Introduction

Immanuel Kant (1724-1804) was one of the most important philosophers of the “Enlightenment” period (ca. 1650-1800) in western European history. Born in Königsberg, Prussia (now Kaliningrad, Russia) to poor and religiously devout parents, Kant’s intellectual promise was apparent at an early age. He attended college at the University of Königsberg (Albertus-Universität Königsberg) and eventually taught as a professor there (1770-1796).

Kant wrote his most significant philosophical works relatively late in his professional life, having only achieved a position as full professor in 1770, at the age of forty-six. From 1781 to 1798 Kant published a series of tremendously influential writings, including the *Critique of Pure Reason* (1781/7), the *Groundwork of the Metaphysics of Morals* (1785), the *Metaphysical Foundations of Natural Science* (1786), the *Critique of Practical Reason* (1788), and the *Critique of the Power of Judgment* (1790). This body of work had a transformative impact on virtually all parts of philosophy including aesthetics, epistemology, ethics, logic, metaphysics, philosophy of religion, and philosophy of science. This encyclopedia entry focuses on Kant’s views in the philosophy of mind, which undergird much of his epistemology and metaphysics. In particular, we’ll be focusing on metaphysical and epistemological doctrines forming the core of Kant’s mature philosophy, as presented in the *Critique of Pure Reason* (*CPR*) of 1781/87 and elsewhere.

There are certain aspects of Kant’s project in the *CPR* that should be very familiar to anyone versed in the debates of seventeenth century European philosophy. For example, Kant argues, like [Locke](#) and [Hume](#) before him, that the boundaries of substantive human knowledge stop at experience, and thus that we must be extraordinarily circumspect concerning any claim made about what reality is like independent of all possible human experience. But, like [Descartes](#) and [Leibniz](#), Kant thinks that central parts of human knowledge nevertheless exhibit characteristics of necessity and universality, and that, contrary to Hume’s skeptical arguments, we can have good reason to think that they do.

Kant carries out a ‘critique’ of pure reason in order to show its nature and limits, and thereby curb the pretensions of various metaphysical systems articulated on the basis of a firm faith that reason alone allows us to scrutinize the very depths of reality. But Kant also argues that the legitimate domain of reason is more extensive and more substantive than previous empiricist critiques had allowed. In this way Kant salvages (or attempts to) much of the prevailing Enlightenment conception of reason as an organ for knowledge of the world.

Below I discuss Kant’s theory of cognition, including his views of the various mental faculties that make cognition possible. I distinguish between different conceptions of consciousness at the basis of this theory of cognition and explain and discuss Kant’s criticisms of the prevailing rationalist conception of mind, popular in Germany at the time.

1. Kant's Theory of Cognition

Kant is primarily interested in investigating the mind for epistemological reasons. One of the goals of his mature "critical" philosophy is articulating the conditions under which our scientific knowledge, including mathematics and natural science, is possible. Achieving this goal requires, in Kant's estimation, a *critique* of the manner in which rational beings like ourselves gain such knowledge, so that we might distinguish those forms of inquiry (such as natural science), which are legitimate, from those (such as rationalist metaphysics), which are illegitimate. This critique proceeds via an examination of those features of the mind relevant to the acquisition of knowledge. This amounts to an examination of the conditions for "cognition" [*Erkenntnis*], or the mind's relation to an object (there is some controversy about the best way to understand Kant's use of this term, but here we'll understand it as involving relation to a possible object of experience, and as being a necessary condition for positive substantive knowledge [*Wissen*]). Thus to understand Kant's critical philosophy we need to understand his conception of the mind.

a. Mental Faculties & Mental Representation

Kant characterizes the mind along two fundamental axes – first, the various kinds of powers which it possesses; second, the results of exercising those powers. We'll take these in turn.

At the most basic explanatory level, Kant conceives of the mind as constituted by two fundamental capacities [*Fähigkeiten*], or powers, which he labels "receptivity" [*Receptivität*] and "spontaneity" [*Spontaneität*]. Receptivity, as the name suggests, constitutes the mind's capacity to be affected by something, whether itself or something else. Kant's basic idea here is that the mind's receptive power essentially requires some external prompting in order to engage in the production of representations. In contrast, the power of spontaneity needs no such prompting. It is able to initiate its activity from itself, without any external trigger.

These two capacities of the mind are the basis for all (human) mental behavior. Kant thus construes all mental activity either in terms of its resulting from affection (receptivity) or from the mind's self-prompted activity (spontaneity). From these two very general aspects of the mind Kant then derives three further basic faculties or "powers" [*Vermögen*], termed by Kant "sensibility" [*Sinnlichkeit*], "understanding" [*Verstand*], and "reason" [*Vernunft*]. These faculties characterize specific cognitive powers, none of which is reducible to any of the others, and to each of which is assigned a particular cognitive task. We'll discuss these in turn.

i. Sensibility, Understanding, and Reason

Kant distinguishes the three fundamental mental faculties from one another in two ways. First, he construes sensibility as the specific manner in which human beings, as well as other animals, are receptive. This is in contrast with the faculties of understanding and reason, which are forms of human (or of all rational beings, should that class extend more widely) spontaneity. Second, Kant distinguishes the faculties by their output. All of the mental faculties produce "representations" [*Vorstellungen*], which are best thought of as discrete mental events or states, of which the mind is aware, or in virtue of which the mind is aware of something else (it is somewhat controversial whether representations are the ultimate objects of awareness or merely the vehicles of such awareness). We can see these distinctions at work in what is generally called

the “stepladder” [*Stufenleiter*] passage from the Transcendental Dialectic of Kant’s major work, the *Critique of Pure Reason* (1781/7). This is one of the few places in the entire Kantian corpus where Kant explicitly discusses the meanings of and relations between his technical terms, and defines and classifies varieties of representation.

The genus is representation (*representatio*) in general. Under it stand representations with consciousness (*perceptio*). A perception [*Wahrnehmung*], that relates solely to a subject as a modification of its state, is sensation (*sensatio*). An objective perception is cognition (*cognitio*). This is either intuition or concept (*intuitus vel conceptus*). The first relates immediately to the object and is singular; the second is mediate, conveyed by a mark, which can be common to many things. A concept is either an empirical or a pure concept, and the pure concept, insofar as it has its origin solely in the understanding (not in a pure image of sensibility), is called *notio*. A concept made up of notions, which goes beyond the possibility of experience, is an idea or a concept of reason. (A320/B376–7).

As Kant’s discussion here indicates, the category of representation contains sensations [*Empfindungen*], intuitions [*Anschauungen*], and concepts [*Begriffe*]. Sensibility is the faculty that provides sensory representations. Sensibility generates representations based on being affected either by entities distinct from the subject or by the subject herself. This is in contrast to the faculty of understanding, which generates conceptual representations spontaneously – i.e. without advertence to affection. Reason is that spontaneous faculty by which special sorts of concepts, which Kant calls “ideas” or “notions”, may be generated, and whose objects could never be met with in experience. Such ideas include those concerning God and the soul.

Kant claims that all the representations generated via sensibility are structured by two “forms” of intuition—space and time—and that all sensory aspects of our experience are their “matter” (A20/B34). The simplest way of understanding what Kant means by “form” here is that anything of which one might have experience will be such as to either have spatial features (e.g. extension, shape, location), or temporal features (e.g. being successive or simultaneous). So the formal element of an empirical intuition, or sense perception, will always be either spatial or temporal, while the material element is always sensory (in the sense of determining the phenomenal or “what it is like” character of experience), and tied either to one or more of the five senses, or the feelings of pleasure and displeasure.

Kant ties the two forms of intuition to two distinct spheres or domains, the “inner” and the “outer”. The domain of outer intuition concerns the spatial world of material objects while the domain of inner intuition concerns temporally ordered states of mind. Space is thus the form of “outer sense” while time is the form of “inner sense” (A22/B37; cf. An 7:154). In the Transcendental Aesthetic, Kant is primarily concerned with “pure” [*rein*] intuition, or intuition absent any sensation, and often only speaks in passing of the sense perception of physical bodies (e.g. A20–1/B35). However, Kant more clearly links the five senses with intuition in his 1798 work *Anthropology from a Pragmatic Point of View*, in the section entitled “On the Five Senses”.

Sensibility in the cognitive faculty (the faculty of intuitive representations) contains two parts: *sense* and the *imagination*...But the senses, on the other hand, are divided into *outer* and *inner* sense (*sensus internus*); the first is where the human body is affected by physical things, the second is where the human body is affected by the mind (An 7:153).

Kant characterizes intuition generally in terms of two characteristics—viz. *immediacy* [*Unmittelbarkeit*] and *particularity* [*Einzelheit*] (cf. A19/B33, A68/B93; JL 9:91). This is in contrast to the mediacy and generality [*Allgemeinheit*] characteristic of conceptual representation (A68/B93; JL 9:91).

