reject or downplay the significance of the kind of phenomenological claims made by the presentational theses.  

6. Intuition, Insight and E=K

Now we have a clearer grasp on the notion of a rational intuition we can return to the partiality and revenge problems. Recall, the challenge now is to show how a proponent of the intuition picture can maintain that intuitions play an important evidential role in philosophy given the assumption that E=K. The proponent of what I will call the knowledge version of the intuition picture (KI) meets this challenge by appealing to the idea that intuiting is a way of knowing. This idea may seem hopeless for reasons already raised, namely, that knowledge is factive and belief-entailing whereas intuition is not. To address this worry we need to adopt an account of what ways of knowing are. Two well-developed accounts are: Williamson (2000, Ch. 1) and Cassam (2007). Given our engagement with Williamson and E=K, I will focus more on Williamson’s account but it will also be useful to note some distinguishing features of Cassam’s account.

Williamson and Cassam on ways of knowing

Williamson’s account of ways of knowing is intimately related to his view that knowledge is the most general factive stative attitude (2000, pp. 33–48). Williamson tells us that a propositional attitude is factive, iff, necessarily, it is an attitude one has only to true

---

20 Ludwig notes (2007, p. 136) that his doxastic view of thought-experiment intuitions is consistent with the idea that intuitions have a distinctive phenomenology but he himself rejects both presentational theses. Ludwig (2007, fn. 18) points out that in this sense his use of the term ‘intuition’ differs from Bealer’s notion of a ‘rational intuition’. For our purposes, however, it is still useful to classify Ludwig as someone who endorses E4 given that he does agree with Bealer that thought-experiment intuitions satisfy the two etiological theses.
propositions. Not all factive attitudes are mental states. For example, forgetting is a mental process rather than a mental state. The factive stative attitudes include such mental states as seeing or perceiving that something is so, remembering that something is so, and knowing that something is so. The claim that knowledge is the most general factive mental state amounts to the claim that knowledge is the factive stative attitude one has to a proposition if one has any factive stative attitude to that proposition at all.

To illustrate this idea, Williamson draws an analogy between the state of knowing and the property of being coloured. Williamson (2000, p. 34) writes: “If something is coloured then there it has some more specific colour property; it is red or green or…. Although that specific colour property may happen to lack a name in our language, we could always introduce such a name, perhaps pointing to the things as a paradigm.” The analogy is then drawn between the property of being coloured and the mental state of knowing: “Similarly, if one knows that A then there is a specific way in which one knows; one can see or remember or … that A. Although the specific way may happen to lack a name in our language, we could always introduce such a name, perhaps pointing to the case as a paradigm” (2000, p. 34). And, in the other direction, if one sees, or remembers, that A, it follows that one knows that A. As Cassam (2009, p. 348) points out, the implication of Williamson’s analogy is that the relationship between a specific way of knowing and knowledge is a determinate-determinable one, just like the relationship between being coloured and being some specific colour.

Williamson also claims that corresponding to some specific ways of knowing there are also mental processes that aim at those mental states: “While a belief aims at knowledge, various mental processes aim at more specific factive mental states. Perception aims at perceiving that something is so; memory aims at remembering that something is so.” As part of his
‘knowledge-first’ approach to epistemology, Williamson rejects the project of trying to analyse knowledge as some special kind of belief. Instead, he advocates taking knowledge to be a primitive that can then be used to “elucidate” other important epistemic and mental notions. For example, Williamson offers a characterization of belief according to which “believing $p$ is, roughly, treating $p$ as if one knew $p$”, and mere believing is treated as “a kind of botched knowing” (2000, p. 47). Similarly, on this approach one might think of a perceptual appearance that $p$ as an apparent seeing that $p$, and a mere perceptual appearance as a kind of botched seeing.

