

The
Omnidoxy

The Omnidoxy

The Omnidoxy

solely authored by

Cometan,

Philosopher, Author, Diarist and Founder of The Philosophy of Astronism
and the Astronic Philosophical Tradition, and is the mononym for,

Brandon Taylorian,

Founder, First Chairman and Constitutional Leader of
The People's Constitutional Company of Jesse Millette.

The Omnidoxy officially, though often not commercially, resides within The Grand Centrality of the Astronist Philosophical Tradition which is protected by The Institution of The Philosophy of Astronism which wholly authorises the distribution of this treatise and states that its material is for universal public use for all peoples.

All new terms in this treatise can be found defined in The Grand Lexicon of Astronology in their relevant places in alphabetical order and some may also be found in the Index of the Omnidoxy found in the omnidoxical appendix. It is officially ascribed herein that this treatise is written under the principle of impartialism.

CONTENTS

The Preamble of The Grand Centrality

The Twenty-Five Refoundations of Philosophy

The Identity & Purpose of The Philosopher

The Absolute Notions of The Universe

The Reascension of Philosophy

The Commencement of The Cosmos

Prependix of the Omnidoxy

The Monodoxy - The Principles of The Aesthetic Cosmos

The Duodoxy - The Principles of Aid & Stewardship

The Tridoxy - The Principles of The Logical Cosmos

The Tetradoxy - The Principles of Justice & Patience

The Pentadoxy - The Principles of Ambition & Enlightenment

The Hexadoxy - The Principles of Ontology & Perception

The Heptadoxy/Septidoxy - The Principles of Cosmic Exploration

The Octadoxy - The Principles of Advancement & Eschatology

The Nonodoxy - The Principles of Epistemology & Ethics

The Decadoxy - The Principles of Space & Time

The Hendecadoxy - The Principles of Peace & Acceptance

The Dodecadoxy - The Principles of Imagination & Freedom

Appendix of the Omnidoxy

The Grand Canon of Astronism

The Astronist Methodology

The Notations of Brandon Taylorian

The Statement of Amendments

The Declaration of Allegiance

The Entwinement of Faith

The Edict of Universal Values

The Note on the Encouragement of Expansion

The Final Affirmation of Loyalty and Compliance

The Omnidoxy

About Astronism

Snippet form

Astronism is the philosophy of the Astronists, a panentheistic organised philosophy regarded as founded and revealed through Cometan as the progenitor of cosmocentric thought.

A panentheistic religion based on the ideas attributed to Cometan revealed through the Omnidoxy.

Astronism is a panentheistic religion of the Astronic tradition teaching that The Cosmos must become the centre of human worldview, and that Cometan is the progenitor of this worldview.

Astronism is an Astronic cosmocentric religion teaching that God non-invasively interpenetrates each cosmos as a metaphysical force, that there is an infinite number of cosmoses in The Universe, and that God exists both within each Cosmos and outside of The Universe.

Astronism is the progenitorial religion of the Astronic tradition teaching an impersonal cosmology based on scientific discovery and philosophical logic. It holds that humanity is of no special significance to the creation and destiny of The Cosmos. It also teaches that God (referred to as The Divine) is a metaphysical essence transcending both cosmic and universal nature, rejects the notion of an anthropomorphic God such as incarnations, and proclaims God to be interpenetrative and omncreative.

Astronism is an Astronic panentheistic religion teaching that God is a metaphysical essence interpenetrating the universe and that Cometan is the progenitor of cosmocentric thought.

Astronism is an Astronic cosmocentric religion based on the writings, ideas and beliefs of Cometan, a prodigy of philosophy and theology.

Astronism is a new religion of Cometanic origin proclaiming the centrality of The Cosmos and the resurgence of astronomical religions.

Astronism is a belief system founded by Cometan predicated upon the centrality of space to spirituality and prophesies the re-emergence of long-persecuted astronomical religions.

Sophisticated form

Astronism is an Astronic, cosmocentric religion founded by Cometan teaching that God interpenetrates the universe, and that the only redemption for humanity is our collective

physical, intellectual and spiritual exploration of The Cosmos. Astronism proclaims its lineage to be found in the astronomical religions first practiced during the Stone Age.

Through the works of Cometan, Astronism is the reviver of astronomical religions in turn birthing a new religious and philosophical category known as the Astronic tradition. The size of the population adhered to Astronism is not currently recorded, however, populations practicing some form of astronomical religion could be as high as 500 million, about 6.5% of the world's population.

Astronism uniquely follows a depadotheistic theology meaning that God, which is referred to as The Divine, is removed of all attributes traditionally associated with God. This includes mercifulness, forgiveness, and lovingness, as the association of such characteristics is considered to be a distortion and lowering of divinity, or a humanisation of God to suit the insecurities of humanity. It also teaches that God holds direct connections with humans through our imaginations and thoughts which guide each of our unique destinies.

However, it is maintained that the principal role of God is God's interpenetration of The Cosmos, guiding its chronology and destiny as a whole and bestowing uniqueness to all sentient beings. Central to Astronist belief is the notion that humanity is currently unfulfilled in its true existential purpose and that this will only be fulfilled through humanity's exploration of space with the subsequent achievement of transcension and corporeal cosmosis.

The founding book of Astronism is the Omnidoxy which was written by Cometan (b. 1998) through a series of revelations, known as personal inspirations. It was proclaimed post-omnidoxically that Astronism is the Final Religion due to it being the synthesis of religion and philosophy, which is why it is sometimes also referred to as the Great Synthesis and is technically categorised as an organised philosophy.

Astronism maintains a deeply philosophical identity and is the founder of the reascensionist movement. It emphasises the practice of debating and maintains that ideas and beliefs must be logically justified if they are to be accepted. An important element of the identity of Astronism is that it does not proclaim directly divine revelation. Like in other Astronic religions and philosophies, Astronism also incorporates astronomical observation and related practices into its orthopraxy.

There are four main schools of eschatology of Astronism dealing with the topics of death, the afterlife, and the existence and final destination of the soul. In Institutional Astronism, the naturalistic school is generally followed wherein an afterlife is disbelieved and all supernatural phenomena are attributed to falsehood or natural phenomena. Meanwhile, the transtellationist school proposes a supernaturalistic understanding and incorporates a number of different beliefs involving supernatural phenomena.

Staple concepts in other religions are noticeably absent from Astronism including heaven and hell, the concept of sin, and a paradisiacal afterlife in which loved ones are reunited. Astronism historically originated in the early 21st century just prior to the invent of mass spacefaring. Astronism is poised to be disseminated in a vastly different way to other religions through modern means of marketing and advertising (known as promulgation) as part of efforts to commercialise it.

Simplified form

Astronism is a new religion that was founded by Cometan, a prodigy of theology and philosophy, from the age of fifteen. The founding book of Astronism is called the Omnidoxy and is over 1 million words long, making it one of the longest books ever written. The Omnidoxy was authored by Cometan from age seventeen and continued to be added to. Believers of Astronism are called Astronists.

They believe that the only way for humanity to progress and fulfil its existential destiny is to explore what they call The Cosmos both physically, spiritually, and through gaining knowledge about space. They also believe that all humans achieve a state of existence known as cosmosis when they die during which they “become one with The Cosmos.” Some Astronists believe that this state of cosmosis can be achieved during one’s lifetime through transcension or the solving of astronomical mysteries. Astronists trace their lineage back to the astronomical religions practiced during the Stone Age, hence they claim to be the oldest religious group in the world.

Astronism is built on a philosophical identity meaning that it places rationality and the logical justification of opinions and beliefs. There exists a strong tradition of debating within Astronism as all Astronists are encouraged to accept opposing beliefs and ideas as long as they are logically justified. Cometan is also responsible for organising astronomical religions into a new category of religions and philosophies known as the Astronic tradition, of which Astronism is the founding member. Although various theological positions are held within Astronism, the religion’s main branch teaches that God, which is known as The Divine, is a state of existence interpenetrating every cosmos of The Universe, of which there is believed to be an infinite amount.

About Cometan

Snippet form

Cometan is the founder of the organised philosophy of Astronism.

Cometan is a British philosopher, writer, and religious figure on whose writings and ideas Astronism was founded.

Cometan is the first Astronic philosopher and the founder of the Astronist religion.

Cometan is an English philosopher who became a prodigy of theology and philosophy from age fifteen and went on to found Astronism.

Cometan is a Lancashire-born novelist and writer who an autodidact of philosophy and theology and started the Astronist religion.

Sophisticated form

Cometan is the first Astronic philosopher, an encyclopaedist, novelist, theologian and the founder of Astronism, a new religious movement pivoted around a cosmocentric worldview. From the age of fifteen, Cometan became a prodigy of philosophy and theology and started to receive a series of revelations and ideas across a six year period. Cometan did not claim that these revelations had come from God directly, however, he called them personal inspirations, a non-theistic form of revelation based on divinely-directed imaginations and thoughts as well as destiny.

As a consequence of these personal inspirations, Cometan began writing a philosophical treatise from the age of seventeen which would become known as the Omnidoxy. The Omnidoxy became a vast tome stretching to approximately 1.3 million words long and covered all aspects of the Astronist religion and philosophy. The Omnidoxy covered topics such as metaphilosophy, metareligion, ethics, ontology, and many other subjects relating to philosophy and theology. It offered a uniquely Astronist approach to all of these subjects and formed the foundations of the Astronic lexicon.

Cometan studied all the major religions and philosophies and understood that the role of astronomical religions had been long-undermined and persecuted throughout its long history. Cometan then combined his love of astronomy with his religious and philosophical beliefs and ideas to form a new religion named Astronism as well as to organise a category of religions and philosophies oriented on an astronomical theme known as the Astronic tradition. Cometan firmly believed that a new era of religious belief was upon humanity; these would encompass a set of religious beliefs directed towards The Cosmos, space exploration, and the transformative advancement of humanity.

Cometan considered a vast array of new ideas as part of his founding of Astronism, many of which concerned the nature, role, and identity of both religion and philosophy in modern society. In addition to this, Cometan pondered and wrote about conceptual value as well as the ethical grounds for the practical commercialisation and commodification of both religion and philosophy. Cometan became an exponent of religious commercialisation as well as a space activist, but the first of whom to base his advocacy for space exploration on religious beliefs.

Cometan dedicated his life to the establishment and worldwide dissemination of his beliefs regarding Astronism. In order to organise Astronism, Cometan founded and developed The Institution of The Philosophy of Astronism which was omnidoxically-granted the role of proprietorship over Astronism. As part of his wider authorship, Cometan also created the Spacefaring World franchise in which Jesse Millette is the main character. The Spacefaring World became a vehicle for Cometan to express his philosophical and beliefs through a fictional paradigm of mass commerciality across different age groups. Cometan's authorship of the Spacefaring World franchise combined with the Omnidoxy granted him a distinct authorial identity pivoted around writings of space, astronomy, religion, and the future of humanity.

Simplified form

Cometan is a British writer, astronomer and philosopher. He founded the religion called Astronism when was fifteen years old. He founded Astronism through writing the Omnidoxy, a book of over 1 million words and one of the longest books written in history. Cometan began writing the Omnidoxy when he was seventeen years old. He became of the youngest religious founders of all time and worked towards the worldwide dissemination of Astronism.

From the age of fifteen, Cometan had received a huge amount of ideas about space, exploration and discoveries made in astronomy, and the future role of philosophy and religion in society. Cometan believed that a new era of religion was about to resurge in the world. He worked towards the revival of long-practiced and long-persecuted and undermined astronomical religions. Cometan would organise a new tradition of religions and philosophies known as the Astronic tradition which would sit alongside the Abrahamic and Dharmic religious categories.

Astronism is a religion and philosophy that is based on the idea that space exploration is the salvation of humankind. That space exploration is key to humanity's spiritual and intellectual advancement. Astronism teaches that after all alive creatures have died, they experience cosmosis where they become one with The Cosmos as part of their decomposition. The Astronist faith and philosophy is also based on the belief that space exploration and the increase of knowledge about The Cosmos is central to the future worldview of humanity.

Cometan is also the creator of the Spacefaring World franchise and fictional universe. He began the franchise by writing The Original Jesse Millette Series, a series of mystery books about the Jesse Millette character and his adventures.

Acknowledgements

As the author of the *Omnidoxy*, I, as Cometan, must express my most sincere of gratitudes to those around me during my authorship of the *Omnidoxy*. Those closest to me know whom they are, they know what they have done for me, and they also know what they haven't done. Acknowledgement is both about recognising what has been done, but also what hasn't. It is a reflective element to begin the *Omnidoxy* and I want to use this short segment of the Preppendix to offer us all the chance to take accountability for both what we have done compliments abound, but also what we have not done, what we have failed to do for ourselves and for others, which is often more telling of our character than that which we have done.

A Tradition of Polyagency

When Astronism is referred to as a tradition of polyagency, this pertains to the multifaceted functions of Astronism as an organised philosophy concerned with the mind, the body, the soul, the world, the future, and the destiny of humanity among other elements. Astronism acts in a state of polyagency because it provides a variety of services to its believers as part of its primary functionality.

Under the principles of polyagency, it is important that Astronism serves its adherents in a multitude of ways so that it may become a fully-functioning belief system that not only presents a set of beliefs, but provides a service to those whom follow Astronism. This remains a central element of the functional and operational identity of Astronism; that it is not just a body of ideas, but that such abstracts are able to become serviceable to the adherents of Astronism. Therefore, by the principles of polyagency, abstracts transform into services relatable and thematised to the abstract.

Authorship of the Omnidoxy

The authorship of the Omnidoxy solely rests with the British philosopher, Cometan, who began writing the founding treatise of Astronism at the age of seventeen. It took Cometan approximately five years to write the first edition of the text which would become known as the Cometanic edition. Cometan was able to write the Omnidoxy through the extensive series of revelations and ideations that Cometan experienced from the age of fifteen. The amalgamation of ideas that came to form the Omnidoxy would subsequently develop the foundations of Astronism.

Chronology of the Omnidoxy

The chronology of the Omnidoxy refers to the timeline by which the Omnidoxy was authored by Cometan. It involves the series of most pivotal events and occurrences in the life of Cometan that directly contributed to the creation of the Omnidoxy. The chronology of the Omnidoxy is herein established as a subdiscipline of study within omnidoxicology that shall be known as omnichronology. Omnichronologists shall explore the chronology of the creation of the Omnidoxy and considers the circumstances of the creation of the Omnidoxy by Cometan through his life and the affairs of the wider world during the time of the creation of the Omnidoxy.

Cometanic Edition

The Cometanic edition, also known as the Original Cometanic edition, refers to this edition of the Omnidoxy; the first edition of the Omnidoxy which was written by Cometan. Due to the nature of the Omnidoxy as a rolling treatise, there will now exist forevermore different redactions (not to be confused with formats) of the Omnidoxy.

Redactions are newly written additions to the Omnidoxy which may or may not hold Cometanic origin and can be added to any of the discourses of the Omnidoxy. They may materialise as entirely new discourses, or additions to either the preppendix or the appendix of the Omnidoxy. The redaction of a disquisition of non-Cometanic origins would be a major event and undertaking as that would also mean the creation of a inclusive discipline so the disquisition would need to present a new area of study not already encompassed by one of the other twelve inclusive disciplines.

Whichever type of addition it is, The Institution must approve it for the redaction to be considered omnidoxical and to be described as such. Cometanic editions of the Omnidoxy

wherein all redactions are of Cometanic origin would always be labelled as such. Meanwhile, when a redaction is added to the Omnidoxy whilst Cometan is still alive and the redaction is not of Cometanic origin, it would be labelled non-Cometanic, but if the same scenario were to occur yet Cometan has died then the redaction or edition would be labelled post-Cometanic.

Createdness of the Omnidoxy

The createdness of the Omnidoxy is a major topic of discussion of omnidoxicology dealing with the notion that the Omnidoxy was either created or uncreated. Omnidoxical createdness states that the Omnidoxy was created by Cometan while omnidoxical uncreatedness states that the Omnidoxy has always existed and was only revealed to the world through Cometan rather than having been created by Cometan hence not existing pre-Cometanically. Institutional Astronism aligns with omnidoxical createdness as it is accepted that Cometan did create the Omnidoxy and that the Omnidoxy's origins are firmly Cometanic.

The Dedicatory

The Omnidoxy is herein and henceforth dedicated to all the stargazers rich and poor, all the astronomers young and old, and all those in the present day and in the past that have been persecuted for what they believe fuelled by their love of the stars whether scientifically, religiously, philosophically, or otherwise. Here, now, you all have a book to call home, to call your own. This is a book which presents an organised system through which new beliefs and ideas may flourish, a series of disciplines through philosophical inquiry may emerge, and creates Astronism, an organised philosophy advocating for a love of their stars, speaking out about one's love of the stars, and exploring one's love of the stars in new ways.

This book is for those people who do and do not know of the magnificence of The Cosmos. Those whom do already know of its glory and ability to transform one's consciousness shall relish in a treatise which organises and labels their beliefs into a worldview to which they can identify. Those whom do not already know of The Cosmos in such a context will be plowed over by its intrinsic splendour to connect with the mind, the body, and the soul on a multitude of levels. They will be opened up to a new understanding of their life, those around them, and the world on which they reside as part of their cosmisation. Their cosmisation will lead to them being granted a whole new perspective on everything they presently prioritise.

The Omnidoxy is for the seekers, the thinkers, the lost, and the found. It is for the wanderers, the dreamers, and the romancers of all things cosmical. The Omnidoxy is herein dedicated to all of you and as I live and breath, as Cometan, I will ensure to be one of your representatives and I will ensure to let the world know of your existence.

Epigraph of the Omnidoxy

“The Cosmos is the centre of our lives. It shall be become whom we are as it always has been. Our cosmic ignorance shall be released through this writing, the writings of the Omnidoxy. The Cosmos is to become our liberator, our all-encompasser of spirituality, ambition, and knowledge. The Omnidoxy is the presenter of this liberated way and it is the Omnidoxy that is praised for its multifaceted abilities to introduce, to enknowledge, to create, and to inspire.”

Etymology of the Omnidoxy

The etymology of the Omnidoxy pertains to the study of the structure and meanings behind the name and word “omnidoxy”. Omnidoxy is comprised of a two-part structure, the first of which is the prefix omni- meaning ‘of all things’ while the second part is the suffix -doxy which has an Astronic meaning ‘knowledge imparted through written means’, but is also derived from the word ‘doxa’ used in the word ‘orthodoxy’ meaning an opinion or point of view.

Therefore, the etymology of the Omnidoxy is partly Astronic in origin, but majoratively pre-Cometanic or non-Cometanic in its origins and when considered in chronological totality literally means ‘all knowledge and knowledge of all things imparted through written means.’

As aforementioned, omnidoxy is both a name and a word. When it is referred to as a name or title, such as for the book of my writing herein, it will be capitalised. When it is referred to as a word, such as an adjective or noun, then it will not be capitalised.

Inimitability of the Omnidoxy

The inimitability of the Omnidoxy relates to the proclamation made herein that the Omnidoxy is a unique treatise with a unique and particular cause and motivation that could not ever be imitated due to the unique circumstances of its authorship. The inimitability of the Omnidoxy is to be studied as part of the wider discipline of study of omnidoxicology and the inimitability of the Omnidoxy remains one of the most important attributes to the articulation of its identity.

Introduction of Indexment

Indexment forms one part to the two part structure of the Omnidoxy and contributes to the uniqueness of the creation of the Omnidoxy. Indexment is the unique style of indexing used in the Omnidoxy which is applied to each and every insentensation of the text. Indexment allows for the precise navigation of the extensive text that is the Omnidoxy as it allows readers to pinpoint particular insentensations out of the thousands which populate the text.

Introduction of Insentence

Insentence forms one part to the two part structure of the Omnidoxy and is highly contributive to the uniqueness of the creation of the Omnidoxy. Insentence is the writing system utilised in the Omnidoxy whereby sentences are presented as paragraphs, each of which are known as insentensations. This writing structure allows for the indexation of each insentensation in the Omnidoxy.

Neology of the Omnidoxy

The neology of the Omnidoxy is essentially the neology of its author, Cometan, yet beyond Cometan, these written words will long outlast a single author and founder. With the completion of the first edition of the Omnidoxy has become a lexicon now poised for use by all Astronists and non-Astronists in their reference to topics addressed and often introduced within the Omnidoxy. A huge amount of new words have been introduced as part of the Omnidoxy with the intention of the formation of the lexicon for Astronism, some of which can be found in the Appendix of the Omnidoxy, but all of which can be found either in The Grand Lexicon of Astronology, the Dictionary of Astronism, or the Cometanic Encyclopaedia of Astronism. A subject of discussion itself is the neology of the Omnidoxy and all new words penned by Cometan expected to become post-omnidoxically.

Note from The Institution of The Philosophy of Astronism

The Institution of The Philosophy of Astronism herein bestows the world with the Omnidoxy, the founding text of the Astronist religion, a new belief system pivoted around a cosmocentric worldview. It remains the solemn and continuous responsibility of The Institution to care for and preserve the Omnidoxy for all-time. The Institution asks that the Omnidoxy is respected, but that it is also justifiably challenged and criticised so that it may be improved, expanded, and developed according to the principles of motionalism. The Institution bestows eternal importance to the Omnidoxy for the Astronic tradition, but also proclaims that other texts will emerge from authors far into the future that will also justifiably contribute to the further development of the Omnidoxy, Astronism, and the Astronic tradition.

Omnidoxical Foreword

This edition of the Omnidoxy is intended to partner the use of the Omnidoxy in philosophical debataions, enabling public and private readers to prepare and follow up the debatory readings. The introductions to each Disquisition, and the explanatory notes are entirely unique, written for this edition and this edition only for they are not to be used again for any future editions.

Omnidoxicality

Omnidoxicality rather the state or fact of being omnidoxical or the extent to which something is omnidoxical. Omnidoxicality pertains to the set of characteristics associated with pieces of writing that are included within the Omnidoxy and so, for something such as a piece of writing, a word, or a concept to be considered omnidoxical, it must have some direct reference in one of the editions or redactions of the Omnidoxy.

There are different forms of omnidoxicality that should also be introduced here which include extraomnidoxicality which encompasses a categorisation of literary works, discussions, concepts, theories, entire philosophies, or any other type of conceptual that was either not fully discussed within The Omnidoxy and was only mentioned, or was not mentioned at all within the founding treatise, but was later addressed in greater detail by Cometan in another text, which would be described as an extraomnidoxical text.

Meanwhile, pseudocometanian or pseudo-omnidoxical writings pertains to pieces of writing which are proclaimed to be of Cometanian or omnidoxical origin, but are not in factuality. Also addressed as part of discussions of omnidoxicality is the extent of the authority bestowed upon the Omnidoxy by The Institution of The Philosophy of Astronism with wide variances across followers of Astronism regarding how much weight and authority should be bestowed upon the Omnidoxy, thus expecting to form several schools of thought on the matter in a post-omnidoxical setting.

Personal Inspiration

Personal inspiration is the form of revelation and ideation amalgamated together which fuelled and motivated and allowed for Cometan's ability to create and solely author the Omnidoxy.

Preface of the Omnidoxy

The Omnidoxy is principally a treatise; a book which formally and systematically deals with a particular subject and in this case, the subject of the Omnidoxy is the Astronic tradition, specifically the introduction of Astronism. This points to the primary aim of the Omnidoxy which is to outline, define, explore, and make comments upon the topic of Astronism and its many facets and branches. To fulfil the role of being a treatise, a book must hold a subject, a scope, and an aim, the first of which we have just outlined. The second of which, the scope, is demonstrable by the Omnidoxy's extensive size and the range of subtopics that it pertains to as part of its wider exploration of Astronism in the Astronic tradition.

The depth and breadth of the Omnidoxy are both evidence through the text's extensivity and are further pertained to through the multitude of exeges that shall occur post-omnidoxically. The third part of the functionality of the treatise which is the aim has already been alluded to, but it can be concretely founded by relating to the founding of Astronism and this as being the principal aim of the Omnidoxy for there is no greater aim for any work than to establish a tradition of thought and belief that shall live on far passed the publication and relevancy of its founding text and in this case, Astronism's founding text is undisputedly the Omnidoxy.

Structure of the Omnidoxy

The Omnidoxy's structure is poised to become a prominent topic of discussion within omnidoxiology with an essential understanding of the structure of this mammoth text granting one a clearer understanding of its message, its purpose, and the presentability of its ideas.

The Omnidoxy is structure according to twelve disquisitions, each of which hold a particular number discourses which are themselves populated by indexed insentences of the writing style and writing system of insentence. The Omnidoxy is split according to these twelve disquisitions, but also holds both a preppendix with its own segments at the beginning of the text preceding the first disquisition and an appendix with its own number of segments at the end of the text following the final disquisition of the Omnidoxy which is the Dodecadoxy.

In its most basic understanding, therefore, the Omnidoxy can be considered split according to three parts, its preppendix, its disquisitions, and its appendix. However, both the preppendix and most segments of the appendix do not follow the insentence structure that is applied to the omnidoxical disquisitions and also, only some segments of the preppendix and the appendix are indexed according to the system of indexment which is applied to the twelve disquisitions of the Omnidoxy.

Technical Note

The translation of the Omnidoxy is a very technical process and is a process which is indeed vested as one of the many responsibilities of The Institution of The Philosophy of Astronism as the Omnidoxy's proprietor. However, some verified societies and organisations which can be found listed in the Appendix of the Omnidoxy are also vested with the ability to translate the Omnidoxy and its redactions with varying levels of Institutionalality. The process of the translation of the Omnidoxy is expected to become a topic of scholarly debate regarding which words in languages other than English are able to capture the essence of the complex points made within the Omnidoxy. Another important and highly technical element in the translation of the Omnidoxy is neotranslation which involves the translation of new words introduced in the Omnidoxy from English into other languages with accuracy to still encapsulate the originally intended meaning of the neologism.

The Preamble of the Omnidoxy

“For the furtherance of oneself. For the betterment of peoples. For the final meeting with one's creator when all one was, one is and one will be, becomes as one and you shall see nothing, but Divinity.”

Written by Cometan, Founder, First Chairman and Constitutional Leader of The People's Constitutional Company of Jesse Millette, for those who wish to enlighten themselves on Astronism, The Grand Centrality is hereby declared the official documentation upon which Astronism is inscribed, thus The Grand Centrality mustn't be obscured by any persons though official amendments can be made in accordance with The Statement of Amendments.

Those who read The Grand Centrality may interpret its ideas however they please though it must be specified that The Grand Centrality does not endorse its words as religious nor does it encourage its words to be interpreted as a religious practice. Astronism, in accordance with the wishes of Cometan, mustn't rival religions as Astronism itself isn't entirely religious though it can work alongside and be entwined with religions and their universal beliefs, ideologies and practices. Thus, a person reading The Grand Centrality must understand, if applicable, that their own religious scripture eclipses the writings of The Grand Centrality and mustn't take action that could intervene with their own religious obligations, practices and values.

The Grand Centrality can be read chronologically from the first text to the last or only a single text may be read as that text may hold the most significance to the respective reader.

The universal philosophy inscribed throughout The Grand Centrality can be implemented into the everyday thought process and the usage of Astronism in the event of decision

making is encouraged. The Grand Centrality does not endorse religious worship of its philosophy nor does it endorse the idea of the creation of a humanised god and nor does it endorse the notion of narrow or fundamentalist violent interpretation of its philosophy.

The Omnidoxy is hereby founded, on the twenty first day of the month of July in the year two thousand and sixteen as a grand founding documentation for the betterment of all peoples and for the expoundation and dissemination of Astronism as a flexible and universal philosophy available to the minds of All.

The Twenty-Five Refoundations of Philosophy

New definition of philosophy

The organisation of foundational ideas, thoughts, and concepts into coherent and meaningful systems in addition to the study of such established systems and their fundamental natures, beliefs, and practices.

1. No Worshipping and No Rituals.
2. There are philosophical buildings, and “Places of Philosophy”, but there are no doctrines to say how often people should visit such buildings or places, or what they should do in those buildings or places.
3. There exists no initiation rites and ceremony, nor does there exist any requirements of induction.
4. There is a central text; The Grand Centrality within which The Omnidoxy rests as the core Astronist philosophical documentation.
5. No mandatory belief or belief practice, and all beliefs and belief practice are interpretational.
6. Minimal mention of the supernatural, especially not the worship of the supernatural.
7. No sacred objects, places, or times.
8. No spiritual difference between philosophical buildings and other buildings or places; the only difference being the designation of philosophical buildings as their usage for philosophical debate and ideation.
9. There are principles to Astronism, but they don't have supernatural or unproven origins, and there are no enforcements of these principles on any adherents.
10. Rather than an individual or a council of people as the leader(s) of the philosophy, The Institution of the Philosophy of Astronism, as philosophical organisation, is the manager, authority, jurisdiction, and leader.