Kant contrasts the particularity of intuition with the generality of concepts in the “stepladder” passage (see the first quote above). But the specific remark he makes is that a concept is related to its object via “a mark, which can be common to many things” (A320/B377) and this suggests that intuition, in contrast to concepts, puts a subject in cognitive contact with features of an object that are unique to particular objects and are not had by other objects (there is some debate as to whether the immediacy of intuition is compatible with an intuition’s relating to an object by means of marks or whether relation by means of marks entails mediacy, and thus that only concepts relate to objects by means of marks. See Smit (2000) for discussion.) Spatio-temporal properties seem like excellent candidates for such features, as no two objects of experience can have the very same spatio-temporal location (B327-8). But perhaps any non-repeatable, non-universal feature of a perceived object will do (for relevant discussion see Smit (2000); Grüne (2009), 50, 66-70).

Though Kant’s discussion of intuition suggests that it is a form of perceptual experience, this might seem to clash with his distinction between “experience” [*Erfahrung*] and “intuition” [*Anschauung*]. In part, this is a terminological issue. Kant’s notion of an “experience” is typically quite a bit narrower than our contemporary English usage of the term. Kant actually equates, at several points, “experience” with “empirical cognition” (B166, A176/B218, A189/B234), which is incompatible with experience being falsidical in any way. He also gives indications that experience, in his sense, is not something had by a single subject. See, for example, his claim that there is only one experience (A230/B282-3).

Kant also distinguishes intuition from “perception” [*Wahrnehmung*], which he characterizes as the conscious apprehension of the content of an intuition (Pr 4:300; cf. A99, A119-20, B162, and B202-3). “Experience”, in Kant’s sense, is then construed as a set of perceptions that are connected via fundamental concepts that Kant entitles the “categories”. As he puts it, “Experience is cognition through connected perceptions [*durch verknüpfte Wahrnehmungen*]” (B161; cf. B218; Pr 4:300).

Empirical intuition, perception, and experience, in Kant’s usage of these terms, all denote kinds of “experience” as we use the term in contemporary English. At its most primitive level, empirical intuition presents, in a sensory manner, some feature of the world to the mind, and in such a way that the subject of the intuition is thereby in a position to distinguish that feature from others. A *perception*, in Kant’s sense, involves the awareness of the basis or ground by which the feature of the world that one is aware of in an intuition is such as to be different from other things (Kant tends to use this term in a variety of ways, however—e.g. JL 9:64-5—so there is some controversy surrounding the proper understanding of this term). So one has a perception, in Kant’s sense, when one is in a position to not only discriminate one thing from another (or between the parts of a single thing) based on a sensory apprehension of it, but also can articulate exactly what features of one’s sensory apprehension of the object or objects that distinguish it from others (e.g. that it is green rather than red, or that it occupies this spatial location rather than that one). Intuition thus allows for the discrimination of distinct objects, via an awareness of their features, while perception allows for an awareness of what it is specifically about the features of an object that distinguishes it from others. “Experience”, in Kant’s sense, is even

further up the cognitive ladder (cf. JL 9:64-5), insofar as it indicates an awareness of features such as the substantiality of a thing, its causal relations with other beings, and its mereological features (i.e. part-whole dependence relations).

Kant thus believes that the capacity to cognitively ascend from mere discriminatory awareness of one's environment (intuition), to an awareness of those features by means of which one discriminates (perception), and finally to an awareness of the objects which ground these features (experience), depends on the kinds of mental processes of which the subject is capable.

Before we turn to the issue of mental processing, which figures centrally in Kant's overall critical project, there are two further faculties of the mind that are worth discussion—viz. the faculty of judgment and the faculty of imagination. These faculties are not obviously as fundamental as the faculties of sensibility, understanding, and reason, but they nevertheless play a central role in Kant's thinking about the structure of the mind and its contributions to our experience of the world.

ii. Imagination and Judgment

Kant links the faculty of imagination closely to sensibility. For example, in his *Anthropology* he says,

Sensibility in the cognitive faculty (the faculty of intuitive representations) contains two parts: *sense* and the *power of imagination*. - The first is the faculty of intuition in the presence of an object, the second is intuition even *without* the presence of an object. (An 7:153; cf. 7:167; B151; LM 29:881; LM 28:449, 673)

The contrast Kant makes here is not entirely obvious, but must include at least the difference between cases of occurrent sensory experience of a perceived object—e.g. *seeing* the brown table before you—and cases of sensory recollection of a previously perceived object—e.g. *visually imagining* the brown table that was once in front of you. Kant makes this clearer in the process of further distinguishing between different kinds of imagination.

The power of imagination (*facultas imaginandi*), as a faculty of intuition without the presence of the object, is either productive, that is, a faculty of the original presentation [*Darstellung*] of the object (*exhibitio originaria*), which thus precedes experience; or reproductive, a faculty of the derivative presentation of the object (*exhibitio derivativa*), which brings back to mind an empirical intuition that it had previously (An 7:167).

So, in the operation of productive imagination, one brings to mind a sensory experience that is not itself based on any object previously so experienced. This is not to say the productive imagination is totally *creative*. Kant explicitly denies (An 7:167) that the productive imagination has the power to generate wholly novel sensory experience (e.g. it could not, in a person born blind, produce the phenomenal quality associated with the experience of seeing a red object). If the productive imagination is instrumental in producing sensory fictions, the reproductive imagination is instrumental in producing sensory experiences of previously perceived objects.

The imagination thus plays a central role in empirical cognition by serving as the basis for both memory and the creative arts (for further discussion see Matherne). In addition it also

plays a kind of mediating role between the faculties of sensibility and understanding. Kant calls this mediating role a “transcendental function” of the imagination (A124). It accomplishes this by being tied in its functioning to both faculties. On the one hand, it produces sensible representations, and is thus connected to sensibility. On the other hand, it is not a purely passive faculty but rather engages in the activity of bringing together various representations (memory is a central example here) and this kind of active mental processing Kant explicitly connects with the understanding.

Kant also goes so far as to claim that the activity of the imagination is a necessary part of what makes perception (in his technical sense of a string of connected and conscious sensory experiences) possible (A120, note). Though Kant's view concerning the exact role of imagination in sensory experience is contested, two points emerge as central. First, Kant regards the imagination as playing a crucial role in the generation of complex sensory representations of an object (see Sellars (1978) for an influential example of this interpretation). It is the imagination that makes it possible to, e.g. have a sensory experience (in one's “mind's eye” as it were) of a complex, three-dimensional, geometric figure whose identity remains constant as it is subject to translations and rotations in space. Second, Kant regards the imagination's mediating role between sensibility and understanding as crucial for at least some kinds of concept application (see Guyer (1987) and Pendlebury (1995) for further discussion). This mediating role involves what Kant calls the “schematization” of a concept and an additional mental faculty, that of judgment, to which we'll now turn.

Kant defines the faculty of judgment as “the capacity to subsume under rules, that is, to distinguish whether something falls under a given rule” (A132/B171). However, he spends comparatively little time discussing this faculty in the first *Critique*. There, it seems to be discussed as an extension of the activity of the understanding in applying concepts to empirical objects (or our intuitive representations thereof). It is not until the third *Critique*—Kant's 1790 *Critique of Judgment*—that Kant distinguishes it as an independent faculty with a special role. There Kant specifies two different ways the faculty might function (CJ 5:179; cf. CJ (First Introduction) 20:211)

According to the first, judgment subsumes given objects under concepts, which are themselves already given. This role appears identical to the role he assigns to the faculty of judgment in the *Critique of Pure Reason*. The basic idea is that judgment functions to assign to some intuited object—e.g. a particular dog—the correct concept (e.g. <dog>). This concept is presumed to be one *already* possessed by the subject. In this activity the faculty overlaps with the role Kant singles out for the imagination in the section of the first *Critique* entitled “On the Schematism of the Pure Concepts of the Understanding”. Both are conceived of here in terms of the ultimate functioning of the understanding, since it is the understanding that generates concepts.

The second role for the faculty of judgment, and what seems to make it a distinctive faculty in its own right, is that of *finding* a concept under which to “subsume” some experienced object. This is called judgment's “reflecting” role (CJ 5:179). Here the subject is meant to exercise the faculty of judgment in *generating* an appropriate concept for what is given in intuition (CJ (First Introduction) 20:211-13; JL 9:94-95; for discussion see Longuenesse (1998), 163-166 and 195-197; Ginsborg (2006)).

In addition to the generation of (empirical) concepts, Kant also describes reflective judgment as responsible for scientific inquiry, in that it must sort and classify objects in nature into a hierarchical taxonomy of genus/species relationships. Kant also utilizes the notion of reflective

judgment to unify the otherwise seemingly unrelated topics of the *Critique of Judgment*—viz. aesthetic judgments and teleological judgments concerning the order of nature.

Thus far, the discussion of Kant's view of the mind has focused primarily on the various mental faculties and their corresponding representational output. Both the faculty of imagination and that of judgment operate on representations given from sensibility and the understanding. In general, Kant conceives of the activity of the mind in terms of kinds of "processing" of representations. In the next sub-section we'll examine this notion of mental processing more closely.

b. Mental Processing

Kant's term for mental processing is "combination" [*Verbindung*], and the form of combination with which he is primarily concerned is what he calls "synthesis". Kant characterizes synthesis as that activity by which the understanding "runs through" and "gathers together" representations given to it by sensibility in order to form concepts, judgments, and ultimately, for any cognition to take place at all (A77-8/B102-3). Synthesis is not something we are typically aware of doing. As Kant says, it is a "a blind though indispensable function of the soul...of which we are only seldom even conscious (A78/B103)".

