Introduction

Knowledge-first theories of justification give knowledge priority when it comes to explaining when and why someone has a justified belief. As it turns out there are a number of ways of giving knowledge priority when theorizing about justification, and in what follows I offer an opinionated survey of several existing options.

But first, why think knowledge might come first in our account of justification? One reason stems from Williamson's (2000) defense of the unanalyzability of knowledge together with the E=K thesis, which says that the evidence you possess is just what you know. Assuming we should understand justification in terms of evidence, it seems to follow that we should understand justification in terms of knowledge.

A second reason stems from reflections on the normativity of belief. As Williamson (2014: 5) reasons: "If justification is the fundamental epistemic norm of belief, and a belief ought to constitute knowledge, then justification should be understood in

terms of knowledge too.” Here Williamson is connecting norms for good instances of a kind and norms for bringing about instances of that kind. So if one is justified in holding a belief only if it’s a *good belief*, and a good belief is one that constitutes knowledge, then it seems to follow that a justified belief has to be understood in terms of knowledge (Kelp, et al. 2016; Simion 2019).

A third reason stems from conceptual relations between knowledge and justification. Sutton (2005; 2007) has argued that grasping the concept of *epistemic* justification depends on our prior understanding of knowledge:

We only understand what it is to be justified in the appropriate sense because we understand what it is to know, and can extend the notion of justification to non-knowledge only because they are would-be knowers. We grasp the circumstances—ordinary rather than extraordinary—in which the justified would know. Justification in the relevant sense is perhaps a disjunctive concept—it is knowledge or would-be knowledge (Sutton 2005: 361).

Another reason stems from the way in which asymmetries of knowledge can explain certain asymmetries of justification. While much of the knowledge-first literature on lottery beliefs has focused on assertion (see [the entry on knowledge norms](#)), the points are easily extended to justification. One cannot have justification to believe that (L) *one has a losing lottery ticket* just on the basis of one's statistical evidence. But one can have justification to believe (L) on the basis of a newspaper report. What can explain this asymmetry? Knowledge. For one cannot know (L) on the basis of statistical evidence, but one can know (L) on the basis a newspaper report. Accordingly, knowledge can play a role in explaining the justificatory asymmetry involving (L) (Hawthorne 2004; Smithies 2012). A similar asymmetry and knowledge-first explanation can be drawn from the literature on pragmatic encroachment (Smithies 2012; De Rose 1996). For a further justificatory asymmetry that certain knowledge-first approaches to justification can explain involving lottery and prefaces cases see Dutant and Littlejohn (2020).

Further, putting knowledge in the explanatory forefront can explain (broadly) Moorean absurdities. Consider, for instance, the absurdity involved in believing *p* while also believing that one doesn't know *p*. Some explanation for the irrationality of this combination of beliefs should fall out of a theory of justification that tells us when and why a belief is (or isn't) justified. Theories of justification that explain justification in terms of knowledge have an easy time explaining this (Williamson 2000; 2009; 2014).

Lastly, putting knowledge in the explanatory forefront of justification can explain the tight connection between justification and knowledge. For it's widely believed that knowing p or being in a position to know p entails that one has justification for believing p . One way of explaining this entailment is by saying that knowledge or being in a position to know is constitutively required for justification (Sylvan 2018).

Due to space limitations, I will not pause to explain how each of the following knowledge-first theories of justification link up with each of these motivations. But in most cases it will be easy to see how they link up.

1 The Token-Identity Theory

Perhaps the first knowledge-first theory of justified belief is the token-identity theory, according to which token instances of justified belief just are token instances of knowledge, which yield the following biconditional (Williamson 2009, 2014; Sutton 2005, 2007; Littlejohn 2017: 41-42):

(J=K) S 's belief that p is justified iff S knows that p .

As should be clear, this is a theory of a justified act of believing (=doxastic justification), not a theory of having justification to believe, whether or not one does in fact believe (=propositional justification). But it's not hard to see how a (J=K) theorist might accommodate propositional justification (Silva 2018: 2926):

(PJ=PK) S has justification to believe p iff S is in a position to know p .

What does it take to be in a position to know p ? One type of characterization takes being in a position to know as being in a position where all the non-doxastic demands on knowing are met (Smithies 2012; Neta 2017; Rosenkranz 2018; Lord 2018). The doxastic demands involve believing p in the right kind of way, i.e. the kind of way required for knowing. The non-doxastic demands involve the truth of p and one's standing in a suitably non-accidental relation to p such that, *typically*, were one to believe p in the right kind of way, one would know. (For alternative characterizations of being in a position to know see Williamson 2000: 95; Rosenkranz 2007: 70-71.)

One issue raised by characterizing being in a position to know in counterfactual terms concerns what we might call *doxastic finks*: features of one's situation that are triggered by one's act of coming to believe p at a time t_{+1} that would preclude one from knowing p despite all the non-doxastic requirements of knowledge being met at an earlier time t . For example, I might have all the evidence it could take for

anyone to know p , but suppose Lewis' (1997) sorcerer doesn't want me to know p . So in all or most nearby worlds when the sorcerer sees me beginning to form the belief in p , he dishes out some kind of defeater that prevents me from knowing p . So, on standard possible worlds analyses of counterfactuals, it's false that I have some way of coming to believe p such that were I to use it, I would know p (cf. Whitcomb 2014). Alternatively, one might seek to characterize being in a position to know in terms of having *the disposition to know* which is compatible with the existence of doxastic finks. Another alternative is to give up on the idea that being in a position to know is best understood in terms of worlds and situations nearby or "close" to one's actual situation, thereby making the target characterization of 'being in a position to know' a much more idealized notion, one that I'll discuss below (cf. Smithies 2012: 268, 2019: sect 10.4; Rosenkrantz 2018; Chalmers 2012).

There are various problems with $(J=K)$, and by extension, $(PJ=PK)$. *First, $(J=K)$ is incompatible with the fallibility of justification, i.e. the possibility of having justified false beliefs.* So $(J=K)$ cannot permit justified false beliefs. But any theory of justification that rules out such beliefs is widely seen to be implausible (Bird 2007; Comesana and Kantin 2010; Whitcomb 2014; Ichikawa 2014).

Second, $(J=K)$ is incompatible with the possibility of having a justified true belief in the absence of knowledge. Gettier cases are typically cases of justified true belief that do not constitute knowledge. But $(J=K)$ implies that there are no such cases because it implies that there can be no cases of justification without knowledge. Obviously, this bucks against a history of strong intuitions to the contrary (Bird 2007; Comesana and Kantin 2010; Whitcomb 2014; Ichikawa 2014).