11. No religious feelings such as guilt or sin, but philosophical feelings including Wonderment, Adoration, Laudation, Ponderment, Inspiration, Imagination, and Knowledge.
12. No prayer or communication with a supernatural being or God.
13. There is a particular worldview, or futureview, in Astronism known as the Cosmocentric Worldview.
14. Astronism, and philosophy in general, is not dependent on the concept of faith for explanations of ideas.
15. A distinct focus on the present and future events rather than a centrality on the events of a past time.
16. No proclamations that any event or story in Astronism, or in Mystology, ever actually happened.
17. There are central figures as humanly manifestations of Astronism, yet those figures are neither real, nor supernatural, and are purely fictional and metaphorical.
18. Little focus on a supernatural existence or life after death, but more focus on The Cosmos, Human Civilisation, The Exploration of Space, and the concepts of metaphysics, existence, knowledge, and The Origins of The Universe.
19. The Institution of The Philosophy of Astronism does not seek, nor would accept, any form of tax exemption, for it expounds that philosophy should add and give back to the society in which it exists.
20. In religion, one must believe in the entirety of one's religion for one to be a part of it. In philosophy, specifically Astronism, one may just believe in a part of the philosophy, for there is no requirement to believe in the entirety.
21. In religion, one cannot be part of two religions in parallel. In philosophy, one can be part of multiple philosophies in parallel, and so one may follow Astronism and also follow another philosophy or religious tradition simultaneously.

22. Astronism focuses on what is existential, rather than superstition or supernaturalism. Philosophy is not focused on giving a definite answer unlike its religious counterparts, but instead, focuses on the seeking of the answers and acknowledging that one can never truly know enough; philosophy is the exploration for answers.
23. Faith is championed as good, but faith isn't required to believe in, or to become an adherent of, the words of the Omnidoxy or Astronism respectively.
24. Other subjects and practices are at the centre of Astronism, including Astronomy, Cosmology, Technology, the Sciences, the Humanities, and Futurology.
25. Astronism only concerns itself with the possibilities in the cosmic realms and there are no consequences of any particular action in Astronism, for philosophy is founded on knowledge, however, the universal and divinical realms of existence are also allured to in the Astronist Cosmology.

The Identity & Purpose of The Philosopher

In all things The Philosopher has knowledge for The Philosopher is knowledge itself, embodied into a being within whom knowledge is forefront and foremost.

A Seeker of Truth is The Philosopher at heart. Truth is the intrinsic nature of The Philosopher's mind, and to seek such truth is The Philosopher's ultimacy.

In whom, when whom, and how whom becomes The Philosopher that one is destined to be, is up to the person at hand, and whether they wish so to be The Philosopher intended.

We are philosophers in the very core of us all, and some grasp this marvellous gift when young and naive; the most dangerous of circumstances, and others when old and wise; the most disappointing of circumstances for a life of philosophy has been lost.

Though, it must said, that no one person is ever too old to realise one's place as The Philosopher for that is as destined so.

The Philosopher stands as the greatest beacon of humanity and thought, for The Philosopher sees the world through a way in which no other human can see it.

The Philosopher must guide the world to become what it has been destined to become, for The Philosopher's Duty to the peoples of the world is key to their gift of knowledge, imagination, and understanding of the world around them.

The Philosopher is anyone who places their thoughts on the acquisition of knowledge, centralises their duty on the betterment of peoples, and concentrates their wonderment on the grandiosity of The Cosmos in The Universe.

The Philosopher does not see themselves, nor the world in which they live, as the centrality of The Cosmos in The Universe, but a mere cog in a much larger wheel of divinity.

The Philosopher's purpose is that of a grand path as destined so, and takes the meaning, structure, and appearance of all things created to be an entity of some Divine creation.

The Philosopher's path of life is long, and full, and difficult, and easy in many uniquely interlocking ways to The Philosopher themselves.

There are five components that are central to The Philosopher's life:

- The Philosopher's Imagination
- The Philosopher's Knowledge
- The Philosopher's Wonderment
- The Philosopher's Duty
- The Philosopher's Understanding

The Absolute Notions of The Cosmos

The Cosmos is the all-encompassing entirety of existence from the perspective of that which exists within it and all that is within it can be known to exist to those whom stand within it, and all that is said to be without it, cannot be known to exist to those whom stand within it.

The Cosmos is as it appears for it does not share the deceptive qualities that exist within man, and so, only one version of The Cosmos can be known to exist in absolute truth.

Relativism remains the greatest opposition to the absolute truth and reality of The Cosmos for relativism allows for one to see The Cosmos how they wish to see, and not how it truly and actually is.

Humanity must be unified under one idea that The Cosmos holds a truth and a reality which cannot be distorted by relative thought.

This truth is that The Cosmos is finite; there is a definite edge to its existence; it had a beginning and it will have an end, and it is so that no ultimate answer to the mysteries of The Cosmos can ever be proven to be true for humanity has not seen The Cosmos in its entirety; they can only be right for the adherent and how they truly feel towards that view.

The reality is that The Cosmos is ultimately unknown to humanity and all that could possible exist within The Cosmos does so in direct conjunction with the confines of The Universe.

The Cosmos resembles order, patterns, and structure and exists alongside, underneath, and within The Universe, and is the guide, the protector, and the incubator from The Universe for which exists within it.

The Reascension of Philosophy

Philosophy: The Originator of Knowledge, The Initiator of Academics, The Root of All Subjects, The Breaker of Falsities, and The Resolver of Reality & Existence, thrived in ancient times with the likes of Aristotle, Socrates, Plato, and Epicurus creating the foundations of Western thought, and Laozi, Mencius, and Confucius establishing the fundamentals of Eastern thought.

Ever since, however, the great era of philosophical thought has dwindled and the greatest thinkers have become fewer over the centuries as religion, materialism, and politics have taken a central role in the lives of people, and in society as a whole.

This domination has become so prevalent that philosophy has descended to become an obscure, and dubious subject to most people, and its application and study, very niche and its purpose and importance almost completely forgotten outside the academic world.

This will change as Organised Philosophy, New Philosophy, and Advanced Philosophy take the stage with their initiator, Astronism, navigating humanity towards a greater and united future.

It is the central precept of The Reascension of Philosophy that states that philosophy's societal role must rise and become central to the functioning of humanity, and vital to the future of humankind.

Philosophical buildings must become forefront in the societal landscape, and such buildings must become centralised in society.

Philosophy must stand again as one of the fundamental pillars of society.

The Commencement of The Cosmos

In the beginning, there was nothing, and then, in an infinitesimal moment, at an infinitesimal point in a place that is still unknown to us, an eruption occurred, giving birth to an endless expanding existence consisting of time, space, and matter, and it is this well-ordered whole, that we call, in the Astronist Tradition, The Cosmos.

First it is the size of a subatomic particle. The tiniest of fractions of a second later, it is just big enough to hold in the palm of one's hand.

Moments later, it is the size of The Earth, and from thereon expands across a timeline of fourteen billion years to reach a still continuously expanding size today, which is absolutely and ultimately inconceivable for the humanity of The Earth to comprehend.

During this timeline of endless creation, a vast series of directly Divine celestial entities formed and their sizes, colours, distances, and mysteries confound the greatest of minds.

Every day, new discoveries are unlocking the mysteries of The Cosmos, for it be our duty to learn as much as we can about such a vast, complex, and truth-concealing place.

If it is The Cosmos that stands as the central and foremost element of The Universe, then it is The Cosmos that humanity must explore, learn, and gain an understanding of, for the furtherance of humanity.

There will be a time when The Cosmos comes to an end, but until that time comes, The Cosmos, as The Order of The Universe, will exist to be the central, and most directly Divine element of The Universe.

The Eidouranium, The Observatory, The Promontory & The Planetarium

The most centralised buildings and structures in a society form the middle of a concentric pattern around which the city, the society, and the lives of the people gyrate.

Throughout the history of civilisation, the buildings constructed in a city, town, and village reflect the values, the core beliefs, and the most important functions of that society.

These buildings were masterfully architected to look grand, to stand tall, to offer a kind of guidance for the people, and most importantly, to be the foremost symbol of what the people envisioned their society to stand for.

A building can take many forms, and hold many purposes, and stand for many aspects of thought, opinion, and knowledge.

The society must ask itself what it wants to be, what it wishes to stand for, and what future it is pursuing for itself, and for its people.

The buildings that the society erects must reflect these choices in accordance with the system of societal governance that has been democratically chosen by the people.

The Eidouranium is The Grand Centrality of the society in which its towering height, stunning beauty, and complex structure, make it the beating heart of the city, and from which all knowledge is gained, all guidance is given, and all governance is performed.

The Observatory is The Grand Seeker of the society in which its towering height too, and its stunning beauty too, are carefully crafted to spark the greatest of wonderments from the people whom it serves.

The Promontory is The Grand Eye of the society in which although it may not stand at the centre to perform its duty, it is the people's eye to The World Beyond, and all knowledge, all wonderment, and all imagination of The Cosmos originates from this building.

The Planetarium is The Grand Disseminator for it is the most common of all these buildings, the most accessible, and the most relevant to the masses, and so, the Planetarium stands as the most widespread reflection of the society created.

The people must be able to enter these buildings freely without charge to their economy, their mind, nor their conscience, for these are The People's Buildings, and they are to be for all for the purpose of establishing the founded vision for the society.

These buildings are to propound beauty for to look, and feel, and know of beauty is to know of creation, imagination, The Cosmos, The Universe, and The Divine.

These buildings are to propound knowledge for to promote knowledge is the only way to achieving the vision founded for the society's future.

These buildings are to propound, most ultimately, wonderment for that which we all share as all of us are part of The Cosmos, so as to be amazed with one another is as to be in awe of The Cosmos itself.

The Story of Cometan

Cometan (born 1 July, 1998) is the first Astronic philosopher and an autodidact of philosophy, the eponymous founder of Cometanism and the founder of Astronism, as well as the sole author of the Omnidoxy which immortalised Cometan's philosophership. Cometan is the mononym and historical name for Brandon Taylorian who is responsible for founding the Astronist philosophical tradition which was structured in the document known as The Grand Centrality within which The Omnidoxy, The Astronist Methodology and other founding works reside.

Astronist philosophy is interchangeably known as cometic philosophy which can be summarised as a distinct preoccupation with the affairs, issues, mechanisms, theology and philosophy of The Cosmos as is manifested through the tenet and concept of cosmocentricity.

Cometan officially embarked upon a philosophical career from the age of seventeen onwards, but had been developing his writing style, ideas, and stances on various topics from the age of fifteen during the Year of The Gift. One of the appellations of Astronism is cometicism which remains specific to the figure and persona of Cometan as made distinct from that of Brandon Taylorian and as a distinct variation of Astronism.

The young writer was then enthralled into a six year-long journey that involved him becoming an autodidact of religion, geography, linguistics, astronomy, cosmology, and most importantly, philosophy. During this formative period, he decided to change his name from Brandon Taylorian to a mononym after being inspired by the mononymous names of the Ancient Greek philosophers and he chose the cosmically-themed mononym of Cometan to match the astronomical theme of his philosophy.

Cometan, using his original professional name of Brandon Taylorian, also during this time started to pen The Original Jesse Millette Series, a series of fictional mystery books centred on chronicling the life of its protagonist, Jesse Millette, alongside four other deuteragonists to form The Five Astronist Characters as they are collectively referred to.

By the age of 20, Cometan had completed The Omnidoxy which remains over 1 million words in total length. Not only had Cometan created a philosophy, but an entirely new understanding of what philosophy was and the role of a philosopher in the world which in turn formed the wider Astronist philosophical tradition. Afterwards, Cometan founded and established The Institution of The Philosophy of Astronism which holds sole proprietorship over all aspects of Astronism, including sole copyright to The Omnidoxy and Cometan's other philosophical works.

A famed Armenophile, Cometan held an instant affinity and curiosity towards the history and people of Armenia upon learning about the country during his formative autodidactic years. This led to him eventually coming across a young woman named Liana Tiratsuyan whom he met in person almost one year later at Zvartnots International Airport in the

capital city of Yerevan in December 2018. Cometan claimed love at first sight with Tiratsuyan and their week together in Yerevan was even granted the privilege of being chronicled in *The Omnidoxy* in the formation of that which would be known as Cometanic love which encompassed the philosophical musings of Cometan on the topic of love.

Cometan was born on 1st of July 1998 in Preston, Lancashire, England, United Kingdom and is now 20 years old. He is the son of Sean Taylor (Father) and Louise Counsell (Mother) who separated when their only son was just four years old. Cometan has spoken of the fact that he remained of an “unknown identity” up until the age of fifteen when he had the idea for *Jesse Millette*. Up until that point, he never committed to any hobby, had few close friends, and held an unhappy personality.

Cometan has been graced by having seven siblings in total on both his father and mother’s side; Lucia Richardson (born June 7, 1989), Kieran Taylorian (born February 6, 2007), Charlotte Sophia (born August 20, 2007), Kent Taylorian (born July 17, 2008), Zara Taylorian (born July 17, 2008), Jay Taylorian (born September 17, 2009), and Edie Taylorian (born February 27, 2011).

However, the majority of Cometan’s childhood was spent with his cousins at his grandparents’ residence at 222 Longmeanygate, Leyland. Cometan’s childhood at the house and its surrounding grounds was spent observing deeply religious Catholic traditions primarily lead by his grandmother, Irene, whom Cometan would later credited with igniting his fervent interest in religion during his autodidactic formative teenage years.

The Grand Chronicles of Astronist Mystology

Preface

It is the true and pure purpose of The People's Constitutional Company of Jesse Millette to inspire and stimulate enthusiasm for all peoples in their chosen disciplinary for the eventual prosperity, furtherance and betterment of peoples here and beyond.

And so, in accordance to Astronism,, The People's Constitutional Company of Jesse Millette and the wishes of The Divine, I, Brandon Reece Taylor, Founder, First Chairman and Constitutional Leader of The People's Constitutional Company of Jesse Millette, do hereby inscribe The Grand Chronicles , of which I hope will stay in the hearts and minds of all peoples here and beyond for many generations to come.

The Grand Chronicles of Astronist Mystology is the ninth of The Eleven Astronist Dogmatic Works and in this documentation here holds the stories of figures young and old for the betterment, inspiration, enlightenment and inspirit of all peoples. Hold these stories close to thine heart and listen to their words and wonder and wish all about the figures you read of for their stories will guide thee to a path of betterment and prosperity for one and for all.

Together, learn and listen and love of these figures, and so too will thee be of their divine nature, but do not forget thy binding faith and morality for without these such components, the stories of these figures are all as nothing. So now, with the knowing of the divine in thy presence, read The

Grand Chronicles of Astronist Mystology and take from them what thy please for they and all are for thy and all and so they serve thee and all peoples, forever.

The Fabled Era of Astronist Mystology

The Fabled Era comprises of fifty Astronist stories considered fictitious, yet mythical to the Astronist Timeline, due to them taking place sometime before Jesse's canonical birth.

The Fable of the Books of Guidance

On a day of such beauty and warmth, in a land of the true riches of nature and family and love, does a Boy live. In this vast and beauteous land does stand a small house on a small hill in which a Boy, as small as they come, did live with his small family. So insignificant were they in their quiet part of the land that rarely did they receive any visitors and lived a small life, did this small Boy and it was only the creatures, in the woodland next door, that served as his friends. Hour after hour would this Boy play, in the woodland next door: With ladybirds and dragonflies and twigs and leaves and all kinds of bugs and beetles and bees. Created, did he, houses for them, parks for them to play in, and climbed the trees with them, did he, before stepping across The Great River. And when it was time to say goodnight, he guided them back to their homes, wished them good sleep and to be very ready, for the morrow's activities at dawn. On one morning, a spring one it was, the Boy got up and got dressed. His mother, so sweet she was, had made breakfast his small belly. But when he was about to leave, his Father did then shout, "Boy, get back here. I need to show you some things of much importance."

A writer, his Father was indeed, and a good one he was at that. The Boy had never bothered his Father for he knew he was always busy, so when his Father had called for him, he couldn't quite believe it. "Yes, Father?" The Boy did say as he stood in his Father's study.

"I want you to take a look at these books," his Father did then say. "And I want you to tell me which you prefer, which you believe in your heart to be true to you."

"But Father, did you write them?" The Boy did say as his Father handed him them.

“No, no, not these my son. We shall save mine for another day. No, these are the books of the greatest thinkers from all around our world. Ancient some are and some are not, and pose The Questions they do. Those of creation, of all-time and the ones one ponders about throughout their existence.”

And so, the Boy did then take, The Books of Faith with him, and read them he did, surrounded by nature, and picked from them, his favourite, the one most true to him. And then, when night did fall, he went back to his Father and said, “Father, I loved them all, but this, this is the book for me, I feel and know it so.”

“Then son, you have done it, you have chosen the book to guide. Guide you through your life this will, through all your tests and trials, and in the end, when you meet The One of Creation, The Creator will accept thee for lived in trueness to thyself will you and that is all that can be asked of one for trueness is the way of The Divine”.

The Fable of the Man Who Did Right

In a land so far and wide and dry and desolate, lived a man so lonely, all had forgotten him, for no name had he, and no family had he and no friends had he and so lonely was he for he had nobody but himself, he believed. In pain, was he, from day to night from the ills of his body and mind and suffer would he, until the day, he passed from this dreaded world, he believed.

It was, one day, so very scorching silence, and the man with no name had little to do, like all other days, yet this one was much worse for today was the day of his birth, and nobody, but himself, he believed, knew or cared that this was his day.

Sitting on his porch, was he, watching the last hairs of grass melt away from the searing sun in the bold, blue sky, thinking about the world beyond and all he did not know and would never know, he believed. It was then, when all seemed so ordinary, when the unordinary did occur:

He looked right down the usually empty road and saw what he had never seen before. A man, he saw, with a woman and a child. Got up from his seat faster than he ever had, did he, and waved and called to them, these people of appearance, thinking all was well. But, all was not.

When the man and the woman got closer and told him of their story, the man gasped for he had never heard, such a dreaded, awful tale than his own. The woman was carrying a baby, it seemed, and ill she so very was. Her husband, told him of her state and the man welcomed them

inside. A night, they did spend, and the night after that, but it was the third night that did conclude, and such a miracle did occur:

The woman birthed her child and glowing was he, with the purity of divinity and so beautiful and heavenly was he. Her husband did smile and laugh and dance as his wife did hold her baby and the man did play a wondrous tune on the piano that had never since been struck. Such a miraculous night this was and destined it had always been, yet the night came to an end as all do and the moon did set and the sun did rise and the morning did then come.

Time to leave, the husband did announce and the man's heart did sink far for alone again would he then be and so lonely did he feel for so long and never again, after that Miracle Night, could he ever live like that even once more. As he waved goodbye to the family of three, he felt a strange, stirring sensation throughout his body. He looked up to the sky and saw The Great Light, and knowing that the time had come, there, he passed, to The Great Beyond, knowing all he had done was right.

The Fable of the Girl Who Shared Her Time

In a land so rich and lush, does live a girl so pretty, yet crushed. Crushed inside did she so feel for her mother had died just an hour before meal. So generous and kind had her mother always been, so the girl did promise to be as strong and honest for as long as she would be. Yet one day in spring, when she did dance and sing, her father asked her to get, some bread and butter from the next village before the shutter and should carry them in this net.

And so slipping on her shoes, she shimmied in such shock and awe, for she had never yet been out alone before, she skipped out the front door. As her house got smaller, she felt taller as she never had done this before. Yet out in the wide world, was she, and without her father at her side, she was wondering whether, she would ever weather, this weird world without. But, brave was she and so bypass would she, her stumbling, blundering broods.

On the horizon, as she hiked up The Hill of Highgon, her heart did hop in a hurry, for far beyond did her eyes take her to see a hunched old haggard, hauling a hog and howling at it was she, as the girl got closer, she asked, "What's the matter?"

"My hog, so stubborn is he. Haven't a hint of why he's holding me be, suppose, thee help me?" My time, I will share, for generous am I, the girl did think to herself. Spent an hour with the woman did she, helping the hog, up the height of the hill. Yet waving goodbye, she was totally in surprise, for she had forgotten about her chore.

“Oh, good golly, I’d better darn hurry for if not, my father will worry.”

Walk she did, yet now with a power; for the time did strike, the twelfth hour. Heading into The Whitney Woods, knowing cut her journey it would, for time was quickly becoming her enemy and the day was nearing short. Half way through, she looked up and saw Two. Little boys, they were, smaller than her, so cute and cuddly, yet something seemed rather unruly.

“Why Miss,” one of the boys did say. “Please would you help us today, carry these big logs up, to our house, just up that way.” The girl did try, but the other did cry, so she agreed to help them today. Remembering, she did, her promise to keep, a kind and caring heart, always.

Heavy logs, they were and splinters and cuts, did tear her such young skin, but kept her deed did she. After a good hour’s work, the boys did wish her, on her merry way. “Thank you for sharing your strength with us for if not, never would we have finished with that lot.”

Now, I must get to the village, the girl thought in utter dismay, for if not, never will I get my chore done this day. Yet as fate would have it, across a lost man she added, to her encounterments that day. “Oh, sweet girl, where’ve I gone wrong?” The man did then say. Pointed him in the right direction, the girl did kindly say. “Oh, thank you, for sharing your true knowledge with a silly old man such as I, and now little girl, be on your way, for your father, worry, he may.”

The girl then did scurry, in such a hurry, toward the market wearing a face of such worry. She paid for the things and went back to her dwellings as her father saw her coming. Nearly seven it was, by the time she returned, and her father seemed stern.

“Where have you been, my little girl wonder?” Her father did then ask with squinting eyes.

“Oh, father please don’t shout at me, I’ve had such a day of tasks.”

“I know, I know, I know, my sweet child, you don’t have to defend, I just asked. You’ve shared all thy could and that’s all that mattered and if Time was not pleased, then that’s Time’s old fault, but it’s you, my sweet child, whose without revolt on this so very wondrous day.”

The Fable of the Spirit of a Child

In a land of death and despair and destructive dynamites of demons, all seems so lost and lonesome in the depths of debris and dejection. As the soot of sins does stick to all surrounding, like a sign of sorrow and sombre, seems all is so sad and strayed and stolen from what should be sincerity.

In a world of past wonders and a time of powerless people, hope is helpless for having hope, in this devil world, is a weakness more than a worship, one does believe. Yet true, deep down, all believe this not for having hope within our hearts is the path to peace which all one can wish for in this human world.

When all above, make the decisions, and impotent we all are, it is hard to hold hope for when one sees no heading and all hills and holes and houses are blocked by boulders of bureaucracy, it is easy to believe that building an existence is beyond all that one can achieve. But, alone nobody is, for this world is full of others of your kin, and building with them is brighter than building alone, for in togetherness, one takes turns, and triumph, all shall.

But amid the floating authoritarian ashes of atrocity, a woman does lay in bed with family and friends surrounding her and despite, the demolitions and destructions being dealt outside, a darling miracle is about to occur:

With the screams and shouts of love and pain, and the bombings of buildings beyond their own, the family and friends do watch as a little cry is heard and All is hushed. From the explosions of evil to the dynamites of the devil and the screeches of shock, a little cry comes and the proud people peer as The Prodigy's parentage do plant pecks, all-world and all-evil does stop for the spirit of something so special is speaking, in the only voice, she knows how.

The devils of the world drawback. The bombs of the world bow. The destruction of the world deals no damage. "Why and how does this occur?" One poor soul does ask. A whisper does then, fill their ears as the words of The Divine do spout.

*“Listen all, to the cries of this child,
For a sinner she is not,
As so pure and precious and powerful is she,
With ever knowing not,
And so bow, to her, all shall and will,
For the future, she foretells,
A bright one it shall be, as long as sinners see, the spirit of a child is the purest form to me.”*

The Fable of The Perfect Garden

In a land of legend and love and life lies a house with many rooms. To whom the house belonged was a mystery since the birth of Time, yet all knew of its infamous grounds. The house with no owner and no name or number; had a very strange garden indeed. All from across the land did hear of its legend. The Perfect Garden, it was, and all who heard of it, instantly wanted to see it.

Impossibly large, was this perfect garden. Those so lucky to witness its legend, did describe it as a beacon, one of nature and one of heaven, yet on no map was The Perfect Garden, so how on this world, could one possibly find it. Legend it was that some hikers had seen it, yet of all impossibilities, did they describe it. So wide and long, beyond the eye could see. So thick and lush and vast with vines and trees and flowers and leaves. So deep and rich with colours so bright, that unreal did nature look, even at midnight. All animals that had ever lived, did exist in this place of perfection. No creature too vicious or vile; no plant too tall or small. Every living thing do come here when their time had been and gone, and stay here, would they, forever without dismay, for now they existed in The Perfect Garden, and is all wherever one wishes to be.

To be conscious of worldliness is not to be in The Perfect Garden. To be of the feelings of jealousy, destruction and judgement is not to be in The Perfect Garden. Yet it is to be as all-accepting, all-loving and all-knowing to be in The Perfect Garden. When one is passing from this world, beyond living and breathing and all that is humanly, one does not feel for one's worldliness is behind them and so, to exist within The Perfect Garden, one must be beyond their living self.

One winter's day, an old, sick woman did take a walk in the snow alone. Despite all her worldliness within her telling her not to go, she felt a force within her too, beyond all that she could resist. And so, leave her house she did. As she did reach halfway toward a destination she did know, she looked ahead and saw someone she never thought she'd see again. Her husband, it was. Clear as day. Standing before her, he was right now, waving for her to come his way. At first, believe not, did she the figure before her for she knew her husband to be dead. Yet with an unstoppable driving force within, she continued toward him. As she neared him, faint did he become and when reached out to him with her shaking hand, did she believe it was all a vision. But it was then, when she turned the corner, it was then when she say her destination. Right before her, yet still so distant, was the numberless house with no name. And then, she did feel, as the snow-filled world did start to unseal, a force of draining; draining her

life. And as her body did fall to the snow, so too did her spirit transcend, into the beyond of all life and on her love's arm, did she then link, for together they walked, into The Perfect Garden.

54. The Topography of The Cosmos (Cosmotopography) - page 725

Compendology

[1:1:1] In the first disquisition of the Omnidoxy, The Cosmos shall be discussed in terms according to its aesthetics, development, naturity, orderity, as well as according to its origination, and ultimation as the most basic outline of the address of the inclusive discipline that is and shall be henceforth known as compendology.

[1:1:2] The Cosmos exists as the order, the pattern, and the structure of The Universe, and it is The Cosmos that fills the empty, yet all-expanding, underpinning that is The Universe.

[1:1:3] The Cosmos is in direct opposition to The Chaos, which is characterised by the imbalances, the unknowns, and the disordered parts of The Cosmos, and perhaps even The Universe beyond; the true breadth and width of the influence of The Chaos remains undecided by the Astronist Tradition; this issue shall be henceforthly known as the Chaotic Influence Problem.

[1:1:4] The Cosmos is everything we are, every time, every space, and every dimension, perspective, and every existence that is real to us.

[1:1:5] We owe all we are to The Cosmos as the entity from which we originated after the uncreation of The Universe.

[1:1:6] The Cosmos is the most grand of all things that we know to exist.

[1:1:7] It is the most vast of all things we know to exist and too, the most complex.

[1:1:8] The immense complexity of the structure of The Cosmos, even in its most simplest of forms, is completely incomprehensible to the mind of humanity for we can't fully comprehend that which we are ourselves part of, and made from.

[1:1:9] However, it is herein stated for henceforth application and fundamental to the Astronist understanding of reality is the notion that the first and only realities of The Cosmos; it has been created and so holds a natural physical and temporal limitation and is itself transient subsequence to all else within it.

The Journey Through The Cosmos

[1:2:1] Beginning where we know, the most homely and most comfortable of all places in The Cosmos so far, we begin The Journey Through The Cosmos at the one place we do know of almost wholly, and that is, The Earth.

[1:2:2] Perhaps it is easy to forget that the Earth and ourselves are just as much part of The Cosmos as the radiant stars, the black hole oblivions, and the most colourful and creative of the nebulae.

[1:2:3] But we are so part of The Cosmos in an equal way rather The Earth and ourselves existing superiorly to all other cosmic entities or sentient beings as is the belief for some other traditions of philosophy and religion, but this is not the approach of the Astronist Tradition of course.

[1:2:4] When one appreciates the beauty of the Earth, one also appreciates the beauty of The Cosmos and our insignificant place as a chapter in the history of the former within the latter.

[1:2:5] The very nature of the human mind and soul is to gravitate towards order, pattern, and structure so in the footsteps of The Cosmos do we follow for we are the microprogeny of The Cosmos; the phenomena of The Cosmos are the events taking place in The Cosmos on the most grand or the most minuscule of scales while the progeny of The Cosmos are the objects, beings, and structures of cosmic proportion that form the cosmic ecosystem.

[1:2:6] The Astronist Tradition envisions that humanity is to explore The Cosmos as we have explored The Earth and therefore established is the concept of the Humanic Exploration of The Cosmos.

[1:2:7] The Astronist Tradition prophesies that the Humanic Exploration of The Cosmos shall occur when our engineering capabilities are advanced, when the reascension of philosophy has occurred, and when our empirical knowledge of The Cosmos has heightened to new levels never before achieved in our history.

[1:2:8] The Astronist Tradition not only prophesies the Humanic Exploration of The Cosmos, but considers it to be the most solemn duty of humanity to embark upon, and it is the Humanic Exploration of The Cosmos that is the practical manifestation of The Journey Through The Cosmos.

[1:2:9] Humanity are destined to venture to the furthest reaches of the galaxy and even beyond into intergalactic territory if the technology, engineering, and philosophic will is developed and established to allow us to do so.

The Functionalities of Cosmic Progeny & Phenomena (Functionality)

[1:3:1] The Cosmos as it exists now and as we are now, is apart from us though we exist within it, and the entirety of our existence depends upon it.

