

Normative Reasons as Reasons Why We Ought

Jacob M. Nebel

New York University

Abstract

I argue that a reason for someone to do something is just a reason why she ought to do it. This simple view has been thought incompatible with the existence of reasons to do things that we may refrain from doing or even ought not to do. For it is widely assumed that there are reasons why we ought to do something only if we ought to do it. I present several counterexamples to this principle and reject some ways of understanding *ought* so that the principle is compatible with my examples. I conclude with a hypothesis for when and why the principle should be expected to fail.

This paper is about reasons. Many philosophers believe that there are at least three kinds of reasons, or senses of the count-noun *reason*. Consider the following examples:

- (1) The reason why the town was abandoned was that zombies attacked.
- (2) That the zombies attacked was a reason to abandon town.
- (3) The reason for which they abandoned town was that zombies attacked.

The type of reason in (1) is usually called *explanatory*. The type in (2) is usually called *normative*. And the type in (3) is usually called *motivating*. My focus is on explanatory and normative reasons; I shall not discuss motivating reasons.

My thesis is that normative reasons are just explanatory reasons of a particular kind. More specifically, a reason for someone to do something is just a reason why she ought to do it.

The paper comes in four sections. In §1, I introduce the view that normative reasons are a kind of explanatory reason. In §2, I introduce the main problem with this view: it is

thought to be incompatible with the existence of reasons to do things that we may refrain from doing or even ought not to do. Many people assume that there are reasons why we ought to do something only if we ought to do it. I present some counterexamples to this principle. In §3, I consider ways of understanding *ought* so that the principle is compatible with my examples. In §4, I present a hypothesis for when the principle should be expected to fail—namely, when *ought* is multidimensional, in a sense to be explained.

1 Normative Reasons

Many philosophers take the concept of a normative reason—or of the counting-in-favor-of relation that holds between normative reasons and the acts or attitudes they support—as primitive. They are *reasons primitivists*. Many of these reasons primitivists hope to understand all normative concepts—e.g., the concepts *good*, *right*, *justified*, and *ought*—in terms of the concept of a normative reason (see Smith 1994; Dancy 2004; Skorupski 2010; Parfit 2011; Scanlon 2014). Parfit, for example, believes that *S ought to φ* means that *S*'s reasons to φ are stronger than *S*'s reasons to do otherwise (p. 33).

Opponents of reasons primitivism believe that the concept of a normative reason can be analyzed in other terms (whether normative or non-normative). But it seems that no proposed analysis has been successful.

Kearns and Star (2008), for example, propose that a reason to φ is just evidence that one ought to φ . Intuitively, however, many pieces of evidence that one ought to φ are not reasons to φ . That some reliable book says I ought to exercise (with no explanation) is not, many people believe, a reason for me to exercise, although it may be good evidence that I ought to exercise (Broome 2013).

The reasons to exercise must, according to Broome, play a role in explaining *why* I ought to exercise (see also Toulmin 1950; Finlay 2001). Broome holds that all reasons are explanatory. There I agree with him. But what is their explanatory role?

Broome claims that, in one sense, a reason for someone to φ is a fact that explains why she ought to φ . He calls these *pro toto* reasons. If there is a *pro toto* reason for *S* to φ , then *S* ought to φ . For if *p* explains why *q*, then *q* must be true. But not all normative reasons are *pro toto* reasons. There are normative reasons to do things that one may refrain from doing, and normative reasons to do things that one ought not to do. We have *pro tanto* reasons,

which need not be decisive (in the sense of implying that we ought to do what they count in favor of doing). For example, that I am hungry may be a reason for me to steal a person's food, but I ought not to steal a person's food. That reason is not decisive.

On Broome's view, a *pro tanto* reason for S to φ is explanatory, but it is not an explanation of why S ought to φ . He suggests that *pro tanto* reasons for S to φ do not quite explain why S ought to φ , but rather play a certain role in a certain kind of explanation of why it is or is not the case that S ought to φ , whatever the case may be. The certain kind of explanation is a *weighing* explanation: one ought to φ because the reasons for φ ing outweigh the reasons against φ ing. Broome then understands the counting-in-favor-of relation in terms of the for- φ ing role in an explanation of that kind. That is, when one ought to φ , the facts that count in favor of φ ing are just the facts that win out in the weighing explanation.¹

Broome's account of *pro tanto* reasons strikes some philosophers as *ad hoc* or unilluminating. For one thing, our grip on which facts play which roles in explaining whether we ought to φ seems parasitic on our more basic understanding of which facts count in favor of φ ing (Schroeder 2007; Kearns and Star 2008; Brunero 2013). So Broome's account of *pro tanto* reasons in terms of weighing explanations seems not to provide a non-circular, informative account of what it is for some fact to count in favor of, or be a reason for, φ ing. Moreover, it is not obvious that normative reasons must participate in weighing explanations: reasons might not add up or interact in the way that weights add up and interact; weakening the metaphor of weighing to allow for such possibilities makes it less clear what weighing explanations are supposed to be (Hawthorne and Magidor forthcoming).