Synthesis is carried out by the unitary subject of representation on representations that are either given to it in sensibility (i.e. intuition) or produced by it in thought (e.g. in an act of stipulative conceptual definition). When synthesis is carried out on representations forming the content of a concept or judgment, it is called "intellectual" synthesis; when carried out by the imagination on material provided by sensibility (i.e. on intuition and sensation), it is called "figurative" synthesis (B150-1). In the *Critique of Pure Reason* Kant is primarily concerned with synthesis performed on representations provided by sensibility, and discusses three central kinds of synthesis – viz. apprehension, reproduction (or imagination), and recognition (or conceptualization) (A98-110/B159-61). Though Kant discusses these forms of synthesis as if they were discrete types of mental acts, it seems that at least the first two forms must always occur together, while the third may or may not always occur as well (cf. Brook (1997); Allais (2009)).

One of the central topics of debate in the interpretation of Kant's views on synthesis has been whether Kant endorses a position concerning the nature of sensory experience called "conceptualism." Roughly, conceptualism about experience is the claim that the capacity for conscious sensory experience of the objective world depends, at least in part, on the repertoire of concepts possessed by the experiencing subject, insofar as those concepts are exercised in acts of synthesis by the understanding. I discuss this further below, in section 3.

Kant typically contrasts synthesis with other ways in which representations might be related, most importantly, by association (e.g. B139-40). Association is primarily a *passive* process by which the mind comes to connect representations due to the repeated exposure of the subject to certain kinds of regularities. One might come, for example to associate thoughts of chicken soup with thoughts of being ill, because one only ever had chicken soup when one was ill. In contrast, synthesis is a fundamentally *active* process, dependent upon the mind's spontaneity, and is the means by which genuine judgment is possible.

Consider, for example, the difference between the merely associative transition between holding a stone and the feeling of its weight, as compared to the judgment that the stone is heavy (B142). The association of the holding of the stone with a feeling of weight is not yet a judgment about the stone, but merely a kind of involuntary connection between two states of oneself. In

contrast, in thinking of the stone, that it is heavy, one moves beyond merely associating two feelings to a thought about how things are objectively, i.e. independently of one's own mental states (Pereboom (1995), Pereboom (2006)). One of Kant's most important points concerning mental processing is that association cannot explain the possibility of objective judgment, and that what is required is a theory of mental processing by an active (or "spontaneous") subject capable of acts of synthesis.

We can summarize several of the important differences between synthesis and association as follows (Pereboom (1995), 4-7):

1. The source of synthesis is to be found in a subject and this subject is distinct from its states.
2. Synthesis can employ a priori concepts as modes of processing representations, whereas association never does.
3. Synthesis is the product of a causally active subject - it is produced by a cause that is realized in a faculty of the subject (either the imagination or the understanding).

Kant's conception of synthesis and judgment is tied up with his conception of "consciousness" [*Bewußtsein*] and "self-consciousness" [*Selbstbewußtsein*]. However, these two notions require some significant unpacking, so we'll look at them in the next section.

2. Consciousness

The notion of consciousness [*Bewußtsein*] plays an important role in Kant's philosophy. There are, however, several different senses of "consciousness" in play in Kant's work, not all of which line up with [contemporary philosophical usage](#). Below I detail several of Kant's most central notions and their differences from and relations to contemporary usage.

a. Phenomenal Consciousness

Contemporary philosophical discussions of consciousness typically focus on phenomenal consciousness, or "what it is like" to have a conscious experience of a particular kind (e.g. seeing the color red, smelling a rose, etc.). Such [qualitative features of consciousness](#) have been of major concern to philosophers in the last several decades. However, the metaphysical issue of phenomenal consciousness is almost entirely ignored by Kant, perhaps because he is unconcerned with problems stemming from commitments to naturalism or physicalism. He seems to attribute all qualitative characteristics of consciousness to sensation and what he calls "feeling" [*Gefühl*] (CJ 5:206). Kant distinguishes between sensation and feeling in terms of an objective/subjective distinction. Sensations indicate or present features of objects, distinct from the subject of experience. Feelings, in contrast, present only states of the subject to consciousness. Kant's typical examples of such feelings include pain and pleasure (B66-7; CJ 5:189, 203-6).

Thus, while Kant clearly assigns a cognitive role to sensation, and allows that it is "through sensation" that we cognitively relate to objects given in sensibility (A20/B34), he does not focus in any substantive or systematic way on the phenomenal aspects of sensory consciousness, or how it is exactly that they aid in cognition of the empirical world.

b. Discrimination & Differentiation

The central notion of “consciousness” with which Kant is concerned is that of discrimination or differentiation. This is the conception of consciousness that was mostly in use in Kant’s time, particularly by his major predecessors [Gottfried Wilhelm Leibniz](#) (1646–1716) and [Christian Wolff](#) (1679-1754), and he gives little indication that he departs from their general practice.

According to Kant, anything which a subject can discriminate from other things is a thing of which a subject is or can be conscious (An 7:136-8). Representations which allow for discrimination and differentiation are “clear” [*klar*]. Representations which allow not only for the differentiation of one thing from others (e.g. differentiating one person’s face from another’s), but also the differentiation of parts of the thing so discriminated (e.g. differentiating the different parts of a person’s face) are called “distinct” [*deutlich*].

Kant does seem to deny, as against the Leibniz-Wolff tradition, that clarity can simply be equated with consciousness (B414-15, note). His primary motivation for this position seems to be that he allows that one’s discriminatory capacities may outrun one’s capacity for memory or even the explicit articulation of what is so discriminated. In such cases one does not have a fully clear representation.

Kant’s conception of “obscure” [*dunkel*] representation as that which allows the subject of the representation to discriminate differentially between aspects of her environment without any explicit awareness of the basis by which she is doing so, connects him with the Leibniz-Wolff tradition of recognizing the existence of *unconscious* representations (An 7:135-7). Kant conceives of the majority of representations that we appeal to in order to explain the complex discriminatory behaviors of living organisms as being “obscure” in his technical sense. Likening the mind to a map Kant goes so far as to say that

The field of sensuous intuitions and sensations of which we are not conscious, even though we can undoubtedly conclude that we have them; that is, *obscure* representations in the human being (and thus also in animals), is immense. Clear representations, on the other hand, contain only infinitely few points of this field which lie open to consciousness; so that as it were only a few places on the vast map of our mind are *illuminated*. (An 7:135)

Thus, obscure representations, i.e. representations of which we have no direct or non-inferential awareness, but which must be posited to explain our (and those of other living beings) fine grained differential discriminatory capacities, constitute the majority of the mental representations with which the mind busies itself.

Though Kant does not make this point explicit in his discussion of discrimination and consciousness, it is clear that he takes our capacity to discriminate between objects and parts of objects to be ultimately based on our sensory representation of those objects. This means that his views on consciousness as differential discrimination intersect with his views on phenomenal consciousness in the following manner. Since we are receptive beings, and the form of our receptivity is sensibility, the ultimate basis on which we differentially discriminate between objects must be sensory, and hence on what it is like to perceive those objects. Thus, though Kant seems to take for granted the fact that conscious beings are in states with a particular phenomenal character, it must be the clarity and distinctness of this phenomenal character which allows a conscious subject to differentially discriminate between the various elements of her environment (see Kant’s discussion of aesthetic perfection in the 1801 *Jäsche Logic*, 9:33-9 for relevant discussion).

c. Self-Consciousness

As the discussion of unconscious representation indicates, Kant believes that most of our representations are ones of which we are not directly aware. They are nevertheless to some degree conscious, since they allow differential discrimination of elements of the subject's environment. Kant seems to think that the process of making a representation clear, or fully conscious, requires a higher-order representation of the relevant representation. As Kant says, "consciousness is really the representation that another representation is in me" (JL 9:33). Since this higher-order representation is one of another representation *in me*, Kant's position here suggests that consciousness requires at least the capacity for self-consciousness. This position is reinforced by Kant's famous claim in the Transcendental Deduction of the *Critique of Pure Reason* that

The **I think** must **be able** to accompany all my representations; for otherwise something would be represented in me that could not be thought at all, which is as much as to say that the representation would either be impossible or else at least would be nothing for me. (B131-2; emphasis in the original)

Kant might give the impression here of saying that for representation to be possible for a subject, that subject must possess the capacity for self-ascribing her representations. If Kant really did endorse this self-ascription condition, then representation, and thus the capacity for conscious representation, in either of the phenomenal or discriminatory senses outlined above, would depend on the capacity for self-consciousness. Since Kant ties the capacity for self-consciousness to spontaneity (B132, 137, 423), and restricts spontaneity to the class of rational beings, the demand for self-ascription would seem to deny that any non-rational animal (e.g. dogs, cats, birds, etc.), at least according to Kant's conception of such animals as lacking understanding and reason, could have phenomenal or discriminatory consciousness!