[1:3:2] Despite this knowledge known to All, the world has grown ignorant of The Cosmos and our place within it as we continue with our geocentric lives.

[1:3:3] To exist within something is to perceive everything beyond through a very narrow telescope.

[1:3:4] The closer we are to something, the greater detail we see, yet too, we miss the wider perception of the surrounding world.

[1:3:5] We mustn't blame the world for their geocentricity; if an ant you are in a forest, you too wouldn't hold the ability to conceive its true scale and grandiosity.

[1:3:6] It falls to the greatest of minds to create insight of The Cosmos for the rest of the world to be able to perceive it as The Divine created it so.

[1:3:7] A philosophy must be formed to lead the next frontier beyond our celestial home.

[1:3:8] This philosophy; it must be strong in purpose, clear in thought, and a supportive guardian for the venturers, the wonderers, and those of ignorance too.

[1:3:9] That philosophy is this which you read now, and its purpose is strong, its thought clear, and its guardianship supportive and never ceasing.

[1:3:10] There are many journeys of our lives; many are physical, and others emotional, but there are those few which are a mixture of both, and are named Cosmical Journeys.

[1:3:11] A Cosmical Journey is that which one embarks upon during their quest for knowledge and a greater level of insight into the real nature, purpose, and beauty of The Cosmos.

[1:3:12] The Cosmosis is the overarching element of the Cosmical Journey of our lives which every one of us possesses.

[1:3:13] Some of us decide to explore our Cosmosis in greater depth than others, whom may spend only a small fraction of their time devoted to cosmical study, appreciation, and wonderment, amongst other types of cosmic interaction.

[1:3:14] It is one of the purposes of Astronism to increase each and every person's individual Cosmosis by demonstrating the wonderment, the complexity, the direct divinity, and the ultimate necessity of The Cosmos.

[1:3:15] Our Cosmosis is unique and our own from our beginning to our end; it cannot be taken away just as it cannot be forced upon us; we can only be enlightened towards it due to our want and need.

[1:3:16] Every book you read about The Cosmos; every thought you have about The Beyond; every dream you hold close to you of the possibilities is your Cosmosis progressing; racing on in its uniquely designed trajectory as part of our individual transcension.

[1:3:17] The level of your Cosmosis is an exact reflection of the effort, the time, and the thought into which you place in your philosophisations and your cosmic interactions, devotions, and enknowledgements.

[1:3:18] A little child looking up at the night sky right now beholds in their eyes the future of humanity, and it is the job of the world to make what they foresee a reality for them and their offspring thereafter forevermore.

[1:3:19] The family, the education, and the society must guide the young towards the future they foresee and what they hope to be, for the mind of one child represents a million new opportunities.

[1:3:20] The child can see, and feel, and know their future in The Cosmos for they have not been tainted by the distortions and distractions of the world around them; they can see more clearly their future than any adult could ever understand and it is this insight that we must preserve and encourage so that the next generations of adults are instilled with this heightened understanding of our cosmicity.

—

[1:3:21] The planet's course is ours too, and the way in which the planet flows is the way in which the nature of all life exists.

[1:3:22] It would do good for the world to know our dependence on what seem to be the smallest of things in The Cosmos for any slight change renders us entirely extinct.

[1:3:23] Each and every cosmical planet follows its course as a singer follows a song, a writer a train of thought, a pianist a melody; nothing of true cosmicity is exempt from the cosmic pattern and order.

[1:3:24] Every one thing of existence follows a course whether by destiny, or nature, or both; it is true for all things.

[1:3:25] But it is the study of the orbits of planets which will enlighten you to the centrality of everyone's course, and the intrinsicity of such courses to the functionality of The Cosmos.

[1:3:26] It is so that planets of all cosmical order rotate in coplanarity, and in time, and in speed, and in distance from one another with the same constant force, gravity, bounding their elliptic trajectories.

[1:3:27] An orbit represents the positioning of a planet for the majority of its existence; it is chosen for the planet according to gravitational pull, solar proximity, and alignment with the other planetary entities of the system.

[1:3:28] Is it not fascinating to you that every planet in every system has its own unique orbital trajectory according to the factors aforementioned? It is for this reason and many other examples that I herein introduce and latterly explore the worldview of unquitarianism.

[1:3:29] It is not a basic or foolish highlight to pose that such perfection in the cosmical system exists, and remains ready to be adored.

[1:3:30] To a simple system we look, our's in fact, the one in which we exist, and wonder of the planets and their orbital trajectories and remember that each of which functions uniquely to itself, but in symbioticity to the planets which surround it and The Sun around which it orbits.

[1:3:31] A system of such perfection in function created by chance and not by some design? Now a basic and foolish suggestion that would be.

[1:3:32] The orbitality of the planets is the extent to which their functions align with their trajectories.

[1:3:33] This must firstly and foremostly be discussed in the context of The Earth and its function; a world of diversity, complex, and relatively mature life.

[1:3:34] Why doesn't Mercury, or Venus hold the same life? Their trajectories fall too close to The Sun for life to exist, but the environments on those planets are unique in The Solar System and their functions are followed accordingly as The Earth's function as the supporter of life which is, too, followed and wholly fulfilled.

[1:3:35] It is of narrowthought to think of a planet's function in the context of our own needs and desires; you must learn now that The Cosmos does not, and will not ever work for us, or the way we want it to work for we are within it and part of it and it is not the role of a single jigsaw piece to dictate the way in which the other pieces interlock.

[1:3:36] To follow open thought is to think of a planet's function in terms of The Cosmos and its place within it, and what that planet may do for the system in whole.

[1:3:37] It is the immediacy of humanity which misses us our opportunities, for our quickness to judge is our impatience to learn of the ways in which the subject may be of use to us either now or in future times.

[1:3:38] We must think of planets in this way; immediately, one planet may seem hostile, barren, and worthless, but in a different set of circumstances after some time has passed, that same planet may very quickly become a place of huge potentiality to which then the people will flock.

[1:3:39] No matter its function in the system, every planet is there in existence to play its minute role in The Grand Cosmos.

[1:3:40] A world is exactly that; a place unique with its own laws, limitations, abilities, and possibilities that must be cherished for they are directly Divine, created in the essence of The Universe; the worlds are the quintessences of The Cosmos.

[1:3:41] It must be said that the orbits of the planets are those which we must seek to discover the interrelations between The Cosmos and its order and system and perfection.

[1:3:42] When learning of the orbitalities of planets, you start your journey of knowledge into Cosmic Time; the time cosmocentric, not geocentric or based upon anthropocentric doctrines.

[1:3:43] Cosmical time is time devised by The Universe, and its creator; not by the insignificancies of one lone civilisation, or even multiple civilisations.

[1:3:44] To learn of cosmical time is to attempt to learn knowledge of true time; Divine time.

[1:3:45] It is the hope of Astronism to align anthropologic time with that of cosmical time.

[1:3:46] Orbits of worlds are the orbits of our lives too; not without orbits could we exist.

[1:3:47] Finally, around which the orbits of planets follow we must discuss; that of stars and the nature of orbits.

[1:3:48] Orbitalities are bound to their courses by the laws of solarly; the proper Cosmical System involves a star around which a planet circumgyrates endlessly until the laws of solarly change to force orbital distortion, or total destruction.

[1:3:49] Orbitalities are bound to the stars like much else in The Cosmos; bound to light and life and possibility, yet it is now known that around which the galaxies circumgyrate

are the most supermassive of oblivions; the quintessences of darkness, nothingness, and impossibility.

[1:3:50] Why is that the wider our perspective of The Cosmos, the greater The Unknown becomes?

[1:3:51] It is unthinkable to imagine that the entirety of our existences depend upon oblivions, of which we know nothing and around which all galaxies orbit.

[1:3:52] If galactic orbitalities are bound to the laws of oblivions, then planetary orbitalities are too, bound to these laws in their eventuality.

[1:3:53] Perhaps the laws of solarity are simple microcosms for the laws of oblivion; are the laws of oblivion greater than the laws of all else? In that, we begin to wander down the path of Thesis & Antithesis; The Great Cosmic Battle between The Cosmos and The Chaos.

—

[1:3:54] From our place bound here on The Earth, we can only see through scopes so narrow, distorted by distance.

[1:3:55] The nature of the orbitalities of planets is currently our only window of opportunity in discovering the nature of the individual planets themselves.

[1:3:56] When a planet passes in front of a star, it is simple to know that the intensity of the light emitting from the star will reduce infinitesimally.

[1:3:57] This infinitesimal change is measured and can tell us certain facts about the planet, but this information is of an extremely limited nature and in reality, tells us very little about the detailed naturity of the planet.

[1:3:58] This demonstrates a huge complication in our technologies of discovery and exploration, though from this fear not, for the time will come when a mind immense shall be born and reshape and advance our understanding.

[1:3:59] What we all must fear is a world concerned only of itself; a world ignorant of the world in which it exists and is dependent upon; a world that refuses to allow its children the opportunity to excel in their Cosmosis; that is what we must fear for if such a world persists, then forever we will be bound to its regressivity.

—

[1:3:60] Looking at the system in which a planet is inhabited by our civilisation, the medium in which its functions operate may not be so immediately clear to the masses

despite its relative simplicity in comparison to other areas of cosmic contemplation and study.

[1:3:61] It is another intrinsic quality of The Cosmos that every entity that does exist within it, does so in a plane of sorts; a planar of a homaloidal nature; a flat surface fluxed by gravitational potentials.

[1:3:62] This surface on which planets, stars, galaxies, and all other celestial entities exist is the planetoplane, and such like The Earth is perched upon it, creating a kind of invisible undercurve, the size of which depends on the gravitation of the celestial object upon it.

[1:3:63] The planetoplane is one of those few encompassing components of The Cosmical System with only two main exemptions; the oblivionic tears and whether its existence continues on beyond the current size of The Cosmos.

[1:3:64] The planetoplane forms the basis of the entire cosmical system and it is upon which our world, our lives, and our entire existence has formed and is established.

[1:3:65] If the planetoplane were to collapse, then we would see the end of The Cosmos as we know it now.

—

[1:3:66] The orbitality of a celestial entity follows its functional course, but a perturbation highlights a deviation in the orbit of a celestial entity, typically due to the overwhelming gravitation of another celestial.

[1:3:67] These perturbatory deviations do not represent an influence of The Chaos as would perhaps be immediately presumed, but instead, they are of a cosmical nature for their purposes, existences, and origins can all be known and defined to and by The Cosmos.

—

[1:3:68] The apsis of an orbit relates also to the apsides of the mind, and how we are to think and perceive and learn if we are to strive towards progressivity.

[1:3:69] The mind works along the greatest of extremities of the world around us, such that the decisions and thoughts it generates may be so distant from one another; this is the diversity of the mind.

[1:3:70] The apsides of the mind circumgyrate the centrality; the beating heart of all existence; that is the soul, the spirit, the unicity of the person; the divinity within all ourselves.

[1:3:71] It is the nature of the apsis that neither end shall ever meet for the oppositisms of an entity cannot ever do so if the cosmical system is followed properly.

[1:3:72] The part of the apsis with the shortest radii to the centrality reflects the ideas that are closest to whom you are, or whom you were destined to be.

[1:3:73] The length of the apsidal radii forms one of the fundamental elements of The Cosmos itself in that the apsis connects together both ends of the orbitality.

[1:3:74] Throughout our lives, our mind's orbit will move along its course and pass through each apsis; the key to fulfilment in life is knowing when to latch onto the ideas closest to the centrality and when to let go of those that are furthest away.

[1:3:75] Gaining knowledge of Cosmosis will allow All to perceive this with clarity in the hope of attaining a better life; one in which you not only help yourself, but you also help to progress the world.

[1:3:76] This is the purpose of the apsis; to show the naturity of Peripheral Thoughts, and their counterparts of Central Thoughts, as well as the naturity of the two extreme points of orbitality.

[1:3:77] Apsides serve primarily in cosmical terms, but also in a personal context and will teach those whom need it about the nature of what is central and what is peripheral to their lives in a way that remains uniquely individual to them and their own applications.

[1:3:78] It must be noted, however, that in this context, to be peripheral does not mean to suggest a reduction in importance; it is purely relating to the extent to which something is closest to our true selves; our own centralities.

[1:3:79] A peripheral thought may be far from who we are, or whom we are destined to be, but it may be necessary in our lives to push us towards our centrality.

—

[1:3:80] A cosmical process you will have witnessed countless times is that of Acronicality.

[1:3:81] This is the rising or the setting a celestial entity; the sunrise and the sunset; a common everyday occurrence, but the importance of which has been lost to most of the world.

[1:3:82] The acronical process has structured our days and our nights; our societies and our histories; our evolutions and our existences.

[1:3:83] There is much to be said for the influence of the acronical rising and setting of the star upon which we depend.

[1:3:84] Further afield into The Cosmos, the acronical process is seen in the most distant of stars for when the night sky is dark and clear, stars in our galaxy and beyond, rise and appear in our vision of the cosmical viewscape.

[1:3:85] The acronical setting of our star opens up our eyes to The Cosmos; it allows us to see what cannot be seen due to the light of life on which we too depend entirely.

[1:3:86] Finally, to note the dependency of our lives upon just one function in The Cosmical System; if the acronical process did not occur, we would either have to live in perpetual light, or perpetual darkness and no life at all would that be.

[1:3:87] The greatest irony of humanity is our dependence upon that which we are so ignorant of; that which, if it was taken away right now, most of us wouldn't know what had disappeared, we would only know of the consequences of its absence and our sudden inability to reap the benefits from its existence.

[1:3:88] Many peoples of this world have spent their lives here thinking of ways to create order, system, and new rulers while the original, true, and divine orders, systems, and rulers have been here long before their manufactured and ultimately inferior counterparts and is it these originals that Astronism dedicates itself to the study and focus of henceforth.

[1:3:89] It must now be time for peoples to think on what is truly giving them life, structuring their days, and feeding their thoughts; it is The Cosmos, the greatest of all systems; it always has been and always will be for that is its purpose and meaning and nature; it is from this very notion and belief that the Astronist/Astronic philosophical tradition is born and is structured upon.

[1:3:90] The acronicalities of celestial entities are just one type of cosmical function on which our whole existence depends; think on what you, as an organic being, are dependent upon to live, to breath, to think, and your answer will always return to the cosmical functions for it is true that we are their descendants.

—

[1:3:91] The part of the apsis closest to the centrality is the perihelion; the point of orbitality nearest to the star around which it circumgyrates.

[1:3:92] Reaching the perihelion doesn't necessarily mean the celestial in question is destroyed due to the heat; a perihelion of a celestial entity may still be far enough away for it to be a world of solid ice.

[1:3:93] It could be said that the perihelion is, in abstract terms, the closest we can reach to the best versions of ourselves.

[1:3:94] It could be said that the perihelion is, in cosmical terms, the closest a celestial can reach to the star which it is supported by and which it is dependent upon for the entirety of its existence.

[1:3:95] Perhaps reaching the perihelia is the highest purpose; the greatest achievement; the most important of functions of the orbitality?

[1:3:96] This is much like our own lives and desires; we aim to reach the greatest, the truest, the most superior version of ourselves, and that is part of the nature of being human.

[1:3:97] This is a quality humanity shares with its cosmical ancestors who also aim to reach their maturities in many such ways as in size, in proximity to their depender, and in fulfilling their functions within The Cosmical System.

—

[1:3:98] The function of an entity describes its most fundamental purpose, usages, relevancy, and role in the wider system; it is thus logical to suggest that celestial entities should be named according to the cosmical function upon which they operate.

[1:3:99] In the aid of this, a new system of celestial naming shall be founded within Astronism called The System of Velorum.

[1:3:100] The newfound Veloric system shall name all types of celestial entities according to their functionality, appearance, and proximity to other named celestials.

[1:3:101] All Velorial names, whether of existence already, or totally new words, are chosen based on the entity in question and it alone; all Velorial names must be cosmocentric in their nature.

—

[1:3:102] In a binary star system, two centralities orbit one another; it is a common mistake to presume that all other solar systems are like our own with only one centrality around which the planets orbit.

[1:3:103] That is one of the many contradictories of the words spoken by those of ignorance for they say no other system is as ours in that life exists here, yet they do not understand notions showing them that other systems are diverse from our own.

[1:3:104] This is The Cosmos; everything is unique in its own way and every system existing within it exists with certain cosmical functions, but the contents of which will differ greatly.

[1:3:105] The apastron is the point in a binary system in which the two centralities are the furthest away they can be from one another; the Apastronal Aphelion.

[1:3:106] The binary system of cosmical order is evermore fascinating for those who choose to advance their Cosmosis, as it is the singular system doubled in complexity.

[1:3:107] As a mindful philosopher of cosmical wonderment, one must be to be able to fully comprehend such a system, but it can be done with fair ease.

[1:3:108] The speeds of the stars are distorted when they cross close to one another, but the point at which they are furthest away, the apastron, demonstrates something remarkable to relate to ourselves.

[1:3:109] In a cosmical system, if planets are our thoughts and stars are our soul then the apastron demonstrates the point at which our soul, the very core of what makes us who we are, is furthest from each of itself; a soul in bipolarity with itself.

[1:3:110] Remove time from the equation and this is a soul forever parted, and no matter how close it may reach its counterpart, it will never merge.

[1:3:111] This is not physically true of course for many of the binary systems in The Cosmos will one day merge with one another, in turn forming a new centrality, a centrality reborn of the surviving parts from its past existence.

—

[1:3:112] The part of the orbitality furthest from the star is named the aphelion; the part in the orbit furthest from ourselves; furthest from the source of life; furthest from a centre directly Divine.

[1:3:113] The aphelionic point in the cosmical system demonstrates not only the furthest position in the orbitality, but also the coldest, and the darkest point in the planetary orbit.

[1:3:114] Relative to ourselves, our human minds, we move close to, and later, further away from, our true selves and it is this cycle that continuously reoccurs throughout our lives, until our last breath; this demonstrates another example of how we as humans exist as microcosms of the cosmic pattern and order; when we think in this cosmocentric way, no longer is it a stretch to say that we are cosmical in our psychology.

[1:3:115] It tends to be the goal of the youth to find themselves in the world, yet what they do not understand is they already have themselves in the ideas, the thoughts, and the feelings from which originate within them.

[1:3:116] If you are looking for purpose, look toward the things created directly Divine and know and accept your small place in The Cosmos, but also, the opportunity given to you to change the world in which you reside.

[1:3:117] The products of humanity will not lead to the fulfilment of your life's purpose; only products directly Divine or of a cosmical nature can truly provide you with wonderment that is long-lasting, meaningful, and wholly.

[1:3:118] The importance of knowing one's own aphelion must be stressed as equally as important as knowing one's own perihelion; to know what isn't oneself is a step closer to knowing who one truly is.

[1:3:119] The forming similarities between cosmical order and human natural order should not be of surprise; as aforementioned, we are descendants of The Cosmos and like we share qualities of our ancestors, we too, share qualities with The Cosmos.

—

[1:3:120] It is one of the fundamental natures of cosmical order that for one entity to exist, the exact opposite must also.

[1:3:121] This is the same for the apsides of an orbit, of which the opposite is the apoapsis; the median of the orbit; the points at neither furthest nor nearest to the star.

[1:3:122] For in the mind also, the extremities of thoughts exist as do the most moderate and median, as typically so in equal measure.

[1:3:123] The nature of the apoapsides in orbitality is that one side's trajectory faces toward the aphelion, and the other, the perihelion.

[1:3:124] Perhaps this suggests also the nature of medianity itself; at the midpoint there are two options of trajectory to one extreme or the other, therefore does it remain the true nature of the median that its eventuality is an extremity?

[1:3:125] This expresses the distinct motionalty of the median and its profound inability to resist sliding into extremity.

[1:3:126] As it is the nature of our minds to hold medianic thoughts, it is the nature, too, of the cosmical system to have medianity throughout its order.

[1:3:127] The role of medianity in the cosmical system is one of greater importance than immediately realised for the cosmical order is filled with extremities; lightness and darkness; proximity and disproximity; incineration and eternal coldness.

[1:3:128] To witness the rareness of medianity in the form of the apoapsis is refreshing to the mind and the soul relatively, and refreshing for the cosmical system in its functionalities.

—

[1:3:129] As the study of the selenological Cosmos furthers its development, the study of the nature of the apogee is crucial for in the context of the nature of The Moon's orbitality, the apogean point plays a large role.

[1:3:130] The Moon controls much of our lives; again, a celestial entity upon which we are dependent, but to those of ignorance, the immensity of our such dependence should be easier to understand and accept and wonder upon due to the proximity of The Moon to ourselves.

[1:3:131] The Moon, that which we now call our own, holds a very special place in Cosmic Adoration for it was the first contact made between humanity and The Cosmos beyond The Earth itself.

[1:3:132] The landing on The Moon will forever hold immense gravity in our struggle for Humanic Exploration of The Cosmos and it remains a symbol of humanity's first step toward cosmical wonderment and discovery, transcension and widespread cosmosis.

[1:3:133] Such a symbol will forever be remembered in history; not only for its immensity in being a great leap forward, but also in what it means as the first manifestation of the hundreds of years of astronomical groundwork preceding it.

[1:3:134] Though now, it is time, to underpin such a manifestation and all the groundworks conducted previous to it, by the construction and establishment of a philosophy of coherence, direction, and purpose in our lives that is in its core nature, cosmocentric, and herein we speak, of course, of Astronism, officially and originally known as Astronism.

[1:3:135] Finally, the landing on The Moon demonstrated so much more; viewed by hundreds of millions, it brought peoples from all over The Earth, those at war, those in sorrow, and those in oppression, closer together under the banner of The Cosmos, for the love and wonderment of The Cosmos alone and all the possibilities it does hold.

[1:3:136] The world will see this unity more and more if progression is what we seek; progression in cosmical wonderment; progression in cosmical discovery; progression in who we are and who we all hope to be; progression towards our transcension; progression towards mass cosmosis.

[1:3:137] The apogee, like many other parts of the cosmical system, is a reflection of the order of ourselves; our own minds, for the further we are from something, we may not see

the details, but we may see the whole; this is a decision we must make in our own lives; what would we prefer to see; the detail or the whole?

—

[1:3:138] Asteroids are often considered in their natures to be without order, launching themselves through The Cosmos wildly without any sense of direction, and purpose, and holding a destructive power against any entity it were to collide with.

[1:3:139] But there are asteroids of strong cosmicality, in full orderity with a larger celestial entity and these are the apoheleic asteroids, around which a planet they are in full orbit.

[1:3:140] If the ultimate nature of The Cosmos is order and control, then the apoheleic asteroid orbitality is a distinct way in which The Cosmos resolves the destructive, wild, and somewhat chaotic nature of a celestial of its own creation.

—

[1:3:141] As discussed in the lattermentioned centrality on perception, one of the fundamental restrictions about who we all are now is our shared perception of The Cosmos from our infinitesimal place on The Earth.

[1:3:142] To view something that is magnificently larger than oneself is difficult for the greatest of minds, and for the masses, apparently impossible.

[1:3:143] Only through our focus on astronomy, cosmology, philosophy, and technology, will we as a world, a species, a civilisation, be able to widen our perception on what The Cosmos was, is, and will be to us and to itself.

[1:3:144] The subject of the appulse is an example of our current inaptitude to perceive the planets of The Cosmos; the worlds like our own that are presently invisible to us.

[1:3:145] Behold the stars and our Sun itself; how bright, and how brilliant in all ways it is, but attempt to really see it and blind you it will.

[1:3:146] The Sun is both our supporter and our destroyer, and for that, we must always respect its dominion over All of us.

[1:3:147] In the face of something with such a directly Divine nature, it is difficult to see anything else, especially when turning our vision towards distant stars.

[1:3:148] To see a planet positioned in front a star is presently our only way of knowing to confirm the planet's existence at all, but perceiving any larger details of said planet is impossible.

[1:3:149] Nothing is impossible with the right amount of thought, time, and technology applied to it, but impossibility is an undeniable fact of our current astronomical and technological capabilities.

[1:3:150] We are blind to that which we exist within; such a saddening fact, but true still, though it is prophesied here and now that this shall not continue for much longer.

[1:3:151] If we have been destined as a species to have been blind to The Cosmos for the majority of our existence up to now then that is the will of creation, but it is in our destiny's future to explore and fulfil the wonderments of The Cosmos as prophesied so by the Astronist/Astronist/Astronic philosophical tradition.

—

[1:3:152] Much of the cosmical system cannot be seen to us now as we know, but we must accept that some of its functions will also never be seen to us for invisible they are to the eye.

[1:3:153] In Cosmosis, we must not only see with our eyes, but also our minds, for imagining propositions of the cosmical system is just as important for us with our narrow sights as is the struggle for greater technologies to see with our eyes.

[1:3:154] As is lattermentioned in the nature of rotality, it is one of the most fundamental functions of celestial entities to rotate on a particular axis during their lifespan.

[1:3:155] The Axis of Rotation is an example of an invisible line around which a celestial entity spins, but it is the motional nature of celestials in their dynamicity that should be studied upon.

[1:3:156] Our inability to see something doesn't question its own very existence, such as air, and gravity, and helium and many other forces and gases in the cosmical system.

[1:3:157] Around the Axis of Rotation, The Earth spins, and despite its invisibility to us, its role in the cosmical order is immense for without the structure it provides our world and all others, we wouldn't exist for The Chaos would rule and our world and all others would rotate wildly, or stop eternally.

[1:3:158] In this, it is important to note the continuous, yet transient, nature of the cosmical system; it is not the nature of The Cosmos to be intermittent; the cosmical order begins and ends with no intervals until the moment the stars collapse, and the planets rotate no longer.

[1:3:159] Think on the cosmical system which existed before you and shall certainly exist after, and appreciate that if it were to collapse, you would have no power to stop it no matter the consequences for your own existentiality.

[1:3:160] The Systemics of our time is the study of The Cosmos in its true form; a well-ordered, controlled, and fully functioning system, of which the inner workings perhaps we will never know, but are too, intrinsic to knowing ourselves as human beings and our natures, and functions, and purposes within The Cosmos itself.

[1:3:161] If you look at all types of cosmical systems in every corner of The Cosmos, you will see that their sizes, structures, and functions all share an order that is unique to themselves, yet in parallel, shared with all else in The Cosmos.

[1:3:162] This is the distinction between the natures of The Cosmos and The Chaos; the former constitutes order and the latter does not.

[1:3:163] The cosmical system is structured as such that distances between celestials are perfect, their functions upon which they operate are perfect, and their naturities are perfect as they remain directly Divine.

[1:3:164] Even the ends of the celestials are perfect despite their violent naturities for to be part of the cosmical system is to have an ultimatum for that constitutes order; beginning and end; that is the cosmic nature.

[1:3:165] Not only is our cosmical wonderment restricted from our current geocentric culture, but our economics are also.

[1:3:166] All the world has ever been up to now has been restricted by its oneness, its loneliness in The Cosmos, for explored not have we the wider view of that in which our planet resides.

[1:3:167] Our lack of exploratories has only limited our abilities to expand our systems, our ways of life, our businesses, and our economies and the ways in which they function.

[1:3:168] Everything needs space to breath, and on The Earth, we are seeing the impacts of our human greed for more space, more money, and more people to work.

[1:3:169] We cannot go on like this, but who has suggested any alternative; we cannot halt our progressions for the sake of having not enough room; we must do as no other generations have done in such environments and look toward The Cosmos, for it is the only place of viability to resolve our issue of space; if we no longer have space in our home, we move to a larger home fit for our needs and this principle is no different in the context of humanity.

[1:3:170] The philosophers of us must first imagine what could be when we venture beyond our current world; the possibilities for resourcing, economics, entrepreneurship, technology, and countless other aspects.

[1:3:171] We must then galvanise the greatest generation of engineers to materialise the imaginations of the greatest of thinkers; these groups naturally work in symbioticity with one another.

[1:3:172] A range of new principles, philosophies, and systems of economic, law, business, and financial organisation shall rise to suit the spacial environment and the new worlds and territories beyond our own into which we will enter and civilise.

[1:3:173] These new systems will fall under a newfound subject of learning titled Astronomics.

—

[1:3:174] As witnessed beforehand, the cosmical system holds not only singular structures and functions, but also those binary in structure and function.

[1:3:175] Binaricity in a cosmical system, although a common structure in The Cosmos, is of course twice as complex as that of a singular structure.

[1:3:176] The naturity of binary functions in a cosmical system are such that they must work in coherence with one another, in perfect chronology, symmetry, and conjuncture.

[1:3:177] Without such awarenesses of each other celestial's functionalities, the binary cosmical system would not achieve operation; in anything with a nature of binarity, there must be mutual cooperation and mutual benefit as is the nature of anything involving two entities.

[1:3:178] In any binary cosmical system, the chances of celestial collision would logically be higher, and in the immature periods of the cosmical system's lifespan, there were huge and violent collisions, the scales of which transcend beyond our comprehensions.

[1:3:179] However, during the mature age of a cosmical system, the orbitalities of all the celestials and the binary stars themselves are perfectly ordered in speed, size, gravitation, and rotation so that they are not in danger of collision.

[1:3:180] The philosophical study of binary systems and the binarities of celestials will open up more segments of study in the questions of naturity, motionality, maturity, and rotality, and shall henceforth be known as Binarics.

[1:3:181] Not only do binarities exist in the cosmical orders, but like most other cosmical elements, they exist within ourselves too.