What I find most unattractive about Broome's view is that he posits two normative senses of the count-noun *reason*: *pro toto* and *pro tanto* senses. This move, it seems to me, multiplies senses beyond necessity and lacks a basis in either our ordinary or distinctively philosophical uses of the word. The main advantage of Broome's view is, I believe, its unification of normative and explanatory reasons. But this unification comes at the cost of an objectionably disjunctive account of normative reasons (Schroeder 2007; Kearns and Star 2008). This

¹Maguire (2017) emphasizes the features of normative reasons mentioned in the previous two paragraphs: that reasons need not be decisive, and that they play a certain role in weighing explanations. He argues these features (and another: gradable weights) are lacked by the kinds of considerations that support affective attitudes, and that we therefore have no reasons to have such attitudes. This conclusion may be in tension with my analysis of normative reasons. For we sometimes ought to have such attitudes, and presumably, when that is so, there are reasons why we ought to have such attitudes. So there can, on my analysis, be reasons for us to have those attitudes. I must therefore either reject Maguire's claim that reasons must have the features in question, or insist that the kinds of considerations that support affective attitudes have those features. I am currently inclined to prefer the first strategy.

cost does not seem to me worth paying.

There is, however, a simpler account that captures the unifying advantage of Broome's view while avoiding its costs. On this account, a (normative) reason for S to φ is just an (explanatory) reason why S ought to φ . That is the view I shall defend.

2 Factivity

The view that reasons to φ are reasons why we ought to φ seems to face the same problem that led Broome to distinguish *pro tanto* from *pro toto* reasons. The problem is that we can have reasons to do things that we may refrain from doing or even ought not to do. But if a reason to φ is a reason why one ought to φ , then the existence of reasons to φ might seem to require that one ought to φ . So my view might seem to rule out the possibility of non-decisive reasons.

The key assumption that generates this problem is

Factivity: For any p , there is a reason why p only if p is true.

If factivity is correct, and if reasons to φ are reasons why one ought to φ , then there are reasons to φ only if one ought to φ . That would rule out the existence of reasons to do things that we may refrain from doing or even ought not to do.

Factivity is assumed implicitly by Schroeder (2007, 35), Broome (2013, 50), and Skow (2016, 38), and explicitly by Lawler (1971, 167), Dancy (2000, 132), Grice (2001, 31), Finlay (2014, 109), and Hawthorne and Magidor (forthcoming). I know of only one philosopher who seems to reject it (see Wilson 1979, 273, although his non-factive usage may be merely stipulative).

I believe that factivity is false. Just as we can have reasons to φ and reasons not to φ , there can be reasons why we ought to φ and reasons why we ought not to φ . But it cannot, I assume, be true both that we ought to φ and that we ought not to φ . (In the next section, I consider ways in which this assumption might be rejected.)

Consider the following example from Abraham Lincoln, regarding the proposed release of Confederate diplomats Jason Mason and John Slidell:

- (4) Governor Seward, you will go on, of course, preparing your answer, which, as I understand, will state the reasons why they ought to be given up. Now I have a mind to try my hand at stating the reasons why they ought not to be given up. (Burlingame 2013, 227)

Lincoln thought that there were reasons why Mason and Slidell ought to be given up and reasons why they ought not to be given up.² But surely he didn't think both that they ought to be given up and that they ought not to be given up.

Similar examples arise for other modals:

- (5) [T]here exist good reasons why consent should be granted and good reasons why consent should be withheld [. . .]. (In re Cotton 1994, 526:185)
- (6) Thus, subjects who were able to think of many reasons why an event would happen, and few reasons why it would not, judged that event to be likely. (MacLeod 1994, 119)
- (7) There are many reasons why a free offer will work and reasons why it won't. (Carpenter 2015)
- (8) This article presents four reasons why [Argentina] can [beat Uruguay], and four reasons why they can't. (Traquette 2011)
- (9) [C]an a lightsaber cut through Superman? We [...] came up with reasons why it could and reasons why it couldn't. (Chen 2008)

These examples state that there are reasons why some p should, would, can, could, or ought to be the case and also reasons why that p should, would, can, could, or ought not be the case. But surely they do not presuppose both of these claims.

Examples like (4)–(9) are my main reasons for rejecting factivity. But let me mention another reason to be suspicious of this principle. If *reason why p* were factive with respect to p , then we might expect it to remain factive when negated. Karttunen (1971) observes that, except in very special circumstances, negations of factive verbs presuppose the truth of their complements:

²At least, he thought this at the time. The next day, Lincoln told Seward that he couldn't develop a satisfying argument for retaining Mason and Slidell.

(10) John didn't [regret/forget/like] that he had not told the truth. (Karttunen, 63)

This presupposes that John had not told the truth.³ But consider:

(11) That one is hungry is not a reason why one should steal another's food.

This does not presuppose that one should steal another's food. One could felicitously follow up (11) with something like, 'One shouldn't steal another's food even if one is hungry'. By contrast, when the *why*-clause contains no modal verb, both *is a reason why p* and *is [no/not a] reason why p* seem factive with respect to *p*:

(12) #There's a reason why John didn't tell the truth. [And/but] John did tell the truth.

(13) #That he was nervous isn't a reason why John didn't tell the truth. [And/but] John did tell the truth.

Those sound bad. When the *why*-clause contains no modal verb, *reason why* appears to work like more familiar factive constructions. We should therefore expect that if the construction remained factive when the *why*-clause contains a modal verb, then (11) would presuppose that one should steal another's food. But it doesn't.