Third, $(J=K)$ is incompatible with the new evil demon hypothesis. Consider someone who, unwittingly, has had their brain removed, envatted, and is now being stimulated in such a way that their life seems to go on as normal. According to the new evil demon hypothesis: if in normal circumstances S holds a justified belief that p then S 's recently envatted brain-duplicate also holds a justified belief that p . It is beyond the scope of this entry to defend the new evil demon hypothesis. But as Neta and Pritchard (2007) point out, it is a widely shared intuition in recent epistemology. This generates problems for $(J=K)$. For since one cannot know that one is looking at a hand (or that a hand is in the room) if one is a recently envatted brain who merely seems to be looking at a hand, then according to $(J=K)$ one cannot be justified in believing it either (Bird 2007; Ichikawa 2014). (For further discussion see [the entry on the new evil demon hypothesis.](#))

There are further objections to (J=K) that I'll note below since they apply also to alternative knowledge-first theories of justification. I'll return to discuss the standard response to these objections in the final section on excuses below.

2 Modal Theories

To avoid the problems with (J=K), some have sought to connect justification and knowledge in a less direct way, invoking some modal relation or other.

Here is Alexander Bird's (2007) knowledge-first account of justification:

(JuJu) If in world w_1 S has mental states M and then forms a judgment [or belief], that judgment [or belief] is justified iff there is some world w_2 where, with the same mental states M , S forms a corresponding judgment and that judgment [or belief] yields knowledge.

(JuJu) counts as a knowledge-first theory of justification because it explains one's justification in terms of the knowledge of one's mental state duplicates. And it does a good deal better than (J=K) when it comes to accounting for justification's intuitive characteristics, including its fallibility, its compatibility with Gettier cases, and its compatibility with the new evil demon hypothesis. Despite this, various problems have been pointed out concerning (JuJu).

First, it seems that we can obtain justified false beliefs from justified false beliefs. For example, suppose S knew that:

(a) Hesperus is Venus.

But, due to some misleading evidence, S had the justified false belief that:

(b) Hesperus is not Phosphorus.

Putting these two together S could infer that:

(c) Phosphorus is not Venus.

As Ichikawa (2014: 191-192) argues, S could justifiably believe (c) on this inferential basis. But, according to (JuJu), S can justifiably believe (c) on the basis of an inference from (a) and (b) only if it's possible for a mental state duplicate of S's to know (c) on this basis. Content externalism, however, precludes such a possibility. For content externalism implies that any mental state duplicate of S's who believes (c) on the basis of (a) and (b) will be a thinker for whom the terms 'Phosphorus'

and 'Venus' refer to the very same astral body, thus making knowledge of (c) on the basis of (a) and (b) impossible. Because of this, (JuJu) implies that you cannot have justification to believe (c) on this inferential basis, contrary to what seems to be the case. This is not just a problem for (JuJu), but also (J=K).

Second, (JuJu) fails to survive the Williamsonian counterexamples to internalism. Williamson's counterexamples, as McGlynn (2014: 44ff) observes, were not intended to undermine (JuJu) but they do so anyway. Here's one example of the kind of case (JuJu) has difficulty with:

Suppose that it looks and sounds to me as though I see and hear a barking dog; I believe that a dog is barking on the basis of the argument 'That dog is barking; therefore, a dog is barking'. Unfortunately, I am the victim of an illusion, my demonstrative fails to refer, my premise sentence thereby fails to express a proposition, and my lack of a corresponding singular belief is a feature of my mental state, according to the content externalist. If I rationally believe that a dog is barking, then by [JuJu] someone could be in exactly the same mental state as I actually am and know that a dog is barking. But that person, too, would lack a singular belief to serve as the premise of the inference, and would therefore not know that a dog is barking. (Williamson (2000: 57-58).

McGlynn (2014: 44) draws attention to the fact that a "natural verdict is that one's belief that a dog is barking is rational or justified" despite the fact that one cannot know this while having the same mental states. For any (non-factive) mental state duplicate will be one for whom the sentence 'That dog is barking' cannot be true, and hence cannot be known either. So we have another counterexample to (JuJu). Again, this is not just a problem for (JuJu), but also (J=K).

Since (JuJu)'s problems stem from its insistence on sameness of mental states, a natural response is to abandon that emphasis and focus on what a thinker and, say, her duplicate [on Twin Earth](#) can have in common. This is just what Ichikawa (2014: 189) attempts to do:

(JPK) *S* has a justified belief iff *S* has a possible counterpart, alike to *S* in all relevant intrinsic respects, whose corresponding belief is knowledge.

The target intrinsic respects are limited to the non-intentional properties that *S* and her Twin Earth duplicate can share. But they are not intended to include all such properties. Ichikawa wants to maintain that if, say, *S* unwittingly lost her body in an envattment procedure, she could still have a justified belief that she has a body even

though the only counterparts of hers who could know this are ones who have a body. So the target intrinsic respects are to be further restricted to what S and her envatted counterpart could share. In the end, this seems to amount to sameness of brain states or something close to that. This aspect of (JPK) goes a long way towards making it internalist-friendly and also helps (JPK) avoid the difficulties facing (JuJu) and (J=K).

Nevertheless, (JPK) has problems of its own. Both problems stem from the attempt to reconcile (JPK) with the idea that justified belief is a type of creditable belief. Here is how Ichikawa (2014: 187) describes the first problem. As Zagzebski (1996: 300-303) and many others have argued, it's plausible that S's holding a justified belief entails that S is creditworthy (=praiseworthy) for believing as she does. Moreover, S is creditworthy *because* S holds a justified belief: that is, it is S's *particular act of believing* that explains why S deserves credit. But (JPK) seems forced to explain S creditworthiness in terms of facts about a S's counterparts since it's one's counterparts that explain one's doxastic justification. But this seems odd: why facts about a merely possible, *distinct* individual make *me* creditworthy for believing as I actually do? As others have pointed out, this can seem odd (Silva 2017). But a more promising response involves noting that having a justified belief immediately grounds being creditworthy for believing, just as our intuition has it. And facts about one's counterparts' knowledge immediately grounds having a justified belief. But immediate grounding is not transitive, so stuff about knowledge does not immediately ground being creditworthy for believing. So, the odd consequence does not follow. A consequence that does follow is that stuff about knowledge mediately grounds being creditworthy for believing. (Because there's a chain of immediate grounds connecting these.) But here it's open for the knowledge-firster to say that our intuition really concerns only immediate grounding.