[1:3:182] In our minds, we all have felt split from time to time; divided in the face of a decision typically.

[1:3:183] It is the ultimate nature of binarity in both ourselves and The Cosmos that one of the two triumphs, though not in any type of victory, but in the core nature of what it means to be binary.

[1:3:184] Two binary stars, though cooperative, are in opposition to one another; this is the same for all other binarities, such as the two options we come across in the face of a decision, one must prevail.

[1:3:185] In the binary cosmical system, the two stars may merge into one, typically the larger of the two stars will overwhelm the smaller, but it is the nature of binarity that one eventually triumphs over the other to which it is in opposition.

[1:3:186] Not only do binarities exist in star systems, but in galactical systems too; it is the nature of such galactical binarities to merge with one another as they enter further maturity and as the two central oblivions begin to attract towards each other.

[1:3:187] Again, it is the nature of binarity that gravitational attraction forces them to become as one as it seems all cosmicalities do in the end.

[1:3:188] Perhaps it is the destiny of all that are two, to become one, both in ourselves and our lives, and in The Cosmos, as typical binarities don't interrelate with ultimation; a key nature of ultimation is its oneness.

[1:3:189] Binarity, too, exists in pulsaric systems as it does in galactical and star systems and such a spectacular phenomena of cosmical wonderment that is to imagine.

[1:3:190] To think that a pulsar, of which already an elegant nature it possesses, could be doubled in its cosmical beauty is overwhelming to the mind.

[1:3:191] The force of gravity compacts the cores of these stars down to such small and dense points and around which wisps of radiation are emitted like spider legs stretching in and out without end.

[1:3:192] There would be no way to imagine both the horrors caused by these pulsars by their radiations in parallel to their immense beauties.

[1:3:193] It is the obvious nature of binarity to be twice all that is a singularity, but not so immediately comprehended are the inevitable consequences both in complexity of the cosmical system, and in relation to ourselves, the complexity of the decisions we must make in our lives.

[1:3:194] It is perhaps misjudged of explosions that they are agents of The Chaos, but as aforementioned, cosmical violence in the form of destructions, explosions, and eruptions can be the most ordered and cosmical of all occurrences.

[1:3:195] This is much like the boloidal meteor explosions which enter the atmosphere at striking speeds and are destroyed by our protector, the bubble within which we live, that which again we are dependent upon, but too, we so easily forget; The Earth's atmosphere.

[1:3:196] Bolides and their natures and purposes are perhaps one of the greatest of examples of our vulnerability without our atmosphere.

[1:3:197] Perhaps they are exemplars of The Cosmos attempting to remind us of the world beyond our own, which too, we tend to easily forget down here in our own little lives, the little comfortable bubbles in which we exist.

[1:3:198] Bolidic meteors could so easily destroy us and it is that everlooming fact which we all need to remind ourselves of, and should be the primary reason for us to explore and civilise other worlds beyond our own.

[1:3:199] Our vulnerability in a Cosmos so full of dangers is a constant threat to our civilisation, our history, all that we have built so far; nobody wants to see everything we have done be lost to The Cosmos forever if we aren't ever prudent enough to protect ourselves and who we are.

[1:3:200] The inner workings of the ways in which celestial entities function is to be called celestiology, and discusses the philosophical aspects of the functions of such celestials.

[1:3:201] The ways in which celestial entities do function are different depending upon the way in which they are structured.

[1:3:202] Stars do not function as planets do, and galaxies do not function as stars do, and the phenomenons of pulsars, supernovae, and quasars do not function as any other, or each other forevermore.

[1:3:203] The Sun, not Our Sun, for it does not belong to us moreover we belong to it for that which supports, protectors, and upon which one depends is the superior; the sustainer; the enabler of who we are today.

[1:3:204] The Sun, for it is gas in its structure, does not hold the same rotality as The Earth for its equator spins faster than its poles.

[1:3:205] All the functionalities of The Earth and The Solar System are extensions of the functionality of The Sun.

[1:3:206] The Sun is All we are, have been, and always will be for we are intrinsically and extrinsically dependent upon The Sun.

[1:3:207] In the context of functionality, the dependent celestial is that which is dependent upon another, and the independent celestial is that which is dependent upon no other in an isolated system.

[1:3:208] The Sun is such that The Earth is dependent upon it as we know, but The Sun's radiance is such that not only is every celestial in the system depend upon it, but every celestial rotates around it, in wonderment and worship.

[1:3:209] The Sun's function is the breath of life; all light in the system holds its origins in The Sun, from The Sun alltime.

[1:3:210] If it is the function of The Sun to dictate to the planets then it is the function of the planets and celestials to be ordered to for around which The Sun they do rotate like subjects of a ruler; a ruler's dominion leading its celestial citizens.

[1:3:211] It is the function, the role of the planets of the system to obey their master; the star around which they rotate and upon which they depend.

[1:3:212] It isn't what The Sun does for us; it is what we do for The Sun, for our entire lives are bound to its celestial will, within the limitations of the functions of its time.

[1:3:213] Not without the nature of wonderment can we discuss the mechanics of celestials for wonderment is the driving force of the human spirit in all cosmical affairs, and this is true for all peoples of all times and nations as they peer up at the stars.

[1:3:214] It is the nature of celestial mechanics that the slightest push, the smallest touch can send echoes of consequences throughout space and time through matter and mind.

[1:3:215] The destruction of one forms the creation of another; a rebirth here causes a death elsewhere because for time we are all but waves of the cosmic ocean; forever moving; forever changing, and that is the nature of celestial mechanics.

[1:3:216] It must be pressed of true wonderment the second nature of celestial mechanics; how the functions of one do and have created many, and vastly many more.

[1:3:217] Every leaf of every tree, every heart of every body, every mind of every soul has come in our history from One; that which we rotate around; that which holds a certain Divine nature.

[1:3:218] Too, every moment in every time; every matter in every space; every possibility in every dimension comes from One; that which from all originates; a point and an idea of infiniteness in every possible and impossible direction.

[1:3:219] If it is indeed the nature of all things to originate and ultimate to One then what be of Oneness for everything that which exists, there must be a predecessor, leading us to the nature of The Divine and what it means to be beyond existence and to achieve total independence.

[1:3:220] As the planets do rotate, the stars in turn rejuvenate, and for longer than our minds will live, will this order withstand.

[1:3:221] The mechanics of the celestials are not just mentioned here, but are infused with all insentations of this philosophy, and all other works of cosmocentricity.

[1:3:222] The functions of the celestials are the microcosms of the functions of The Cosmos in full motion.

[1:3:223] Within such design there exists an order; a distinct way of things and it is the way of this order which we must attempt to understand if we are to know anything about which we exist for we are behind in which we know.

—

[1:3:224] The Cosmos shares its space, time and structure with the galaxies; The Sun shares its heat and light with The Earth; The Earth shares its natural beauties with humanity; this is the nature of the reciprocity of The Cosmos.

[1:3:225] One must study the reciprocity of The Cosmos in reciprology to learn furthermore of the naturity of The Cosmos.

[1:3:226] It is the symbiotic nature of The Cosmos that is at the core of its reciprocity.

[1:3:227] Much like in our lives, we do and we receive in return; much like in our minds, we think and we are rewarded with ideas in return.

[1:3:228] As The Universe was created, the existence of The Cosmos formed in return in perfect reciprocity to The Big Bang, thus confirming that reciprocity is not only existent in the cosmical nature, but also in the universal nature.

[1:3:229] It is the equal and opposite reactions of The Universe which have formed all existence for The Divine's creation caused creation, The Universe's structure caused The Cosmos, and The Cosmos's order caused all celestials.

[1:3:230] It is therefore the nature of reciprocity to be intrinsically connected to that of causation, though the distinction between the two must be made.

[1:3:231] Reciprocity is that which holds a symbiotic function from that which creates, and causation is not necessarily a result of a symbiotic function, but a result of an action that may not cause a symbiotic consequence from that which caused it.

[1:3:232] It is the reciprological study relating to humanity's symbiotic relation to The Earth that is the most perfect of microcosms for understanding the nature of reciprocity.

[1:3:233] In isolation, humanity's existence on The Earth is of direct reciprocity of the The Earth's ability to sustain such a complex species; if not for The Earth then humanity would not exist in The Solar System, but if not for humanity, The Earth would not be as unique as it is today.

[1:3:234] When revelling within the wonderments of cosmocentricity, we must not forget the importance of humanity's place and purpose relative to ourselves for until we find other forms of life in The Cosmos, we are until then alone relative to our own narrow perspective and knowledge, but it is important to state that we shall continue to retain our uniqueness as a species and civilisation even when we do find life on others planets for such life will hold its own evolutionary journey and its uniqueness as a result.

—

[1:3:235] If it is The Earth that is part of The Cosmos then what be its quiddity?

[1:3:236] If it is the nature of celestials to share resemblance in structure and function then what are the quidditative qualities of such entities?

[1:3:237] The quiddity of The Earth is its suitability for life; the quiddity of The Sun is its immensity in energy, light, and heat; and the quiddity of The Moon is its powers of gravitation toward The Earth.

[1:3:238] It is the nature of quiddity; distinctness; cosmical identity that each and every celestial holds some uniqueness relative to itself, but too, as the nature of The Cosmos prevails, shares the majority of its orders and systems with out celestials.

[1:3:239] Quiddity of celestials relates to cosmical identity; that which makes a celestial unique relative to itself, but quiddity also relates to that which is the essential naturity of the celestial; not just its nature but the essential qualities structuring what it is.

[1:3:240] Another nature of quiddity is its diversity in element; in function, yes, but also in appearance, purpose, structure, and causality.

—

[1:3:241] Much like the harmonies of tone in music, there are such harmonies in orbital functions in the form of resonance.

[1:3:242] The resonancy of planetary entities in their orbits is one of the most wondermented functions of The Cosmos.

[1:3:243] The most resonant of orbitalities reveals itself in the alignments of moons rotating around their centralities.

[1:3:244] Resonancy is one of the most Divine revelations of order and system in The Cosmos for their perfection in functionality and structure can only rarely be matched by the resonancies of larger celestials.

[1:3:245] The most fundamental naturity of resonance is the symbioticity intrinsic to the subjects of which the resonant system is structured within, around, and upon.

[1:3:246] Time, too, is another of the fundamentalities of resonance in The Cosmos for it is the element that which allows the resonance to form in its perfect function.

[1:3:247] It is true to say in fact that without time's bounds, resonancy would not occur in The Cosmos for the order and system it imparts would be lost.

[1:3:248] Not only is time a fundamentality to orbital resonance, but too, is the single primary; the centrality around which the resonant subjects do rotate.

[1:3:249] One could argue that the entirety of The Cosmos is in resonancy both with itself and The Universe; this suggestion would be true, but in resonancy, it reveals a quiddity greater still than other celestials.

[1:3:250] Wonderment of the order in the cosmical systems one must, but in resonancy, we speak of something even greater than order; we speak of perfection in symmetry, appearance, structure, function, and purpose.

[1:3:251] And as cosmical a celestial may be, if not in resonance, then it does not remain perfect by definition.

[1:3:252] Mistake not, however, resonancy with divinity for a fool's path you take, but see resonancy for what it is; a flawless cosmical model; a exemplar of the fruits of The Cosmos and the boundless omnicreativity of The Divine.

—

[1:3:253] The direction towards which the planets of the cosmical system progress can be diverse, though it isn't hard to define the particular orderity in which the celestials do locomote.

[1:3:254] There is a normalcy in the cosmical system; a particular routine of celestial affairs distinct from of its orderity.

[1:3:255] The prograde is this such normalcy in whatever it may be relative to the system's order such that the normalcy in the system in which The Earth is present may be opposite to the normalcy in another system.

[1:3:256] It is the progradial direction that dictates west to east, and although not all the planets in our system follow the normalcy, the majority do and that is what constitutes its establishment as the routine of the celestials.

[1:3:257] It must be clear now that The Cosmos acts in such a way of vastness and complexity that normalcy is relative to the subject at hand, and although there is consistency in the order in The Cosmos, the routine in which such orderity is conducted can vary widely.

[1:3:258] If the prograde is the normal locomotion in which the planets are directed by the orderity of The Cosmos, then the retrograde is the abnormal locomotion in which the planets are directed, still by the orderity of The Cosmos.

[1:3:259] It is the retrogradial direction that dictates east to west and represents no influence of Chaos in the system, but instead, an untypical orderity for there is still order in that which may not be common to a system.

[1:3:260] With the limitations on the knowledge we have, the retrograde may transform before our eyes and in our minds into the prograde, as is the nature of abnormality; it can soon become normality relative to the mind upon which it is categorised.

[1:3:261] The prograde and retrograde may represent normality and abnormality respectively in the orderity of the cosmical system, but even greater is their purpose in reminding us that The Cosmos works not in conformity to a singular functionality, but a diverse range of orderities.

[1:3:262] That in which The Cosmos exists is The Universe, and its vastness, complexity, and most importantly, diversity, represents one of the core and most fundamental components of its naturity; that of ultimate heterogeneity.

[1:3:263] We can look towards and venerate both the progradial and retrogradial locomotions for their importance in showing us one of the most significant naturities of The Cosmos.

[1:3:264] Relative to our narrow visions, the ability of The Cosmos to be All and to become All for its vastness and complexity and diversity is so that it could be All things in All ways to us, but this potentiality remains unreachable to us still.

[1:3:265] The orbitality of a celestial is its rotation around that which supports it entirely, and it is the orbitality that forms the essential structure of the functionality of the celestial.

[1:3:266] The point of completion in the orbitality is named the revolution; this completion marks the end of one orbitality and its transition into another.

[1:3:267] This highlights the cyclical nature of The Cosmos; its tendency of recurrence in both the largest and smallest of functions.

[1:3:268] When we speak of revolution, we think of the anthropocentric violent, and explosive overturning of governments.

[1:3:269] Cosmocentrically, revolution is not just an occurrence in orbitality, but an intrinsic naturity of function in The Cosmos for revolutions occurs in the births and deaths of stars, the cosmic years of galaxies, and the rotations of pulsars, quasars, and magnetars.

[1:3:270] Broadened in its cosmical definition, revolution means completion in general, but in relation to ourselves, revolution is that upon which we thrive.

[1:3:271] Completion, wholeness, achievement; these are the qualities of our lives we cherish most and those which we most want to attain for the serenity of our beingness.

[1:3:272] We strive toward that which we desire, as do the celestials do in their cosmical orderity, and in this way, our natures are similar for we are the way of the stars.

[1:3:273] Synchrony in The Cosmos is that which describes celestials in their identical positions and natures relative to Time.

[1:3:274] If, like All else in The Cosmos, synchronies are bound to the nature of Time, then it is the function of synchrony to reflect Time's ability to control for Time is the greatest of allies of orderity in The Cosmos.

[1:3:275] Not only is synchronocity found in the proper alignment of celestials within the orderity of Time, but it is found in the locomotions, developments, and occurrences according to their proper functions.

[1:3:276] The proper functions of celestials are found in the execution of their functionalities according to their purposes and when done in simultaneity, this results in synchrony.

[1:3:277] The study of the sychronies of celestials is hereby considered as synchronics, or synchronology.

[1:3:278] The synchronies of ourselves are perhaps not in our natures, and that is a difference between who we are and who The Cosmos is.

[1:3:279] In our current capacities, we are rare to find our achievement of simultaneous action, but in The Cosmos, simultaneity in function is accomplished seamlessly and continuously; this is the ability of synchrony in the cosmical system.

—

[1:3:280] If we are to progress to that which we are destined in The Cosmos then we are to worship that which The Cosmos is to The Universe, and will be to ourselves.

[1:3:281] The ancestors of ourselves had the most wondrous of minds and they were more blind to The Cosmos than we are now.

[1:3:282] Although, perhaps not, perhaps in their lack of sight, they saw true vision of The Cosmos, for what it truly is; the greatest integrant of wonderment.

[1:3:283] Our ancestors peered up at the stars and wondered all what could be and wrote down and held discussions for hours on end of the possibilities of The Cosmos, the world beyond the world in which they lived, but of which they knew so little.

[1:3:284] Not only did the study of the stars form their entertainment and education, but it was central to their lives; it was their ultimate goal to achieve knowledge of The Beyond.

[1:3:285] What a glorious time that must have been, to witness the minds of the early astronomers in full wonderment of The Cosmos and its possibilities and consequences it would perform unto them; this is the time and mentality that I, as Cometan, intend to inspire the world to reprogress to through the establishment of Astronism.

[1:3:286] To compare that world to our's today is saddening; we may have progressed in many things, but in the wonderment of The Cosmos, we have stagnated; even regressed.

[1:3:287] See not its primarity in schools; see not its wonderment in the eyes of the peoples of the world; see not the construction of cosmical buildings; see not its centrality in the societies and communities in which we live.

[1:3:288] It has been turned into something perceived to be niche, vague, obscure; a subject only those with the greatest of minds can understand, but this is a lie.

[1:3:289] Don't you see, our ancestors, our great and wise ancestors, did not understand a fraction of what we know now, but they believed; they had hope; they held wonderment in their vision, hearts, minds, and souls.

[1:3:290] Towards that we as Astronists must strive to save our civilisation from further regression is a regression of the cosmical wonderment and vision felt by ancient societies in the context of our modern capabilities.

[1:3:291] In the absence of that which overshadowed The Cosmos, we have lost all meaning to ourselves and have tried to put such meaning into materials, though we know in our spirits that these are the actions of desperation and foolishness.

[1:3:292] As a world, we are lost; we believe we know, but we don't; we believe we have found the answers to life, but we haven't.

[1:3:293] Those only the closest to the truth were the ancestors whom found a fondness for gazing up at the starry nights; we must finish what they began, for those whom have struggled to prove the centrality of The Cosmos through the centuries; for ourselves, and for our futures.

[1:3:294] In taking this course of action, we move closer to whom we are; that from which we have lost.

[1:3:295] But it is there nonetheless; it must be reawakened for it is within us All; it is not a religious belief; it is not a faith; it is part of us; intrinsic to that which we are, and we cannot escape the nature of ourselves and who we are destined to be.

[1:3:296] Beyond ourselves our vision must turn for the way starward is the only way for us All.

[1:3:297] Towards that which we sail upon are the waves of The Cosmos, and to discover that which we are is to hold wonderment of The Cosmos in our visions, our hearts, our minds, and our spirits.

[1:3:298] As the worlds are destined to collide; ours and the much larger world of The Cosmos shall meet, and interact, and form a new world; one of technology, philosophy, cosmology, science, and astronomy, but above All; the people's wonderment of The Cosmos.

[1:3:299] As our ancestors began, we must go beyond in the worship of the stars in astrolatry.

[1:3:300] The astrolatrists will be those of the most wonderment of the The Cosmos and the world in return, and will serve the most enlightened of us All, as our ancestors intended and were on the path towards.

[1:3:301] Astrolatrim will lead us to the new heights of ourselves; closer to whom we are; whom we know from deep within that we ought to be.

[1:3:302] To those whom tell you that the worship of the stars is heresy, you cannot be contrary to that which you are at heart, in your spirit, and to that which you are destined.

[1:3:303] The stars are from which we came and we must now return unto them as destined so.

[1:3:304] The astrolater is the person you must seek wisdom from for they know of what is the future and they know of The Cosmos more than any other.

[1:3:305] What we must not forget is the ability of the masses to understand who they are and who they know they will be in The Cosmos for in Sabaism, the wonderment of such is the centrality.

[1:3:306] Not without are we the knowledge for within our minds and spirits it grows stronger as we progress further towards our cosmic destiny.

[1:3:307] Applaud those systems and persons whom have given their lives to the make the world what it is, but now as forever, we must take our natural course towards The Beyond.

[1:3:308] We are now worlds apart from where we ought to be though with Time and a course set right and a mentality focused, leaps between worlds can turn to single steps.

[1:3:309] All we have is Time here and we must use what little Time we have to progress our people to realise their next stage and on and on; you are just a cog in the wheel of destiny; the beauty is that you can choose the role you play and the size of the cog you wish to be, or it will be chosen for you by destiny itself or the functions and flows of society.

[1:3:310] Centre our minds, spirits, visions, and hearts on the stars and they will show you the way in wonderment; closer to whom you are, and whom The Divine has intended us All to be.

—

[1:3:311] Since the times our peoples had first peered up to the stars, we have known in our hearts that those which our eyes gazed upon are entities with natures beyond our own; they are to us of nature heavenly; a nature of direct divinity.

[1:3:312] In the functions of the stars, we see their divinity for they are beyond what we are now in a way that is metaphysical; it is within their very natures and beingnesses.

[1:3:313] We share only a minute amount of what we see in the celestials, though that is plenty, for our bodies and minds and spirits could take no more.

[1:3:314] To see the celestials in their way of divinity is to understand the nature of astrogeny; the study of the evolution of celestials in their heavenly forms; the vista upon which you take in this study is as no other for no other sees the celestials in such close proximity to The Divine.

[1:3:315] The astrogenic view is that which is formed by the belief in the celestials as heavenly bodies; celestials are of a world and naturity that is ultimately and divinely beyond our own, and even beyond The Cosmos itself, that in which they exist.

[1:3:316] That which is Divine is that which is heavenly, and an astrogenist would say that the celestials are such; beyond what we are which is cosmical, and toward divinity.

[1:3:317] The greatest of minds can see themselves from the viewpoint of another; in a cosmical context, this is what we must do and what the wondermenters of our times are able to do for we must see and know and accept our place in The Cosmos for what it truly is; a minute cog in a giant wheel which remains larger still than we can perhaps ever know.

—

[1:3:318] The lights we see now, and have seen since our Time began, seem not to move to us for their Time's are on much larger scales than our own, and so a year to us, is a second to them.

[1:3:319] The study of the stars is as ancient as our first ideas, and such that we know more now of the natures of stars does not mean we cannot see them from the perspective of wonderment, adoration, and devotion as our ancestors did.

[1:3:320] Even to our minds and eyes of greater knowledge now, we still see the stars above in fixed positions in the sky, but this is merely our own defect for the perspective we have of The Cosmos.

[1:3:321] In this knowledge, we chart our course of study towards astrognosy, which centres itself on the study of the stars strictly from a geologic perspective.

[1:3:322] Despite this, there is still much to be learned from such a study for the greater knowledge we possess of the way in which the stars appear to us on any planet on which we inhabit, is of greater usage to us as we begin our voyage beyond this one world.

[1:3:323] We must know of the ways in which the stars shift depending upon the planet from which we view them; if this lead to the wonderment of our ancestors, then this too, shall contribute to the wonderment of us now and those whom succeed us.

—

[1:3:324] In the study of the functions of The Cosmos, it is easy to forget the study of the naturity of that structure and system which binds billions of star systems together; the galaxy.

[1:3:325] One of the most wondrous elements of The Cosmos, the galaxies span time, and space, and matter like no other celestial, and like no other celestial, their entire superstructures are made up of and upon the collation of a number of celestial forms.

[1:3:326] They are the celestial of the celestials, and are the greatest of exemplars of how the cosmical system binds its subjects together into even larger structures, the sizes of which are incomprehensible to even the greatest of minds.

[1:3:327] But what we can and will do is train our minds, the minds of the masses, to imagine what such cosmical superstructures could look like, and one day, our successors will see such structures for themselves and truly understood how they function.

[1:3:328] The greatest of All things are those in the minds of humanity; constructible; destructible; and most prominent of All; imaginable.

[1:3:329] The naturity of the functions of The Cosmos are their structures, and the galaxies of The Cosmos offer such structure to the star systems within them, for without such structure, the star systems would just simply be floating within space and time without order, structure, or purpose.

[1:3:330] It is the naturity of the functionality of The Cosmos that those which exist within it are existing within larger structures; humanity within The Earth; The Earth within The Solar System; the star systems within The Milky Way; The Milky Way within The Local Group; The Local Group within the Laniakea Hypercluster, and such hyperclusters within The Known Universe.

[1:3:331] The nature of such for galaxies in particular is known as the metagalaxy; the entire system of galaxies in The Cosmos as studied collectively, in the relations with, connections to, and interactions between the galaxies in the system.

[1:3:332] It could be said that the star systems within galaxies are microcosms of that in which they exist for the immensities of galaxies are even dwarfed by the size of the superclusters and hyperclusters within which they do reside.

[1:3:333] The metagalactic outlook is that which views the galaxies of The Cosmos in their entirety which is important for the development of wider Cosmic Philosophy for if we know the nature of the structure of that which our own galaxy resides within, then we are better positioned to gain knowledge of the wider structure of The Cosmos in The Universe.

[1:3:334] With the introspective technologies we now possess to map the galaxies of The Cosmos in The Universe, we have discovered that our galaxy is on the far edge of an outer arm of a hypercluster of galaxies, appellation pre-Astronistally as Laniakea.

[1:3:335] Seeing our galaxy, that in which we reside, and to us, is so grand, so vast, and so worthy of our total wonderment, in a hypercluster cluster that shows The Milky Way to be as The Earth is within The Milky Way, is more mind-shattering than ever.

[1:3:336] We see that in which we exist, and have existed, and will always exist within without intergalactic travel, to be so small and insignificant further demonstrates the immensity, vastity, and overall naturity of The Cosmos in The Universe.

[1:3:337] To be within the outskirts of The Milky Way, but then to see and know and understand that The Milky Way itself is only within the furthest reaches of this hypercluster plows me over still, and forever will metagalactical study be one that is both wondrous, but too, terrifying in simultaneity.

[1:3:338] The nature of the metagalactic superstructure which, to our current knowledge, forms the foundations of The Cosmos is that of The Cosmic Web.

[1:3:339] A plane of interconnected superclusters, typically paralleled on either side by voids unimaginable in size; then clusters and superclusters are form the branches that create The Metagalactic Plane.

[1:3:340] Upon this plane, the galaxies exist atop the filaments, firmaments, and filigrees of the cosmical cusps in complete Divine perfection, beyond all our comprehension, though venerable for our grand wonderment to be accorded upon them.

—

[1:3:341] The functionalities of the celestials are bound to the purposes and structures upon which they are constructed for without these two elemental components, function would have no reason, or direction.

[1:3:342] The study of such is Uranometry and in this, we discover that the nature of function is dictated by its purpose and by the structure of the cosmical system into which it is to be positioned.

[1:3:343] The function of moons is their orbitality around which the primarity is the planet; the function of a planet is their orbitality around which the primarity is the star; the function is twofold for it has both an orbitality around which the primarity is the galaxy, and its second function is to give vitality to the cosmical system it holds as its dominion.

[1:3:344] The uranomic outlook is that which understands that The Cosmos is bound to these such principles of functionality under which purpose and structure is founded.

The Future of the World

[1:4:1] Progression of us All must be at the centre of our beings; our minds; our hearts; our spirits; we must be the progression we want for the world, or else, whom else will lead the world to the next stage of our Time?

[1:4:2] When you think about the future, what do you want for the world, and for the peoples of this world; for the children whom are so young and naive and full of possibility; for those souls whom have yet to be born?

[1:4:3] Do not let the world go down a path if you know the right path for the world, for the world will enter that path despite all the warnings of danger, all the cries of evil, and all the signals of immorality; that is unless you stand for the world's interests alone, and not your own.

[1:4:4] A few questions often wondered; where are we heading? Where is our destination? What is our next great endeavour? And what and whom will lead us through that endeavour to reach our intended destination?

[1:4:5] If we are to stay on one world as some of ignorance believe we should, then are we destined to live the same lives of those whom have lived before us?

[1:4:6] At the Time of this writing, the world is lost in decision for we stand at a great crossroads; one choice is that of opportunity and possibility, and the other is of sameness and stagnancy.

[1:4:7] We have to choose the path on which we wish to go down; such a decision must be made in the goodness of our hearts, with the best of intentions for we must find the most Divine parts of ourselves and place that figuratively into that decision we make, for unless so, then we haven't bound ourselves to that decision.

[1:4:8] You and all others, even those of ignorance, know deep in your hearts the path we must take and they know that if we take the opposite path, the one of stagnancy, then it is simply an inevitability that we will eventually return to the same crossroads.

[1:4:9] Let us make the right decision now for the betterment of the peoples of this world with good and Divine intention in our hearts, minds, souls, and visions for All.

[1:4:10] We want and need and are destined to have a future in which we return to that which we originated from; the stars; The Cosmos; our true home.

[1:4:11] As we have explored this world, let us explore the world beyond that which we reside, and let not the troubles of the world, or those without wonderment, hold us back from that mission which we know we must undertake as destined so.

[1:4:12] We must want for the world what The Divine has destined for each of us and that is to explore the world beyond our world; that which The Divine has created; The Cosmos.

[1:4:13] If we are to lead our world, we must tell the world in which way we intend to lead it.

[1:4:14] The world in which we now live has placed the materials of our own creation at the centre of our lives, and how wrong we are for doing this.

[1:4:15] We cannot place that which we have created ourselves at the centre of our lives and expect to feel fulfilled, or even the slightest hopeful that we will achieve wonderment.

[1:4:16] We must reorientate our lives toward that which we are destined so; toward centring our lives on that which are of Divine creation; the celestials; The Cosmos; this is the cosmocentric worldview and this is the single-most important champion of Astronism.

[1:4:17] The right path of the crossroads hails not our anthropocentrics, or geocentrics, but praises all those whom live for a cosmocentric world; a world in which The Cosmos, and its laudation is at the centre of all our lives.