The factivity of *reason why* might be thought to follow from the semantics of *why*-questions. It is natural to think that a reason why *p* is an answer to the question, 'Why *p*?' (Hieronymi 2011; Skow 2016). And many philosophers and linguists claim that questions of the form 'Why *p*?' presuppose that *p* (Kim 1964; Bromberger 1966; Lawler 1971; Sober 1986; Temple 1988; Pietroski 2002; Fitzpatrick 2005; Brandtler 2008; Tomioka 2009). For example,

(14) Why didn't John tell the truth?

This question presupposes that John did not tell the truth. But, again, things seem different in the presence of modals:

³An anonymous referee points out that some utterances of (10) do not seem to carry this presupposition. Karttunen himself notes that one might utter a version of (10) with an emphasis on *didn't* to emphatically deny a previous assertion that carries the presupposition. But such cancelling contexts are very much the exception; *in general*, negative assertions involving factive verbs presuppose the truth of their complements.

(15) Why wouldn't John tell the truth?

(16) Why shouldn't John tell the truth?

These questions do not presuppose that John wouldn't or shouldn't tell the truth (as Kim 1964, 363, acknowledges). So even if reasons why p are answers to the question, 'Why p ?', neither the answers nor the questions presuppose p in certain cases.

The examples I have discussed so far use the plural *reasons why* and the indefinite singular *a reason why*. But the definite singular *the reason why* seems to work differently:

(17) That one is hungry is not the reason why one should steal another's food.

This sentence seems to presuppose that one should steal another's food. If *the reason why p* is factive with respect to p , this may pose a problem for my view. For suppose that r is a reason why p , and that there are no other reasons why p . Then r is *the reason why p* . But it would be strange if the existence of a reason why p and the existence of no other reasons why p were enough to secure that p , when the existence of additional reasons why p would be compatible with p 's falsity. The apparent factivity of *the reason why* might therefore lead one to accept the factivity of *reason why* more generally.

However, the apparent factivity of *the reason why* seems to me a pragmatic feature of the definite singular, not a semantic feature of *reason why* more generally. For one thing, the presupposition can be cancelled by various modifiers:

(18) The only/best reason why one should steal another's food is that one is hungry. But that's not a good enough reason. One should never steal another's food!

This suggests that even though *the reason why p* may normally convey that p , this is not because the existence of a unique reason why p more generally presupposes that p . Moreover, the presupposition seems absent when the definite article modifies a plural noun:

(19) The reasons why one should steal another's food are silly.

This sentence seems not to presuppose that one should steal another's food. Indeed, one might assert (19) in an attempt to argue that one shouldn't steal another's food. I, therefore,

doubt that the usual commitments of *the reason why* are due to the factivity of *reason why* more generally.

Moreover, the definite singular seems to carry different commitments for talk of normative reasons as well:

(20) That one is hungry is not the reason to steal another's food.

Sentence (20) seems to presuppose that one ought to steal another's food. But the presupposition is cancelled or entirely absent in other cases:

(21) That one is hungry is not a reason to steal another's food.

(22) The only reason to steal another's food is that one is hungry.

(23) The reasons to steal another's food are silly.

(24) The best reason to steal another's food is that one is hungry.

One can assert (21)–(24) in the course of denying that one should steal another's food. The same pattern seems to hold for both explanatory and normative reasons. This suggests that the apparent factivity of *the reason why* is not a problem for my analysis of normative reasons as explanatory reasons.

I have suggested that *reason why p* is not always factive with respect to *p*. So there can be reasons why one ought to φ even if it's not the case that one ought to φ . This means that my simple account of normative reasons is compatible with the existence of reasons to do things that we may refrain from doing or even ought not to do. There is no need to distinguish between *pro tanto* and *pro toto* reasons. All normative reasons are explanatory reasons of the same kind.

3 Alternative Oughts

In §2, I denied that *reason why p* is factive with respect to *p*. My main reasons for denying factivity were examples (4)–(9), which say that there are reasons why some *p* should, would,

could, can, will, or ought to be the case, and reasons why p should, would, could, can, will, or ought not to be the case. In this section, I consider alternative explanations of this data.

After presenting examples (4)–(9), I said that although there are reasons why we ought to φ and reasons why we ought not to φ , *surely* it's not the case that we both ought and ought not to φ . Abraham Lincoln, for example, was not presupposing both that Mason and Slidell ought to and ought not to be released. Some philosophers, though, might deny this.

This strategy could be pursued in at least two ways. One way would read the *oughts* in question as somehow attenuated in strength. The other way would differentiate between the modal parameters or flavors of the *oughts* in question, in a sense that I shall explain. But let me start with the strategy of attenuation.⁴

3.1 Attenuation

I have been assuming that the *oughts* in question are *all things considered oughts*. This may be the sense that reasons primitivists analyze in terms of normative reasons: we ought to φ (in this all-things-considered sense) if and only if we have most reason to φ . We cannot have most reason to φ and most reason not to φ . In this sense of *ought*, it cannot be the case both that we ought to φ and that we ought not to φ .