However, there is little evidence to show that Kant endorses the self-ascription condition. Instead, he distinguishes between two distinct modes in which one is aware of oneself and one's representations, via "inner sense" and via "apperception" (See Ameriks (2000) for extensive discussion). Only the latter form of awareness seems to demand a capacity for self-ascription. We'll take these two notions in turn.

i. Inner Sense

Inner sense is, according to Kant, the means by which we are aware of alterations in our own state. Hence all sensations, including such basic alterations as pleasure and pain, as well as moods and feelings, are all the proper subject matter of inner sense. Ultimately, Kant argues that not only all sensations and feelings, but all representations attributable to a subject whatsoever must ultimately occur in inner sense and conform to its form, time (A22-3/B37; A34/B51).

Thus, to be aware of something in inner sense is minimally, at least in the case of the awareness of sensations and feelings, to be phenomenally conscious. To say that a subject is aware of her own states via inner sense is to say that she has (at least) a temporally ordered series of mental states, each of which she is phenomenally conscious, though she may not be conscious of the series as a whole. This could still count as a kind of self-awareness, as when an animal is aware of being in pain. But it is not an awareness of subject as a *self*. Kant himself indicates such a position in a letter to his friend and former student Marcus Herz in 1789.

[representations] could still (I consider myself as an animal) carry on their play in an orderly fashion, as connected according to empirical laws of association, and thus they could even have influence on my feeling and desire, without my being aware of my own existence [*meines Daseins unbewußt*] (assuming that I am even conscious of each individual representation, but not of their relation to the unity of representation of their object, by means of the synthetic unity of their apperception). This might be so without my cognizing the slightest thing thereby, not even what my own condition is (C 11:52, May 26, 1789).

Hence, according to Kant, one may be aware of one's representations via inner sense, but one is not and cannot via inner sense alone aware of oneself as the *subject* of those representations. That requires what Kant, following Leibniz (1996) calls "apperception".

ii. Apperception

Kant uses the term "apperception" to denote the capacity for the awareness of some state or modification of one's self as just such a state. For a being capable of apperception, there is a difference between feeling a pain, and thus being aware of it in inner sense, and apperceiving that one is in pain, and thus ascribing, or being in a position to ascribe, a certain property or state of mind to one's self. In the example above, of a non-apperceptive animal as being aware of its own pain, while there is something (in this case rather unpleasant) it is like to be the animal, and the animal is itself aware of this – the pain, and its awareness is partially explanatory of its behavior (e.g. avoidance), Kant construes the animal as incapable of making any self-attribution of its pain. Kant seems to think of such a mind as incapable of construing itself as a subject of states, and thus as unable to construe itself as persisting through changes of those states. This is not necessarily to say that an animal incapable of apperception lacks any subject or self. But, at the very least, such an animal would be incapable of conceiving or representing itself in this way (See Naragon (1990); McLear (2011)).

Kant considers the capacity for apperception as importantly tied to the capacity to represent objects as complexes of properties attributable to a single underlying entity (e.g. an apple as a subject of the complex of the properties *red* and *round*). Kant's argument for this connection is notorious both for its complexity and for its obscurity. In the next sub-section I give an overview, though not an exhaustive discussion, of some of Kant's most important points concerning these matters, as they relate to the issue of apperception.

d. Unity of Consciousness & the Categories

In order that we may better understand Kant's views on apperception and unity of consciousness, we need to step back and look at the wider context of the argument in which he situates these views. One of the core projects of Kant's most famous work, the *Critique of Pure Reason*, is to provide an argument for the legitimacy of a priori knowledge of the natural world. Though Kant's conception of the a priori is complex, one central aspect of his view, shared with his German rationalist predecessors (e.g. Leibniz (1996), preface), is that we have knowledge of universal and necessary truths concerning aspects of the empirical world (B4-5), including, e.g., that every event in the empirical world has a cause (B231). This tradition tended to explain the

possession of knowledge of such universal and necessary truths by appeal to innate concepts whose content could be analyzed to yield the relevant knowledge. Kant importantly departs from the rationalist tradition by arguing that not all knowledge of universal and necessary truths is acquired via the analysis of concepts (B14-18). There are some “synthetic” a priori truths that are known on the basis of something other than conceptual analysis. Thus, according to Kant, the activity of pure reason achieves relatively little on its own. All of our ampliative knowledge that is also necessary and universal consists in what Kant calls “synthetic a priori” judgments or propositions. The central question he then pursues concerns how knowledge of such synthetic a priori propositions is possible.

Kant's basic answer to the question of synthetic a priori knowledge involves what he calls the “Copernican Turn”, according to which the objects of human knowledge must “conform” to the basic faculties of human knowledge – viz. the forms of intuition (space and time) and the forms of thought (the categories).

Kant thus engages in a two-part strategy for explaining the possibility of such synthetic a priori knowledge. The first part consists in arguing that the pure forms of intuition provide the basis for our synthetic a priori knowledge of mathematical truths. Mathematical knowledge is synthetic because it goes beyond mere conceptual analysis to deal with the structure of (our representation of) space itself. It is a priori because the structure of (our representation of) space is a priori accessible to us, being merely the form of our intuition and not a real mind-independent thing (a “thing in itself” as Kant would call it).

However, in addition to the representation of space and time, Kant also thinks that possession of a particular privileged set of a priori concepts is necessary for knowledge of the empirical world. But this raises a problem. How could an a priori concept, which is not itself derived from any particular experience, be nevertheless legitimately applicable to objects of experience? To make things even more difficult, it is not the mere possibility of the application of a priori concepts to objects of experience that worries Kant, for this could just be a matter of pure luck. Kant wants even more than mere possibility, for he wants to show that with regard to a privileged set of a priori concepts, they apply necessarily and universally to all objects of experience and do so in a way that we are in a position to know independently of experience.

This brings us to the second part of Kant's argument, which is directly relevant for understanding Kant's views on the importance of apperception. Not only must objects of knowledge conform to the forms of intuition, they also must conform to the most basic concepts (or “categories”) governing our capacity for thought. Kant's strategy is thus to show how a priori concepts legitimately apply to their objects in virtue of being partly constitutive of the objects of representation, rather than the traditional view according to which the objects of representation were the source or explanatory ground of our concepts (Bxvii-xix). Now, exactly what this means is deeply contested, in part because it is rather unclear what Kant intends us to understand by his doctrine of Transcendental Idealism. For example, does Kant intend that the objects of representation are *themselves* nothing other than representations? This would be a form of phenomenalism similar to that offered by [Berkeley](#). Kant, however, seems to want to deny that his view is similar to Berkeley's, asserting instead that the objects of representation really exist independently of the mind, and that it is only the way that they are represented that is mind-dependent (A92/B125; cf. Pr 4:288-94).

What makes Kant's “Copernican Turn” relevant for our discussion is that his strategy for validating the legitimacy of the a priori categories proceeds by way of a “[transcendental argument](#)”

tying together the conditions necessary for consciousness of the identity of oneself as the subject of different self-attributed mental states with those necessary for grounding the possibility of representing an object distinct from oneself, of which various properties may be predicated. In this sense, Kant argues that the intellectual representation of subject and object stand and fall together. Kant thus denies the possibility of a self-conscious subject, who could conceptualize and self-ascribe her representations, but whose representations could not represent law-governed objects in space, and thus the material world or “nature” as the subject conceives of it.

Though Kant's views regarding the unity of the subject are contested, there are several points which can be made fairly clearly. First, Kant conceives of all specifically intellectual activity, including the most basic instances of discursive thought, as requiring what he calls the “original unity of apperception” (B132). This unity, as original, is not itself brought about by some mental act of combining representations, but as Kant says, is “what makes the concept of combination possible” (B131), and it is itself the ground of the “possibility of the understanding” (B131).

Second, the original unity of apperception requires whatever form of self-consciousness characteristically relates to the “I think”. As Kant famously says, “the **I think** must be able to accompany all my representations” (B131). Moreover, the “I think” essentially involves activity on the part of the subject – it is an expression of the subject's free activity or “spontaneity” (B132). This means that, according to Kant, only beings capable of spontaneous activity – i.e. self-initiated activity that is ultimately traced to causes outside the reach of natural causal laws – are going to be capable of *thought* in the sense with which Kant is concerned.

Third, and related to the previous point, Kant seems to deny that a subject could attain the kind of representational unity characteristic of thought if her only resources were aggregative methods. Kant makes this point later in the *Critique* when he says, “representations that are distributed among different beings (for instance, the individual words of a verse) never constitute a whole thought (a verse)” (A 352). In an often-cited passage, William James provides a vivid articulation of the idea: “Take a sentence of a dozen words, and take twelve men and tell to each one word. Then stand the men in a row or jam them in a bunch, and let each think of his word as intently as he will; nowhere will there be a consciousness of the whole sentence” (James (1890), 160). Kant thus construes consciousness as the “holding-together” of the various components of a thought in a manner that seems radically opposed to any conception of unitary thought which tries to explain it in terms of some train or succession of its components (Pr 4:304; see Kitcher (2010); Engstrom (2013) for contrasting treatments of this issue).