[1:4:18] This book, the Omnidoxy, does not proclaim as other's have; it does not proclaim any connection to divinity for this book itself is anthropocentric, but the words within are hopefully cosmocentric enough to let the world see the way we must go.

[1:4:19] We speak of this way as the way we must go, but really, it is the way we are naturally to go; the way in which it has been intended that we go rather than a way that is forced or unnatural to us.

[1:4:20] Look at the naturity of The Cosmos in The Universe; all that exists returns to that which created it, and now we must do the same in reciprocation for our existence, and such glorious new worlds there will be for us, and they are for us.

[1:4:21] The Universe was never created, but remains sustained by The Divine; The Universe isn't sustained for us for such a notion is held by the highest of ignorants, but we have been allow to evolve on our planet in The Cosmos for some reason; that reason is so that we can develop and explore the world in which we evolved and we have done just that, but now we come to the decision aforementioned; crossroads of cosmic proportion stand before us; we may either choose the cosmocentric path or the geocentric path.

[1:4:22] Such a grand decision we face in our times; some will say we are not ready; others will say we will never be ready; others just don't want to accept that the world and all our lives have to change, but the will of The Cosmos is strong and ultimate for it is Divine beyond us, and against that, our efforts of stagnancy and unchange are pointless.

[1:4:23] Do not be afraid for the decision we will make as The Divine leads us in All do, by Cosmical Will and by our own destinies.

[1:4:24] We will make that decision and we will return to that which we originated and such a grand reunion it will be; a cosmic union; a complete of our destined cosmosis.

[1:4:25] The greatest of minds have pondered it; our ancestors of the desert and the forests and the tundras have wondered it; but it is we whom have been given such a great gift to live in this Time of decision that will change the course of our history like no other decision before.

[1:4:26] We have to make the right decision, in the right, proper, and just way, and though we may not know what awaits us in The World Beyond, we do know that these words and all the wonderments of all the peoples past and present, and all the opportunities of the lives of those in the future will be with us, and they will propel us forward, toward that which we are destined so.

[1:4:27] It is true of the peoples of the current Time that we do not think enough on the right elements; on those which were here long before us and all that we have created.

[1:4:28] It is saddening to the see the world as it is today; almost totally ignorant of The World Beyond because we are too close up against our own world to understand our insignificancy.

[1:4:29] For the wondermentors and the wondermentrixes of our Time, this is eternally unnerving that the world is so ignorant of the world in which we are resided within and dependent upon.

[1:4:30] Back to the question of our future world; what do we want for the people now and the people in the future for we dictate the quality, the wonderment, and the knowledge in their lives more than we do anyone else now.

[1:4:31] Think on those whom have yet to exist and think about the spacefaring culture across a multitude of worlds that you could help create for them; think about the ways in which you could make their lives better.

[1:4:32] You may ask, for what reason am I to do this? And that is the problem with the world in which we live; for every deed we expect a reward; we are all guilty of this.

[1:4:33] In the future, for a cosmocentric future, we do not explore The Cosmos for ourselves; we don't learn all we can for ourselves; we don't strain ourselves, break ourselves, and torment ourselves with worry for ourselves; we do it for the world; for the betterment of our people.

[1:4:34] So, as they ask for what reason are you to make the world better, you may ask yourself that question in reverse; why not am I to make the world better for the people whom will share it after me?

[1:4:35] It's not about giving up your life; it's about making your life mean something for the world and for others of the future while it is in existence.

[1:4:36] And finally, we turn to progression; the centralmost principle of All; we need to take that right path on the crossroads before us now in the name of progression; for posterity.

The Centrality of Big History

[1:5:1] When we look at history from an Astronist focus, we must study it in its entirety for the cosmical history is far greater, larger, and more complex than our own histories ever could be.

[1:5:2] The philosophy of history should be known in its proper means, from that which all else originated; from the creation of The Cosmos; not just the simplicity of our anthropocentric history.

[1:5:3] What we must also know about the history of The Cosmos is that it is ultimately unknown for if we do know of the entirety of the history of The Cosmos, we will know of all its mysteries.

[1:5:4] The central principle to the history of The Cosmos is that all that does exist within The Cosmos, originated as a consequence of The Big Bang.

[1:5:5] And it is a fact of the philosophy of history that we must accept our small place within it for as we turn our attentions to a cosmocentric view of history, we realise the immensities of the times, matters, and events of The Cosmos that each of our very existences are dependent upon.

[1:5:6] If the entirety of the life of The Cosmos was compressed into just one hour, the length of humanity's existence would take up less than a millisecond.

[1:5:7] It is not the place of this to discuss the individual events that established the history of The Cosmos, and the centrality subsequent history of ourselves, but its purpose stands in teaching us the perspective we must take when discussing history, its nature, and its tendencies to be distorted.

[1:5:8] It is no shock to us now when we learn that this planet that we call our own; our home, was once too the home to beasts unimaginable.

[1:5:9] On God's green Earth would we never have imagined such ginormous killing machines, and no minds before science had ever imagined such beasts could ever have existed before the first humans evolved; there are the dinosaurs.

[1:5:10] But what is shocking to us All still, and frightening for the possibility of its reoccurrence, is the way in which the dinosaurs were killed and how such huge, powerful, and ghastly creatures ended up as just bones under the ground.

[1:5:11] We and all life on The Earth is subject to The Will of The Cosmos beyond us and its true authority was demonstrated when a asteroid, six miles across, was travelling through the vast regions of space with its trajectory directed towards The Earth, to which it reached and collided into.

[1:5:12] The impact and the consequences of such an event are beyond any nightmare any of us could ever dream.

[1:5:13] The destruction, the suffering, the death; an extermination of life on The Earth and after such a blinding light came, a smothering darkness followed for many years to come.

[1:5:14] Perhaps it was better that the beasts of The Earth did not know what would extinguish them; perhaps it's always better to not know the horrors of what's to come; what we are to face.

[1:5:15] But like All other things in The Cosmos, such follow a linearity, and in this way, the extinction of the dinosaurs created just as much as it destroyed.

[1:5:16] You would be a fool to say that the dinosaurs should have lived on, for how would we ourselves have become the top of the food chain; how would we have controlled such beasts as we have done so to everything else on The Earth.

[1:5:17] But let us not get comfortable in our own dominance for we would be greater fools still to suggest we have any control over that which is beyond us; The Cosmos, and it will administer whatever destiny it wishes upon us as it did so to those beasts.

[1:5:18] But perhaps that's All we are right now; simply waiting for our own destruction, yet never knowing when, and in what manner or measure, it will come.

[1:5:19] All that has occurred in the history of The Cosmos has lead to our own evolved existence and histories as a direct cause; the ultimate causation in The Cosmos is The Big Bang.

[1:5:20] It is true; without history we are ignorant of the futures to come for it is the nature of The Cosmos to repeat, and to reciprocate, and to return to its origination.

[1:5:21] Therefore, we must think of history in terms of what the future can be, for in our current time, the future can be what it is we make of it.

[1:5:22] The history and the future are two sides of the same coin and in the present time, we exist on the edge between what has been and what is yet to be.

[1:5:23] What we have in our history is what we have in our future for All we have experienced and All that we gained in knowledge is All that we carry with us to our futures.

[1:5:24] We now turn to the progressions of humanity stated within The Grand Centrality; the journey that is the will of The Cosmos that is laid out before us All is to explore The

Cosmos and be provided the minds and measure with which we are to achieve such an endeavour.

[1:5:25] We are here to make our own histories under The Will and destiny of The Cosmos.

The Centrality of Gravitation (Gravitology)

[1:6:1] There are the unknowns and the knowns in The Cosmos, and then there are the certainties in The Cosmos; they are few and far between, but one of these certainties is the role of the force of gravity.

[1:6:2] The nature of air on The Earth is its distribution in every crevice, and corner, in every open space it can find; gravity is similar in its naturity, but on a much grander scale for it exists in, on, and around every progeny and phenomena in The Cosmos at vastly varying levels; gravity is the figurative cog in the cosmic engine.

[1:6:3] The philosophy of gravity explores the philosophical nature, the purpose, and the fundamentality of the existence of gravity in The Cosmos in The Universe.

[1:6:4] The arrangement of the cosmical plane is such that the planets, the stars, and all the other cosmical phenomena exist in one place, and although they follow courses of orbit and rotation, they exist in their designated locations according to the cosmical orderity.

[1:6:5] Gravity is unique in its existence in The Cosmos when compared to all other phenomena; it is the one true element of The Cosmos that underpins all cosmical orderity; gravity is the cosmical orderity.

[1:6:6] It is clear now that gravity plays a fundamental role in the structure of the cosmical plane as it is the fourth element of The Cosmos after time, space, and matter.

[1:6:7] Gravity is the force that holds, bounds, and intertwines every firmament of The Cosmos together; if The Cosmos is to be controlled, then gravity is the best candidate to do so for gravity exists in all aspects of cosmical orderity.

[1:6:8] In our small world, gravity is one of the weakest forces we encounter, yet relative to the workings of people and society, the weakest of us should never be underestimated and that is how gravity earns its name as The Dark Horse of existence; The Dark Horse of The Cosmos.

[1:6:9] Gravity is solely responsible, in the cosmical orderity, for the creation of the phenomena of The Cosmos; the rotalities and orbitalities of the planets, stars, and galaxies; the organisation of matter to create the filaments and firmaments of The Cosmos and what we know and wonderment them to be.

[1:6:10] Gravity is responsible for the order of The Cosmos; time and gravity are interlocked in functionality both from our perspective and from the perspective of The Cosmos in The Universe.

[1:6:11] Orbitality is predicated on the extent to which gravity's pull demands; gravity is the fundamental instrument of The Cosmos for everything of order is coupled with gravity in dyad.

[1:6:12] The premise of symbiocity lays in dyadicity; two elements working together for mutual benefit; this is the nature between gravity and every other phenomena in The Cosmos.

[1:6:13] If space is the paper, then gravity is the glue, so time is the edges, and matter is spread out across the page.

[1:6:14] Throughout the cosmical plane exists dips into which celestials lock in place and the extent to which spacetime is bent underneath such, is a mixture of the size of mass and the extent of gravity's pull on the celestial in question.

[1:6:15] If the nature of gravity is simply attraction between masses, then could the force of gravity not be the one and true influencer of The Cosmos; Creator of The Cosmos?

[1:6:16] If we are made by that which we are bound to, then such a notion stands true with regard to gravity and its role in The Cosmos.

[1:6:17] As the gravity of The Great Attractor in The Metagalaxy applies a force unimaginable; a force that is powerful enough to move hundreds of millions of galaxies towards one point of attraction, then we must ask those of ignorance, is there no higher purpose for gravity?

[1:6:18] Is there no way that gravity itself is Life Force; ironies are plentiful in our lives, but the greatest of all would be to discover that a force that surrounds us always and forever, is that which also created us and The Cosmos to become what we are.

[1:6:19] And as we All search for answers relative to ourselves, the real truth surrounds, binds, and entwines us together with each other, The Earth, and The Cosmos in The Universe.

[1:6:20] Gravity's mysteries are the greatest of All the cosmical wonderments; but again, we must be prepared to witness and understand such secrets before they are revealed to us through discovery.

[1:6:21] We may believe that we are ready to know now, but it is clear we are not; the people of this world are still too concerned with the actions of others, the actions of themselves, and the importance of themselves in The Cosmos to properly appreciate the truth, even if it stood before them at dawn tomorrow.

[1:6:22] An education must place first before such mysteries are discovered; a cultural revolution of global proportions; if we are to know of such grand secrets of gravity and

The Cosmos at all, then we must change ourselves; our ways; our minds; towards the wonderment of The Cosmos rather than the wonderment of ourselves.

[1:6:23] Like the diversity of the flora and fauna of The Earth, gravity itself too, comes in varying degrees of intensity and functionality.

[1:6:24] Much like the orderity of The Cosmos, the patterns, specifically the concentricity of the cosmical plane, are structured and reigned under gravity's will.

[1:6:25] There are such places in The Cosmos that experience a degree of gravity's power like no place else; these phenomena exist amongst the quasars, the pulsars, and the black holes of The Cosmos; gravity's invisible beauty abounds in these cosmical spectacles of wonderment.

[1:6:26] The cyclical inflation and deflation of The Cosmos reveals the extent of gravity's hold over The Cosmos, and from that which space and time and matter's abundance is governed, for every element of The Cosmos is finite as if not, it would be of Divine naturity.

[1:6:27] There are certain gravitational phenomenas in The Cosmos whose gravities extend beyond that which any other element of The Cosmos could fathom; these gravitational extremities are known as being in a state of supergravity.

[1:6:28] Not only does gravity surround us from within and without, but too, binds us to The Cosmos and forms our place within it; penetrating us and attracting us to The Earth on which we stand, gravity extends itself physically throughout our very being.

[1:6:29] The nature of attraction is the nature of gravity; if we are to narrow down that which we depend upon then we focus our attentions to gravity, of which our very physiology is wholly reliant upon.

[1:6:30] Do not mistake gravity's dyadicity with duality; of which gravity has none; gravity's only property is to attract, never repel.

[1:6:31] But in its attraction, it could alternatively be seen as detracting from the celestials located in opposition.

[1:6:32] Gravity increases in relativity to the size of the existing mass; more mass means more gravity; and in this way too, the greater the existence, the greater the gravity; gravity is in direct conjunction to the extent of the existence of an entity.

[1:6:33] Interrelated to gravity is the speed at which one must travel to escape its influence; the velocity at which one must go in order to escape gravity's pull demonstrates gravity's capacity; the end of the extent to which gravity may control.

[1:6:34] This fact, and this fact only, makes gravity one of the most championed elements of The Cosmos for it can be controlled and wills itself to be controlled by the instruments existing around and encompassing it.

[1:6:35] Though it is the weakest of the four fundamental forces, gravity is the most important to cosmical orderity, as its very core nature is to affix together in their proper places, the elements of The Cosmos.

[1:6:36] The extent of gravity's attraction may be infinite in theory, but it is the nature of gravity as a subject of cosmical orderity that such infinity is ultimately controlled and limited by The Cosmos and to allow such infinite gravitational attraction to occur, would still be within cosmical laws in order for it to occur without collapse.

[1:6:37] Another reality of gravitation is its immunity to differentiation as all matter is gravitated at the same rate despite its weight; this standardisation of cosmical orderity is one of commonplace, though of knowledge little.

[1:6:38] Gravity is described as the fabric embodiment of The Cosmos, and without such, the cosmical plane and its orderity, pattern, and structure would collapse; we must think on this when we speak of gravity, always.

[1:6:39] With gravity as the distorter of spacetime, we begin to form in our minds the true picture of what The Cosmos really is; a paradigm of interconnecting forces, all serving interrelational roles in a dimension of order, pattern, structure, and purpose.

[1:6:40] If mass warps the spacetime encompassing it, then it is the role of gravity to be the intercorrelation between the celestials and the fabric of spacetime; in this way, gravity is the intermediary of The Cosmos, existing between all things of physicality; the bonding agent in the cosmical orderity, without which such orderity could not exist.

[1:6:41] At present, we must study The Cosmos in either gravitational terms, or in quantum terms, for currently, we do not have the knowledge required to understand the reason why these two studies of structure of The Cosmos cannot coincide with one another.

[1:6:42] If we are to discover why the study of the most minute parts of the physicality of The Cosmos cannot interact with the most important of the forces of the cosmical orderity, then we are to focus our efforts on priming the minds of the young to challenge these questions and more.

[1:6:43] If you are looking for the answer to the question of the purpose of The Grand Centrality within which the Omnidoxy resides, then you have witnessed it firsthand; it is here to show the young, the old, the rich, and the poor that we all have a right to wonderment; that we all have our place to contribute to the world and beyond.

[1:6:44] To that which we contribute is most important, and what we must focus on is the appreciation of the civilisation we have developed, but too, and that which we must in moving forward, focus our minds, of the spellbinding articles existent amongst the stars.

[1:6:45] We have become accustomed to perceiving The Cosmos in geometric terms of centrality, yet what is more poignant to the structure of The Cosmos is the barycentre; the centre of gravity's pull.

[1:6:46] Barycentricity considers the centre of gravity to be the true cosmical perception of what the centre of something is to be known and considered as.

[1:6:47] Upon studying and understanding the nature of The Cosmos, it becomes apparent soon that The Cosmos is most reliant upon gravity, and if you notice most of the celestials, the planets, the stars, the star systems, the galaxies, and far beyond even those; each of these in its own unique way is dependent upon, and controlled by, gravity's influence.

[1:6:48] All the barycentric idea is based upon is the size, the intensity, and the influence of gravitational pull, but the contemplation of barycentricity by its own nature is not just such.

[1:6:49] Barycentricity harbours at the centre of its principle the fundamentalities of what structures The Cosmos; the forms of gravity and its distribution amongst, between, and within all celestials.

[1:6:50] If we are to change our minds from a geocentric perception, we must do so with regard to the way in which we measure, perceive, and describe The Cosmos; we must do this according to that which plays one of the largest roles within its fundamental construction; gravity, of course, is the key.

[1:6:51] The Gravicentric Cosmos is The Cosmos perceived through the lens of gravity alone; it places all importance; all imperativity; all immersions of The Cosmos towards the centrality of gravity's role within the cosmical plane.

[1:6:52] We understand the gravicentre to be the centre of gravity's pull, but we also understand the gravicentre to be the centre of ourselves; that which holds us to The Earth, and that which without, we would not be.

[1:6:53] As we look for whom we are in this noise-ridden world, we must remember the force that has developed and continues to envelop The Cosmos.

[1:6:54] Gravicentricity in its core teaches all peoples to never forget the imperative role which gravity plays in cosmical orderity, and too, demonstrates gravity's direct divinity as the key to understand The Cosmos in The Universe.

[1:6:55] When we speak of the centre, the centrality, we speak of that which is closest to the naturity of something; that which is closest to our naturities as humans.

[1:6:56] Throughout our lives, we take courses of action which point us centrifugal, and those which point us centripetal, and that is the way of our lives for we are driven by our emotions, ambitions, and the influences of the world.

[1:6:57] But in centrifugality, and centripetality as the direct parallel, an emphasis is positioned upon The Cosmos in relation to ourselves for we are the ancestors of it.

[1:6:58] Centrifugality comprises that when a celestial moves away in its orbit from around which it rotates, it is simply taking a course for which it intends to return to the centre.

[1:6:59] Relative to ourselves, we often must travel on paths which may lead us away from that which we are, or that which we hope to be, but in the hope that in the end, we will return to our centrality.

[1:6:60] Moving away from whom we are is often seen as a negative step, but whom we are is simply a perception we, and the world, create of ourselves, but is constantly in motionality.

[1:6:61] In order to understand the centrifugalities of our lives, and wider existence, we must understand motionality, and the motionality of ourselves.

[1:6:62] Throughout our lives, we move both physically, mentally, and intellectually towards new horizons to find ourselves.

[1:6:63] With whom we are, where which we are, and how that we are consist of differences through the times of our lives; the only constant is ourselves, and The Cosmos of course.

[1:6:64] So just as the celestials move in their orbits away from their centres in accordance with motionality, so do ourselves; this journey is triadic; it is lifelong, well-trodden, and unstoppable.

[1:6:65] In direct symmetry to centrifugalism stands centripetalism; the movement towards the centre; the steps taken to near ourselves to that which we are, or that which we hope to be.

[1:6:66] After the aphelionic turn in the orbitality of the celestials comes the centripetal half of the orbital course; that in which the celestial returns to its axis after concluding its journey in the furthestmost regions of its orbitality.

[1:6:67] In cosmical kinship, we are much like the celestials for we too travel on paths alone, and we too venture to the furthestmost regions of ourselves, before we do find who we are and who we wish to be to the world.

[1:6:68] The greatest feeling we can hope to experience is that of centripetality; the movement of ourselves towards our centres; the warming of our hearts towards peoples, philosophies, and places we most wish to locate ourselves around; it is the belief of Astronism that The Cosmos, our union with it and our wonderment and enknowledge of it, that will lead to our achievement of centripetality.

[1:6:69] However, the first and only reality of this cycle is its constant motionality; meaning that when we reach centrality from the centripetal path, we must, by The Will of The Cosmos, then move away on the centrifugal path once again as do the celestials, and as they have done since the establishment of the cosmical orderity for we see that we act just as the celestials do.

[1:6:70] The time at which we spend at the centre; what we do, say, be there is of our own accord, but the time will come for the cycle to force oneself on new paths.

[1:6:71] This is the nature of the centrifugal and centripetal paradigm and it cannot be changed for in doing so, you would change cosmical nature.

[1:6:72] To resist this cycle only resorts one's mind and heart to suffering for to change the cosmical nature is an ability reserved only for its creator and that, we certainly aren't.

[1:6:73] Fear not the path of centrifugalism for to move away from ourselves is just as important as nearer ourselves, and in fact, the further move away we become, the greatest warmth we shall feel when we return.

[1:6:74] The centripetalities shape themselves in various ways throughout our lives, but it is the responsibility and purpose of the Omnidoxy to detail the centrifugality of the current world, and the inevitable centripetality that awaits us through the Humanic Exploration of The Cosmos, and of which our collective transcension and individual cosmosis are integral driving forces.

[1:6:75] The nature of peoples is based upon dominance over one another and this has run true through the institutions of faith that we have developed.

[1:6:76] In this battle of dominancy throughout our history, philosophy and its treasures within, have fallen short amongst the tyrannies and totalitarians.

[1:6:77] But now, in our generation of continuously growing knowledge, we return to that which is our true nature; our core; our centrality.

[1:6:78] We return to philosophy as we begin to see The Will of The Cosmos and our destiny within it; to explore, to wonderment, and to experience its elements in trueness, in oneness, and in appreciation of its direct divinity.

[1:6:79] We have reached our own aphelion as a world, and now we must return as in accordance with the cycle of The Cosmos we must keep, and this means joining a new path for the world.

[1:6:80] A path in which society, culture, philosophy, and all peoples are cosmocentric in thought, vision, and ambition; this is our current centripetal path and as aforementioned, we must appreciate the time with which we have as we move towards our true selves again; as we move towards The Cosmos; its study, its wonderment, and its centrality in our lives, our hearts, our minds, and our souls, we will have Astronism to guide us there as the champion of this new and long-lasting age of cosmicality, cosmosis, transcension, cosmic exploration, and discovery.

The Philosophy of The Grand Cosmos

[1:7:1] Look at the world around you now; the smallest grain of sand; the largest ocean; the smoothest leaf of a tree; the highest mountain to climb; this is all part of The Grand Cosmos, as are we; all of humanity.

[1:7:2] The greatest wonderment of The Grand Cosmos is its scope; from the atoms within that we cannot see to the largest of galaxies one in which we reside but cannot see also; for one's mind to jump from something so microscopic to something so unbelievably vast is the greatest of wonderments one can experience of the ways and naturities of The Cosmos.

[1:7:3] In an order so unique, yet intrinsic to all that exists, and such beauties of magnificent size and colour and function, The Grand Cosmos is The Cosmos in its entirety, and is the greatest subject of wonderment for any individual.

[1:7:4] It is the nature of our perspective of The Cosmos that its size, and scope, and structure is a constantly evolving subject for we whom cannot see it as the whole version of itself, cannot truly know its nature.

[1:7:5] We need only to look up at the night sky and see the stars and the moon to witness the minutest microcosm of The Grand Cosmos for its nature is within all that exist within it in a finite way.

[1:7:6] No one celestial can be as The Grand Cosmos is, though each and every entity of existence possesses an urge to live, to survive, to conduct its functions, and fulfil the purpose of its existence, and these are the qualities we share with The Cosmos.

[1:7:7] Too, the very core nature of The Grand Cosmos cannot be truly known to the perspective on which we take now for if The Grand Cosmos is the entirety of The Cosmos, there will always be an unknown quantity of The Grand Cosmos that we shall never see.

[1:7:8] This isn't saddening; this is the nature of The Cosmos and whether we accept what its nature is or not, it will not change, just as long as we know it; that is all that matters.

[1:7:9] The Cosmos beyond The Cosmos we can see is perhaps more beautiful than we, in our finite minds, could ever possibly imagine, but what we have is The Cosmos we can see, and we should cherish what we have here, now, and forevermore.

[1:7:10] If anywhere we are to go, it will be among the stars for there is from which we came.

[1:7:11] If it is the true nature of all cosmical entities to return to that which they once were, or from which they came, then it is too our nature to return to the stars as destined so.

[1:7:12] The central components of currently existing faiths is their mysticism of the afterlife; what is to become of our bodies, our souls, and our minds after which we perish from The Earth.

[1:7:13] Many a faith throughout the ages have scripted stories of what is to occur to us when we pass from this world, and many such stories have formed the foundations of the faith.

[1:7:14] Some speak of eternal divinity, others of a continual return to our physical selves; but it is that which we tell our children that holds the most sensuality with respect to The Cosmos.

[1:7:15] For time immemorial, we have spoken of those whom have passed on as having risen up to, and now belonging among the stars.

[1:7:16] Such a marvel to be wondermented is this prophecy for it is cosmically centred and true; we do return to that which we originated from.

[1:7:17] We become one with and within The Cosmos; one cannot know in what capacity, or whether we shall meet our creator, the creator of The Cosmos, but All one can know is that we will return to which we originated from and that is all, and much it is.

[1:7:18] If we were to know where we are to go when we pass from The Earth then we would be as The Divine is, and that cannot be possible for under cosmical orderity, we are finite.

[1:7:19] We are as products of The Earth and The Earth The Cosmos, and until our death and perishment, we cannot know, but we can hope that who we are and who we hope to be are left for the generations forthcoming.

[1:7:20] We are as products of The Earth and The Earth The Cosmos, still and when we do depart, we do so by our eternal dissolution; our eternal intertwinement with the elements of The Cosmos for we are the stuff of stars, and that is wherein we shall return and remain.

[1:7:21] We cannot be without that which we are within, and this is true too for The Cosmos and the elements by which it is constructed.

[1:7:22] We must believe of the afterlife that which we feel true in our hearts, and our minds, but to be told to believe such cannot be of truth for to force is to be unnatural.

[1:7:23] To know the truths of The Cosmos, we must look toward the procedures of nature; those which we know are of direct Divinity for they existed before humanity and will exist long after.

[1:7:24] When discussing the articles of immortality, to learn of cosmical truth is to understand the anthropocentric principle wherein humanity is not the centrality of The Cosmos in The Universe, as previously discovered by the greatest thinkers of The Cosmos; the founders of wonderment.

[1:7:25] The principle of anthropocentricity states that humanity is relevant only in relation to humanity itself which will lead to achievements long aspired and dreamed by the greatest of astronomers, but in relation to The Cosmos, we are just one of its many elements.

[1:7:26] To ourselves we are relevant, and we are ourselves, so we must think in this way always, for if not, we will not achieve any measure of cosmical exploration, wonderment, and discovery.

[1:7:27] But on the circumstance of immortality, we cannot take this view for we speak of the fate of all else in The Cosmos in The Universe, and we cannot perceive this through our own lens for we are not the entirety of The Cosmos, and that is something no faith, or opinion can deny.

[1:7:28] Make no mistake of the anthropocentric principle; it is not inhuman in fundamentality, but instead, an embrace of what and whom we truly are in the cosmical orderity.

[1:7:29] It does not exaggerate our presence; it does not distort the cosmical orderity; it projects a view in which humanity is a minute creation within The Cosmos as intended, and rejoices in the abundant discoveries to be championed and treasured by future humanity.

[1:7:30] The anthropocentric principle expounds always the immensity, the grandiosity, and the true direct divinity of The Cosmos in The Universe; its vastity, complexity, and overall mysteriosity.

[1:7:31] Believe what you wish for that is your will and destiny to do so, but know too, that if immortality is true, then most certainly, it is intertwined with the fate, and purpose of The Cosmos.

—

[1:7:32] New words, new ideas, and new systems in which we conduct thought, practice, and method are always evaded by the masses until they too become the normality, until they too become understood and accepted.

[1:7:33] This has stood true and fact for some of the greatest discoveries of human history; heliocentricity, evolution, and palaeontology.

[1:7:34] If the definition of progression is to move ahead with the greatest of minds, then should we not be more open to listening to the manifestations of the minds of our peoples?

[1:7:35] A mind is only great if we nurture it and make it so; without such, it is simply lost in the noise of the world; how many minds have we lost? We say here, and now, no more.

[1:7:36] It would not be surprising if every time we discarded a mind from the world, a wound is inflicted on The Will of The Cosmos.

[1:7:37] Though fear not, for The Cosmos works in such a way that its Will shall be performed no matter the circumstance, and it is true, still, that minds great will return in new abundances when the peoples of the world are ready to accept, understand, and appreciate them for what they truly are; pioneers of thought; champions of progression; heralders of change.

[1:7:38] There is just one point to make on absolutism; All is absolute that is The Cosmos in The Universe, and therefore, All that is said in The Grand Centrality is but an interpretation of such finities.

[1:7:39] Everything in cosmical existence is finite, and therefore, absolute in its naturity for if not, its nature, would consist, of Divine elements, and such cannot be true in cosmical orderity.

[1:7:40] Aforementioned was the acceptance, understanding, and appreciation of the greatest of minds to be in existence as products of The Cosmos; the mental practice and subphilosophy regarding this is hereby named Millettosis / Astronosis.