Some philosophers countenance a *pro tanto* sense of *ought*. This sense could be understood in various ways. According to Crisp (2015, 153), you *pro tanto* ought to φ just in case, to some extent, you ought to φ . According to Reisner (2013), you *pro tanto* ought to φ just in case, if there were no other relevant considerations, you ought to φ . On these weaker readings, the existence of reasons why we ought to φ and reasons why we ought not to φ is compatible with factivity, so long as these *oughts* are merely *pro tanto*.

I am not convinced that this is a bona fide sense of *ought*. If it was, then we might expect these readings to be eligible without explicitly qualifying the *ought* with phrases like *to some extent* or *if there were no other relevant considerations*. But these reading do not seem eligible

⁴One response that I do not consider here is that my examples involve genuine deontic dilemmas in which, all things considered, we both ought to and ought not to φ , all things considered. As an anonymous reviewer suggests, that is implausible because even if such dilemmas are possible (see, e.g., van Fraassen 1973; Horty 2003; Horty 2012, ch. 4), we should expect them to be rare; the mere existence of reasons to φ and reasons not to φ should not generate a tragic dilemma (although see Sachs 2015). Moreover, in order to address all of (4)–(9), there would have to be not just deontic dilemmas (involving deontic *oughts* and *shoulds*), but also genuine dilemmas of other modal flavors involving conflicting *wills*, *woulds*, *cans*, and *coulds*. That sort of view has no precedent, as far as I am aware.

without explicit qualification. For example, if someone would enjoy torturing puppies, she might have *some* reason to do so. And perhaps if all other things were equal—i.e., if there were no other relevant considerations in favor or against torturing puppies—it *would* be true that she ought to torture puppies. But there seems to be no sense of *ought* in which she ought indeed to torture puppies. When a philosopher says that someone *pro tanto* ought to do something, this seems to me a technical way of saying that she has some reason to do something, or that it would be the case that she ought to do it if other things were equal. It does not clarify an independently existing sense of *ought* that folks like Lincoln would use in statements like (4).

It might be thought that statements of Rossian (1930) duties like, ‘We ought to keep our promises’, use *ought* in a *pro tanto* sense. After all, we cannot conclude from the fact that we ought to keep our promises and that S promised to φ that S ought to φ all things considered. But it is more plausible that *ought* has its ordinary sense throughout, and that what ought to be the case—i.e., that we keep our promises—is a generic, rather than universal, generalization. Because it is generic, it does not entail that whenever someone promises to do something, she ought to do it. We do not need a *pro tanto* sense of *ought* to account for Rossian duties, because genericity is sufficient to distinguish them from absolute requirements.

Moreover, even if there is a *pro tanto* sense of *ought*, appealing to such a sense might be a merely partial solution, for two reasons. First, it is doubtful that there are *pro tanto* senses of *could*, *can*, *will*, and *would*. And without such senses, the view cannot account for examples (6)–(9). Second, there may be cases in which one says that there are reasons why some p ought to be the case *all things considered* and reasons why that p ought not to be the case *all things considered*. Consider Lincoln’s (4). Plausibly, Seward was giving reasons why, all things considered, Mason and Slidell ought to be given up, and Lincoln was intending to give reasons why, all things considered, Mason and Slidell ought not to be given up. Appealing to an attenuated sense of *ought* does not save factivity if one can assert the existence of reasons why, all things considered, we ought to φ , and reasons why, all things considered, we ought not to φ .

3.2 Differentiation

Appealing to attenuated *oughts* is one way of maintaining that the *oughts* in question are compatible. Another way is to distinguish between the modal parameters or flavors of the *oughts* in question, in a sense that I shall now explain.

The conventional wisdom in linguistics maintains that sentences containing *ought*, *should*, and other modals express different propositions depending on contextually relevant background conditions and standards. According to Kratzer (1977)'s influential version of this view, they quantify over possible worlds. The context supplies a way of restricting the set of possible worlds to a relevant domain, which forms the *modal base*. For example, suppose that a hurricane has just passed, and someone says,

(25) The bridge ought to have collapsed.

The modal base here might only include worlds in which, among other things, the hurricane occurs. But what has to be true of the worlds in the modal base for (25) to come out true?

On the orthodox view, *ought* is treated as a universal quantifier. But of course not *all* worlds in the modal base are worlds in which the bridge collapses: one might assert (25) after watching the bridge withstand the hurricane. Kratzer's proposal is that we somehow rank the worlds, and that (25) is true just in case the bridge collapses in all of the top-ranked worlds. The mode of ranking worlds is the *ordering source*, which (for Kratzer) consists of a set of propositions. For deontic modals, the ordering source might be a set of laws or moral requirements. For epistemic modals, it might be a set of propositions that are normal, stereotypical, probable, or otherwise reasonable to expect. We rank worlds by their closeness to the ideal—i.e., satisfaction of all propositions in the ordering source. For example, (25) is true just in case the bridge collapses in all of the most normal worlds in the modal base.

Many aspects of Kratzer's semantics are controversial. But the core features of the account that are relevant for our purposes are shared by most of the alternatives that have been proposed. For example, one radical departure from Kratzer's semantics holds that modals do not quantify over possible worlds, but should instead be understood on the model of gradable adjectives (Lassiter 2011). This view starts from probabilities and degrees of obligation or desirability, and understands *ought* in terms of these scalar notions. Other views add additional ordering sources for *ought*, hold that *ought* requires the relevant proposition to hold only in most of the best worlds, allow the ordering source to vary with the agent's or

speaker's evidence, replace propositions with event-descriptions or actions, or rank options (understood as sets of worlds) rather than worlds (see Von Stechow and Iatridou 2005; Chrisman 2012; Silk 2013; Cariani 2011.) These departures from the orthodox view are, I think, harmless for our purposes. We can use Kratzer's semantics in the interest of simplicity, as long as what we ought to do is a function of some ranking of some contextually relevant items according to relevant standards.