The exact content of Kant's argument for the connection between subject and object in the Transcendental Deduction is highly disputed, and it is likely that no single reconstruction of the argument can itself capture all of the points for which Kant argues in the Deduction. Below I present at least one strand of Kant's argument as it appears in the first half of the Deduction. Here I focus on Kant's denial that the unity of the subject and its powers of representational combination could be accounted for by a merely associationist (i.e. Humean) conception of mental combination, sometimes termed his “argument from above” (see A119; Carl (1989); Pereboom (1995)). I take Kant's argument here as follows (see Pereboom (2009)):

1. I am conscious of the identity of myself as the subject of different self- attributions of mental states.
2. I am not directly conscious of the identity of this subject of different self-attributions of mental states.

3. If (1) and (2) are true, then this consciousness of identity is accounted for indirectly by my consciousness of a particular kind of unity of my mental states.
4. ∴ This consciousness of identity is accounted for indirectly by my consciousness of a particular kind of unity of my mental states. (1, 2, 3)
5. If (4) is true, then my mental states indeed have this particular kind of unity.
6. This particular kind of unity of my mental states cannot be accounted for by association. (5)
7. If (6) is true, then this particular kind of unity of my mental states is accounted for by synthesis by a priori concepts.
8. ∴ This particular kind of unity of my mental states is accounted for by synthesis by a priori concepts. (6, 7)

Premise (1) says that I am aware of myself (or at least in a position to be so aware) as the subject of different states. For example, right now I might be hungry as well as sleepy. Previously I was sleepy and slightly bored. Premise (2) claims that I have no immediate or direct awareness of the being which has all of these states. In Kant's terms, I lack any *intuition* of the subject of such self-ascribed states, instead having intuition only of the states themselves. Nevertheless, I am aware of all of these states as related to a subject (it is *I* who am bored, hungry, sleepy), and it is in virtue of these connections that I can call one and all of these states *mine*. Hence, as premise (3) argues, there must be some unity to my mental states which accounts for my (indirect) awareness (or my being in a position to be so aware) of their unity. My representations must have some basis for which they go together, and it is the basis for their "togetherness" that explains how I can consider them, one and all, to be mine. Premises (4) and (5) unpack this point, and premise (6) argues that association could not account for such unity (the theory of association was articulated in a particularly influential form by [David Hume \(1888\)](#), [Hume \(2007\)](#)) and the reader should look to that entry for relevant background discussion).

Kant's point, in premise (6) of the above argument, is that forces of association acting on mental representations (whether impressions or ideas) cannot account for either the experience of a train of representations as *mine*, or for the "togetherness" of those representations, both in a single thought or in a series of inferences. Hume argues that we have no impression (and thus no ensuing idea) of an empirical self ([Hume \(1888\)](#), I.iv.6). Kant also accepts this point when he says that "the empirical consciousness that accompanies different representations is by itself dispersed and without relation to the identity of the subject" (B133). By this Kant means that when we introspect in inner sense, all we ever get are particular mental states (e.g. boredom, happiness, particular thoughts, etc.). We lack any intuition of a subject of those mental states. Hume concludes that the idea of a persisting self which grounds all of these mental states as its subject must be a fiction. Kant disagrees. Kant's contrasting view takes the mineness and togetherness of one's introspectible mental states as a datum needing explanation, and since an associative psychological theory like that of Hume's cannot explain these features of first-person consciousness (Hume himself was aware of this problem, see [Hume \(1888\)](#), III.Appendix), we need to find another theory – viz. Kant's theory of mental synthesis.

Recall that, prior to the argument of the Transcendental Deduction, Kant links the operations of synthesis to possession of a set of a priori concepts (concepts whose content is not derived from experience) – viz. the categories. Hence, in arguing that synthesis is required to explain

the mineness and togetherness of one's mental states, and by linking synthesis to the application of the categories, Kant argues that we could not have the experience of the mineness and togetherness of our mental states without applying the categories.

While this argument is only half of Kant's argument in the first part of the Deduction (the other half consisting of an "argument from below", concerning the conditions necessary for the representation of unitary objects, see Pereboom (1995), (2009)), it shows how tightly Kant took the connection to be between the capacities for spontaneity, synthesis and apperception, and the legitimacy of the categories. According to Kant, the only possible explanation of one's apperceptive awareness of one's psychological states as one's own and as all related to one another is that, as the subject of such states, one possesses a spontaneous power for synthesizing one's representations according to general principles or rules, the content of which is given by pure a priori concepts – the categories. The fact that the categories play such a fundamental role in the generation of self-conscious psychological states is thus a powerful argument for demonstration of their legitimacy.

Given that Kant leverages certain aspects of our capacity for self-knowledge in his argument for the legitimacy of the categories, the extent to which he argues for radical limits on our capacity for self-knowledge may surprise one. In the final section I discuss Kant's arguments concerning our capacity for a priori knowledge of the self and its fundamental features. However, in the next section I look at one of the central debates in Kant interpretation concerning the role of concepts in perceptual experience.

3. Concepts & Perception

During the discussion of synthesis above I characterized conceptualism as claiming that there is a dependence relation between a subject's having conscious sensory experience of an objective world, and the repertoire of concepts possessed by the subject and exercised in acts by her faculty of understanding.

As a first pass at sharpening this formulation, we may understand conceptualism as a thesis consisting of two claims: (i) sense experience has correctness conditions determined by the "content" of the experience; (ii) the content of an experience is a structured entity whose components are concepts. Let's take these in turn.

a. Content & Correctness

An important background assumption governing the conceptualism debate construes mental states as related to the world cognitively (as opposed to merely causally) if and only if they possess correctness conditions. That which determines the correctness condition for a state is that state's "content" (see Siegel (2010), (2011); Schellenberg (2011)).

Suppose, for example, that an experience E has the following content C:

C: That cup is white.

This content determines a correctness condition V:

V: S's experience E is correct iff the cup visually presented to the subject as the content of the demonstrative is white and the content C corresponds to how things seem to the subject to be visually presented.

Here the content of the experiential state functions much like the content of a belief state to determine whether the experience, like the belief, is or is not correct.

A state's possession of content thus determines a correctness condition, in virtue of which we can construe the state as mapping, mirroring, or otherwise tracking aspects of the subject's environment.

There are reasons for questioning whether Kant endorses the content assumption as I've articulated it above (see McLear (2015a)). Kant seems to deny several claims which are integral to it. First, in various places he explicitly denies that intuition, or the deliverances of the senses more generally, are the kind of thing which could be correct or incorrect (A293–4/B350; An §11 7:146; cf. LL 24:83ff, 103, 720ff, 825ff). Second, Kant's conception of representational content requires an act of mental unification (Pr 4:304; cf. JL §17 9:101; LL 24:928), something which Kant explicitly denies is present in an intuition (B129–30; cf. B176–7). This is not to deny that Kant uses a notion of "content" in some other sense, but rather only that he fails to use in the sense required by interpretations endorsing the content assumption (see Tolley (2014), (2013)). Finally, Kant's "modal" condition on cognition, that it provide a demonstration of what is really actual rather than merely logically possible, seems to preclude an endorsement of the content assumption (Bxxvii, note; cf. Chignell (2014)). However, for the purposes of understanding the conceptualism debate, we will assume that Kant does endorse the content assumption. The question then is how to understand the nature of the content so understood.

b. Conceptual Content

In addition to the content assumption, I defined conceptualism as committed to a conception of the content of intuition as being completely composed of concepts. Against this, Clinton Tolley (Tolley (2013), Tolley (2014)) has argued that the immediacy/mediacy distinction between intuition and concept entails a difference in the content of intuition and concept.

if we understand by "content"...a representation's particular relation to an object...then it is clear that we should conclude that Kant accepts non-conceptual content. This is because Kant accepts that intuitions put us in a representational relation to objects that is distinct in kind from the relation that pertains to concepts. I argued, furthermore, that this is the meaning that Kant himself assigns to the term "content". (Tolley (2013), 128)

Insofar as Kant often speaks of the "content" [*Inhalt*] of a representation as consisting in a particular kind of relation to an object (Tolley (2013), 112; cf. B83, B87) Tolley's proposal thus gives us ground for a simple and straightforward argument for a non-conceptualist reading of Kant. However it does not necessarily prove that the content of what Kant calls an intuition is not something that we would construe as conceptual, in a wider sense of that term. For example, both pure (e.g. *that, this*) and complex demonstrative expressions (e.g. *that color, this person*) have conceptual form, and have been proposed as appropriate for capturing the content of experience (e.g. McDowell (1996), ch. 3; for discussion see Heck (2000)). Demonstratives are not, in Kant's terms, "conceptual" since they do not exhibit the requisite generality which, according to Kant, all conceptual representation must.

c. Conceptualism & Synthesis

If it isn't textually plausible to understand the content of an intuition in conceptual terms (at least as Kant understands the notion of a concept) then what would it mean to say that Kant endorses conceptualism with regard to experience? The most plausible interpretation, endorsed by a wide variety of interpreters, reads Kant as arguing that the generation of an intuition, whether pure or sensory, depends at least in part on the activity of the understanding. On this way of carving things, conceptualism does *not* consist in the narrow claim that intuitions have concepts as contents or components, but rather consists in the broader claim that the occurrence of an intuition depends at least in part on the discursive activity of the understanding. The specific activity of the understanding is that which Kant calls "*synthesis*", the "running through, and gathering together" of representations (A99).