Ichikawa is clear that (JPK) is a theory of justified belief (=doxastic justification) and that this is the notion of justification that is connected to a believing being creditworthy. But doxastic justification has a basing requirement, and this makes doxastic justification partly a historical matter. And epistemic credit and blame also seem to depend on historical factors too (Greco 2014). Thus, Ichikawa's defense of (JPK) is susceptible to cases like the following:

Bad Past: At *t* S comes to believe that there is a ceiling overhead. S believes this because she just took a pill which she knew would induce random changes in her intrinsic states. In advance of taking the pill, S knew it would very likely cause her to have many false perceptual beliefs. But as it happens, the pill induced a total re-organization of her intrinsic states such that at *t* S has a counterpart who knows a ceiling is overhead.

(JPK) implies that S has a justified belief in Bad Past because she happens to have a knowledgeable counterpart. And because she has a justified belief she is also creditworthy. But this seems wrong. Rather, S seems positively blameworthy for believing as she does. (See Silva (2017) for further discussion of (JuJu) and (JPK) and see Greco (2014) for further discussion of historical defeaters for doxastic justification.)

An alternative solution to these problems would be to revise (JPK) so that's it's only a theory about propositional justification:

(PJPK) S has justification to hold a belief iff S has a possible counterpart, alike to S in all relevant intrinsic respects, whose corresponding belief is knowledge.

One could then, arguably, concoct a knowledge-first theory of doxastic justification by adding some kind of historical condition that rules out cases like Bad Past.

It should be noted that (PJPK) has a strange result. For if your intrinsic counterpart knows p , then your intrinsic counterpart believes p . But if your intrinsic counterpart believes p , then *you* also believe p (cf. Whitcomb 2014). So if (PJPK) is true, you only have propositional justification to believe p if you actually believe p . But it's usually assumed that it's possible to have justification to believe p even if you don't believe p . To accommodate this (PJPK) will need revision.

3 Reasons-First, Knowledge-First Theories

Sylvan (2018), and Lord (2018) each take a reasons-first approach to justification, on which justified belief just is belief that is held for sufficient reason:

(J=SR) S's belief that p is justified iff S possess sufficient reason to believe p , and S believes that p for the right reasons.

While (J=SR) is not itself a knowledge-first view of justification, it can become one if combined with a knowledge-first account of what it takes to possess reasons. Lord (2018: ch3) and Sylvan (2018: 212) both do this, taking reasons to be facts and arguing that one possesses a fact just in case one is in a position to know it:

(Pos=PK) S possess the fact that p iff S is in a position to know that p .

Others have argued for some kind of restriction on (Pos=PK). For example, Neta (2017) has argued that our evidence is the set of propositions we are in a position

to know *non-inferentially*. Provided one's evidence just is the set of reasons one has for belief, this view will fall into the reasons-first, knowledge-first camp. (For objections to (Pos=PK) see Kieseewetter (2017: 200-201, 208-209) and Silva (2020).)

Perhaps surprisingly, the category of reasons-first, knowledge-first views cross-cuts some of the other categories. For example, (J=K) theorists have tended to fall into this camp. Williamson (2009) and Littlejohn (2018) take one's evidence to consist of the propositions that one knows. Provided one's evidence just is the set of reasons one has for belief, this leads to a view on which one possess p iff one knows p . This more restrictive knowledge-first view of possession together with (J=SR) and (J=K) constitute a kind of reasons-first, knowledge-first theory of justification. Since justified belief that p and knowledge that p never separate on this view it can seem hardly worth mentioning this view as a reasons-first view. But there is more in need of epistemic justification than *belief* (though that will not be discussed here). There are other doxastic attitudes (e.g. suspension, credence, acceptance, faith) as well as actions and feelings that are in need of epistemic justification, and on knowledge-first reasons first views these states can only be justified by one's knowledge. For another example of this taxonomic overlap see my discussion of Millar's (2019) virtue theory below.

As mentioned above (J=K) is subject to a range of objections. So in what follows I'll focus on Lord and Sylvan's incarnation of the knowledge-first program that consists of (J=SR) and (Pos=PK). These two principles give us a knowledge-first theory of justification that avoids some of the main problems facing (J=K).

First, (J=SR) and (Pos=PK) are consistent with the existence of justified false beliefs. This is due to the fact that one's reasons (the facts one is in a position to know) can provide one with sufficient, yet non-conclusive, reason to believe further propositions that may be false. The fact that a drunk has always lied about being sober, can be a sufficient yet non-conclusive inductive reason to believe that he will lie about being sober in the future. Since it's non-conclusive, having justification for this belief is consistent with it turning out to be false. So this view can allow for justified yet false *inferential* beliefs. We'll discuss the possibility of justified false *perceptual* beliefs below in connection with the new evil demon hypothesis.

Second, (J=SR) and (Pos=PK) are consistent with the existence of Gettier cases: cases of unknown, justified true beliefs. Because Smith can have justified false beliefs in the way described above, he can have a justified false belief that Jones will get the job based on the fact that the employer said so and the fact that this is a highly reliable indicator of who will get the job. Smith may also know that Jones has ten coins in

his pocket based on perception. So, through an appropriate inferential process, Smith can come by a justified true inferential belief that the person who will get the job has ten coins in his pocket. This is a Gettier case, i.e. an instance of an justified true belief without knowledge.

A few caveats. First, it's worth noting that the reasons-first, knowledge-first theory of justification only has this implication under the assumption that the justificatory support one derives from facts one is in a position to know is transitive, or can at least sometimes carry over inferences from premises that one is not in a position to know. For, here, Smith's false belief that Jones will get the job is justified by the reasons Smith is in a position to know, and we're assuming this justified false belief—which Smith is not in a position to know—can nevertheless facilitate Smith's ability to acquire inferential justification for believing that the person who will get the job has ten coins in his pocket. For worries about the non-transitivity of the justification relation see Silins (2007) and Roche and Schogenji (2014).

Second, it's also worth noting that while Lord and Sylvan's view is consistent with some intuitions about Gettier cases, it is not consistent with all such intuitions. After all, their view seems to be that we possess different reasons/evidence in the Gettier cases than we do in the good cases. This will seem counterintuitive to those who think that it's obvious that we have the same evidence in both cases.