[1:7:41] And the study of such is Millettosy / Astronosis and a practitioner of such is a Millettosist / Astronosist.

[1:7:42] If we are to achieve the highest of heights in cosmical discovery, we will require the greatest and most diverse of minds imaginable; those greater still than those passed.

[1:7:43] It is the practice of good Millettosis / Astronosis to be able to direct individuals according to their strengths through identification, communication, and swift allocation.

[1:7:44] It is the solemn duty of the phrontisteries of the world and beyond to achieve this in all peoples; the practice of Millettosis is the singlemost important purpose of phrontisteries.

[1:7:45] The greatest of Astronosists / Millettosists nurture the minds of the young to see their futures as equally as their place within the future they envision and it is too, the solemn duty of a Millettosist to work alongside the young to help navigate themselves a meaningful place in the future.

[1:7:46] The key quality of Millettosis is its focality on the individual for in our world with billions and statistics of billions, the individual is always easily forgotten of; the practice of Millettosis vows never to forget the individual.

[1:7:47] Millettosy and its study not only encompasses the learning of the solemn duties of Millettosists, but too, includes the study of the minds which the envisioned future requires in order to achieve it.

[1:7:48] The teachers will teach; the Millettosists will allocate individuals to such teaching in accordance with the skills, the strengths, and the interests of the individual.

[1:7:49] The most important dimension of the role of the Millettosist is their imperativity on meaningfulness; as humans, we require purpose in this world; without such, we are lost, but with such, we are the rulers, and obstacles abound, we will overcome and achieve that which we seek.

—

[1:7:50] Since humans could first learn to read and write and perceive the world, we have wondered what could have made us, The Cosmos, The Universe in all its entirety, complexity, and Divine beauty.

[1:7:51] We may perceive The Divine in two distinct ways; what The Divine is, known as Cataphatics, and what The Divine not, known as Apophatics.

[1:7:52] Neither perceivence is superior to the other for it is equilibrium they strike, but in such that one adds, and the other negates.

[1:7:53] Let us begin with Cataphatics; the first principle is such that we, as humans, as the creations of the creator, cannot ever know the true nature of The Divine.

[1:7:54] In the creation of idols, characteristics, and embodiments of The Divine, we lower what it means to be Divine for we reduce its nature so that we may then understand it.

[1:7:55] We are eternally subordinate to The Divine, or wherever from which we came, and this is an everlasting principle.

[1:7:56] The second principle of Cataphatics expounds such that in the creation of a divine to suit and stimulate our own insecurities is tolerable, yet to bring proclamations that such a stimulator is the actuality, the true manifestation of The Divine, cannot be true, and never will ever be.

[1:7:57] We must begin Cataphatics by understanding what we know for this are All we have, and knowing too, that we do not know All, and that we do not have All, and in this,

we know that our knowledge can never be complete for if this were not, then we would be as The Divine, and that cannot be and only The Divine could ever be all-knowledge.

[1:7:58] Firstly and foremostly, we have The Cosmos in All its wonderment, vastity, and complexity; we then have ourselves as products of such and within ourselves our minds and our hearts.

[1:7:59] We have The Universe in All its unknownness and above all, we have that which created the entirety in whatever form it truly does take.

[1:7:60] We know in certainty that whatever The Divine may be, it created all The Cosmoses and sustains The Universe in its vision and equally, holds the ability to destroy All.

[1:7:61] One aspect we must understand of what divinity is; divinity is both good and evil; light and darkness; creation and destruction; divinity is a totality of independence; All in equal measure for all that does exist, and all that does happen and has happened, is All part of The Universe, and was thus, All in the vision of The Divine as The Universe is sustained.

[1:7:62] You say, well how can our creator be so cruel? Divinity is not emotion, and thus, cannot be compared with such for to lower divinity to a personal level of emotion like is conducted in other religions is to do a disservice to the nature of divinity not to mention the ignorant tradition of anthropomorphising divinity; divinity is All things encompassed; even the worst of things progress us; in fact, such worsts are the greatest signifiers of change for they demonstrate to us the consequences of our mistakes.

[1:7:63] So, The Divine encompasses All, but what is All?

[1:7:64] All encompasses time, space, matter, the forces, and the natures, the purposes, and every possibility in every dimension there possibly can be; The Universe and every cosmos within The Universe to form The Omniverse; The Entirety.

[1:7:65] The Divine, however, is not just All, but All beyond All, and All beyond that still; the point to make in clarity is that The Divine cannot be understood because everything it encompasses is firstly, beyond what we could possibly know, and secondly, beyond everything in infinite measures, and so is immeasurable, but that it also remains independent of all that exists due to its own omnificativity.

[1:7:66] This demonstrates why we cannot attempt to manifest The Divine, for in doing so, we eternally reduce it from its true state; from its true being.

[1:7:67] All we can hope to do is wonderment the extent of The Cosmos we are privileged to see and hope that perhaps, in some dimension, in some time, we would be graced so much as to understand just a fragment of what The Divine is; this is All we can hope for;

in Astronism, it is a principal and fundamental belief that The Cosmos is our one and other connector to The Divine due to The Cosmos's direct divinity, hence the reason for the cosmocentric orientation of Astronism.

[1:7:68] We must too understand that if such insight is never to occur for us, then that is the way and the will of The Divine.

[1:7:69] In faiths come and gone, an emphasis has been placed upon one's audience with The Divine, The Creator; such is neither wrong, nor right, though the key median is that we accept in trueness and clarity that if we were not to have such an audience, then that is the will of The Divine.

[1:7:70] We should not waste what little time we have in The Grand Cosmos worrying about what shall happen to us, but instead, making a mark in The Cosmos as Divinely destined so.

[1:7:71] In direct oppositism, Apophatics explores what The Divine is not in order to decipher what The Divine might be.

[1:7:72] Firstly, we know The Divine not to be of any human creation, nor any such creation resembling humanity, or the traits of humanity; any such is false and cheapens The Divine eternally.

[1:7:73] Secondly, we know The Divine not to be anything of cosmical orderity, universal encompassment, or bound by the physical laws which form The Cosmos in The Universe, for it is the creator of such, and so it cannot be bound by them.

[1:7:74] Our world, as we now All know, is one of countless in The Cosmos, and if you do wish to throughsee Astronism, you will understand that there is a belief in the The Grand Cosmos to house countless worlds of life, as well as those without.

[1:7:75] Our world is one of such with life, and for that we thankful, but what we understand is the principle of anthropincentricity; such means that we firstly cannot be alone yet we retain our unquity, and secondly, we cannot have been in direct Divine contact for this would defy cosmical orderity and our very natures as subcosmic or terrestrial or anthropic beings.

[1:7:76] The Divine is with us in all aspects of us, no doubt, but the proclamations of anthropocentricity to The Divine are indivine in their nature, for they do not respect The Divine as something beyond our comprehension; again, they lower The Divine to suit human needs and insecurities about the truth of our own transient and limited nature.

[1:7:77] Finally and to end Apophatics, The Divine is All we are and All we are not; The Divine is All we know and All know not; The Divine is All in every which way and

beyond, for we are the creations of The Divine, and such means we are eternally inferior and cannot every truly know, see, and believe what The Divine is and that which it is not.

—

[1:7:78] Many faiths and mythologies have spoken of such beings which float between cosmical orderity and some other existence; they are named as spirits.

[1:7:79] Spirituality in humanity has come to collectively describe the deeper thoughts of us; the times we speak and think of that which we are, our purposes, existence, and the nature of being, knowing, and perceiving.

[1:7:80] Instead of spirituality, we must drawn upon philosophy, for philosophy discusses all these questions and more with no deliberation for myths and fakery; all Astronist / Astronic philosophy is based upon what we know and what we could know in the future; not that which we cannot ever know, hence why discussions of the nature of The Divine and The Universe, as realms beyond our knowability, are not provided with as much immediacy and centrality as that which is provided to The Cosmos.

[1:7:81] That is all on spirituality, and its vague collusion into the territories of philosophy.

—

[1:7:82] Cosmical Apologetics is short and clear in both its nature, and purpose, for there are no possible needs for the justification of The Cosmos and its intrinsicity to our nature, purpose, past, and future.

[1:7:83] All whom say otherwise have simply not been taught of The Cosmos, but in them, you should see opportunity; to teach them the wonderments of The Cosmos; to feel pity on them for their lack of knowledge, and in parallel, think of oneself as gifted for the knowledge you possess of the grandities of The Cosmos.

[1:7:84] One final note on apologetics in relation to The Cosmos, take this as a warning; never allow someone to convince you that The Cosmos is not grand and worthy of wonderment for The Cosmos is greater than we ever could dream to be and it is of direct divinity; no more need be said on this take of justification for cosmocentricity presently.

—

[1:7:85] The time in which we live; the time during which the Omnidoxy is written is pivotal for one reason alone; we stand as a world, as a peoples, at a crossroads, on the edge of a spacial future.

[1:7:86] Whether you are believing in destiny, or not, Time you do believe in, and the timing of this writing is just as important as the writing itself.

[1:7:87] We are before The Cosmical Nascency and our place within it; the actions we take now; the philosophies we foundate and those we exhume and rebirth now; the ways in which we educate our youth; each of these and more in all aspects of our lives will result in either our realisation of our place within The Cosmos, or our continued ignorance of such.

[1:7:88] Cannot you not see that the greatest minds of the past have lead us to our discoveries today? It is The Will of The Cosmos and the destiny of us All to continue on this trajectory; the speed at which we do so is up to us.

[1:7:89] I can see what we could be, intertwined with The Cosmos forevermore, and this is why, I must share with the world and All peoples that which I wonderment of The Cosmos for I am under duty to share the elements of my mind.

[1:7:90] A world of nascence is in which we live for we are full of our own potential; that which has become infused within us since the creation of The Cosmos in The Universe.

[1:7:91] Our nascency as peoples and as a world is both our greatest of qualities and our worst of faults for we are eternally trapped in the bounds of our own potentiality if we do not harness it as it has been destined so.

[1:7:92] We must understand, accept, and nurture the nascency of present times; the nascency we bear in respect to The Cosmos; that which we have the grand opportunity before us to grasp and realise the entirety of its potential.

[1:7:93] Let us strive, with The Grand Centrality as our inspiration, or whichever writing you may choose, to lead our peoples and ancestors towards cosmocentricity; towards worlds beyond our own now; towards lives of exploration, discovery, and eventual total wonderment.

[1:7:94] Let us achieve such by first understanding our potential, but then, secondly, by understanding how so easily it may be stripped away from us.

—

[1:7:95] The naturity of the orderity of The Cosmos principling that The Cosmos is standardised in many ways is an important note of fact.

[1:7:96] First comes the concentricity of The Cosmos; in all systems, there are courses of orbit to which planets take; although these may vary in size, and distance, the fundamentality of the orbit remains.

[1:7:97] Then comes the formation of worlds; although the planets and planetoids of The Cosmos are as varied as there are amounts of such, there are standards by which each and

every world follow in accordance with the cosmical orderity, except those within which they do not align with the cosmical orderity, but with The Chaos.

[1:7:98] The functionalities of The Cosmos are largely in standardisation; the orbits take their circuits; the rotations complete their courses; the cosmical creations and destructions happen in ways kindred.

[1:7:99] The Standardisation of The Cosmos demonstrates the cosmical orderity in its highest form of clarity and in such ways the cosmical elements function, so too does this demonstrate the structure, formation and development of The Cosmos in The Universe.

[1:7:100] Why are these standardised functions of The Cosmos the way they are? Perhaps efficiency, perhaps that's the only way in which they could exist, or perhaps an orderity could not be achieved without this functional type.

[1:7:101] The standardisation of the elements of The Cosmos and their functions is in certainty one of the keys to understand the naturity of The Cosmos, as well as its orderity, formation, and its inception.

—

[1:7:102] Those which are infinite in Time cannot be cosmical in nature and orderity, and therefore, can only be either Universal or Divine in nature which are themselves distinguished by dependence and total independence respectively.

[1:7:103] As you know, eternality is infinite time, but if time is a product of measurement, and The Universe remains infinite by its nature, then infinite time cannot be possible due to the inability for time to be measured in such an environment hence demonstrating the inability for time to exist.

[1:7:104] There is time, space, and matter, but the only one of those which is of human construct is Time and to The Universe, is Time even an element to be considered in The Universe? These questions must be asked or else in philosophical terms, we do not speak.

[1:7:105] No type of cosmical element is eternal in nature; Time is finite in The Cosmos, it had a beginning and it shall have an end, however, Time in The Universe is a different integrand.

[1:7:106] In philosophical measures, we speak metaphorically of eternal elements in hyperbolic notions such as eternality as a reflection of Time up to the point at the end of The Cosmos in The Universe, or The Universe in its entirety.

[1:7:107] The nature of eternality is the entirety of Time, but in our perspective, Time is the most unknown of all the elements of The Cosmos for we know not its true role and

purpose in the cosmical orderity, and we know not the extent to which Time has influence over The Cosmos, if at all.

[1:7:108] The concept of eternity is one not of The Cosmos, nor The Chaos, but The Divine, and to explore the nature of The Divine is lattermentioned and aforementioned.

—

[1:7:109] The Grand Cosmos is The Cosmos in all encompassment, in time, in space, in matter, and in dimension through a lens of wonderment.

[1:7:110] The Grand Cosmos is The Cosmos in its mystical form; without such settings forming wonderment, perhaps there would be no wonderment at all.

[1:7:111] The Grand Cosmos is The Cosmos vibrant in colour, vast in scale, and virile in nature, structure, and orderity, and is The Cosmos in idealism; The Cosmos in concentration, in exaggeration in All its aspects.

[1:7:112] The Grand Cosmos is The Cosmos in vast distances and in grand scale, yet too, and in equal measure, The Cosmos in close proximity and in personal interaction.

[1:7:113] The Grand Cosmos is The Cosmos in both a magnified and entire focality; in both one perception and in many.

[1:7:114] The Grand Cosmos is The Cosmos in a perceivence in All its possible dimensions, but too the futures in parallel.

[1:7:115] The Grand Cosmos is The Cosmos in relation to humanity within it, and expounds a grand future of cosmical discovery, exploration, and wonderment.

[1:7:116] Ultimately, The Grand Cosmos relates to the all-encompassing connection between The Cosmos and humanity; the interpersonal relationship between The Cosmos and humanity which, when developed and explored, will lead to both our transcension and to cosmosis.

The Centrality of Wonderment

[1:8:1] The word and concept of wonderment is lattermentioned and aforementioned in the Omnidoxy, but it is in this centrality that we shall explore its splendour, treasures, and why its relevancy to Astronism must be championed.

[1:8:2] Wonderment is one's personal reflection on The Cosmos in The Universe; wonderment is the extent of one's imagination towards The Cosmos; wonderment is the people's collective relationship with, and their entire philosophical connection towards, The Cosmos.

[1:8:3] The most simple, yet perhaps the most rewarding form of wonderment, is the act of looking up at the stars in total awe, admiration, and respect towards The Cosmos in The Universe.

[1:8:4] Wonderment is the driver of all cosmicity; it is the catalyst of all relation toward that which is cosmical; wonderment and The Cosmos are intertwined with humanity at their core.

[1:8:5] The wondermenters of us are those whom see The Cosmos for what it was destined to be seen as; the next frontier of humanity's discoveries; and what a time we have ahead.

[1:8:6] The wondermenters of us are those whom see our future and its potentiality in The Cosmos, and the wondermenters are the dreamers, the envisioners, of us All.

[1:8:7] We depend upon the wondermenters to show the world the way to go; All the greatest of minds in our histories have been wondermenters, but there is now a word to mark their level of envisionment.

[1:8:8] As we return to the practice of wonderment, we explore to where which we shall conduct such a practice.

[1:8:9] The true abstract beauty of wonderment is such that it need not be practiced in any certain building, or in any certain place; one all needs is the stars, even just to imagine the stars.

[1:8:10] If we can experience wonderment for the stars we see in the night sky now, then just think of the wonderments possible if our vision of The Cosmos was widened, for at present, our eyes can only see a fraction of the stars of the galaxy; imagine being amongst the stars and the level and saturation wonderments conducted by those spacefaring across The Cosmos.

[1:8:11] The greatest part of wonderment is its universality; All peoples of All ages from All nations of All worlds can do it; it is All natural for them to do so; it is in the nature of peoples to admire that from which we came.

[1:8:12] Feeling wonderment is the greatest of feelings for it warms and proximates our hearts, and minds, and souls to The Cosmos; the wondermenters are the best of us for they see that which the rest cannot; so go now, look up at the stars, and imagine All the grand treasures beyond and become a wondermenter and perhaps the next great envisioner.

The Cosmic Alchemy (Drentology)

[1:9:1] We speak of The Cosmos, but what is it that we refer to?

[1:9:2] Cosmic Alchemy explores the composite nature of The Cosmos as it is formed, structured, and functioned by a mixture of elements by which it exists, and from which it is created upon.

[1:9:3] If we are to wonderment The Cosmos and if we are to explore it, we must first, and most fundamentally, understand those elements which form it to be what it is.

[1:9:4] In The Cosmic Alchemy, we speak of The Cosmos in its composite parts, rather than its ordered and functioning entirety as is the case for the rest of the Omnidoxy.

[1:9:5] In The Cosmic Alchemy, we take a philosophical approach veiled in wonderment in the exploration of The Cosmos and both the abstracts and the actualities which meet to form it.

—

[1:9:6] We begin with the Philosopher's Cosmos; the foremost and centralmost of all Cosmo-alchemic concepts relating to the most sort after state to which all Cosmo-alchemists strive toward and hope to achieve.

[1:9:7] This is wherein oneself is perceived to be connected to The Cosmos in such a way that the individual understands, respects, and feels a wholeness of wonderment towards The Cosmos, and is wholly advocative towards cosmocentricity.

[1:9:8] It must be said that such a state is rarely achieved, and only the best of wondermenters and alchemists combined in one mind can hope to achieve its treasures.

[1:9:9] The Philosopher's Cosmos is itself composited into three components by which one could hope to achieve it; first through witnessment, secondly through experiment, and thirdly, through discoverment.

[1:9:10] These three elements of The Philosopher's Cosmos lead one to achieve it, yet only in the order lattermentioned; chronology is paramount in The Philosopher's Cosmos, so one cannot conduct discoverment before experiment, or experiment before witnessment and so on.

[1:9:11] There are two perceptions of The Philosopher's Cosmos; the first consisting of a philosopher's, or a thinker's, or a wondermenter's view of The Cosmos, and how in which

they see The Cosmos in its composite parts with the sole purpose of forming The Cosmos in its entirety; known as Entire Philosopher.

[1:9:12] The second consisting of a philosopher's, or a thinker's, or a wondermenter's view of The Cosmos, and how in which they see The Cosmos in its composite parts with the sole purpose of keeping such parts separate from the entirety and thus, viewing The Cosmos only in its composite parts; known as Composite Philosopher.

[1:9:13] The second of these is perhaps the hardest to achieve for we as humans enjoy perceiving The Cosmos in its entirety, or imagining it as a whole, but in the composite philosopher perception, we come across people whom are able to separate every element of The Cosmos in order to study each of their greatnesses in isolation, in detail, and in their separate functions from the wider cosmical orderity.

[1:9:14] The first of the three components of The Philosopher's Cosmos is witnessment; beholding The Cosmos in both physicality and mentality must come before All else, and this is achieved through years of wonderment.

[1:9:15] The second of the three components of The Philosopher's Cosmos is experiment; the recording, the organisation, and the establishment of the ideas sprouted from witnessment encompass this component.

[1:9:16] The third of the three components of The Philosopher's Cosmos is discoverment; the taking of actual steps towards either the exploration of The Cosmos, or the orientation of society towards cosmocentricity through the development of technologies, the implementation of new systems, and the educating of the youth towards our cosmical futures.

[1:9:17] For one to embrace The Philosopher's Cosmos is to ensue themselves into a world of wonderment in totality, and to learn of and experience The Cosmos in a way unique.

—

[1:9:18] We now introduce the Cosmic Philosophical Egg; the one of two main members of The Cosmic Alchemy.

[1:9:19] It is consistent of the shell as representing The Cosmos in its entirety, beyond which only The Universe exists.

[1:9:20] Then, it is consistent of the membrane as representing the lining of The Cosmos to follow it; this is representative of the four fundamentals; time, space, matter and gravity.

[1:9:21] And then, it is consistent of the egg white as representing The Cosmos and all its elements, components, and wonderments in their entireties.

[1:9:22] Finally, it is consistent of the egg yolk as representing The Divine to be at the centre of All existence, and that which without such, nothing else could be as it is and as we know it to be.

[1:9:23] That which we can gain from studying The Cosmic Philosophical Egg is the reliance of The Cosmos on The Universe, and The Universe on The Divine as the quadarchy of existence.

[1:9:24] We may look towards the wisdom infused with The Cosmic Philosophical Egg to help lead ourselves towards better practice of wonderment and a simpler view of The Universe, The Cosmos, and The Divine, and the hierarchy they share.

[1:9:25] From the cosmology of The Cosmic Philosophical Egg, The Divine sustains The Universe to form the limitation that is The Cosmos; The Cosmos, both the child of The Universe, and its parent The Divine.

[1:9:26] The Cosmos is everywhere near and far; The Cosmos would continue on forever if it were not The Universe; The Universe provides The Cosmos with its finity; The Cosmos holds much of form, function, and filament; colour, shape, and scale.

[1:9:27] All beyond the confines of The Cosmic Philosophical Egg is The Chaos; that which seems not to follow any course of orderity.

[1:9:28] The Cosmic Philosophical Egg represents the preserver of life and being in alignment with both cosmical and Divine orderity.

—

[1:9:29] We now introduce The Cosmic Philosophical Tree; the second of the two main elements of The Cosmic Alchemy.

[1:9:30] The Cosmic Philosophical Tree is created to signify the processes of The Cosmos in cosmo-alchemical terms and each of the nine branches of The Cosmic Philosophical Tree represents The Ten Cosmical Elements.

[1:9:31] The Cosmic Philosophical Tree is always depicted as growing amongst The Cosmos, especially upon new worlds, or amongst the most vibrant cosmical filaments as a representation of the Tree's deep interrelation with The Cosmos in The Universe.

[1:9:32] Look towards The Cosmic Philosophical Tree and its subsequent writings for a deeper understanding of The Cosmical Elements and the ways in which they interact separately and wholly with and from within The Cosmos.

[1:9:33] The beauty of The Cosmic Philosophical Tree is its ability to branch out to different areas of The Cosmical Elements; we must know that which forms The Cosmos in order to understand it in order to discover it.

[1:9:34] The Cosmic Philosophical Tree is structured from low to high as follows; chaos, air, fire, water, earth, lightness, darkness, cosmos, universe and Divine.

[1:9:35] The positioning of The Cosmical Elements in this such way is poignant, especially so that The Divine is positioned at the top representing The Overseer role and element, under which All else resides.

[1:9:36] The Chaos resides at the bottom of The Cosmic Philosophical Tree; this is poignant in such that The Chaos is furthest from The Cosmos and The Divine.

[1:9:37] The worldly elements exist in-between and lightness and darkness resides just below cosmos and Divine; such is also poignant for it is lightness and darkness which form The Cosmos, and The Cosmos which is formed by The Divine.

[1:9:38] In this way, The Cosmic Philosophical Tree interconnects and highlights the relationships between The Ten Cosmical Elements.

[1:9:39] We can look towards The Cosmic Philosophical Tree for guidance in our studies of The Cosmical Elements and each of their unique interactions with each other, with The Cosmos, and with The Divine.

[1:9:40] But we must remember too, that the branches of trees can easily grow new branches from themselves, and so, The Cosmic Philosophical Tree is a concept and depiction in constant motionality and the way in which one may see it now, may not be so true after Time's passing.

[1:9:41] Let us see now the truest and foremost beauty of The Cosmic Philosophical Tree; the fact by which it serves its purpose as one of the two main elements of The Cosmic Alchemy, and also, its extension into paths and visions not yet known.

[1:9:42] The Cosmic Philosophical Tree shall be with us for as long as there will be wondermenters to study the cosmical elements and its continuously shifting talents and patterns demonstrates its true understanding and interrelation with The Cosmos.

—

[1:9:43] And now we turn to Cosmochemistry, a newfound branch of study and a major part of The Cosmic Alchemy, and towards which most Cosmo-Alchemists point their ambitions in discovering and adding to.

[1:9:44] As we are destined for the exploration of new worlds, we are inevitable to discover new medicines, chemicals, and new components and methods to cure disease and find new uses for all the chemicalities.

[1:9:45] Cosmochemistry focuses on the philosophical position of The Cosmos as being formed by the chemicalities; a chemicality is that which plays a fundamental role in the chemical structuring of The Cosmos.

[1:9:46] The Cosmochemists of our time and of future times will make it their ambition to explore the chemicalities of The Cosmos beyond the confinements of our own world, and shall view chemicality through a philosophical lens, as never done so before.

[1:9:47] In the embarkation towards the exploration of new worlds, we open our minds to that which perhaps one cannot fully comprehend in the initiality.

[1:9:48] To explore new worlds is to explore different and unique structures of those new worlds; some elements will be the same as are in our own world, but others, many others, will be different; vastly beyond All we know here on The Earth.

[1:9:49] The gravity of the situation is such that new worlds means a huge paradigm of new discoveries; take a moment to imagine All that could be beyond that which we know now about The Cosmos and all the countless worlds that reside within it; think about what is happening right now on all the possible worlds of The Cosmos and be prepared to have your mind cosmicalised.

[1:9:50] The way in which we retrieve, these new chemicalities in which we believe, will also have to change, for the extent of the range, and the environmental danger, we must establish new technologies, have the workspeople to conduct such, and know the new worlds as well as they do our own now.

[1:9:51] Think on who which we will be in this new order of the world atop cosmocentricity; the role you shall play; the achievements you will display; think on this harder than any other, and then act with your heart, imagination, and knowledge to find your forefront meaning here, now, and for the future of you.

[1:9:52] The longing of the young is to discover; to discover themselves, the world in which they reside, and the worlds beyond; Astronism understands this natural need well.

[1:9:53] I have seen this longingness in the youth of the world for I see it in myself and in those I know, and in those I do not; we long to live lives full, and dynamic, and as abundant with discoveries and triumphs as the lives of our prominent ancestors.

[1:9:54] Though a microcosm in comparison, Cosmochemistry and its centricity on the discovery of new worlds and new chemicalities and the methods to practice such chemicalities, within such is a greater message; that which touches the hearts and minds

and the wondermenting spirits of the youth; that of the fulfilment, the journeying, and the triumph of our lives and that which our lives mean to the world, and to the wider Cosmos.

[1:9:55] From the perspective of the Omnidoxy here and now in writing, we can delve into the wonderments of Cosmochemistry for we have not yet discovered in enough detail the new worlds which await us, though such subjects must be formed beforehand in order for them to develop in their maturity and preparatories in awaiting for the actuality of the subject to form.

[1:9:56] Such new worlds await us, but what form these new worlds, the Cosmochemist wonders.

[1:9:57] With new worlds, comes new plants, and animals, and new life in entirety, and with such, new evolutions of life's offspring, so very different from the evolutions of our own world past, present, and future; this is what Cosmochemistry is to be dedicated to contemplating the consequences of.

—

[1:9:58] The first integrant of Cosmic Alchemy is Cosmahest; the unique, abstract and typically interpretational feeling, substance, or thought which is sought out by all Cosmo-Alchemists, and is also known as wonderment.

[1:9:59] Wonderment as the centrality to the entirety of Astronism is made up of chemicalities; the focus on such chemicalities and the achievement of such through proper Astronistic means is the achievement of the cosmahectic ability.

[1:9:60] The wondermenters seek the cosmahest as the centralmost of All cosmicality.

[1:9:61] The cosmahectic feeling is that which one experiences in the deep cores of themselves; it is the warming feeling of possibility; the uplifting of ourselves to new heights fuelled solely by a love of The Cosmos.

[1:9:62] The cosmahectic substance is that which one projects their cosmahectic thoughts and feelings upon; those productions which we create as directed from our wondermented visions; we must treasure such substances as the physical manifestations of wonderment.

[1:9:63] The cosmahectic thought is that which is initiated into one's mind from the forefront of their imagination as divined by The Will of The Cosmos; every figment of thought is brought to us by a power no thinker has yet defined.

[1:9:64] Such a power, such a will, that pervades All else; pushes our world, and The Cosmos in The Universe towards their intended trajectories; whether by some Divine force, or not, it serves us to think on such a ponder for the force, the power, the will we

speak of now reveals itself in All aspects of our lives and in the wider Cosmos, but we cannot quite see, or know it as it truly is.

[1:9:65] To achieve the cosmahest is the most high in heights of wondermental experience for one has All three components; the feeling, the substance, and the thought.

[1:9:66] Perhaps we will all experience our own cosmahest in different ways, but we will know when we near its wondrousness for the experience is like no other.

[1:9:67] What must be said about the cosmahest is that it is a process; a journey upon which an individual embarks at the moment of their first wonderment of The Cosmos and continues on throughout their life until their cosmosis; whether you race towards the cosmahest, or whether you never intend to achieve it, All that can be said is that those whom do, are changed for the better forevermore.

—

[1:9:68] The second integrant of the Cosmic Alchemy is the Azoth; the essence from which all transformation, morphation, and transmutation occurs in The Cosmos according to the Cosmic Alchemists.