The conceptualist further argues that taking intuitions as generated via acts of synthesis, which are directed by or otherwise dependent upon conceptual capacities, provides some basis for the claim that whatever correctness conditions might be had by intuition must be in accord with the conceptual synthesis which generated them. This arguably fits well with Kant's much quoted claim,

The same function that gives unity to the different representations in **a judgment** also gives unity to the mere synthesis of different representations **in an intuition**, which, expressed generally, is called the pure concept of understanding. (A79/B104-5)

The link between intuition, synthesis in accordance with concepts, and relation to an object is made even clearer by Kant's claim in §17 of the B-edition Transcendental Deduction that,

Understanding is, generally speaking, the faculty of **cognitions**. These consist in the determinate relation of given representations to an object. An **object**, however, is that in the concept of which the manifold of a given intuition is **united**. (B137; emphasis in the original)

However else we are to understand this passage, Kant here indicates that the unity of an intuition necessary for it to stand as a cognition of an object requires a synthesis by the concept <object>. In other words, cognition of an object requires that intuition be unified by an act or acts of the understanding.

According to the conceptualist interpretation we must understand the notion of a representation's content as a relation to an object, which in turn depends on a conceptually guided synthesis. So we can revise our initial definition of conceptualism to read it as claiming that (i) the content of an intuition is a kind of relation to an object; (ii) the relation to an object depends on a synthesis directed in accordance with concepts; (iii) synthesis in accordance with concepts sets correctness conditions for the intuition's representation of a mind-independent object.

d. Objections to Conceptualism

At the heart of non-conceptualist readings of Kant stands the denial that mental acts of synthesis carried out by the understanding are necessary for the occurrence of cognitive mental states of the type which Kant designates by the term "intuition" [*Anschauung*]. Though it is controversial as to what might be considered the "natural" or "default" reading of Kant's mature critical philosophy, there are at least four considerations which lend strong support to a non-conceptualist interpretation of Kant's mature work.

First, Kant repeatedly and forcefully states that in our cognition there is a strict division of cognitive labor — objects are given by sensibility and thought via the understanding.

Objects are given to us by means of sensibility, and it alone yields us intuitions; they are thought through the understanding, and from the understanding arise concepts (A19/B33; cf. A50/B74, A51/B75–6, A271/B327).

As Robert Hanna has argued, when Kant discusses the dependence of intuition on conceptual judgment in the *Analytic of Concepts*, he is specifically talking about *cognition* rather than what we would consider to be perceptual experience (Hanna (2005), 265-7).

Second, Kant characterizes the representational capacities characteristic of sensibility as more primitive than those characteristic of the understanding (or reason), and as plausibly part of what humans share with the rest of the animal kingdom (Kant connects the possession of a faculty of sensibility to animal nature in various places, e.g. A546/B574, A802/B830; An 7:196.) For example, Kant's distinction between the faculties of sensibility and understanding as seems intended to capture the difference between the "sub-rational" powers of the mind that we share with non-human animals, and the "rational or higher-level cognitive powers" that are special to human beings. (Hanna (2005), 249; cf. Allais (2009); McLear (2011))

If one were to deny that, according to Kant, sensibility alone is capable of producing mental states that were cognitive in character then, as was pointed out in the section on consciousness, it would seem that any animal which lacks a faculty of understanding, and thus the capacity for conceptual synthesis, would thereby lack any capacity for genuinely *perceptual* experience. The mental lives of non-rational animals would thus, at best, consist of non-cognitive sensory states which causally correlate with changes in the animal's environment. Aside from an unappealing and implausible characterization of the cognitive capacities of animals (for relevant discussion of some of the issues in contemporary cognitive ethology see Bermúdez (2003); Lurz (2009); Andrews (2014), as well as the papers in Lurz (2011)), this reading also faces textual hurdles. Kant is on record in various places as saying that animals have sensory representations of their environment (CPJ 5:464; LM 28:449; cf. An 7:212), that they have intuitions (LL 24:702), and that they are acquainted with objects though they do not cognize them (JL 9:64–5) (see Naragon (1990); Allais (2009); McLear (2011)).

Hence, if Kant's position is that synthetic acts carried out by the understanding are necessary for the cognitive standing of a mental state, then Kant is contradicting fundamental elements of his own position in crediting intuitions (or their possibility) to non-rational animals.

Third, any position which regards perceptual experience as dependent upon acts of synthesis carried out by the understanding would presumably also construe the "pure" intuitions of space and time as dependent upon acts of synthesis (see Longuenesse (1998), ch. 9; Griffith (2012)).

However, Kant's discussion of space (and analogously, time) in the third and fourth arguments (fourth and fifth in the case of time) of the Metaphysical Exposition of Space in the Transcendental Aesthetic seems incompatible with such a proposed relation of dependence.

Kant's point in the third and fourth arguments of the Metaphysical Exposition of space (and similarly of time) is that no finite intellect could grasp the extent and nature of space as an infinite whole via a synthetic process involving movement from representation of a part to representation of the whole. If the unity of the forms of intuition were itself something dependent upon intellectual activity, then this unity would necessarily involve the discursive (though not necessarily conceptual) running through and gathering together of a given multiplicity (presumably of different locations or moments) into a combined whole, which Kant believes is characteristic of synthesis generally (A99).

But Kant's arguments in the Metaphysical Expositions of space and time require that the fundamental basis of our representation of space and time does not proceed from a grasp of the multiplicity of features of an intuited particular to the whole that has those features. Instead the form of pure intuition constitutes a representational whole that is *prior* to that of its component parts (cf. CJ 5:407-8, 409).

Hence, Kant's position is that the pure intuitions of space and time possess a unity wholly different from that given by the discursive unity of the understanding (whether it be in conceptual judgment or the intellectual *cum* imaginative synthesis of intuited objects more generally). The unity of aesthetic representation—characterized by the forms of space and time—has a structure in which the representational parts depend on the whole. The unity of discursive representation—representation where the activity of the understanding is involved—has a structure in which the representational whole depends on its parts (see McLear (2015b)).

Finally, there has been extensive discussion of the non-conceptuality of intuition in the secondary literature on Kant's philosophy of mathematics. For example, Michael Friedman has argued that the expressive limitations of the prevailing logic in Kant's time required the postulation of intuition as a form of singular, non-conceptual representation (Friedman (1992), ch. 2; Anderson (2005); Sutherland (2008)). In contrast to Friedman's view, Charles Parsons and Emily Carson have argued that the immediacy of intuition, both pure and empirical, should be construed in a "phenomenological" manner. Space in particular is understood on their interpretation as an original, non-conceptual representation, which Kant takes to be necessary for the demonstration of the real possibility of constructed mathematical objects as required for geometric knowledge (Parsons (1964); Parsons (1992); Carson (1997); Carson (1999); cf. Hanna (2002). For a general overview of related issues in Kant's philosophy of mathematics see Shabel (2006) and the works cited therein at p. 107, note 29.)

Ultimately, however, there are difficulties in assessing whether Kant's philosophy of mathematics can have relevance for the conceptualism debate, since the sense in which intuition must be non-conceptual in accounting for mathematical knowledge is not obviously incompatible with claiming that intuitions themselves (including pure intuition) are dependent upon a conceptually-guided synthesis.

The non-conceptualist reading is thus clearly committed to allowing that sensibility alone provides, in a perhaps very primitive manner, objective representation of the empirical world. Sensibility is construed as an independent cognitive faculty, which humans share with other non-rational animals, and which is the jumping-off point for more sophisticated conceptual representation of empirical reality.

In the next and final section, I look at Kant's views regarding the nature and limits of self-knowledge and the ramifications of this for traditional rationalist views of the self.

4. Rational Psychology & Self-Knowledge

Kant discusses the nature and limits of our self-knowledge most extensively in the first *Critique*, in a section of the *Transcendental Dialectic* called the "Paralogisms of Pure Reason". Here Kant is concerned to criticize the claims of what he calls "rational psychology", and specifically, the claim that we can have substantive metaphysical knowledge of the nature of the subject, based purely on an analysis of the concept of the thinking self, or as Kant typically puts it, the <I think>.

I think is thus the sole text of rational psychology, from which it is to develop its entire wisdom...because the least empirical predicate would corrupt the rational purity and independence of the science from all experience. (A343/B401)

There are four "Paralogisms". Each argument is presented as a *syllogism*, which consists of two premises and a conclusion. According to Kant, each argument is guilty of an equivocation on a term common to the premises, such that the argument is invalid. Kant's aim, in his discussion of each Paralogism, is to diagnose the equivocation, and explain why the rational psychologist's argument ultimately fails. In so doing Kant provides a great deal of information about his own views concerning the mind (See Ameriks (2000) for extensive discussion). The argument of the first Paralogism concerns our knowledge of the self as substance; the second, the simplicity of the self; the third, the numerical identity of the self; the fourth, knowledge of the self versus knowledge of things in space. We'll take these arguments in turn.

a. Substantiality (A348-51/B410-11)

Kant presents the rationalist's argument in the First Paralogism as follows:

1. What cannot be thought otherwise than as subject does not exist otherwise than as subject, and is therefore substance.
2. Now a thinking being, considered merely as such, cannot be thought otherwise than as subject.
3. ∴ A thinking being also exists only as such a thing, i.e., as substance.