On Cassam’s account, ways of knowing are not determinates of the determinable that is knowing. Rather, Cassam (2007, p. 340) gives an explanatory account according to which $\Phi$-ing that $p$ is way of knowing that $p$ just if it is possible to satisfactorily explain how $S$ knows that $p$ by pointing out that $S$ $\Phi$s that $p$. One worry with Williamson’s account is that regretting is a factive stative attitude but, intuitively, it is not a way of knowing. An attractive feature of Cassam’s account is that it predicts this result given that normally one cannot explain how one knows that $p$ by citing the fact that one regrets that $p$. Another important difference between the accounts is that on Williamson’s view ways of knowing entail knowledge, but Cassam rejects this restriction because, for example, that Bill read that James was born in Akron is a possible explanation of how Bill knows that James was born in Akron even though ‘$S$ read that $p$’ does not entail ‘$S$ knows that $p$’.

**KI and rational insights**

The proponent of KI claims that as well as seeing and remembering etc there is at least one other distinctive way of knowing, one that plays a crucial evidential role in philosophy. What is this way of knowing? Given that intuitions are non-factive it seems that having a
rational intuition cannot be the relevant way of knowing. In which case, the proponent of KI might have to admit that we lack a natural language term for this way. But, as Williamson notes, we could always introduce a term for it, perhaps by pointing to paradigm cases. For example, if we assume that we do know that the Gettier subject has NKJTB then the proponent of KI could point to this as an instance of this distinctive way of knowing. The proponent of KI might say that in this case one has a genuine rational insight that the Gettier subject has NKJTB, rather than just a mere rational intuition or seeming.21

Now, as a matter of fact, I think a proponent of KI could make a reasonable case that there is a factive sense of ‘intuition’ and its cognates that picks out this putative way of knowing. For example, if one looks up the verb ‘intuit’ in a dictionary the definitions one finds often seem to be appealing to something like the notion of a genuine rational insight:

OED Online

2 a. intr. or absol. To receive or assimilate knowledge by direct perception or comprehension.

2 b. trans. To know anything immediately, without the intervention of any reasoning process; to know by intuition.22

21 I use the phrase ‘rational insight’ here (and in the discussion to follow) because ‘insight’ has the advantage of being naturally interpreted as a factive term. But, as a reviewer for this journal pointed out, one downside of this choice is that neither ‘insight’ nor any of its cognates are clearly associated with processes (broadly construed) and, hence, there is a disanalogy here with both ‘intuition’ and ‘seeming’ and their cognates (‘intuition’ can plausibly be used to pick out both certain supposed kinds of occurrent mental processes and the corresponding standing mental states, and also the faculties responsible for these states and processes). Intuiting that \( p \) is something that (at least grammatically speaking) a subject does, and when it seems to a subject that \( p \) this is something that happens to that subject. If the proponent of KI wanted to introduce a term for the relevant factive mental process involved when one has an occurrent rational insight—to parallel the non-factive sense of ‘rationally intuits’—a natural choice would be something like ‘rationally perceives’ or ‘intellectually sees’. Alternatively, they might be able to argue that there is also a factive sense of ‘intuits’ that can refer to this factive mental process (see discussion above).

Definitions like these with their use of phrases like “to know by direct comprehension” appear to support the hypothesis that there is a factive sense of ‘intuits’. If there is such a sense of ‘intuits’ the proponent of KI who accepts E=K could appeal to it and endorse both I→E and the claim that intuiting is a way of knowing, as long as they added the clarification that “intuits” in these claims should be interpreted in the factive way.

However, the important issue is not whether there is a factive sense of ‘intuits’. The important issue is whether a proponent of KI can identify this supposed way of knowing. And a proponent of KI will not only think that they can do this by pointing to paradigm cases, they will also think they can offer a partial characterization of what unites those cases. In particular, the proponent of KI can utilize any of the standard characterizations of rational intuitions. For example, echoing the etiological theses, the proponent of KI can say that a rational insight is knowledge, the source of which is not perception, or memory, or testimony etc, and that it is knowledge gained simply on the basis of one’s understanding of the known proposition and one’s reasoning capacities. The proponent of KI might also echo the presentational theses and claim that this way of knowing has a distinctive presentational phenomenology, and that when one has a rational insight that $p$ this proposition is presented as being not merely true but necessarily true.