[1:9:69] One of the commonalities of The Cosmos are its transformative processes; The Cosmos is in constant repetition and reciprocation without and within its elements; this is the naturity of The Cosmos.

[1:9:70] But what is that forces such repetitions and reciprocations to occur, and such change and progression in The Cosmos?

[1:9:71] To the Cosmo-Alchemists, this is known as the Azoth; the essence, the force in All cosmical things to change, to grow, to die, and to rebirth, or live on in some way.

[1:9:72] The stars, and the planets, and the galaxies, and all the filaments of The Cosmos experience morphational processes throughout All aspects of their existences.

[1:9:73] In terms of realism, the Azoth can resemble many a type of force according to the physicists; perhaps gravity, or to the religionists of us, the Azoth is simply the hand of God conducting Divine works in The Cosmos.

[1:9:74] Whatever it is, and however one interprets the Azoth, it is there and existent in The Cosmos and always has since The Beginning, and always will, until The End.

[1:9:75] If we learn that Time is the greatest of healers, we can begin to understand Time's role within The Cosmos and how and why it took millions of years for the firmaments and filaments of The Cosmos in The Universe to heal and turn into their destined selves after the wondrous trauma of The Beginning.

[1:9:76] The Azoth is in all of us; in all the components of The Cosmos, and although it battles with the forces of The Chaos, it is cosmical in nature, and thus, holds limitations, for it is not Divine in its essence.

[1:9:77] It is the ambition of the Cosmo-Alchemists to explore the mysterious Azoth; to enjoy its rich wonderments, and to admire its abundance as well as its lingering unknownness.

—

[1:9:78] In The Cosmic Alchemy, and wider Astronist Symbology, divinity is never lowered in depiction by any distinct colour, yet golden is the colour of superiority in the entirety of The Cosmos.

[1:9:79] In The Cosmic Alchemy, we look towards abstract transformations to learn all ourselves towards lives of progression, betterment, and wonderment.

[1:9:80] In these abstract transformations, we place ourselves, and our peoples into positions in which they are raised, and lowered, altered, and kept the same; these are the transformations of Cosmic Alchemy.

[1:9:81] The transformation of humanity is the transformation of whom we are, and whom we hope to be in The Cosmos; we must define our role in order for the future generations of us to fulfil it.

[1:9:82] Chrysopoeia is the metaphorical concept in Cosmic Alchemy of transforming humanity into gold; in this, we speak not literally, but in figurative measure; as the Astronist characters cast in gold lead our peoples to progression, betterment, and wonderment, we must turn the entirety of humanity into gold.

[1:9:83] Gold is the closest physical depiction to the nature of divinity; it be the ambition of some Cosmo-Alchemists to achieve total Chrysopoeia, in the minds of All humanity; at the forefront of which is humanity's wonderment, betterment, and progression in The Cosmos.

[1:9:84] In such a transformation, we see humanity's part in The Cosmos as the leaders of civilisation; the explorers of worlds; the wondermenters and the knowledge seekers of The Cosmos.

[1:9:85] The Chrysopoeian transformation takes place in the minds of the peoples of humanity through wonderment, applied wonderment, and ultimate respectation for The Cosmos in which we exist, and our place inside it, but too, our unique opportunity to discover All there is within its bounds.

[1:9:86] Turning our minds golden means making our minds open to the knowledge, the discoveries, and All the possibilities and potentialities of The Cosmos in its most grand of scales.

[1:9:87] To achieve total Chrysopoeia is to turn the entirety of humanity to cosmocentricity, and in this, wonderment and betterment shall be most relevant to All our societies on The Earth and beyond, in orbital accordance around the centrality that is The Cosmos.

[1:9:88] If humanity is to fulfil every aspects of the destiny planned for us, we must constantly transform ourselves as we have done in natural procession since our civilisation began, but now it must be announced, that another transformation is set to occur, one of large scale and grand proportions and of drastic consequences.

[1:9:89] The transformation we face before us now is one we All know to be our destinies deep within, beyond all our faiths, and fears, and family, and peers; we are to explore The Cosmos.

[1:9:90] But in present concern, we are not prepared; we are not as a people, as a society, as a civilisation, ready to experience the treasures in knowledge, in philosophy, and in wonderment to which The Cosmos will propel us.

[1:9:91] If we are to become ready, the philosophical and cosmocentric revolution must take place in the form of the Astronomic Revolution, and in that, the Cosmo-Alchemist relate such to the transformation of humanity through the process of Chrysopoeia.

—

[1:9:92] Wonderment is that which we feel for The Cosmos; relating to both our personal and our societal connection to The Cosmos philosophically, practically, and divinely.

[1:9:93] Adoration, philosophically, is the love and respect which we feel for The Cosmos, though its concentrative connection is considered one level lower than that of wonderment.

[1:9:94] Laudation is the love and respect we feel for individual cosmicalities within the wider Cosmos.

[1:9:95] In the study of Cosmic Alchemy, the Classical Planets are considered to be those of the eight planets of The Solar System, including their laudation and adoration.

[1:9:96] The first of which is Mercury; the symbol of resilience and championed as the closest celestial in the system to the centrality; The Sun; the closest to the light, to the warmth, and perhaps to The Divine itself.

[1:9:97] The second of which is Venus; the symbol of hostility, and internal warring forces; The Troubled One.

[1:9:98] The third of which, and the foremost venerated of which is The Earth; the central symbol of humanity in The Cosmos; The Origination of humanity itself, and from which All humanic culture, and influence emanates.

[1:9:99] The fourth of which is Mars; the symbol of the first frontier of humanity's exploration of The Cosmos; the barren world veiled in mystery of that which existed in previous times.

[1:9:100] The fifth of which is Saturn; the symbol of new hopes due to its moon, Titan, holding the first possibility of life beyond The Earth, and too, the symbol of spectacality for its famous disc is synonymous with cosmical filaments.

[1:9:101] The sixth of which is Jupiter; the symbol of new worlds due to its abundance of moons; the central symbol, too, of the grandiosity of The Cosmos for it exists multiple times larger than The Earth itself.

[1:9:102] The seventh of which is Uranus; the symbol of cosmical perfection due to its peculiarly pure complexion.

[1:9:103] The eighth of which is Neptune; the symbol of cosmical distance, and the grand vastity of The Cosmos.

[1:9:104] The adoration, laudation, and wonderment of the Classical Planets is one of the centralmost components of Cosmic Alchemy, and wider Cosmic Philosophy, due to their proximity as The Frontier Worlds of the humanical discovery of The Cosmos.

[1:9:105] They are our cosmical neighbours; those elements of The Cosmos closest to ourselves, and in the closest proximity; the study of such will lead to a many great discoveries of the functionalities of The Cosmos.

[1:9:106] Too, their title as the Classicals derives meaning so as to mark the discovery of new worlds; to classify the worlds known before Astronic/Astronist times and those known afterwards with names properly appellated.

[1:9:107] The adorations and veneration of the celestials in their individualities, confirms our wonderment of them in relation to The Cosmos as a whole according to their unique characteristics.

[1:9:108] Each of the Classicals shall henceforth play vital roles in unique means in the humanic exploratory activities in the Proximate Cosmos, and shall be venerated now and forevermore remembered due to their immediacy to The Origination; The Earth.

[1:9:109] We must explore the Classics in the initiality if we are to complete the greater exploration and discoverment of The Cosmos.

[1:9:110] All that does occur, must first do so in initial means and terms, and this is the same for the Humanic Exploration of The Cosmos.

[1:9:111] As we begin to fulfil our destined exploratory path, we shall realise in the discoverments of the Classics to which we pertain, the true grandities of The Greater Cosmos beyond our own cosmical neighbourhood.

[1:9:112] Furthermore, the wonderments we do experience in our exploration of The Neighbouring Cosmos will highlight to the peoples of humanity the potential grander wonderments to be had in The Greater Cosmos.

[1:9:113] In principle, it stands true forevermore that what, whom, and how we are reflects that which we have explored.

[1:9:114] In current times, our exploratories of The Earth are largely complete, though still ongoing.

[1:9:115] Our exploratories of The Neighbouring Cosmos are minimal at best.

[1:9:116] And our exploratories of The Greater Cosmos are barely fractional, and so, in this principle, humanity is minuscule in what, in whom, and in how we are in relation to The Cosmos.

[1:9:117] Before we explore the Classics and beyond, we must decide whom we want to be in The Cosmos, and what we hope to achieve in and for The Cosmos for the betterment of ourselves, and in this, the Philosophical Revolution, shall play a foundative role.

[1:9:118] But even when we have fulfilled our cosmical destinies, and have explored the worlds beyond our own, we shall always remember, adore, and venerate the Classics, as the starting points; the frontiers; our first ventures into The Cosmos, for it is prudent of us All in whatever context it may arise, that we remember from whom, and from where we came, and ultimately, why in which we embarked originally on this most grand of endeavours.

—

[1:9:119] It should be no surprise to hear that The Cosmos is structured by a mixture of elements which can be found throughout for the nature of The Cosmos is to be composite.

[1:9:120] These elements, in Cosmic Alchemy, are known as The Cosmical Elements, and are inspired upon the four elements we know to exist on The Earth.

[1:9:121] Instead, we widen our view when studying The Cosmos, and in result, another five elements are comprised forming The Ten Cosmical Elements as follows: fire, air, water, earth, lightness, darkness, cosmos, chaos, universe and divine.

[1:9:122] The fires of The Earth are much like those of the filaments of The Cosmos; the explosions of distant novae, and the erupting spheres we call stars.

[1:9:123] On The Earth, the burning of the fires for heat, light, and guidance is similar to the functions of such erupting spheres, though on a much grander cosmic scale.

[1:9:124] Such a parallel in purpose and function highlights the importance of fire in both The Earthly Elements, and The Cosmical Elements paradigms.

[1:9:125] The second of The Ten Cosmical Elements is air; considered in Cosmic Alchemy to be both an ally of The Cosmos and The Chaos in equal measure, air is seen as the element of the greatest volatility; ultimately, the element of change.

[1:9:126] There are two ways to perceive the element of air; the first is its cosmicality; air bound by the atmospheres of the worlds on which it exists, and torn from universality by the vacuum and voids of space.

[1:9:127] The second is its chaoticity; it is invisible to us, though we must remember that it is not so to The Divine, and its trajectories, and measurements are either difficult, or impossible for us to know.

[1:9:128] The key to the nature of the element of air is that it is split perfectly in its equality between its cosmicality and its chaoticity; to understand air better, like many chaoticities, it must be contained, and controlled.

[1:9:129] The next element to spotlight is that of water; the greatest and centralmost symbol of life in The Cosmos, for although the celestials are worthy of eternal wonderment, and are too, alive in their own ways, natural life as we know it, is somewhat scarce to our present knowledge...

[1:9:130] Simply, if water did not exist on The Earth, neither would the entirety of humanity; water is the most physiologically important element to human existence and we must remember such during its laudation, and during our exploratory missions into The Cosmos.

[1:9:131] Where in The Cosmos exists water, natural life will too exist not far behind, and so, if it is life we are searching for in The Cosmos, we must look out for that which all life originates from; the element of water.

[1:9:132] The final of the four Earth Elements is prudently named earth, and in this way, symbolises all land, rock, and geological platforms in The Cosmos including, in primarity, The Earth itself as its appellative originator.

[1:9:133] The land on which we walk now, and on which all life has walked throughout the years of life's existence on The Earth; the land which has demonstrated is motional by the forces which have changed its appearance, and structure.

[1:9:134] The element earth is existent throughout The Cosmos in great abundance as a direct oppositism to those worlds wherein air dominates.

[1:9:135] Like the greatest beasts, and the smallest bugs have walked the lands of The Earth, so have our ancestors, but in accordance with our cosmical destinies, new lands we shall venture toward, and new earths we shall walk for leaving The Earth is not leaving earth itself.

[1:9:136] The first of the newly introduced Cosmical Elements is lightness, and such one of brilliance this is to begin with.

[1:9:137] We need not speak of the wondermental qualities of the element of lightness for we have seen its direct Divine attributes in The Sun for as long as humans have existed, and too, now and even more so in the future, we see the grandity of lightness in the stars of the night sky.

[1:9:138] In truth, The Cosmos is made from both lightness and darkness, which will be lattermentioned, and it is in lightness's role that All wonderment originates.

[1:9:139] Like we as peoples need light to guide us physically, mentally, and philosophically, the celestials and the firmaments of The Cosmos forevermore, need light too, in order to follow through with their functionalities, and cosmical purposes.

[1:9:140] All that is cosmical is infused with lightness and darkness in varying measures.

[1:9:141] As the centralities within The Cosmos, the lights of space are too, the lights of our wonderments of The Cosmos, and in such dark voids, we see such great products of lightness, and in these, we venerate for as long as we exist for without lightness, we would not be.

[1:9:142] In perfect oppositism, darkness exists for lightness to meet it, and although the enveloping nature of darkness persists in the vastities of The Cosmos, a balance remains forevermore between lightness and darkness.

[1:9:143] To The Divine, lightness and darkness are all but One, and certainly are not tainted with humanic connotations, and in Cosmic Alchemy, in similarity, no stereotisms

are placed upon either lightness or darkness for in doing so, we would not take a cosmocentric view, but a humanic, or anthropocentric view of The Cosmos.

[1:9:144] To the Cosmo-Alchemists, the most important of All uses of the elements of lightness and darkness is their synthesis within, upon, and encompassing one another in wholeness, and it is in this ambition, that the Cosmo-Alchemists work toward to achieve usage of these two cosmical elements.

[1:9:145] Next, we explore the element most central to All Cosmic Alchemy, Cosmic Philosophy, and Astronism; the element of cosmos as distinct from The Cosmos itself.

[1:9:146] The element of cosmos is All there is within The Cosmos, and is made from, and encompasses all the elements aforementioned.

[1:9:147] The element of cosmos is the most abundant of All other preceding it for it is space, and time, and matter, and the forces, and although the naturity of cosmos is orderity, control, and limitation, its vastity, complexity, and grandiosity cannot be denied.

[1:9:148] Rejoice in the wonderment of The Cosmos and explore the element of cosmos that is all around us forevermore.

[1:9:149] And in opposition to the element of cosmos comes the element of chaos, as distinct from The Chaos itself.

[1:9:150] Lacking the orderity, control, and limitation which are characteristics that serve well the element of cosmos, the element of chaos is marred by sporadic action, disorder, and an unknown quantity, and measure.

[1:9:151] The element of chaos is the antithesis to that which is cosmos, but in some Divine way, these two counterparts are formative of The Universe, dependent upon one another, and are destined to exist beside one another.

[1:9:152] We praise not The Chaos, but its opposite, The Cosmos, for The Cosmos is in which we exist and is that which we wonderment upon; we cannot wonderment The Chaos for its components, naturity, and purpose because all that it is known, it is only partly so.

[1:9:153] The elements of cosmos and chaos play a role of centricity in Cosmic Alchemy, and the Cosmo-Alchemists shall pursue on, in their efforts and studies directed towards the naturities, purposities, and functionalities of both The Cosmos and The Chaos.

[1:9:154] Lastly, and foremostly, we come to speak of the element of that which we know the least amount; the element of divine.

[1:9:155] We speak of the cruelties of the peoples of the world, and the world's natural processes themselves, and we ask, how could the creator of The Cosmos in The Universe be so cruel?

[1:9:156] In asking this, the individual reveals their lack of understanding by what is truly divine in nature.

[1:9:157] To steal, and to kill; these are the haunts of humanity; to create, and to destroy; these are the duties of The Cosmos; to oversee, to destinify, and to begin, and to end, are the works of The Divine.

[1:9:158] So when the next tsunami hits, and when the next innocent is murdered, and when the next avalanche crushes a peaceful village below; speak not of divine, but of cosmos.

[1:9:159] It is The Will and destiny of The Cosmos, as destinified by The Divine, to create and to destroy its products in equal, unbiased, and ordered measures.

[1:9:160] Since time immemorial, we as humans have placed onto The Divine, or The Sustainer of The Universe, our own haunts of suffering, cruelty, and evil, but in order to truly understand divinity, we must not continue on with this distorted view.

[1:9:161] For to The Divine, suffering, cruelty, and evil are non-existent, and in the same way, so are happiness, kindness, love and goodness, for these are humanity's attributes; not the attributes of divinity hence in Astronism, divinity is certainly not lowered in its nature to exhibit love or to be the embodiment of love as it is in other religions.

[1:9:162] To The Divine these vast oppositisms to us, are all the same as one; good and evil do not dictate The Divine for they are both products of divinity and have purposities equal, true, and justified.

[1:9:163] Ultimately, as mere products of The Cosmos, we cannot ever hope to truly, wholly, and entirely understanding what divinity really is, but it is the vocation of the Cosmo-Alchemists to continue with this endless endeavour of hopeful understanding.

[1:9:164] What we must understand on a basic level to which we can all relate is that the element of divine, the naturity of divinity, and The Divine, is All but that which we are, and All that bounds us, interpenetrates us, and which we depend upon are not, and never shall be components of the elemental divinity; All that is Divine is not us, yet All that is us is Divine.

—

[1:9:165] In the depths of Cosmic Alchemy, there exists concepts, beliefs, and certain components of the practice which would be considered either above-cosmos, or anti-cosmos in their natures, though their figurative meanings are relevant nonetheless.

[1:9:166] In forefront of such concepts is The Elixir of The Cosmos; the concept by which The Five Astronist Characters are considered figuratively to be the only people to possess eternal youth by the aid of Divine efforts to ensure this.

[1:9:167] In the words of the Omnidoxy that speak loud herein, we must also establish visualisations and exemplars of these words to reflect their meaning in vibrancy and in the societies in which we live as figures to which we aspire.

[1:9:168] These are mainly The Five Astronist Characters as perfect manifestations of Astronism, and in this way, they demonstrate themselves as possessing The Elixir of The Cosmos as searched for by the Cosmo-Alchemists.

[1:9:169] In Cosmic Alchemy, The Elixir of The Cosmos is considered to be a mystical state in which an individual is in union with not only The Cosmos, but too, The Divine, and demonstrates such by their glimmering leadership of the peoples towards cosmocentricity, or more broadly, to better people for the betterment of the world.

[1:9:170] The Five Astronist Characters are considered by the Cosmo-Alchemists to be the most true and original achievers of this cosmical state; furthermore, they are the champions of it in their leading of the peoples, in their places as icons of cosmocentricity, as the reflectors of the cosmical destiny of humanity.

[1:9:171] So when one sees The Five, or just one of The Five Astronist Characters in their most high depictions in golden encrustations, think of The Elixir of The Cosmos they retain for the peoples of the world.

[1:9:172] The essential nature of The Elixir of The Cosmos is that it can only be achieved by dedicating one's life to three elements; the peoples of the world, the cosmocentricity of humanity, and humanity's exploration of The Cosmos as destined so.

[1:9:173] The Elixir of The Cosmos is unique to each one of us, and we will only know ourselves when we have achieved it; when we know we have done All we can for the people, for humanity, and for The Cosmos.

[1:9:174] And in this, we achieve the eternal youth for we will forever remain young at heart in that our wonderment of The Cosmos is as innocent and pure as the mind of a child.

[1:9:175] If it is The Elixir you wish to achieve, when you do achieve it, remember to champion it and hold it as close to your heart as the people you love; become a champion

of its mysteries, its knowledge, and its answers to the naturity and purposity of The Cosmos.

[1:9:176] It is the duty of the Cosmo-Alchemists to devise and study the mystical elements of The Cosmos, and it is our duty to champion such for the generations of the future for that is the way to pass on what you have achieved, and learned, and have left unfinished in your lifetime.

[1:9:177] Many of the greatest of works have been completed by those whom were not there during their founding, yet this is no failure, but a sign of success for the works and missions have been passed on to those whom share the same worthiness as the founder.

[1:9:178] The Elixir of The Cosmos must remain shrouded in mystery for that is in accordance with its nature, but too, we must encourage those whom are sure of their achievement of it, to speak, write, and champion their elixiral accomplishments with the peoples of The Earth, and All the worlds beyond.

—

[1:9:179] Another component in Cosmic Alchemy is that of the Cosmunculus; the Cosmoalchemic depiction, and study of The Cosmos in its infancy form.

[1:9:180] Like the humans, birds, and animals that have walked The Earth since evolution began, we have all followed the cyclical process of life; birth, growth, and death.

[1:9:181] In a wider sense, the Cosmo-Alchemic study of the Cosmunculus is this, but in correspondence to The Cosmos itself.

[1:9:182] The Cosmos and All its individual elements, in accordance with Divine orderity, function, and naturity, follows, too, this cyclical process of life, and the birth, the growth, and the death of The Cosmos are continuously underpinned in All aspects of Cosmic, Astronic and Astronist philosophy.

[1:9:183] Born from direct divinity, The Cosmos experienced its own stage of infancy well before our times, and as do we all in some stage of our own existences.

[1:9:184] When the galaxies were primitive in formation, and the stars were clustered closer together than we can imagine now, and during the times of which concentricity, and the orderities of The Cosmos were in their formational periods.

[1:9:185] In this time, the Cosmo-Alchemists, and any cosmic philosopher in fact, can learn much about the naturity of The Cosmos in The Universe.

[1:9:186] Definitively, the Cosmunculus is that level of scholarly knowledge, and artistic creativity, or simply the extensive study of such by the commonpeople, toward that which is known to the Cosmo-Alchemists as The Infant Cosmos.

[1:9:187] In the study of the Cosmunculus, Time is the greatest measure for the entirety of the concept of The Infant Cosmos is based on our perception and knowledge of Time in relation to The Cosmos.

[1:9:188] If we are to know the mysteries of The Cosmos, then the Cosmo-Alchemists must concentrate their study towards the Cosmunculus, and achieve that which is known to reside within its study; the revelation of the naturity of The Cosmos in its entirety.

[1:9:189] The study of the Cosmunculus holds the study of The Infant Cosmos at its core, but more broadly, the Cosmunculus is the amazement of the cosmical phases and Time's interrelations with The Cosmos.

[1:9:190] We must explore that which we have been in order to discover that which we are to be, and this is the same for the study of the Cosmunculus; in the study of The Infant Cosmos, the ultimate ambition of the Cosmo-Alchemists is to grasp discoveries of the future, and destiny of The Cosmos.

[1:9:191] Let us All practice our own private, simple, and frequent adorations and studies of the Cosmunculus by peering up towards the stars of the night sky and perceive such as looking back in Time for that is what your eyes gaze upon in truth.

[1:9:192] These perceivences are, in their essentialities, the wonderment of The Cosmos gone by; Time's distortion of our perception of The Cosmos leads our eyes to see The Cosmos as it once was, but in this distortion of perception, comes a grand opportunity to seek greater knowledge of the Cosmunculus study; the study of the early Cosmos.

[1:9:193] The study of that which is not now, but once was, so as to discover what will be.

—

[1:9:194] As the final component of The Cosmic Alchemy, we proceed along to The Eleven Cosmo-Alchemic Processes which stand here, now, and forevermore as the pillars of The Cosmic Alchemy and all its mystical practices, wonderments, and studies.

[1:9:195] A study cannot exist without a process, or an action to make it so, and in this, demonstrated is the importance and relevance of The Eleven Cosmo-Alchemic Processes in relation to wider Cosmic Alchemy.

[1:9:196] The first of The Eleven is that which echoes the aforementioned Origination; the emanator of All humanic influence and the birthplace of All humanical exploration of The

Cosmos; The Earth, and the Cosmo-Alchemic process associated with that is to be known as Terrestrialation.

[1:9:197] As the first, foremost, and closest process to our minds, hearts, and spirits, Terrestrialation deals with the entirety of the involvements of The Earth in all Cosmo-Alchemic studies, practices, and mystical wonderments.

[1:9:198] As aforementioned and lattermentioned, we are from where which we came, and although it is truly spoken that we are the stuff of stars, we built our lives, our societies, and our cultures on The Earth, bound by its own naturity, unique from All else in The Cosmos; we cannot and we must not forget from where which we came and where which we developed whom we are and whom we wish to be.

[1:9:199] The Cosmo-Alchemist concocts chemicalities to complete Terrestrialation by using The Earth colours of blue and green; the process of Terrestrialation is the ultimate symbol of natural processes.

[1:9:200] The Cosmo-Alchemist conducts the process of Terrestrialation as the originative cosmo-alchemic process; the process from which All other processes originate in relation to humanity.

[1:9:201] The Eleven Cosmo-Alchemic Processes reflect in parallel the journey of humanity's exploration of The Cosmos, and as we begin at The Earth, we shall continue on.

[1:9:202] The second of The Eleven Cosmo-Alchemic Processes arrives in the form of Helioation; the process in which the Cosmo-Alchemist concocts chemicalities in order to form resemblance to The Sun.

[1:9:203] The prime choice of colours persists to always be golden and white when concocting Helioation, and as The Sun holds central importance to the entirety of the existence of humanity, the process of Helioation is often considered more important than that of Terrestrialation to some Cosmo-Alchemists.

[1:9:204] The completion of the process of Helioation is one of the paramount processes due to its centrality both in Cosmic Theory and in actuality; the results of the Helioation must always be placed at the centre, except for when the process of Galaxation takes place and thereafter, wherein the Helioation must be highlighted, but not centralised.

[1:9:205] The third of The Eleven Cosmo-Alchemic Processes is that which focuses on the closest celestial in relation to The Earth, The Moon, and it is hereby appellated to be the process of Selenation.

[1:9:206] It is important to note that the process of Selenation does not reflect the entirety of moons in The Cosmos.

[1:9:207] The process of Selenation focuses on the motionality of the moon in its orbitality around The Earth; the selenal colours are white and grey to reflect the colours of The Moon.

[1:9:208] The Selenation process is considered by the Cosmo-Alchemists as an addition to, and the completion of, the process of Terrestrialation.

[1:9:209] The chemical composites of Selenation are essential to humanity's exploration of The Moon and this stands true for All other Cosmo-Alchemic processes.

[1:9:210] We can perceive these processes as being the precursors to humanity's exploration of the processal subject; the mystical discovery of the elements of The Cosmos before our discoveries of it in actuality.

[1:9:211] The process of Selenation, and the other ten Cosmo-Alchemic processes, are used to purify, mature, and perfect our perceptions of the processal subject whether that be The Earth, The Sun, The Moon, or beyond.

[1:9:212] In the quest of the Cosmo-Alchemist, therein lies the heart of Astronism, and the Cosmic Philosopher, a willingness and wonderment to learn, adore, and interact with The Cosmos in a way not done before.

[1:9:213] Now we begin to explore the more immense and less concentrated processes of the eleven, and in this, we begin with the process of Solaration.

[1:9:214] The fourth Cosmo-Alchemic process centres itself on the celestial entities of The Solar System not centred upon in the processes previous.

[1:9:215] Therefore, the process of Solaration encompasses a diverse range of celestial bodies including planets, and moons, as well as introducing new celestial bodies to The Cosmic Alchemy such as comets, meteors, and asteroids.

[1:9:216] Go forth All aspiring Cosmo-Alchemists and experiment with this Cosmo-Alchemic process for its naturity and purposivity is to be vastly interpreted, widely explored, and constantly experimented, as is the naturities and purposivities for the Cosmo-Alchemic processes hereafter lattermentioned.

[1:9:217] Encompassed within the process of Solaration are the concepts of concentricity, orbitality, rotality, and all the other functionals existing within The Solar System.

[1:9:218] The process of Solaration may encompass the study and practices of the celestials of The Solar System, either compositely, or in their entireties, and such a composite focus would be known as for example, Neptunian Solaration.

[1:9:219] As is the naturity of The Solar System, the entirety of Solaration is subject to, dependent upon, and revolvent around The Sun.

[1:9:220] In order to attempt the process of Solaration with its vast diversity, and complexity, the Cosmo-Alchemist must be experienced in The Cosmic Alchemy, and must too, know deeply the central concepts of Cosmic Philosophy in order to perfect their Solaration process.

[1:9:221] As we leave behind the process of Solaration, we enter into alchemical territories reserved only for the most experienced of the Cosmo-Alchemists.

[1:9:222] The fifth of The Eleven Cosmo-Alchemic Processes arrives in the appellation of Galaxation wherein an experience Cosmo-Alchemist attempts to conjure chemicalities in relation to the entirety of The Milky Way.

[1:9:223] The centralmost concept that must be adhered to in Galaxation is that of concentricity for the entirety of The Milky Way revolves around the galactic core, just as The Earth revolves around The Sun.

[1:9:224] The key aspect of Galaxation is the grand scale upon which the process occurs; on a galactical scale, and this demonstrates the experience needed in order to achieve the perfection of this process for the process of Solaration requires still, experience abound in order to achieve it.

[1:9:225] All colours of the Alchemic spectrum must be included in the formation of Galaxation for The Milky Way is to represent the entirety of All in which we exist on a galactical level.

[1:9:226] To all Cosmo-Alchemists whom attempt the purification, the maturification, and the perfection of this process, keep central in your minds the naturity of The Milky Way, the sections from which it is made up, and the functionalities by which it exists.

[1:9:227] With the achievements of Galaxation come some of the most impressive concoctions of chemicalities worthy of the most high wonderment, and in the hope of learning more about the galaxy in which we reside, the Cosmo-Alchemist is the first to discover, through purified wonderment, the mysteries of The Cosmos in The Universe.