Kant's presentation of the argument is rather compressed. In more explicit form we can put it as follows (see Proops (2010)):

1. All entities that cannot be thought otherwise than as subjects are entities that cannot exist otherwise than as subjects, and therefore (by definition) are substances. (All M are P)
2. All entities that are thinking beings (considered merely as such) are entities that cannot be thought otherwise than as subjects. (All S are M)
3. ∴ All entities that are thinking beings (considered merely as such) are entities that cannot exist otherwise than as subjects, and therefore are substances (All S are P)

The relevant equivocation is in the term that occupies the “M” place in the argument – viz. “entities that cannot be thought otherwise than as subjects”. Kant specifically locates the ambiguity in the use of the term “thought” [*Das Denken*], which he claims is taken in the first premise to concern an object in general, and thus something that could be given in a possible intuition. In the second premise the use of “thought” is supposed to apply only to a feature of thought and, thus, not to an object of a possible intuition (B411-12).

While it isn't obvious what Kant means by this claim, something like the following seems apt. Kant takes the first premise to be making a claim about the objects of thought – viz. that an object which exists as an independent subject or bearer of properties cannot be conceived of as anything else (e.g. itself be a property of a further subject). This is thus a metaphysical claim about what kinds of objects could really exist, which explains Kant's reference to an “object in general” that could be given in intuition.

In contrast, premise (2) makes a merely *logical* claim concerning the role of the representation <I> in a possible judgment. Kant's point here is that we cannot use the representation <I> in any place other than the subject place of a judgment. For example, while I can make the claim “I am tall”, I cannot make the claim (it would make no sense) “the tall is I”.

Against the rational psychologist, Kant argues that we cannot make any legitimate inference from the conditions under which the representation <I> may be thought, or employed in a judgment, to the status of the “I” as a metaphysical subject of properties. Kant makes this point explicit when he says,

the first syllogism of transcendental psychology imposes on us an only allegedly new insight when it passes off the constant logical subject of thinking as the cognition of a real subject of inherence, with which we do not and cannot have the least acquaintance, because consciousness is the one single thing that makes all representations into thoughts, and in which, therefore, as in the transcendental subject, our perceptions must be encountered; and apart from this logical significance of the I, we have no acquaintance with the subject in itself that grounds this I as a substratum, just as it grounds all thoughts. (A350)

Kant thus argues that we should differentiate between different conceptions of “substance” and the role they play in our thought concerning the world.

Substance₀: x is a substance₀ iff the representation of x cannot be used as a predicate in a categorical judgment

Substance₁: x is a substance₁ iff its existence is such that it can never *inhere* in anything else (B288, 407)

The first conception of substance is merely logical or grammatical. The second conception is explicitly metaphysical. Finally, there is an even more metaphysically demanding usage of “substance” that Kant employs.

(Empirical) Substance₂: x is a substance₂ iff it is a substance₁ that persists at every moment (A144/B183, A182)

According to Kant, the rational psychologist attempts to move from claims about substance₀ to the more robustly metaphysical claims characteristic of our conception and use of substance₁ and substance₂. However, without further substantive assumptions, which go beyond anything given in an analysis of the concept <I>, we can make no legitimate inference from our notion of a substance₀ to either of the other conceptions of substance.

Since, as we saw in the discussion of the unity of consciousness above, Kant denies that we have any intuition, empirical or otherwise, of ourselves as subjects, we cannot, merely in reflection on the conditions of thinking of ourselves using the first-person concept, come to have any knowledge concerning what we are (e.g. in terms of beings either a substance₁ or a substance₂). No amount of introspection or reflection on the content of the first-person concept <I> will yield such knowledge.

b. Simplicity (A351-61/B407-8)

Kant's discussion of the proposed metaphysical simplicity of the subject largely depends on points he made in the previous Paralogism concerning its proposed substantiality. Kant articulates the Second Paralogism as follows:

1. The subject whose action can never be regarded as the concurrence of many acting things, is simple. (All A is B)
2. The self is such a subject. (C is A)
3. ∴ The self is simple. (C is B)

Here the equivocation concerns the notion of a "subject". Kant's point, as with the previous Paralogism, is that, from the fact that one's first-person representation of the self is always a grammatical or logical subject, nothing follows concerning the metaphysical status of the referent of that representation.

Of perhaps greater interest in this discussion of the Paralogism of simplicity is Kant's analysis of what he calls the "Achilles of all dialectical inferences" (A351). According to the Achilles argument, the soul or mind is known to be a simple unitary substance because only such a substance could think unitary thoughts. Call this the "unity claim" (see Brook (1997)):

(UC): if a multiplicity of representations are to form a single representation, they must be contained in the absolute unity of the thinking substance. (A352)

Against UC, Kant argues that we have no reason to think that the structure of a thought, as a complex of representations, isn't mirrored in the complex structure of an entity which thinks the thought. UC is not analytic, which is to say that there is no contradiction entailed by its negation. UC also fails to be a synthetic a priori claim, since it follows neither from the nature of the forms of intuition, nor from the categories. Hence UC could only be shown to be true empirically, and since we do not have any empirical intuition of the self, we have no basis for thinking that UC must be true (A353).

Kant here makes a point familiar from contemporary [functionalist](#) accounts of the mind (see Meerbote (1991); Brook (1997)). Our mental functions, including the unity of conscious thought, are consistent with a variety of different possible media in which the functions are realized. Kant's point is that there is no contradiction in thinking that a plurality of substances might succeed in generating a single unified thought. Hence we cannot know that the mind is such that it must be simple in nature.

c. Numerical Identity (A361-66/B408)

Kant articulates the Third Paralogism as follows:

1. What is conscious of the numerical identity of its Self in different times, is to that extent a person. (All C is P)
2. Now the soul is conscious of the numerical identity of its Self in different times. (S is C)
3. ∴ The soul is a person. (S is P)

The interest taken in establishing the personality of the soul or mind by the rational psychologists, stems from the importance of proving that not only would the mind persist after the destruction of its body, but also that this mind would be the same person, and not just some sort of bare consciousness or worse (e.g. existing only as a “bare monad”).

Kant here makes two main points. First, the rational psychologist cannot infer from the sameness of the first-person representation (the “I think”), across applications of it in judgment, to any conclusion concerning the sameness of the metaphysical subject referred to by that representation. Kant is thus once again making a functionalist point that the medium in which a series of representational states inheres may change over time, and there is no contradiction in conceiving of a series of representations as being transferred from one substance to another (A363-4, note).

Second, Kant argues that we can be confident of the soul's possession of *personality* in virtue of the persistence of apperception. The relevant notion of “personality” here is one concerning the contrast between a rational being and an animal. While the persistence of apperception (i.e. the persistence of the “I think” as being able to attach to all of one's representations) does not provide an apperceiving subject with any insight into the true metaphysical *nature* of the mind, it does provide evidence of the soul's possession of an understanding. Animals, by contrast, do not possess an understanding but, at best (according to Kant), only an analogue thereof. As Kant says in the *Anthropology*,

That man can have the I among his representations elevates him infinitely above all other living beings on earth. He is thereby a person [...] that is, by rank and worth a completely distinct being from things that are the same as reason-less animals with which one can do as one pleases. (An 7:127, §1)

Hence, so long as a soul possesses the capacity for apperception, it will signal the possession of an understanding, and thus serves to distinguish the human soul from that of an animal (see Dyck (2010), 120).

d. Relation to Objects in Space (A366-80/B409)

Finally, the Fourth Paralogism concerns the relation between our awareness of our own minds and our awareness of other objects distinct from ourselves, and thus as located in space. Kant describes the Fourth Paralogism as follows:

1. What can be only causally inferred is never certain. (All I is not C)
2. The existence outer objects can only be causally inferred, not immediately perceived by us. (O is I)

3. ∴ We can never be certain of the existence of outer objects. (O is not C)

Kant locates the damaging ambiguity in the conception of “outer” objects. This is puzzling since it doesn’t play the relevant role as middle term in the syllogism. But Kant is quite clear that this is where the ambiguity lies and distinguishes between two distinct senses of the “outer” or “external”:

Transcendentally Outer/External: a separate existence, in and of itself

Empirically Outer/External: an existence in space

Kant’s point here is that all appearances in space are empirically external to the subject who perceives or thinks about them, while nevertheless being transcendentally internal, in that such spatial appearances do not have an entirely independent metaphysical nature, since their spatial features depend at least in part on our forms of intuition.

Kant then uses this distinction not only to argue against the assumption of the rational psychologist that the mind is better known than any object in space (this a claim famously argued by [Descartes](#)), but also against those forms of external world skepticism championed by [Descartes](#) and [Berkeley](#). Kant identifies Berkeley with what he calls “dogmatic idealism” and Descartes with what he calls “problematic idealism” (A377).