---

24 Similarly, a proponent of KI could claim that this factive sense of ‘intuits’ is a factive mental state operator (FMSO). According to Williamson, FMSOs are the paradigmatic expressions of factive static attitudes in natural language, examples of which include ‘sees’, ‘remembers’, and ‘knows’. An FMSO behaves syntactically like a verb and is semantically unanalysable (reflecting the assumption that knowledge is unanalysable). FMSOs obey three key principles (2000, p. 39): (i) If $\Phi$ is an FMSO, from ‘S $\Phi$s that A’ one may infer ‘A’; (ii) ‘Know’ is an FMSO; and (iii) If $\Phi$ is an FMSO, from ‘S $\Phi$s that A’ one may infer ‘S knows that A’.
It is true that such characterizations do not distinguish rational insights from mere rational intuitions. However, identifying such properties of rational insights can still be a way of distinguishing this distinctive way of knowing from other ways of knowing. Of course, if the proponent of KI adopts not only Williamson’s account of ways of knowing, but also his knowledge-first approach to epistemology, then they will want to deny that one can analyse what it is to have a rational insight that $p$ in terms of a rational intuition that $p$ and certain further conditions. But this non-analyzability assumption is consistent with the idea that we can usefully distinguish rational insight from other ways of knowing by pointing to certain features that it shares with rational intuition.

Proponents of the intuition picture frequently endorse various analogies between perception and intuition. Similarly, the proponent of KI will not only want to claim that having a rational insight is a way of knowing but that it is a way of knowing that is more closely analogous to perceptual ways of knowing than other ways of knowing. For example, unlike remembering, and like seeing, having a rational insight is most naturally thought of as a way of coming to possess knowledge rather than a way of retaining it. One could also use the notion of a rational insight to elucidate the notion of a rational intuition, in a way analogous to the Williamsonian elucidation of perceptual appearances given above. One might say that a rational intuition is as an apparent rational insight and that a mere rational intuition is a kind of botched rational insight. Similarly, one could characterize the mental process of rational intuition as that process which aims at having a rational insight that something is the case. And a proponent of KI can adopt any of the more familiar analogies between perception and intuition, for example, that they are both basic sources of evidence (Bealer 1992) and that perceptual states and intuitions share a presentational phenomenology (e.g. Bealer 1998, Huemer 2005, Chudnoff 2010).
KI and the role of intuitions

The imagined proponent of KI will characterize rational insights in something like the way just described. To see how they would characterize their evidential role let us return to E1 and E2:

E1) Intuitions are assigned an important evidential role in philosophy.

E2) Intuitions should be assigned an important evidential role in philosophy.

The proponent of KI can endorse both claims. But, given that these claims are ambiguous, we should specify the particular interpretations of these claims that they will endorse:

E1*) Intuited propositions are assigned an important evidential role in philosophy.

E2*) Intuited propositions should be assigned an important evidential role in philosophy in those cases where they are known to be true (where typically the way philosophers know such propositions is by having a rational insight).

E1* clarifies that KI is a non-psychologistic version of the intuition picture. The proponent of KI claims only that intuited propositions—as opposed to propositions about what intuitions we have—play an important evidential role in philosophy. Of course, the proponent of KI can allow that philosophers often have, as part of their evidence, psychological propositions of the form ‘S has the intuition that p’, and they could even allow that such propositions are sometimes used as evidence for philosophical conclusions. But they will not think that the method of cases crucially relies on the use of such psychological propositions.
E2* tells us that intuited propositions should be used as evidence in philosophy, but it adds the qualification that the intuited propositions need to be known to be true. The bracketed clause is also added to reflect the assumption that the standard way we come to know such propositions is by having the appropriate rational insight. (Note a proponent of KI can allow that we can sometimes gain such knowledge by other means, e.g. by testimony.)