Third, (J=SR) and (Pos=PK) are consistent with some intuitions about the new evil demon hypothesis. In the standard telling, the recently envatted brain has a non-veridical perceptual experience as of p and believes p on the basis of that non-veridical experience. While the non-veridical experience does not give one access to the fact that p (if it is a fact) there is an inferential process that can give the envatted brain a justified belief according to (J=SR) and (Pos=PK). This is because mature thinkers who are recently envatted can know (or be in a position to know) that in the past their visual experiences have been a reliable guide to reality, and can sometimes know that they are now having an experience as of p . Together, these are facts that can give one sufficient reason to believe p even if one is an unwittingly recently envatted brain.

Of course, the weakness here is that the envatted brain's perceptual belief that p is not based on her inferential source of propositional justification to believe p . Rather, the envatted brain holds her belief in response to her perceptual experience. So she is not doxastically justified, i.e. her belief itself fails to be justified. So there is some bullet to bite unless, perhaps, one can argue that knowledge of the fact that one is having an experience as of p can itself be a reason to believe p even when one is an unwittingly envatted brain.

There are further problems that the reasons-first, knowledge-first view faces. They are along the lines of the problems for Bird's (JuJu). For if reasons are facts, then one cannot obtain justified false beliefs from justified false premise beliefs unless, as noted above, one's justified false premise beliefs are themselves inferentially justified and justificatory support carries over (see the discussion of (JuJu) above). Similarly, it's unclear whether one can gain justified beliefs from *contentless* beliefs. For contentless "premise" beliefs do not stand in inferential relations to their "conclusions" and such relations seem essential to the ability of justificatory support to transmit across *inferences*.

For a further concern about this view see Littlejohn's (2019) "Being More Realistic About Reasons", where he argues that the conjunction of (J=SR) and (Pos=K) generates explanatory lacunas regarding how reasons should constrain our credences.

4 Perspectival Theories

Perspectival knowledge-first theories of justification put "knowledge first" by letting one's point of view on whether one has knowledge determine whether one has justification. Smithies' (2012) for example argues that:

(PJ=PJK) *S* has justification to believe that *p* iff *S* has justification to believe that she is in a position to know that *p*.

Smithies (2012: 268) treats being in a position to know as a matter of being in a position where all the non-psychological conditions for knowing are met. Smithies is clear that this is only a theory of propositional justification (=having justification to believe), not doxastic justification (=having a justified belief). For as a theory of doxastic justification it would be too demanding: it would require an infinite hierarchy of beliefs and it would require that one have epistemic concepts (KNOWLEDGE, JUSTIFICATION, POSITION TO KNOW) if one is to have any justified beliefs at all. This would over-intellectualize justification, excluding agents incapable of epistemic reflection (e.g. young children, handicapped, smart non-humans). Worse, if knowledge requires justification then this would also rob such beings of knowledge.

It's important to note that (PJ=PJK) is neutral on which side of the bi-conditional gets explanatory priority. To be a genuinely knowledge-first view it must be the condition on the right-hand side that explains why the condition on the left-hand side obtains. This is something that Smithies himself rejects. And there are good reasons for this as there are objections to (PJ=PJK) that emerge only if we give the

right-hand side explanatory priority. But there is also a general objection to this view that is independent of which side gets priority. I'll start with the general objection and then turn to the others.

A central worry to have about (PJ=PJK), irrespective of which side gets explanatory priority, is the extent to which Smithies' purely non-psychological conception of propositional justification is a theoretically valuable conception of *justification* as opposed to a theoretically valuable conception of *evidential support*. For it is obvious that our evidence can support propositions in virtue of entailment and probabilistic relations, where these propositions can be so complex as to be well-beyond our psychological abilities to grasp. For example, even before I had the concept GETTIER CASE my evidence supported the claim that *I exist or I'm in a Gettier case* just in virtue of the fact that *I exist* was already part of my evidence and entailed that disjunction. But since I did not have the concept GETTIER CASE, I could not form that belief.

So one general question concerns whether the motivations appealed to in support of (PJ=PJK) wrongly identify the following two epistemic notions:

Evidential Support. Having evidence that entails or probabilistically supports *p*.

Justification. Having evidence that gives one justification to believe *p*.

Certain evidentialists will like the idea of binding these notions together, thinking that strong evidential support is all there is to epistemic justification (Smithies 2019). Yet many have objected to the kind of evidentialism implicit in making evidential support necessary and sufficient for justification. The necessity direction has been objected to due to lottery problems, pragmatic encroachment, and the existence of justified beliefs not derived from evidence (so called "basic" or "immediate" or "foundational" justification). The sufficiency direction, while rarely challenged, is also objectionable (Silva 2018). For example, some mental states are such that we're not in a position to know that we're in them even upon reflection (Williamson 2000). Suppose you knew that you just took a pill that ensured that you're in a mental state *M* iff you don't believe (A) *that you're in M*. A rational response to this knowledge would be to suspend belief in (A) due to your knowledge of this biconditional: for if you believe (A) then it's false, and if you disbelieve (A) then it's true. So suspension seems like the only rational response available to you. In at least some such cases where you've consciously suspend belief in (A), you will also know that you've suspended belief (A). This is at least a metaphysical possibility, and certainly a logical possibility. Now, since you know the biconditional and since you know you've suspended belief in (A), your evidence *entails* that you're in *M*. But it is

logically impossible for you to justifiedly believe or know (A) on your evidence—and you can know this a priori. For believing (A) on your evidence entails that (A) is false. So connecting justification to evidential support in this way is inconsistent with the following plausible idea: S has justification to believe P on E only if it's logically possible for S to justifiedly believe P on E. (For further discussion of these and related reasons to separate justification from evidential support see Silva (2018); for further objections to Smithies see Smith 2012; for further defense of Smithies' theory see Smithies (2019: sect 9.4).)

Further, as Smith (2012) pointed out, (PJ=PJK) implies that having justification to believe p requires having justification to believe an infinite hierarchy of meta-justificatory claims:

One thing that we can immediately observe is that [PJ=PJK]...is *recursive*, in that it can be reapplied to the results of previous applications. If one has justification to believe that p (Jp) then, by [PJ=PJK], one must have justification to believe that one is in a position to know that p (JKp). But if one has justification to believe that one is in a position to know that p (JKp) then, by [PJ=PJK], one must have justification to believe that one is in a position to know that one is in a position to know that p ($JKKp$) and so on... In general, we have it that $Jp \supset JKn p$ for any positive integer n .