Does this view help to maintain factivity in light of statements like (4)–(9)? This depends on how plausible it is that, when one asserts the existence of reasons why one ought to φ and reasons why one ought not to φ , the *oughts* in question do not share the same modal base and ordering source. If the modal base or ordering source differs between the *oughts*, then it may be true (given one modal base and ordering source) that we ought to φ and true (given another modal base or ordering source) that we ought not to φ .

A shift in modal base may be plausible in some cases. Recall (6):

Thus, subjects who were able to think of many reasons why an event would happen, and few reasons why it would not, judged that event to be likely.

It may be tempting to think that each *would* holds fixed different circumstances (although I question this on page 16). Given some circumstances, the event would happen. Given other circumstances, the event would not happen. So the *woulds* may both be true. Similar stories may apply to (7) and (8)—which use *will* and *can*, respectively—although I won't spell them out.

A shift in modal base is less plausible for certain cases involving deontic modals:

- (26) So far you've given two reasons why Kelly should bring Evelyn's picture out of the rain and one reason why she should leave it there. The two reasons why Kelly should bring Evelyn's picture out of the rain are that Kelly shouldn't be selfish and that it's a shame to let a beautiful picture be ruined. The reason why Kelly should leave it there is that Evelyn needs to learn to be more responsible. (Waggoner et al. 1995, 585)

It is hard to see what the difference between the modal bases would be. Perhaps one modal base includes that Kelly shouldn't be selfish and that it's a shame to let a beautiful picture be ruined, whereas the other includes that Evelyn needs to learn to be more responsible. But it

seems possible that both *shoulds* hold fixed all of these facts: there may be reasons why, even though Evelyn needs to learn to be more responsible, Kelly should bring Evelyn's picture out of the rain, and reasons why, even though Kelly shouldn't be selfish and it's a shame to let a beautiful picture be ruined, Kelly should leave Evelyn's picture out in the rain.

In (26), a shift in ordering source seems to me more plausible than a shift in modal base. That Kelly shouldn't be selfish and that it's a shame to ruin a beautiful picture may explain why, ordering alternatives in some way that gives pride of place to Kelly's character or the appreciation of beauty, it is best to bring the picture out of the rain. The need to teach Evelyn a lesson may explain why, ordering alternatives in some way that gives pride of place to Evelyn's character, it is best to leave the picture out in the rain. On this view, the *shoulds* are interpreted relative to the same set of possible worlds, but these worlds are ordered according to different standards.

It is not clear what features of the sentences are supposed to cause the shifts in modal base or ordering source. Most of the examples state that there are reasons why *p* should, can, will, would, or ought to be the case and reasons why *p* should, can, will, would, or ought not to be the case, without stating what those reasons are. What features of the sentences would make one modal base or ordering source salient for one use of the clause but not for the other?

In other cases where a shift in modal base or ordering source is plausible, there is a good account of what causes that shift. For example, consider the following argument:

(27) (P1) If you want to kill people for fun, you ought to kill them with a chainsaw.⁵

(P2) You want to kill people for fun.

(C) So, you ought to kill people with a chainsaw.

The premises may be true, but the conclusion seems false. We seem unable to detach the *ought* claim in the consequent of (P1). One Kratzerian story about this kind of argument is that we interpret the *oughts* relative to different ordering sources (Silk 2014, 9). For example, in (P1) we might be ordering alternatives according to what would best achieve your goals; this teleological ordering source may be made salient by the *want* in the antecedent. In (C) we might be ordering alternatives according to what would best conform to morality

⁵There is a sizeable literature on these so-called 'anankistic conditionals'. See, e.g., Sæbø (2001); Von Stechow and Iatridou (2005); Huitink (2005); von Stechow, Krasikova, and Penka (2006); Finlay (2014 ch. 3); Condoravdi and Lauer (2016); Finlay (2016).

or some other set of norms; a deontic ordering source may be made salient by mentioning such morally fraught things as guns. I do not claim that this story is correct. My claim is that the plausibility of this story depends on its account of what predicts the teleological interpretation of the *ought* in (P1) and the deontic interpretation of the *ought* in (C). Without this account, the story would not provide a good explanation of the data.

Similarly, a proponent of the view under consideration—that when there are reasons why we ought to φ and reasons why we ought not to φ , these *oughts* are interpreted relative to different modal bases or ordering sources—owes us an account of what predicts this difference. What makes one modal base or ordering source salient for one *ought* but another modal base or ordering source salient for the other? In (27), there are other expressions in the sentences that seem to make one interpretation more salient than another. But there seem to be no such expressions in the examples we are considering. Without an account of what causes the shift in ordering source or modal base in our examples, the story provides a weak explanation of the data.⁶

One might reply as follows:

Saying that there are reasons why we ought to φ makes salient some modal base and ordering source relative to which φ ing is best, because it presupposes that we ought to φ ; so we interpret the *ought* in such a way that it comes out true. Similarly, saying that there are reasons why we ought *not* to φ makes salient some other modal base or ordering source relative to which the speaker thinks not φ ing is best, because it presupposes that we ought *not* to φ .