Problematic Idealism: we cannot be certain of the existence of any material body

Dogmatic Idealism: we can be certain that no material body exists – the notion of a body is self-contradictory

Kant brings two arguments to bear against the rational psychologist’s assumption about the immediacy of our self-knowledge, as well as these two forms of skepticism, with mixed results. The two arguments are (what I am calling) the arguments from “immediacy” and “imagination”. We’ll take these in turn.

i. The Immediacy Argument

In an extended passage in the Fourth Paralogism (A370-1) Kant makes the following argument:

external objects (bodies) are merely appearances, hence also nothing other than a species of my representations, whose objects are something only through these representations, but are nothing separated from them. Thus external things exist as well as my self, and indeed both exist on the immediate testimony of my self-consciousness, only with this difference: the representation of my Self, as the thinking subject, is related merely to inner sense, but the representations that designate extended beings are also related to outer sense. I am no more necessitated to draw inferences in respect of the reality of external objects than I am in regard to the reality of the objects of my inner sense (my thoughts), for in both cases they are nothing but representations, the immediate perception (consciousness) of which is at the same time a sufficient proof of their reality. (A370-1)

I take the argument here to be as follows:

1. Rational Psychology (RP) privileges awareness of the subject and its states over awareness of non-subjective states.
2. But transcendental idealism entails that we are aware of both subjective and objective states, as they appear, *in the same way* – viz. via a form of *intuition*.
3. So either both kinds of awareness are immediate or they are both mediate.
4. Since awareness of subjective states is obviously immediate then awareness of objective states must also be immediate.
5. ∴ We are immediately aware of the states or properties of physical objects.

Here Kant displays what he takes to be an advantage of his [Transcendental Idealism](#). Since both inner and outer sense depend on intuition, there is nothing special about inner intuition that privileges it over outer intuition. Both are, as intuitions, immediate presentations of objects (at least as they appear). Unfortunately, Kant never makes clear what he means by the term “immediate” [*unmittelbar*]. This issue is much contested (see Smit (2000)). At the very least, he means to signal that our awareness in intuition is not mediated by any explicit or conscious inference, as when he says that the transcendental idealist “grants to matter, as appearance, a reality which need not be inferred, but is immediately perceived” (A371).

It is not obvious that an external world skeptic would find this argument convincing, since part of the grip of such skepticism on us relies on the (at least initially) convincing point that things could *seem* to one just as they currently are, even if there really is no external world causing one’s experiences. This may just beg the question against Kant (particularly premise (2) of the above argument). And certainly Kant seems to think that his arguments for the existence of the pure intuitions of space and time in the Transcendental Aesthetic lend some weight to his position here. Thus Kant is not so much arguing *for* Transcendental Idealism here as explaining some of the further benefits that come when the position is adopted. He does, however, present at least one further argument against the skeptical objection articulated above – viz. the argument from imagination, to which we’ll now turn.

ii. The Argument from Imagination

Kant’s attempt to respond to the skeptical worry that things might appear to be outside us while not actually *existing* outside us appeals to the role that imagination would have to play to make such a possibility plausible (A373-4; cf. *Anthropology*, 7:167-8).

This material or real entity, however, this Something that is to be intuited in space, necessarily presupposes perception, and it cannot be invented by any power of imagination or produced independently of perception, which indicates the reality of something in space. Thus sensation is that which designates a reality in space and time, according to whether it is related to the one or the other mode of sensible intuition.

What follows is my reconstruction of this argument.

1. If problematic idealism is correct then it is possible for one to have never perceived any spatial object but only to have imagined doing so.
2. But imagination cannot fabricate – it can only *re-fabricate*.

3. So, if one has sensory experience of outer spatial objects, then one must have had at least one successful perception of an external spatial object.
4. ∴ It is certain that an extended spatial world exists.

Kant's idea here is that the imagination is too limited to generate the various qualities that we experience as instantiated in external physical objects. Hence, it would not be possible to simply *imagine* an external physical world without having been originally exposed to the qualities instantiated in the physical world, *ergo* the physical world must exist. Even Descartes seems to agree with this, noting in *Meditation I* that “[certain simple kinds of qualities] are as it were the real colours from which we form all the images of things, whether true or false, that occur in our thought” (Descartes (1984), 13-14). Though Descartes goes on to doubt our capacity to know even such basic qualities given the possible existence of an evil deceiver, it is notable that the deceiver must be something other than ourselves, in order to account for all the richness and variety of what we experience (however, see *Meditation VI* (Descartes (1984), 54), where Descartes wonders whether there could be some hidden faculty in ourselves producing all of our ideas).

Unfortunately, it isn't clear that the argument from imagination gets Kant a conclusion of the desired strength, for all that it shows (if it shows anything) is that there was *at one time* a physical world, which affected one's senses and provided the material for one's sense experiences. This might be enough to show that one has not always been radically deceived, but it is not enough to show that one is not *currently* being radically deceived. Even worse, it isn't even clear that we need a *physical* world to generate the requisite material for the imagination. Perhaps all that is needed is *something* distinct from the subject, which is capable of generating in it the requisite sensory experiences, whether or not they are veridical. This conclusion is thus compatible with that “something” being Descartes's evil demon, or in contemporary epistemology, with the subject's being a [brain in a vat](#). Hence, it is not obvious that Kant's argument succeeds in refuting the skeptic, or to the extent that it does, that it shows that we know there is a *physical* world, as opposed merely to the existence of something distinct from the subject.

e. Lessons of the Paralogisms

Beyond the specific arguments of the Paralogisms and their conclusions, they present us with two central tenets of Kant's conception of the mind. First, that we cannot move from claims concerning the character or role of the first-person representation <I> to claims concerning the nature of the referent of that representation. This is a key part of his criticism of rational psychology. Second, that we do not have privileged access to our self as compared with things outside us. Both the self (or its states) and external objects are on par with respect to intuition. This also means that we only have access to ourselves as we *appear*, and not as we fundamentally, metaphysically, *are* (cf. B157). Hence, according to Kant, our self-awareness, just as much as our awareness of anything distinct from ourselves, is conditioned by our sensibility. Our intellectual access to ourselves in apperception, Kant argues, does not reveal anything about our metaphysical nature, in the sense of the kind of *thing* that must exist to realize the various cognitive powers that Kant describes as characteristic of a being capable of apperception (e.g. a spontaneous understanding or intellect).

5. Summary

Kant's conception of the mind, his distinction between sensory and intellectual faculties, his functionalism, his conception of mental content, and his work on the nature of the subject/object distinction, were all hugely influential. His work was immediately inspirational to the [German Idealist](#) movement and also became central to emerging ideas concerning the epistemology of science in the late nineteenth and early twentieth centuries, in what became known as the "Neo-Kantian" movement in central and southern Germany. Though Anglophone interest in Kant ebbed somewhat in the early twentieth century, his conception of the mind and criticisms of rationalist psychology were again influential mid-century via the work of "analytic" Kantians such as P.F. Strawson, Jonathan Bennett, and Wilfrid Sellars. In the early twenty-first century Kant's work on the mind remains a touchstone for philosophical investigation, especially in the work of those influenced by Strawson or Sellars, such as Quassim Cassam, John McDowell, and Christopher Peacocke.

6. References and Further Reading

a. Kant's Works in English

Quotations from Kant's work are from the German edition of Kant's works, the *Akademie Ausgabe*, with the first *Critique* cited by the standard A/B edition pagination, and the other works by volume and page. English translations are my own, though I have regularly consulted, and in most cases closely followed, translations from the Cambridge Editions. Specific texts are abbreviated as follows:

- An: *Anthropology from a Pragmatic Point of View*
- C: *Correspondence*
- CPR: *Critique of Pure Reason*
- CJ: *Critique of Judgment*
- JL: *Jäsche Logic*
- LA: *Lectures on Anthropology*
- LL: *Lectures on Logic*
- LM: *Lectures on Metaphysics*
- Pr: *Prolegomena to any Future Metaphysics*

The most used scholarly English translations of Kant's work are published by Cambridge University Press as the *Cambridge Editions of the Works of Immanuel Kant*. The following are from that collection and contain some of Kant's most important and influential writings.

- *Correspondence*, ed. Arnulf Zweig. Cambridge: Cambridge University Press, 1999.
- *Critique of Pure Reason*, trans. Paul Guyer and Allen Wood. Cambridge: Cambridge University Press, 1998.
- *Critique of the Power of Judgment*, trans. Paul Guyer and Eric Matthews. Cambridge: Cambridge University Press, 2000.
- *History, Anthropology, and Education*, eds. Günter Zöller and Robert Louden. Cambridge: Cambridge University Press, 2007.

- *Lectures on Anthropology*, ed. and trans. Allen W. Wood and Robert B. Loudon. Cambridge: Cambridge University Press, 2012.
- *Lectures on Logic*, trans. J. Michael Young. Cambridge: Cambridge University Press, 1992.
- *Lectures on Metaphysics*, ed. and trans. Karl Ameriks and Steve Naragon. Cambridge: Cambridge University Press, 2001.
- *Practical Philosophy*, ed. Mary Gregor. Cambridge: Cambridge University Press, 1996.
- *Theoretical Philosophy 1755-1770*, ed. David Walford. Cambridge: Cambridge University Press, 2002.
- *Theoretical Philosophy after 1781*, eds. Henry Allison and Peter Heath. Cambridge: Cambridge University Press, 2002.