If one adds to this the priority claim that having justification to believe that one is in a position to know p is *the source* of one's justification to believe p , one must either accept a skeptical result due to grounding worries about the infinite hierarchy of meta-justificatory claims, or accept a knowledge-first form of infinitism. But even overcoming the standard general worries with infinitism, knowledge-first infinitism will be especially difficult to handle in light luminous KK failures. For example, in Williamson's (2000: 229) unmarked clock case, one is argued to know a proposition p , while also knowing that it's very improbable that one knows p . Intuitively, this is a case where one knows p and so justifiedly believes p even though they lack justification to believe they know p . (For a discussion of the limits of the unmarked clock case see Horowitz 2014.)

The final issue with (PJ=PJK), is whether or not having justification to believe that one is in a position to know is *the source* of one's propositional justification to believe p (which would make this a knowledge-first view) or whether it is *a non-explanatory necessary and sufficient condition* on having justification to believe p (Smithies' view). To illustrate the difference. Supposing God exists it's certainly true that: Paul is 5'11" at t if and only if God knows that Paul is 5'11" at t . But the right-hand-side of

that biconditional is non-explanatory. God's knowing this doesn't make or otherwise explain Paul's height. Now, if the advocate of (PJ=PJPK) holds that having justification to believe that one is in a position to know is the source of one's justification, then having a doxastically justified belief will, according to tradition, require one to *base* their belief that p on that source of justification. But ordinarily we do not base our beliefs on further facts about knowing or being in a position to know. So if we're not to risk an unacceptable skepticism about doxastically justified belief (and hence knowledge), it seems we'll either have to give up the tradition or treat the right-hand-side of (PJ=PJPK) as specifying a mere non-explanatory necessary and sufficient condition. But if that's the case it can seem puzzling why there should be such a modally robust connection between justification and one's perspective on whether one knows.

A view much like (PJ=PJPK) that avoids all but this final problem is Dutant and Littlejohn's (2020) thesis:

(Probable Knowledge) It is rational for S to believe p iff the probability that S is in a position to know p is sufficiently high.

Even after specifying a the relevant notion of 'in a position to know' and the relevant notion of 'probability' (objective, subjective, epistemic, together with some specification of what counts as an agent's evidence), provided we can and should distinguish between propositionally and doxastically rational belief, it seems that (Probable Knowledge) is either not going to be a genuinely knowledge-first view or, it is but it will not allow for enough doxastically rational beliefs due to the basing worry described above.

Reynolds (2013) has offered a related view of doxastic justification on which justified belief is the appearance of knowledge: "I believe with justification that I am currently working on this paper if and only if there has been an appearance to me of my knowing that I am currently working on this paper." Generalizing this we get:

(J=AK) S 's belief that p is justified iff S is appeared to as though S knows that p .

On his view appearances are not doxastic states nor are they conceptually demanding. As he explains the target notion:

Consider the following example: Walking in a park I notice an unfamiliar bird, and decide I would like to find out what it is. Fortunately it doesn't immediately fly away, so I observe it for two or three minutes. A few

hours later, having returned home, I look up a web site, find a few photos, follow up by watching a video, and conclude confidently that I saw a Steller's Jay. I think it is perfectly correct to say that the bird I saw had the appearance of a Steller's Jay, even though I didn't know that that's what it was at the time. If it hadn't had the appearance of a Steller's Jay, I wouldn't have been able to remember that appearance later and match it to the photos and video of Steller's Jays. I didn't have the concept of a Steller's Jay, yet I had an appearance of a Steller's Jay.

(J=AK) has advantages vis-à-vis (PJ=PJK). It doesn't lead to an infinite hierarchy of meta-justificatory claims and it's not hard to see how many of our occurrent beliefs might be based on such appearances thereby avoiding some of the skeptical challenges that threatened (PJ=PJK). But there are problems.

One concern with (J=AK) is its self-reflective character. To have a justified belief you have to be (or have been) in a state in which it appears *to you* as though *you* have knowledge. This requires introspective abilities, which arguably some knowing creatures might lack. As Dretske (2009) liked to put it: a dog can know where its bowl is, and a cat can know where the mouse ran. The correctness of these and other knowledge ascriptions doesn't seem to turn on whether or not dogs and cats have the capacity to access their own mental lives in such a way that they can appear *to themselves* to have knowledge.

Moreover, (J=AK) implies that *every* justified belief is a belief with such an appearance. But many of the justified beliefs we form and much of the knowledge we acquire is merely dispositional—i.e. it involves dispositional beliefs that are never or only very briefly made occurrent. Do we, as a matter of psychological fact, also have the appearance of knowledge with regard to all such states? There is non-trivial empirical reason to find this suspicious. In the psychology of memory it has been observed that our memory systems are not purely preservative, they are also constructive. For example, our subpersonal memory systems often lead us to forget very specific beliefs while forming new beliefs that are more general in character. Sometimes this leads to new knowledge and new justified beliefs (Grundmann and Bernecker 2019). But if the new belief is the product of subpersonal operations and the more general belief is itself un-retrieved, then it's unclear how that more general unretrieved justified belief could appear to oneself as a case of knowing.

A final concern with (J=AK) is its ability to handle undercutting defeat and the plausible idea that beliefs can cognitively penetrate appearances ([see the entry on cognitive penetration](#)). For suppose you have strong undefeated evidence that you're in fake barn county, but you brazenly believe *without justification* that you're looking

at the one real barn in all the county. Perhaps this is because you pathologically believe in your own good fortune. But pathology is not necessary to make the point, as it is often assumed that we can have unjustified beliefs that we believe to be justified. If either is your situation, your belief that you're looking at a real barn can appear to you to be knowledge given your normal visual experience and the fact that you (unjustifiedly) believe your defeater to have been defeated. According to (J=AK) your belief is then justified. But that's the wrong result. Unjustified beliefs that enable the appearance of knowledge should not have the ability to neutralize defeaters.

Here is a final perspectival, knowledge-first theory of justification. It is mentioned by Smithies (2012) and explored by Rosenkranz (2018):

(J= \neg K \neg K): S has justification to believe p iff S is not in a position to know that S is not in a position to know that p .

Like Smithies, Rosenkranz relies on a conception of justification and being in a position to know that is psychologically undemanding. But unlike Smithies, Rosenkranz explicitly regards his view as about justification for idealized agents and leaves open what relevance this notion has for ordinary, non-idealized agents like us.

There are at least two concerns with this view of justification. First, suppose we were to treat (J= \neg K \neg K) as a theory of justification for ordinary non-ideal agents and imposed (as many wish to) substantive psychological limits on what one has justification to believe. With such limits in place, (J= \neg K \neg K) would face not an over-intellectualization, problem but an under-intellectualization problem. For agents who lack the concept KNOWLEDGE or the complicated concept POSITION TO KNOW could never be in a position to know that they're not in a position to know. So such agents would be justified in believing anything.