But embedding *oughts* in factive environments does not generally lead us to interpret them relative to different modal parameters. Consider

(29) #Cat knows that we ought to φ . Dana knows that we ought not to φ .

⁶But consider the following abomination uttered by Anakin Skywalker after his mother dies in *Attack of the Clones*:

(28) But I couldn't. . . . Why did she have to die? Why couldn't I save her? I *know* I could have.

One might claim that there must be a shift in the relevant modal base or ordering source, because Anakin presupposes both that he could and that he couldn't have saved his mother. And yet nothing would signal which particular modal base or ordering source is relevant to each sentence.

But I read (28) differently: it seems to me that Anakin changes his mind after the ellipses: he starts to say that he couldn't have saved her but then takes it back. This fact is obscured either by Hayden Christensen's acting or by George Lucas's writing.

That sounds bad, to my ear. But, according to the view under consideration, saying something that presupposes that we ought to φ makes salient some modal base and ordering source relative to which φ ing is best, and then saying something that presupposes that we ought not to φ makes salient some other modal base or ordering source relative to which not φ ing is best. So why don't we shift the modal base or ordering source accordingly for (29)? The first sentence presupposes that we ought to φ , and the second presupposes that we ought not to φ . But it is unnatural to read these *oughts* differently in order to accept both presuppositions. The natural reading of (29) interprets these *oughts* the same way. So it remains unclear what would cause a shift in the modal base or ordering source in our examples.

I do not deny that modals like *ought* are context-sensitive in the way required by the strategy of differentiation. My claim is merely that the appeal to context-sensitivity does not save the factivity of *reason why* from the apparent counterexamples. Consider examples involving other context-sensitive expressions:

(30) Cat looked outside and saw that it was raining.

(31) Dana looked outside and saw that it wasn't raining.

Sentences (30) and (31) can both be true because it may have been raining where Cat was and not raining where Dana was. But that doesn't make it felicitous to assert

(32) #Cat saw that it was raining, and Dana saw that it wasn't raining.

We naturally consider the conjuncts according to a fixed contextual parameter—e.g., a single time and place (see Moss 2015, 5:49).⁷ Similarly, there may be cases in which it is felicitous to assert that one ought to φ and felicitous to assert that one ought not to φ , because we interpret these *oughts* relative to different contextual parameters, but this doesn't make it felicitous to assert that one ought to φ and that one ought not to φ . And one would expect that if *reason why p* were factive with respect to p , it would be infelicitous to assert that there are reasons why one ought to φ and reasons why one ought not to φ ; we would expect these *oughts* to be interpreted according to the same contextual parameters, much like in (32).

⁷(32) may have an acceptable reading in certain contexts—e.g., if the speaker wishes to draw attention, in a playful or paradoxical way, to the fact that Cat and Dana are in different locations with different climates. But this rhetorical flourish seems to exploit the fact that the point should, strictly speaking, be expressed with explicit reference to the different locations. Similar remarks apply to (29).

I said on page 12 that an appeal to different modal bases might seem plausible for some of my examples involving non-deontic modals. But, for the reasons given above, I do not think this strategy of differentiation can plausibly explain all of the relevant data—e.g., sentences (26), (4), and (5). One possible reaction to this failure would be to appeal to shifts in contextual parameters for some of the examples but not for the non-deontic examples. This would leave my main claim—that there can be reasons why S ought to φ even if it's not the case that S ought to φ —intact. But other things being equal, a uniform explanation of our data would be preferable. We do not need to appeal to shifts in contextual parameters in order to explain any of the data. We can simply deny that *reason why* is factive.

For example, in (6)—‘Thus, subjects who were able to think of many reasons why an event would happen, and few reasons why it would not, judged that event to be likely’—my interpretation is that both *woulds* share the same modal base: perhaps everything the relevant subjects know, or some other salient body of information. Neither the subjects nor the speaker are committed to thinking both that the event would and that the event would not happen, given those fixed parameters, because there can be reasons why it would (or would not) happen even if it's not the case that it would (not) happen. My interpretation seems preferable to the strategy of differentiation, on which the *woulds* in (6) must be interpreted relative to different modal bases. For that strategy may distort the meaning of the sentence. According to the strategy of differentiation, (6) describes subjects who were able to think of many reasons why, given *some* hypothetical constraints, an event would occur, and few reasons why, given *other* hypothetical constraints, the event would not occur. But that does not seem quite right. These subjects may very well have been able to concoct many reasons why, given various possible constraints beyond their ken, the event would not occur. They just could not think of many reasons why, in light of the information available to them, it would not occur, while being able to think of many reasons why, in light of that same body of information, it would occur. (This interpretation is, at the very least, *an* eligible reading, which suggests that a shift in modal base is not necessary.) Positing a change in modal base without any strong indicator of such a shift may therefore amount to changing the subject.

I have considered two ways of maintaining factivity in light of examples (4)–(9). Neither attenuation nor differentiation seems to me successful. There are surely other ways of pursuing this strategy. But, for reasons that will emerge in the next section, they are unlikely to succeed if they are too specific to modals.