Importantly, the proponent of KI will not merely claim that the content of the Gettier intuition is our evidence that the JTB theory is false, as they will also claim that there is a substantive connection between one’s having the Gettier intuition/insight and the fact that its content is now a part of one’s evidence. This connection falls out of three assumptions: (i) that E=K; (ii) that having a rational insight is a way of knowing; and (iii) that one’s Gettier intuition is a genuine rational insight as opposed to a mere rational intuition.

If the proponent of KI adopts Williamson’s account of ways of knowing, they will think that the rational insight that the Gettier subject has NKJTB is a determinate of the determinable that is knowing that the Gettier subject has NKJTB, that is, it is a specific way of knowing this truth. On the other hand, if they adopt Cassam’s account they will think that the rational insight is a state the possession of which can explain one’s knowledge that the Gettier subject has NKJTB, but they need not also think that it is itself a state of knowledge or a state that entails knowledge.

**KI and the nature of intuitions**

In a similar way to E1 and E2, the proponent of KI can endorse E3 and E4 when they are interpreted like so:
E3*) The intuited propositions that are assigned this important evidential role in philosophy are the objects of intuitions which are importantly distinct from any mere belief, judgment, or inclination to believe or judge.

E4*) The intuited propositions that are assigned this important evidential role in philosophy are the objects of rational intuitions.

In endorsing E3* and E4*, and in claiming that having a rational insight is a distinctive way of knowing, the proponent of KI clearly distinguishes their position from Williamson’s deflationary view of the nature and role of intuitions in philosophy. On this deflationary view, E3* and E4* would be rejected because Williamson claims that what philosophers call ‘intuitions’ are simply beliefs or inclinations to beliefs that are not distinct in any interesting way from mere beliefs or inclinations to believe in general. KI does not collapse into this deflationary view because it incorporates the central claims about the nature of intuitions made by prominent proponents of the intuition picture, including E3 and E4 as well as the etiological and presentational theses.

The partiality and revenge problems

25 In support of this deflationary attitude Williamson (2007. p. 217) notes that philosophers sometimes label commonsense empirical beliefs, like the belief that there are mountains, as intuitions. The observation is correct but even if we grant the correctness of such uses of the term ‘intuition’ (which is far from obvious) this would not be a problem for the intuition picture. For convenience, I have been using the phrase ‘philosophical intuitions’ to refer to the particular intuitions that proponents of the intuition picture are interested in. This might suggest that proponents of the intuition picture claim that any intuition that plays an evidential role in philosophy is a rational intuition, but this is not the case. Rather, what one usually finds is only the ostensive claim that the intuitions that play an evidential role in such-and-such thought experiments, or philosophical paradoxes, are rational intuitions. And, typically, the intuitions in such examples are far more plausible candidates for being rational intuitions than the other kinds of intuitions that Williamson points to. Relatedly, proponents of the intuition picture can grant that as well as rational intuitions there are also ‘common sense’ intuitions, in the same way that Bealer allows that there are ‘physical’ intuitions.
KI illustrates one way that a proponent of the intuition picture could meet the challenge of accommodating $E=K$ by appealing to the notion of a rational insight and Williamson’s account of ways of knowing. In so doing, KI shows us that the partiality problem is only an apparent problem by illustrating the flexibility of the intuition picture with respect to different conceptions of the nature of evidence. Furthermore, a proponent of KI can endorse Williamson’s response to the judgment sceptic and, hence, avoid the revenge problem.\footnote{Suppose that Williamson’s reply to the judgment sceptic succeeds. Could adopting his non-psychologistic conception of philosophical evidence also help in replying to the criticisms of armchair philosophy made by experimental philosophers? See Alexander and Weinberg (2007, p. 72) for an argument that it will not help. Deutsch (2010), Ichikawa (ms), and Cath (ms) all argue for variations of the opposite conclusion.}

This is because, given their endorsement of $E=K$, a proponent of KI will agree with Williamson that it is only in the good case (where the content of one’s intuition is true) that one’s evidence can include the non-psychological proposition that is the content of one’s intuitions.