But even once psychological limits are stripped away, and with them the under-intellectualization problem, another problem remains. Smithies (2012: 270) points out that on this view to lack justification one must *be in a position to know* that one's not in a position to know. Since being in a position to know is factive this limits defeating information to *factive* defeating information. But it seems like misleading (non-factive) information can also defeat knowledge and justification. For example, suppose you're told *that you're in fake-barn country*. But in fact you're not, so you're not in a position to know that you're in fake-barn country. Still, the misleading testimony that you are in fake-barn country gives you justification to believe that you are in fake-barn country. Intuitively, this misleading testimony will defeat your

justification to believe that there is a barn ahead; the misleading testimony ensures you shouldn't believe that. But you're not in a position to know that you're *not* in a position to know that there is a barn ahead—recall the testimony you receive is *misleading*. So $(J = \neg K \neg K)$ says you have justification when intuitively you do not.

In response, it seems open to advocates of $(J = \neg K \neg K)$ to argue that while one might not be in a position to know the content of the misleading testimony (because it's false), the misleading testimony itself can defeat. In this case, for example, it's arguable that the misleading testimony that one is in circumstances that make one's knowing that p improbable itself defeats one's being in a position to know p , and so prevents one's good visual contact with an actual nearby barn in normal conditions from putting one in position to know that a barn is nearby. (However, recent arguments for the existence of "unreasonable knowledge"—i.e. knowledge that p while knowing that it's improbable that one knows p —will challenge the integrity of this response in defense of $(J = \neg K \neg K)$. For more on unreasonable knowledge see Lasonen-Aarnio (2010, 2014) and Benton and Baker-Hytch (2015).)

5 Virtue Theories

We are not simply retainers of propositional knowledge. We are also *able to* acquire it. You are, for example, able to figure out whether your bathroom faucet is currently leaking, you are able to figure out whether your favorite sports team won more games this season than last season, you are able to figure out the sum of 294 and 3342, and so on. In normal circumstances when you exercise this ability you gain propositional knowledge. If you are able to figure out whether the faucet is leaking and you use that ability, the typical result will be *knowledge that* the faucet is leaking (if it is leaking) or *knowledge that* the faucet is not leaking (if it is not leaking). The core idea behind knowledge-first virtue epistemology (KFVE) is that justified belief is belief that is somehow connected to exercises of the ability to know. Predictably, (KFVE)-theorists have had different things to say about *how* justified belief is connected to this ability.

5.1 Infallibilist Knowledge-First Virtue Epistemology

According to Millar (2019), we cannot exercise an ability to know without thereby acquiring knowledge. That is:

(Exercise Infallibilism) S 's belief is the product of an exercise of an ability to know only if S 's belief constitutes knowledge.

It's not only the case, on Millar's view, that exercises of abilities to know produce knowledge, they also produce beliefs that are reasons-responsive. That is:

(Reasons-Responsive) If *S*'s belief that *p* is the product of an exercise of an ability to know, then *S*'s belief is responsive to the fact that *p*.

While much of Millar's work on justification is focused on "well-founded belief"—which is an accessiblist notion of justified belief—he is happy to concede that there is a notion of justified or rational belief that an agent has in virtue of believing *p* in a reasons-responsive way (Millar 2019: 110).

While Millar's view is distinctive in various ways, it notably inherits all of (J=K)'s problems. For (Exercise Infallibilism) entails that when it comes to basic perceptual justification one's perceptual belief that *p* is justified only if one knows that *p*. So Millar's account of perceptual justification will be unable to accommodate the following insights (assumptions) about justification:

Desideratum 1. Justification is non-factive, i.e. one can have justified false beliefs.

Desideratum 2. One can have justified true beliefs that don't constitute knowledge, as in standard Gettier cases.

Desideratum 3. One can have justified perceptual beliefs even if one is in an environment where perceptual knowledge is impossible due to systematically misleading features of one's perceptual environment. This can happen on a more global scale (as in the new evil demon case), and it can happen on a more local scale (as in beech-elm cases discussed below).

5.2 Proficiency-Theoretic Knowledge-First Virtue Epistemology

The central point of departure from Millar's virtue theory and the remaining virtue theories is that they reject (Exercise Infallibilism). It's this rejection that makes the resulting theories resilient to the objections facing (J=K). On Miracchi's (2015) preferred instance of (KFVE), exercises of abilities to know explain our justified beliefs but it is not mere abilities to know that have the potential yield justified beliefs. Rather, it is only *proficient abilities* to know ("competences") that yield justified beliefs. One has a proficient ability to know just in case an exercise of their ability to know ensures a sufficiently high objective probability of knowing. That is, the conditional objective probability that *S* knows *p* given that *S* exercised a relevant

ability to know is sufficiently high. This is a kind of *in situ* reliability demand on justification.

We can summarize her view of justified belief, roughly, as follows:

(KFVE-Proficiency) *S* has a justified belief iff *S*'s belief is competent, where *S*'s belief is competent iff *S*'s belief is produced by an exercise of a *proficient ability* to know.

Central to her view is the idea that exercises of abilities, even proficient abilities, are fallible, i.e. an agent can exercise an ability to know without succeeding in knowing. So (Exercise Infallibilism) is given up. This enables (KFVE-Proficiency) to accommodate justified false beliefs (i.e. Desideratum 1) as well as justified true beliefs that don't constitute knowledge (i.e. Desideratum 2). So (KFVE-Proficiency) avoids two of the main challenges to (J=K) and Millar's (KFVE-Infallibilism).

However, by limiting justified beliefs to beliefs produced by proficient abilities, Miracchi's view is, like (J=K) and Millar's infallibilist view, unable to accommodate Desideratum 3, i.e. the compatibility of justified beliefs formed in certain deceptive environments. The first case of this is just the familiar new evil demon case. For the recently envatted brain, as Kelp (2016; 2017; 2018) argues, retains the ability to know by perception that, say, they have hands by responding to visual appearances in normal circumstances. But because they are no longer in normal circumstances they no longer possess a *proficient* ability to know. In other words, the recently envatted brain's change of environment robs them of the proficiency needed to form justified beliefs.