4 Multidimensionality

I have argued that there can be reasons why we ought to φ even if it's not the case that we ought to φ . In §3, I considered the view that if there are reasons why we ought to φ and reasons why we ought not to φ , then indeed we ought to φ and we ought not to φ , but these *oughts* are consistent, because they are somehow attenuated or differentiated. I denied that these *oughts* should be understood as *pro tanto* or as relative to different modal parameters. Both views considered in §3 are specific to *ought* and other modals. So these views fail to apply in (at least, *prima facie*) non-modal cases like (33)–(36):

- (33) There are doubtless more reasons why grad school is worthwhile (and, assuredly, some reasons why it isn't) [...]. (Sharon 2013)
- (34) As a result, seven reasons why being the first author is important and six reasons why it is not were identified as shown in Table 2. (Krasnova et al. 2012)
- (35) For example, before leading a discussion on prohibition, assign each student to write three reasons why prohibition is a good idea and three reasons why prohibition is a bad idea. (Salsbury 2011)
- (36) Identify reasons why competition is useful and why it is not useful in terms of health-care cost, quality, and access. (Rakich, Longest, and Darr 2010, 4)

These sentences do not presuppose that grad school is both worthwhile and not worthwhile, that being the first author is both important and not important, that prohibition is both a good idea and a bad idea, or that competition is both useful and not useful. The predicates *worthwhile*, *important*, *good*, and *useful* are not being used in merely *pro tanto* senses. Nor does it seem to me likely that each predicate carries two different semantic values within each sentence.

I suggest that we try to understand what is going on in (33)–(36) and then see if the explanation generalizes to the cases involving modals.

One feature that examples (33)–(36) have in common is that *worthwhile*, *important*, *good*, and *useful* are gradable adjectives. Something can be somewhat worthwhile, very important, extremely good, or more or less useful. But, for some gradable adjectives F , we cannot say that there are reasons why a thing is F and reasons why it isn't F :

(37) ?There are reasons why John is tall and reasons why John isn't tall.

(38) ?There are reasons why the table is long and reasons why the table isn't long.

(39) ?There are reasons why the box is heavy and reasons why the box isn't heavy.

These sentences are hard to hear as acceptable. This is because, in normal contexts, (37) presupposes that John is tall and that John isn't tall, (38) presupposes that the table is long and that it isn't long, and (39) presupposes that the box is heavy and that it isn't heavy.⁸ Moreover, the adjectival nature of the predicates in (33)–(36) is inessential. Consider the following examples:

(40) There are many reasons why auto racing is a sport, and many reasons why it isn't. (Sun 2010)

(41) [R]emember that Immanuel Kant offers theoretical reasons why instrumental music is fine art, and then reasons why it is not fine art. (Gracyk 2013, 61)

What (40) and (41) have in common with (33)–(36), which is not shared by (37)–(39), is that the predicates are *multidimensional*. There are multiple ways or respects in which a thing can be worthwhile, important, a sport, good, useful, or fine art. Something can be one of these things in some respects but not in others. Not so for *tall*, *long*, and *heavy*—at least, in normal contexts. (In some contexts, these predicates can perhaps enjoy a kind of multidimensionality: for example, if John has an extremely tall hairdo but is otherwise of average height, or if a rhombus-shaped table has short sides but a long diagonal, or if a massive box is floating in a low-gravity environment. (37)–(39) may be heard as acceptable in such contexts, precisely due to their multidimensionality.) I conjecture that when *F* is a multidimensional predicate, there can be reasons why a thing is *F* and reasons why it isn't *F*. This is not because the semantic value of *F* changes or because *F* expresses only some degree of *F*ness, but rather because the existence of such reasons requires only that the thing is *F* in some respects but not in others. By contrast, when *F* is a one-dimensional predicate, there

⁸I admit that we can understand what a speaker is trying to say in uttering (37), (38), or (39)—perhaps that there are reasons why some would count John as tall and why some wouldn't, or that there are reasons why the table would count as long in some contexts and reasons why it would count as long in others—but our ability to understand what a speaker is trying to say in uttering a sentence is not dispositive of whether the sentence is felicitous.

cannot be reasons why a thing is F and reasons why it isn't F , because such reasons would presuppose that it both is and isn't F .

Returning to the examples involving modals, I propose that we generalize the diagnosis of multidimensionality. There can be reasons why p should, can, would, could, or ought to be the case and reasons why p shouldn't, can't, wouldn't, couldn't, or ought not to be the case when and because these modal operators rank worlds along multiple dimensions. Proximity to an ideal—whether deontic, teleological, bouletic, stereotypical, or whatever—may depend on various factors. There can be tradeoffs between morally relevant considerations, goals, desires, and standards of normalcy. Worlds can be close to the contextually relevant ideal in some respects but not in others.

The hypothesis is that whenever there are reasons why p should, can, would, could, or ought to be the case and reasons why p shouldn't, can't, wouldn't, couldn't, or ought not to be the case, the contextually relevant ideal ranks the relevant worlds according to how F they are, and the p -worlds are F in some respects but not in others. This hypothesis strikes me as plausible in examples (4)–(9) on pages 5–5. Many different kinds of factors may be relevant to whether the Confederates ought to be returned, consent should be granted, some arbitrary event would happen, a free offer will be effective, Argentina can beat Uruguay, and a lightsaber can cut through Superman.