It is worth emphasizing that appealing to the notion of a rational insight is not an \textit{ad hoc} or “whatever-it-takes” response to the assumption that $E=K$. Consider an analogy. Stephanie is a philosopher of mathematics who has developed a novel theory according to which perception is (correctly) assigned an evidential role in certain kinds of mathematical reasoning that were previously thought to be purely \textit{a priori}. Being antecedently committed to a non-factive conception of evidence, when Stephanie develops her view she appeals to a non-factive notion of perceptual appearances. But then Stephanie attends an epistemology conference at Oxford and comes away convinced that $E=K$. Should Stephanie now abandon her theory? It is easy to imagine the case turning out in such a way that the answer is no. After all, the subject of Stephanie’s theory is the epistemology of mathematics, not the nature of evidence in general. It would not be surprising then to find out that her core ideas about the evidential role of perception in mathematics could be made consistent with
different theories about the nature of evidence, including E=K. And, in meeting this
challenge, Stephanie will presumably have reason to appeal to a factive notion of perceiving
that \( p \), rather than just the non-factive notion of it perceptually appearing to one that \( p \).

Similarly, most proponents of the intuition picture appear to presuppose a non-factive view
of evidence. In which case, it is not surprising that they appeal to a non-factive notion of
rational intuitions or intellectual seemings when developing their views. If we assume that
E=K such philosophers do face a *prima facie* challenge of showing how the core of their
views can be restated so as to be made consistent with this assumption. But given that the
core of their view concerns the evidential role of intuitions in philosophy, and not the nature
of evidence in general, we should not be surprised if they can meet this challenge. And, in
addressing this challenge, it would be natural for them to appeal to a factive notion of
having a rational insight that \( p \). It would also be natural to appeal to the notion of a way of
knowing. Recall that on the most obvious way of developing a non-psychologistic model of
the intuition picture simply having the Gettier intuition is itself a way of possessing the
proposition that the Gettier subject has NKJTB as evidence. But note, if E=K, knowing is
effectively *the* way of possessing evidence. In which case, a proponent of the non-
psychologistic model who accepts E=K will quite naturally think that having the Gettier
intuition/insight is a way of possessing the proposition that the Gettier subject has NKJTB
as evidence, because it is a way of knowing that proposition to be true.

**Conclusion**

The intuition picture is consistent with the non-psychologistic view of philosophical
evidence advocated by Williamson, and even with his view that E=K. This shows us that the
intuition picture is not wedded to any particular positions on the nature of the evidence
provided by thought experiments, or the nature of evidence in general. One should not expect then to be able to reject the intuition picture by appealing to different theoretical positions on such matters. Furthermore, this shows us that proponents of the intuition picture are not wedded to any particular response to sceptical challenges to the armchair judgments relied upon in philosophy. In which case, if they choose to, proponents of the intuition picture can avail themselves of Williamson’s response to such challenges, without adopting his deflationary view of intuitions.\footnote{Versions of this paper were presented to the Philosophical Methodology Seminar at the University of St Andrews, the New Research on the A priori Workshop at the University of Cologne, and The XIII Taller d’Investigació en Filosofia at The University of Barcelona. I am grateful to the audiences at those talks for helpful discussion and to Jessica Brown and a referee for this journal for useful comments on the manuscript. Thanks also to Derek Ball, Jessica Brown, Herman Cappelen, Torfinn Huvenes, Jonathan Jenkins Ichikawa, Julia Langkau, Dilip Ninan, Daniele Sgaravatti, Ernest Sosa, and Brian Weatherson for many valuable discussions related to the issues discussed in this paper.}