Miracchi (2020) rejects, or is at least deeply suspicious of, the metaphysical possibility of the new evil demon hypothesis. But we needn't rely on fantastical brain envattment scenarios to make this style of objection to (KFVE-Proficiency). Suppose you grew up in an environment with lots of beech trees and developed the ability to visually identify them and thus the ability to know that a beech tree is nearby by sight. Since exercises of abilities are fallible, you could exercise this beech-identification ability if you were to unwittingly end up in another environment where there are only elms (which, according to Putnam, look indistinguishable from beeches to the untrained). But this is not an environment where your ability to identify beeches amounts to a proficiency: conditional on your exercise of your ability to identify and come to know that beeches are nearby, it is objectively highly likely that you will fail to know. So the intuition that you can have justified perceptual beliefs about beeches being nearby in such a case appears inconsistent with (KFVE-Proficiency). While there may be some doubt about the metaphysical

possibility of the new evil demon hypothesis, this is a perfectly possible scenario. See Kelp (2018: 92) for a similar objection for Miracchi.

One last concern with (KFVE-Proficiency) regards its ability to accommodate defeat. I discuss this in the section below.

5.3 Ability-Theoretic & Functionalist Knowledge-First Virtue Epistemology

Kelp (2016; 2017; 2018) and Simion (2019) offer versions of (KFVE) that do not tie justification so closely to *in situ* reliability and thereby avoid not only the problem of having justified false beliefs and the possibility of gettier cases, but also problems arising from the new evil demon hypothesis and very local cases of deception (like the beech-elm case above). So Desiderata 1-3 are easily managed. I'll first explain their views and then mention some concerns they share.

On Kelp's (2016; 2017; 2019) view, justified belief is competent belief, and competent beliefs are generated by exercises of an agent's ability to know. Importantly, such exercises don't require proficiency in Miracchi's sense. On Simion's (2019) view justified beliefs are beliefs that are generated by properly functioning cognitive processes that are aimed at yielding knowledge. Like the exercise of abilities, cognitive processes can properly function without proficiency. We can provide a rough summary of the type of view that Kelp and Simion endorse:

(KFVE-Ability) *S* has a justified belief iff *S*'s belief is competent, where *S*'s belief is competent iff *S*'s belief is produced by an exercise of an ability to know.

(KFVE-Functionalism) *S*'s belief is justified iff *S*'s belief is produced by a properly functioning cognitive process that has the etiological function of generating knowledge.

These are relatively coarse-grained principles and Kelp and Simion defend more refined theses. Kelp and Simion's views are not unrelated to each other. For the ability to know is an ability one has in virtue of having certain belief-producing cognitive processes, and Kelp's (2018) preferred account of how the ability to know is acquired is the same general kind of account that Simion (2019) relies on in arguing that the cognitive processes that constitute one's ability to know are cognitive processes whose function is knowledge production. Nevertheless, the views are distinct in that (KFVE-Ability) grounds justification in agent abilities, while (KFVE-Functionalism) grounds them in cognitive processes. See Kelp (2019) for a discussion of the importance of this difference.

Central to their views is the idea that exercises of abilities to know are fallible, and given the fallibility of exercises of the ability to know (KFVE-Ability) and (KFVE-Functionalism) allow for justified false beliefs and justified true beliefs that don't constitute knowledge. So Desiderata 1 and 2 are easily accommodated.

Desiderata 3 is likewise easily accommodated. In Kelp's (2018) telling, the recently envatted brain retains and exercises an ability to know when believing she has a hand upon having the visual experience as of a hand. According to Simion (2019), just as an envatted heart pumping orange juice counts as a properly functioning heart a recently envatted brain counts as properly functioning when it comes to believe it has a hand upon having the visual experience as of a hand. And if justified belief can be had in cases of such systematic perceptual deception, then they can also be had in cases of localized perceptual deception as in the beech-elm scenario above.

So (KFVE-Ability) and (KFVE-Functionalism) can accommodate Desiderata 1-3. What about the desiderata that emerged in the objections to (JuJu), (JPK), and reasons-first, knowledge-first views? That is:

Desideratum 4. Justified beliefs can be based on inferences from justified false beliefs.

Desideratum 5. Justified beliefs can be based on "inferences" from contentless beliefs.

Desideratum 6. Justified belief is a kind of creditable belief.

Desideratum 7. Justified belief has a historical dimension that is incompatible with situations like Bad Past.

If (KFVE-Ability) or (KFVE-Functionalism) imply that a recently envatted brain is able to have justified beliefs from an exercise of an ability to know or as a product of their cognitive competences which aim a knowledge, then it's easy to see how claims 4 and 5 will be verified by (KFVE-Ability) and (KFVE-Functionalism). For these seem like more local cases of deception. As for 6 and 7, the virtue-theoretic machinery here is key. For both can be explained by the demand that justified beliefs are beliefs that issue *from* an ability or a properly functioning cognitive process. But that was exactly what was lacking in the cases discussed above that motivated 6 and 7. (See Silva (2017) for an extended discussion of how certain versions of KFVE can satisfy these desiderata.)

There are some worries about these versions of (KFVE). Consider Schroeder's (2015) discussion about defeater pairing. Any objective condition, *d*, which defeats knowledge that *p* is such that: if one justifiedly believes that *d* obtains then this justified belief will defeat one's justification to believe *p*. For example, suppose you formed the belief that a wall is red from an ability to know this by perception and that you're in normal circumstances where the wall is in fact red. You will have a justified belief according to each of the fallibilist versions of (KFVE) above. But suppose you were given *misleading* yet apparently reliable undercutting information that the wall is illuminated by red lights and so might not actually be red. This is not true, but were it true it would defeat your knowledge; were it true you would be in a Gettier situation. Now the defeater pairing insight says that the fact that you justifiedly believe the wall is illuminated by red lights defeats your justification to believe the wall is red. But according to the fallibilist instances of (KFVE) discussed above, since you arrived at your belief that the wall is red through an exercise of your proficiency (/ ability/ properly functioning cognitive process) you have a justified belief according to (KFVE-Proficiency), (KFVE-Competence), and (KFVE-Functionalism). But that's inconsistent with the intuition that the justification for your belief is defeated.

So this objection gives rise to a further potential demand on an adequate theory of justified belief:

Desideratum 8. Justified belief is susceptible to defeat by justified defeating information.

(For resistance to defeater pairing see putative cases of "unreasonable justified beliefs" where S arrives at a justified belief (and perhaps knowledge), but also knows that it's improbable that she has knowledge in her circumstances (Lasonen-Aarnio 2010, 2014; Benton and Baker-Hytch 2015. See Horowitz (2014) for critical discussion of such cases and defense of the idea that justification is inconsistent with certain kinds of negative higher-order information.)