I have not said what dimensions are or how they are structured—e.g., whether a dimension requires a precise cardinal scale of degrees. Nor have I tried to identify the dimensions associated with different kinds of modals, to explain how dimensions combine to form a multidimensional ideal, or to settle whether such ideals are to be understood in terms of Kratzerian ordering sources. I wish to remain neutral on such questions.

If my hypothesis in this section is correct, then it is clear how there can be reasons to φ and reasons not to φ on my account of normative reasons. There can be such reasons only when and because whether we ought to φ depends on many different dimensions of an ideal. Some of these dimensions may favor φ ing, while others oppose φ ing. I find it hard to see how there could be such reasons if there were no respect in which φ ing and not- φ ing were each, in some way, worth doing.

This story is distinct from the appeal to shifting ordering sources considered in §3.2. I am not claiming that, whenever there are reasons why we ought to φ and reasons why we ought not to φ , 'We ought to φ ' and 'We ought not to φ ' both express truths, with their respective *oughts* interpreted in different ways to isolate different dimensions. I am claiming instead

that there can be such reasons even if neither ‘We ought to φ ’ nor ‘We ought not to φ ’ are true. There can be such reasons because *reason why p* need not be factive with respect to p , when p contains a multidimensional expression such as *ought*. This does not require the semantic value of *ought* to shift in the sentences at issue. (Nor, of course, does it rule out such a shift in other contexts.)

Let me conclude this section by briefly considering an objection.⁹ The view I have just sketched might seem too restrictive. For there might seem to be cases in which we have reasons to φ and reasons not to φ , without there being multiple dimensions relevant to whether or not we ought to φ . Suppose, for example, that we have only two options: φ ing and ψ ing. φ ing would relieve Ann’s physical pain, and ψ ing would relieve Bob’s physical pain; they would have no other effects. We have a reason to φ —namely, that it would relieve Ann’s physical pain—and a reason to ψ —namely, that it would relieve Bob’s physical pain—but there might seem to be only one dimension relevant to whether we ought to φ or ψ : namely, the relief of physical pain. If that is right, then there can be reasons to φ and reasons not to φ even if the relevant ideal is unidimensional.

But there are, I think, multiple dimensions relevant to the case just described: there are the effects on Ann, and there are the effects on Bob. If we treat each person’s good as a different dimension of the relevant ideal, we can accommodate the case above. We have a reason to φ and a reason to ψ because φ ing is good in one way (namely, for Ann), and ψ ing is good in another way (namely, for Bob).

This does not mean that the *only* dimensions ever relevant to what we ought to do are the effects on each person. The dimensions might be even more fine-grained, for example, to reflect different components of each person’s well-being. So, for example, we might have a reason to φ because φ ing would be better for someone *in some respect*—e.g., by decreasing the intensity or duration of some physical pain—even if φ ing would be worse for her (and everyone else) all things considered. And, depending on our normative theory, some dimensions might not be reducible to the good of any person at all (e.g., inequality, on some egalitarian views). With a sufficiently fine-grained—and perhaps context-dependent (see Sassoon 2013)—partition of dimensions, we can answer the objection, so long as any source of reasons to φ can be identified with a dimension along which φ ing is worth doing.¹⁰

⁹Thanks to an anonymous referee for pressing this objection.

¹⁰The objector might worry that such a fine-grained conception of dimensions would make my view *too* permissive. But my appeal to multidimensionality was motivated by examples involving uncontroversially unidimensional adjectives, such as *tall*, *long*, and *heavy*. A fine-grained partition of deontic ideals into many

Conclusion

I have defended the view that a reason for someone to do something is a reason why she ought to do it. This view is attractive in its unification of normative and explanatory senses of the count-noun *reason*. But it has seemed incompatible with the existence of *pro tanto* reasons. The problem stems from the assumption that *reason why p* is always factive with respect to *p*.

I have made three main claims in response to this problem. I claimed, first, that there can be reasons why we ought to φ and reasons why we ought not to φ ; second, that this is not best explained by attenuated or differentiated *oughts*; and third, that there can be such reasons when and because the relevant ideal is multidimensional.

If I am right that *reason why* is not factive, then why have so many philosophers thought otherwise? Here is a guess: they have assumed that a reason why *p* must be a fact that (at least partially) explains why *p*, or plays some role in explaining why *p*—in short, that explanatory reasons are (at least partial) explanations. And explanation does seem factive: *q* (even just partially) explains why *p* only if *p* is true. If explanation is indeed factive but explanatory reasons are not, then these philosophers have been wrong to assume that explanatory reasons just are explanations.¹¹ For there can be reasons why *p* even if *p* is not the kind of thing—a fact—that can be explained.¹²

dimensions need not force us to recognize multiple respects in which things can be tall, long, or heavy.

¹¹I am grateful to an anonymous referee for noticing how my arguments challenge this assumption. Interestingly, Wilson (1979, 273) introduces the *reason why* construction as a way of expressing a ‘potential partial explainer’, which—unlike an actual explanation—does not presuppose the truth of what it might potentially explain. So there is precedent for distinguishing reasons why from explanations.