The second concern to have about (KFVE-Ability) and (KFVE-Functionalism) is that there is a question about the extent to which abilities/cognitive processes are "in the head". For example, consider the amputee gymnast. She lost her leg and so no longer has the ability to do a backflip. So her ability to do backflips is located not just in her head, it's also located in her ability to successfully interact with the physical world in some ways. In this case, it's located in her ability to control her body's physical movements in certain ways. This doesn't conflate proficiency with mere ability, for even with both legs the gymnast might not have a proficiency because she's in an inhospitable environment for performing backflips (high winds,

buckling floors, etc.). We might wonder, then, whether the recently envatted brain's ability to know *by perception* is lost with the loss of its body and the body's perceptual apparatus just as the gymnast's ability to do backflips is lost with the loss of her leg. If so, then it's a mistake to think (KFVE-Ability) and (KFVE-Functionalism) are compatible with the new evil demon hypothesis (Desideratum 3). This threatens to make these views much more revisionary than they initially appeared to be.

5.4 Know-How Theories and the No-Defeat Condition

Silva (2017) argues that justification is grounded in our *practical knowledge* (knowledge-how) concerning the acquisition of *propositional knowledge* (knowledge-that). The motivation for this incarnation of (KFVE) starts with the simple observation that we *know how* to acquire propositional knowledge. You, for example, *know how* to figure out whether your bathroom faucet is currently leaking, you *know how* to figure out whether your favorite sports team won more games this season than last season, you *know how* to figure out the sum of 294 and 3342, and so on. In normal circumstances when you exercise such know-how you typically gain propositional knowledge. If you know how to figure out whether the faucet is leaking and you use that know-how, the typical result will be *knowledge that* the faucet is leaking (if it is leaking) or *knowledge that* the faucet is not leaking (if it is not leaking). One way of thinking about the grounds of justification is that it is crucially connected to this kind of know-how: justified belief is, roughly, belief produced by one's knowledge how to acquire propositional knowledge.

Here's a rough characterization of Silva's (2017) view:

(KFVE-Know How) *S* has a justified belief iff (i) *S*'s belief is produced by an exercise of *S*'s knowledge how to gain propositional knowledge, and (ii) *S* is not justified in thinking she is not in a position to acquire propositional knowledge in her current circumstances.

One advantage of (KFVE-Know How) is that it is formulated in terms of *know-how* and so avoids worries about abilities not being "in the head". For example, while the amputee gymnast discussed above lacks *the ability* to perform backflips she still *knows how* to do them. Similarly, in thinking about the recently envatted brain, she still knows how to acquire propositional knowledge by perception even if she lacks the ability to do so because she has lost the necessary perceptual apparatus. So Desideratum 3 is, arguably, easier to accommodate on (KFVE-Know How) than on (KFVE-Ability).

Similarly, since exercises of know-how are fallible *in situ* (Hawley 2003), (KFVE-Know How) has no trouble explaining how exercises of one's knowledge how to know could lead one to have a false belief (Desideratum 1) or have true beliefs that don't constitute knowledge (Desideratum 2). For similar reasons (KFVE-Know How) is able to satisfy Desiderata 4-7. See Silva (2017) for detailed discussion of these points.

Lastly, condition (ii) is a kind of "no defeater" condition that makes (KFVE-Know How) compatible with Schroeder's defeater-pairing thesis and standard intuitions about undercutting defeat. So it manages to accommodate Desideratum 8. (In principle, each of the fallibilist instances of (KFVE) above could be augmented with condition (ii) in order to accommodate Desideratum 8.) So (KFVE-Know How) appears capable of satisfying all the desiderata that emerged above.

6 Excused Belief vs Justified Belief

The objections to knowledge-first views of justification above assumed, among some other things, that justification has the following properties:

Desideratum 1. Justification is non-factive, i.e. one can have justified false beliefs.

Desideratum 2. One can have justified true beliefs that don't constitute knowledge, as in standard Gettier cases.

Desideratum 3. One can have justified perceptual beliefs even if one is in an environment where perceptual knowledge is impossible due to systematically misleading features of one's perceptual environment. This can happen on a more global scale (as in the new evil demon case), and it can happen on a more local scale (as in beech-elm cases discussed above).

Desideratum 4. Justified beliefs can be based on inferences from justified false beliefs.

Desideratum 5. Justified beliefs can be based on "inferences" from contentless beliefs.

Desideratum 6. Justified belief is a kind of creditable belief.

Desideratum 7. Justified belief has a historical dimension that is incompatible with situations like Bad Past.

Desideratum 8. Justified belief is susceptible to defeat by justified defeating information.

Knowledge-first virtue epistemology has the easiest time accommodating these assumed properties of justification, with (KFVE-Know How) being able to accommodate all of them. In defense of alternative knowledge-first views some might argue that 1-8 (or some subset thereof) are not genuine properties of justification, but rather properties of a kindred notion: *excuse*. As Littlejohn (2012: ch. 6; 2020) and later Williamson (2014: 5; 2020) argued, the failure to properly distinguish justification from excuses undermines many of the arguments that object to there being a tight connection between knowledge and justification. An excuse renders you blameless in violating some norm, and it's easy to see how some might argue that 1-8 (or some subset thereof) indicate situations in which an agent is excusable, and so blameless, although her belief is not justified.

Arguably, the most accommodating knowledge-first virtue theories threaten to make the concept of an excuse nearly inapplicable in epistemology. For the situations indicated in 1-8 are so inclusive that it can be hard to see what work is left for excuses. If one thought there should be deep parallels between epistemology and moral theory, which leaves substantive work for excuses, then one might worry that holding on to all of Desiderata 1-8 conflates properties of justification with properties of excuse. For recent exploration of the role excuses can play in defending knowledge-first accounts of justification see Williamson (2020) and Littlejohn (2020). For, perhaps, the *locus classicus* on the concept of excuse see Austin's "A Plea for Excuses".

7 A Methodological Reflection on Gettierology vs. Knowledge-Centrolology

After about forty years of unsuccessful work trying to give a reductive account of knowledge in terms of justification many judged it to be a degenerating research program. In putting knowledge first in the theory of justification, these epistemologists are exploring whether we can more successfully reverse the order of explanation by giving an account of justification in terms of knowledge. If you've read this far you will have noticed that we're around twenty years into putting knowledge first in the theory of justification and problems are still being worked out in a way that is reminiscent the history of attempts to solve the Gettier problem. Perhaps this warrants a return to the tradition from which knowledge-first epistemology sprang (cf. Whitcomb 2014; Gerken 2017). Alternatively, perhaps this merits a further departure from both.