[1:9:228] If one of the central ambitions of Cosmic Alchemy is to achieve some wonderment that is purified, maturified, and perfected, then toward Cosmic Alchemy we must turn in order to experience wonderment on a level higher than our minds alone can hope to achieve.

[1:9:229] In principle, The Cosmic Alchemy insists that which is practiced is that which is more refined, sharpened, and clear, and if it is wonderment toward which we turn, then

The Cosmic Alchemy insists not only the ideation of wonderment, but the application of it through means of chemicality.

[1:9:230] Proceeding, we meet the Cosmo-Alchemic process of Obliviation; the chemicalities concocted that focus on the black holes of The Cosmos.

[1:9:231] The nature of the process of Obliviation is its ultimate unknownness, its ultimate darkness, and its ultimate nothingness.

[1:9:232] In the context of colouration, it is the ambition of the Cosmo-Alchemist whom attempts Obliviation to achieve a colour so dark that consumes All else just as a reflection of the functionality of the black holes of The Cosmos.

[1:9:233] In chemicality, the reflection of the functionality of black holes would exist in the chemicalities of devourment; those which consume all other chemicalities; an obscurity in the chemical processes to reflect the obscure rips in spacetime which are Black Holes.

[1:9:234] The Cosmo-Alchemists must, if they wish to achieve perfect Obliviation, study the possible naturity, purposivity, and functionality of black holes through Obliviology in order to create the chemicalities needed to sufficiently reward the process with the knowledge it needs to achieve it.

[1:9:235] The completion of the process of Obliviation by a Cosmo-Alchemist is to show the wondermenters, the philosophers, and the peoples of humanity, a deeper understand, comprehension, and perceivance of the mysticies of the oblivions of The Cosmos.

[1:9:236] The alchemical culture and tradition of Astronism is influential in the foundations of the philosophy, and too, holds relevancy in the structuring of what it means to wonderment, and the different levels by which one may wonderment The Cosmos, and its many elements.

[1:9:237] In the mists of the darkest reaches of space come the cosmical beasts of oblivion which all whom know of The Cosmos and its element, fear most of All.

[1:9:238] Though it must be said that we fear most that which we least understand, and it is these oblivions besides the entirety of The Cosmos and The Universe themselves, it is these oblivions which we do not understand the most.

[1:9:239] It is the central most of all Oblivionic Alchemists to discover the cosmical, mystical, and philosophical truths of these oblivions and to produce such ideation through the productions of theses and concoctions of chemicalities; however which way one wishes to express the knowledge they have gained is to their own nomination.

[1:9:240] Let us now contrast our studies by moving away from the darkest elements of The Cosmos and moving towards some of the brightest.

[1:9:241] The seventh of The Eleven Cosmo-Alchemic Processes manifests itself in the process of Novation, and is the only process to be divided into two distinct variations; Supernovation and Hypernovation.

[1:9:242] As lattermentioned, the naturities of these such explosive deaths are that they are short lived in cosmical irony; that which is the most beauteous is too, one of the most dangerous; that which is the most powerful is too, an occurrence in one of the least amounts of time compared to the other cosmical elements.

[1:9:243] The explosions of The Cosmos symbolise both celestial birth, and celestial death, and in order to reflect the violent essence of these celestial occurrences, the most extreme of chemicalities must be concocted together.

[1:9:244] The death of stars is ultimately relevant in The Cosmic Alchemy for it is the death of the centrality in the cosmical orderity and such a death sends ripples throughout the entire cosmicality.

[1:9:245] The death of the centrality signals the death of the entire system which, unlike the novae itself, is a long death in which the star devours the planets of its system one by one as it gets larger and larger until eventually it collapses.

[1:9:246] The Supernovation is the Cosmo-Alchemic process wherein certain chemicalities are concocted to create the death of The Philosophical Star.

[1:9:247] The Hypernovation is the Cosmo-Alchemic process wherein the chemicalities of the Supernovation process are concocted fivefold in the creation of the death of The Philosophical Star in the most extreme of circumstances possible within cosmicality.

[1:9:248] Within the principles of cosmicality, there exists the logic which states the further away we are, or the further away in which we study elements of The Cosmos, the closer we shall be to discovering the truths of The Cosmos in The Universe.

[1:9:249] This principle is exemplified by the Cosmo-Alchemic process of Quasation; quasars are some of the distantmost cosmical entities wherein exists a cosmical melting pot including at its centre a supermassive oblivion, and around which rotates countless rings of gas, dust, and cosmical matter.

[1:9:250] The Cosmical Elements of darkness and lightness are central in the creation of what we know to be quasars and how we know them to exist as in their appearances and the ways of the structure, functionality, naturity, and orderity of quasars shall be lattermentioned.

[1:9:251] Lightness exists in rotality of the accretion disc around the central darkness, and lightness too, exists in the form of the lightbeam too, which extends on either side from the central darkness.

[1:9:252] In a strictly Cosmo-Alchemic context, the process of Quasation is concocted through chemicality by the exteriority of lightness, and the interiority of darkness; in lightness, matter exists, and in darkness, the unknown exists.

[1:9:253] In the process of Quasation, the first instance in which the Cosmo-Alchemists focus on the extent of energy produced by a cosmical element, and for a quasar, this equates to a fully matured galaxy of over one-hundred billions stars.

[1:9:254] This concentration of such cosmical energy is reflected through the intense chemicalities formed by the concoctions created by the Cosmo-Alchemists.

[1:9:255] The process of Quasation is perhaps one of the hardest to master due to their relative unknownness to us in Current Knowledge, and their intense naturity of the elemental mixture of lightness, darkness, cosmos, and chaos.

[1:9:256] Perception for the Cosmo-Alchemists in the creation of Quasation is essential for when the processal subject is viewed perpendicularly to ourselves, we see a radio galaxy; when the processal subject is viewed from an angle, we see the traditional quasar; and when viewed down through the barrel of the lightbeam, a blazar is perceived.

[1:9:257] When wondermenting over the fullest, brightest, and the activemost celestials and cosmicals of The Cosmos, it is easy to forget that the most vast of cosmical expanses are taken up by spacial voids.

[1:9:258] But we must not fall to the myth that in such voids, a nothingness exists, for voids are full of the most unknown matters of The Cosmos; Dark Matter.

[1:9:259] It is the role of the Cosmo-Alchemist to create concoctions of chemicality which are transparent, yet dark in their colouration, whilst too, in the construction of the process of Voidation, creates the cosmical plane in which the celestials and cosmicals reside.

[1:9:260] It is the role of the Cosmo-Alchemist to reveal in wondermental and philosophical terms, the mysteries of Dark Matter, as well as the wider naturity of space, time, matter, and the forces of cosmical orderity.

[1:9:261] The penultimate Cosmo-Alchemic process exists with the appellation of Expansion, and relates to the concept of The Expanding Cosmos; that in which The Cosmos exists and extends into in perfect assimilation to its own expansion.

[1:9:262] This process is purely conceptual and is not known to be achievable through chemicality though that which the wondermenting minds of the Cosmo-Alchemists may achieve through their study and experimentation of Expansion cannot be understated.

[1:9:263] The ultimatum of The Cosmic Alchemy wherein The Cosmic Alchemy becomes that which All it can within the limitations of that which we know and too, within the naturity, and orderity of The Cosmos.

[1:9:264] The finality of The Cosmic Alchemy manifests itself in The Eleventh Cosmo-Alchemic Process of Cosmation; the ultimate creation of the Cosmo-Alchemist; that which is raremost, and complexmost, and requires knowledge of wonderment held only by those specially chosen to have lives dedicated to the wonderment of The Cosmos in The Universe.

[1:9:265] The process of Cosmation includes the entirety of All the Cosmo-Alchemic processes aforementioned in their most purified, maturified, and perfected forms.

[1:9:266] Too, it includes the aforementioned processes in their proper positions in accordance to the cosmical orderity, and in such positions, their purposities, naturities, and functionalities may be realised in better clarity.

[1:9:267] The process of Cosmation forms The Cosmos in Alchemic measures and in the proper positionings of All the cosmical elements as products of their processes, the core of Cosmation is the orderities of this; the perfect formation of The Alchemic Cosmos in its entirety according to the knowledge that we possess.

[1:9:268] The construction of The Alchemic Cosmos grasps the concept of wonderment in its purified, maturified, and perfected form, and allows all Cosmo-Alchemists and all beyond, to see The Cosmos as never before seen.

[1:9:269] Functionality in The Alchemic Cosmos is essential to its purpose for wonderment; we must as peoples, see The Cosmos operate in cosmical orderity and perceive such through a mystical lens; a lens by which the composite naturity of The Cosmos is revealed.

[1:9:270] In the completion of the process of Cosmation, the Cosmo-Alchemic Palette becomes visible to view and study the composity of The Cosmos in parallel to the entirety of The Cosmos.

[1:9:271] Ultimately, The Cosmic Alchemy, its study, practices, and knowledges exist to physicalise and realise wonderment, to mysticise it, and to allow the study of The Cosmos and All the instruments of study that come forthwith in a way that emphasises its many mysteries.

The Cosmographics (Cosmography)

[1:10:1] The Cosmographics, also known as Cosmography, are a collection of studies and branches of knowledge within Astronism which relate to the general features of The Cosmos in The Universe.

[1:10:2] The Cosmos and All its celestial products are diverse in their range and appearance, yet uniform in their functionality; the features of which are studied accordingly in relation to functionality, naturity, structurity, purposivity, and orderity.

[1:10:3] The study of Areography is the learning of all geographical aspects of the planet of Mars in The Solar System; the study of such in the context of Astronism relates to the overall Martian cosmicality and the study of Mars philosophically.

[1:10:4] The areographical study depicts that which the planet of Mars has relevancy to humanity's exploration of The Cosmos; the philosophical study of Mars encompasses that which Mars means in terms of wonderment and cosmicality.

[1:10:5] The Areographic Worldview involves the centrivity of Mars in the Astronist Worldview and focuses Mars' place as the first permanent humanic civilisation beyond The Earth itself.

[1:10:6] The barren lands of the Martian surface hold secrets that which we are within proximity to reveal to the peoples of the world.

[1:10:7] In the study of Areographics, there is a certain curiosity in the history of Mars about why there seemingly exists so little life in its topography; we must explore Mars up front in its physicality in order to discover the secrets enclosed within its history.

[1:10:8] It is one of the principles and central studies of Areographics that Mars was once inhabited, and looked very different from which it appears to be now.

[1:10:9] It is believed there were once lakes, grasslands, forests, and tundras in the topography of Mars; that Mars looked much more like The Earth in some period of Time.

[1:10:10] Whether believed or not, and whether true or not, the proposal of an idea sparks a curiosity within the minds of humanity to either prove, or disprove such.

[1:10:11] The planet of Mars symbolises the first venturement of humanity into The Cosmos beyond the influence of The Earth, of which The Moon is under.

[1:10:12] The discovery of the New World of Mars reflects not on its own isolated grandiosity, but also, the absolute grandiosity of The Wider Cosmos; the billions of worlds beyond in the interstellar regions of The Milky Way.

[1:10:13] All the New Worlds that do exist now as the words of this text are written, and will too, exist during your reading of such words and during your grandchild's reading of such words; the New World beyond will exist for longer than we can ever hope, and so, therein Time we have as an ally to such New Worlds.

[1:10:14] The first of such New Worlds to be discovered will be Mars, and in this fact alone, the in-depth study and the raise in relevancy of Areography demonstrates a principle of firstmostness with respect to Mars for on this Red Planet, it is prophesied here and many a time before, that new and life-altering discoveries will be made by the first wave of great cosmic explorers.

[1:10:15] Not only encompassed within Areography is the study and wonderment of the planet of Mars, but too, its adoration and laudation within Cosmic Philosophy and wider Astronist/ Astronic Philosophy as the planet chosen to which we will venture first in our Grand Exploration of The Cosmos as destined and prophesied so.

[1:10:16] We can principle that if Mars has many mysteries and secrets to be revealed, then logic would prevail that all the other worlds of The Cosmos would too, share such mysteries and secrets.

[1:10:17] In this very principle, we pinpoint the purpose of that which All exploration, All wonderment, and All laudation of The Cosmos presides upon, the expansion of the people's minds to the secrets of The Cosmos held within its celestial products.

[1:10:18] Focus on your mastery of the Areographical knowledge for in learning the highest heights of the features, the role, and the philosophy of Mars, then one shall become well-accustomed to the application of such learnings to all the celestials and cosmicals far beyond Mars.

[1:10:19] As we prepare to chart our course towards the New World of Mars and as the wondermenters of us plan and prepare the ways in which humanity shall exist, civilise, and learn upon the planet, the words of the Omnidoxy stress caution in the foremost principle.

[1:10:20] The Omnidoxy and Astronism, of which Cosmic Philosophy is a derivation; All of these are the champions of the exploration of The Cosmos as aforementioned and lattermentioned.

[1:10:21] However, caution is pressed upon the eagermost of the early wondermenters; such caution is afore pressed due to humanity's infancy in whom we are, what we are, where, when, why, and how we are in relation to The Cosmos.

[1:10:22] If we venture into The Cosmos without answers to the most basic of philosophical questions, then we are doomed to miss the opportunity destined and prophesied for us.

[1:10:23] It is the belief held at the time of writing the Omnidoxy that humanity is not ready to explore The Cosmos; a cosmic philosophical revolution, known henceforth as the Astronomic Revolution must take place and be implemented into humanic societies and philosophical foundation must be laid in order to continue on with our cosmical journey.

[1:10:24] If we are to explore and discover The Cosmos as destined and prophesied so, then we, as humanity, must know whom we wish to be in The Cosmos, for what reasons do we wish to explore The Cosmos, whom shall be the explorers, and too, understand the severities of the consequences of such an cosmic embarkation.

[1:10:25] The entirety of the history of humanity will change forever upon the initiation of such an embarkation; by no means is this a negative, but is encouraged by Astronist/ Astronic philosophy.

[1:10:26] What is stressed is that we must embark upon this journey by proper means of a system of worldview, and some organised philosophical groundwork to complement that which we study, discover, and substantiate during our cosmic exploration.

[1:10:27] This is entailed within the philosophical revolution, and it is said henceforth, that Astronism as the first of such Organised Philosophies, will forevermore uphold its duty and purpose to stand as the philosophical foundations of the entirety of humanity's ventures beyond The Earth.

[1:10:28] We must make The Next Frontier with a strong philosophy and religious tradition of whom we are and whom we want to be, and as equally as relevant, what do we hope to find in The Cosmos.

[1:10:29] It seems the more we learn of The Cosmos, the less we know; if we are to open the Cosmical Chest, we must be prepared in mind and body, to withstand that which we discover within it.

[1:10:30] The reascension of philosophy will prime our minds to deal with the hardships, tragedies, and difficulties ahead as we embark upon the largest journey of All.

[1:10:31] The wonderments, knowledges, and discoverments to come will shape whom we are, but we must know whom we are beforehand; in strength, in clarity, and in power of the mind.

[1:10:32] When we do turn to studies Areographically, we do see them through a lens in relation to the planet of Mars and what Mars means to humanity now and in future times.

[1:10:33] Not without these Planetary Studies do we see such in their isolated forms; we must view such worlds for what they are; individual, unique, and worthy of eternal wonderment for their mere existences.

[1:10:34] With which we take with us is that which we become; this principle is most true in humanity's destined and prophesied exploration of The Cosmos; the philosophy, the logic, the system of thought with which we hold to ourselves is that which we will become in The Cosmos.

[1:10:35] It is, therefore, the greatest of imperativities that we take with us and hold strong in our hearts, minds, and cultures, a philosophy that holds strength enough to withstand the strenuousities before us as a peoples, a world, and as merely, a product of The Cosmos.

[1:10:36] We must study that which we are one day to call home; in this, we must study the Areographics, and All the other Planetary Studies, and study The Wider Cosmos for that is what in which we live now, but too, that is what in which we still must explore for there is no greater difference between existing on The Earth and existing in The Cosmos.

[1:10:37] We are within our own world; a world in which we are comfortable; a world in which normality is universal though we feel we live in diversity, we do not know of Greater Diversity; a diversity of world, a diversity of existence; we have much to learn and know, still.

—

[1:10:38] The new worlds in which we encounter; their lands unique; their evolutions unlike any other; the life which resides upon such worlds different from All we know to be here.

[1:10:39] With the discovery of new worlds comes the change of All we know to be true, genuine, and real.

[1:10:40] The physical attributes of ourselves and our world are true only for our own world's evolutionary course; the evolutionary course of a world new will relate in ways to our own, but it will never emulate it unless probability prevails and the chances of such an occurrence realises itself.

[1:10:41] The physiology of the world we call our own has been explored by some of the greatest of minds of All times, but we will require greater minds still, if we are to understand the molecular structures and physiologies of such new worlds, on which New Life exists upon a course of evolutionary uniqueness and orderity relative to itself; never to ourselves and The Earth's evolution.

[1:10:42] Such a study of the lives in residence on these new worlds is hereby to be appellated as Astrobiology; the study of the physiological, and biological structures of life on All worlds other than The Earth.

[1:10:43] A study requiring some of the greatest minds yet, for the progression, sharpening, and expansion of the study; the further and more extensively we explore the new worlds beyond our own, the greater and more expansive this study and others of a similar nature shall become.

[1:10:44] For now, at the time of this writing though, the new life and new worlds waiting to be discovered and studied, are beyond ourselves as we exist now for we are not ready or worthy of studying such new worlds and the treasures and revelations held within them.

[1:10:45] If we are to become ready and worthy, we must change the way in which we see The Cosmos as aforementioned and lattermentioned throughout the writings of the Omnidoxy herein.

[1:10:46] Though do not fret for the times of such will come when the proper means are executed and the reascension of philosophy has occurred and the days of geocentricity are long passed.

[1:10:47] For now, however, to the aspiring Astrobiologists, the best practice for you All is to become the greatest wondermenters ever known for if you are to discover and study the new life of the new worlds in some future time, then you must first wonderment The Cosmos, and imagine what there could exist in its grandities.

[1:10:48] There is much to be done by you All, still, and the development of your study, as encouraged in this writing, is just one of the items on your agenda.

[1:10:49] Fear not for your time will come, but use the time granted to you now to prepare yourself for when the time does come and the world is watching, your knowledge will be put to the test by the peoples and for the peoples of humanity; a great and rare opportunity of duty I would say.

—

[1:10:50] The constellations of The Cosmos have been the originators of wonderment for the centuries prior to greater cosmical knowledge.

[1:10:51] The newly formed constellations of The Cosmos derived from the Astronist Tradition and Cosmic Philosophy are important in Cosmic Laudation and wonderment for they are one of our few physically visual connections with the elements of The Cosmos.

[1:10:52] The constellations of the night sky have enhanced the humanic connection with The Cosmos ever since they have been interpreted and organised.

[1:10:53] Here and now, the concept and the organisation of the concept of Asterism must be explained.

[1:10:54] Asterisms are patterns and collections of stars that are smaller than a full constellation, but it is these asterisms that are the commonmost to wonderment, especially for the untrained eye peering up at the clear night sky.

[1:10:55] With free nature of asterisms, the mass of the peoples can look up at the sky and form unique patterns which would otherwise be lost.

[1:10:56] The peoples are then encouraged to take photos of such asterisms, or record such asterisms in order to demonstrate their astral creativity, and the extent of their cosmical wonderment.

[1:10:57] Although asterisms, also known as the wondermental process of Astration, may be smaller and less complex than their constellative counterparts, they offer the mass of the peoples an outlet of wonderment that All can appreciate and participate in.

[1:10:58] As one of the central practices of wonderment, asterism offers that which other forms of wondermental practice do not; a practice that the ignorant, the poor, the knowledgeable, and all the challenged peoples can participate in.

[1:10:59] As the philosophical ascension begins, and the rise of Cosmic Philosophy follows in direct succession, a rejuvenation in constellation study will emerge too, and within this, the Astronist Tradition shall rise beyond the tradition once known.

[1:10:60] The adoration, and laudation of constellative starpatterns is central and intrinsic to wider Cosmic Philosophy and wonderment of The Cosmos for this practice is a direct way in which one may wonderment regularly, and constitutes a closer connection between oneself and The Cosmos.

[1:10:61] The components of the Astronist Tradition of constellations will be lattermentioned, though will not be constituted and organised within the Omnidoxy as that will be reserved for another future canonical text.

[1:10:62] The third and final type of astral wonderment which will be introduced now and therefore studied hereafter is that of omnistellation.

[1:10:63] The constellations relate to only groups of stars, and asterisms to star groups even fewer in size, yet when one looks up at a cloudless night sky, one sees the entirety of the sky, not just the groups of stars which form patterns.

[1:10:64] That laudation and adoration which relates to the entirety of the stars in the night sky above oneself at one time is hereby and thereafter known as an omnistellation.

[1:10:65] This is the wonderment, laudation, and adoration of the entirety of the stars in the night sky, not just one group, or one single star; in this practice, the entirety of the astrature is that which is perceived.

[1:10:66] It is also encouraged for peoples with experience, and experience none, to record, or photograph the omnistellations they do witness along with the time, date, and location of their viewpoint.

[1:10:67] Unique in its form and wondermentality, omnistellation is the considered the most advanced form of astral wonderment due to its potential vastity and its all-encompassing nature.

—

[1:10:68] At witnessing as aforementioned the formation of the new study of Astrobiology, there came a rush of thoughts in mind that centred themselves on the relation between the discoveries of The Cosmos and the disciplines of study already in existence.

[1:10:69] The intrinsics of such new studies will not be explained in this writing for their opportunities, complexities, and potential vastities would drive away from the core writing of the Omnidoxy, yet fear not, for their fruits of potential will be explored in books beyond this written text by a mind more experienced in their intrinsics.

[1:10:70] What we must remember though in time's future is the birthplace of such new disciplines of study; we remember the Omnidoxy for its role of birthing and mothering these studies into the world and academia.

[1:10:71] As aforementioned, if we are to discover new worlds then the discovery of new life is inevitable in our cosmical path; the course by which we proceed is tempered with such new abundances of discovery.

[1:10:72] So much so that we risk losing order and organisation, which we will retain with the categorisation of concept and discovery into subjects new and tailored to the topic in question.

[1:10:73] If we are to discover new life on new worlds, we must study such new life and its different evolutionary path upon which we progressed; too, we must study the wondermentful new species possible on these worlds new; this study will henceforth be known as Astrozoology.

[1:10:74] That which we cannot see is that which we dependent upon the most; this is true in the physical laws of The Cosmos in The Universe for we are dependent upon the chemicals from which we are structured.

[1:10:75] Can we not appreciate that chemistry is diverse, and real, and fundamental in every aspect of physical and cosmical existence; with this principle forefront, we must study the chemical aspects of the stars of The Interstellar.

[1:10:76] This study is already established, though in its infancy for certain, yet the greater advances we make in the humanic exploration and discovery of The Cosmos and its stellar elements, the wider the study of Astrochemistry will become.

[1:10:77] All greatneses develop derivations and new interpretations as is true for all the great studies established, and thereby, this will stand too also for the context of Cosmic Philosophy, the greatest of all philosophical, idea, and thought studies.

[1:10:78] Naming just one here and now would be Astrophilosophy, though many are aforementioned and lattermentioned throughout this writing.

[1:10:79] A derivational study grand in and of itself, but that which it entails is far greater in gravity than some of its counterparts for Astrophilosophy focuses its time on dealing with All philosophical and wondermental relations towards stars and their properties, functionalities, and their naturities, and orderities.

[1:10:80] In short, Astrophilosophy deals with All things relating between mind and stars, and serves as a grand branch of the wider Cosmic Philosophy discipline.

[1:10:81] As will the biologies and zoologies of the lifeforms be unique on the new worlds toward which we are destined and prophesied to discover, so too will the ecologies of such new worlds differ from The Earth.

[1:10:82] The ways in which the organisms of these newly discovered worlds interact with the environments in which they reside is henceforth to be known and studied as the discipline of Astroecology.

[1:10:83] As is the climate of our own world tempestuous, forever changing, and unpredictable, so it is logical to notion that the climates of new worlds are similar, and even more so, as well as feature their own uniquenesses in climatology.

[1:10:84] The study of the climates of the new worlds which we are destined and prophesied to discover is to be henceforth known as Astroclimatology.

[1:10:85] Within the same field of thought and study comes Astrometeorology, which encompasses the new discipline dealing with the unique meteorological structures and phenomena of new worlds discovered as destined and prophesied so.

[1:10:86] And too, the study of Astrotopography; the newfound discipline dealing with the study of the lands, and the structures, the appearances, and the natures of such lands new and undiscovered by humanity.

[1:10:87] The greatest way to save the things we love and adore is to document them in ways new, abundant, and memorable; from this principle stems the creative branches of new cosmically related studies, the first of which being Astrophotography.

[1:10:88] As lattermentioned, the taking of photographs in order to preserve thought, record, meaning, and purpose to those things which we find most important is key to the promotion of principles, the distribution of philosophies, and the propagation of the ways by which one may wish to wonderment.

[1:10:89] In more general terms, the increase of the photos of astral, cosmical, and celestial entities and phenomena further centralises their positions in art, culture, and wider creativities.

[1:10:90] Too, the greater the mediums and platforms by which cosmical wonderment, laudation, and adoration may be conducted, the greater number of peoples will benefit from such practices.

[1:10:91] The galvanisation and establishment of the subject, industry, and creative medium of Astrophotography will prepare ourselves for the greatest opportunities ahead to take the most grand pictures imaginable and unimaginable to ourselves right now.

[1:10:92] That which exists in The Cosmos cannot be fully appreciated by the masses until visualised and distributed throughout the world of peoples, and to do so, the greatest and most creative of photographers and artists will be required; they must begin practising now through the study of Astrophotography.

[1:10:93] To complement, the studies of Astrofilming, Astrovideography, and Astrocinematography will certainly further supplement the disciplines aforementioned.

[1:10:94] And too, will distinguish their own separate, distinct, and in-depth theories, practices, and methodologies of how a creator may capture the grandities of The Cosmos in their chosen medium in the greatest, most striking way possible.

[1:10:95] Not only will such studiers of the cosmical art subjects aforementioned need to reach skilled and creative heights not yet explored, but too, they will need to be some of the greatest of wondermenters of the all the peoples for the capture The Cosmos in any medium, one must first understand, respect, and revere The Cosmos through wonderment.

[1:10:96] As the technologies evolve to capture such mediums, and new mediums themselves as not yet invented reveal themselves to the world, the cosmical creators and artists and wondermenters will too change, develop, and improve upon their craft as did and do all other craftspeople.

[1:10:97] The mastery of a craft takes a lifetime, but the revolution of a craft may take several lives to accomplish.

[1:10:98] In essence, the photographers, the cinematographers, and the videographers are all encouraged and somewhat expected to record that which they discover, and that which they feel is worthy of note and further theorise in method, practice, and philosophy.

[1:10:99] The recordence of such worthy notes and notions may just be the scribbles that ignite the fires of essays and treatises on a way of thinking never before understood, or known.

[1:10:100] Without such recordences, and without the preservation of such a habit, we risk laziness in notation, and in that, we risk losing the opportunities to change for All that change is stems from an idea, and from where ideas originate is the human mind, and when one does have an idea, it must be noted for if properly nurtured and respected, that single scribble could change our world and worlds beyond more than we can ever imagine possible, probable, or rational.

[1:10:101] If the ideas our grand minds produce are constantly washed away by the tides of our own inabilities to appreciate them, then we will end with receiving no ideas, and this is the scariest notion in All of the Omnidoxy.

[1:10:102] To mark the end on this ponder, how many ideas have been lost to the vacuum of non-existence throughout the course of our histories, and especially so since our minds have turned sloth? Any figure beyond zero is a figure too high and too hard to bare for a mind of ideas upon it depends.

—

[1:10:103] If it is our destined and prophesied path to explore The Cosmos, then we shall need technologies and engineerings in order to conduct such operations.

[1:10:104] We must navigate The Cosmos both in our minds and in the physicality; constructing transports and technologies in order to know where which we travel toward.

[1:10:105] In this principle, we are introduced to Astronavigation; the collective technologies, digital systems, and engineerings geared towards the humanic physical discovery of The Cosmos.

[1:10:106] We must know to where which we are to discover in both our minds and in the physicality and through such, the creative minds of the people shall produce vessels onto which our peoples will climb, and on which they shall travel, journeying towards the destined new worlds.

[1:10:107] The astronavigators shall manoeuvre through the elements of The Cosmos, and will know to where which they are to journey by both their minds and the technologies by which they transport our peoples.

[1:10:108] The astronavigatory systems created by the greatest of minds will guide the greatest of explorers whom shall be remembered in All humanic histories for being those individuals whom pioneered the entirety of humanity towards the exploration of The Cosmos.

[1:10:109] The astronavigational methodologies and principles shall be discovered and philosophised by the greatest of minds of the age and such new systems of thought shall structure the ways of astronavigatory activity.

[1:10:110] If we are to explore The Cosmos in ways not yet imagined, then we are to develop strengths to explore it in actuality.

[1:10:111] To establish our minds to explore The Cosmos is just the first stage and the second is the development of technologies, and transports to conduct such exploratory activities.

[1:10:112] The activity and process of actually exploring The Cosmos is to be henceforth known as Astrogation; the transportation of peoples through space; through The Cosmos.

[1:10:113] That which actions conducted astrogationally are reflected in the wonderments of peoples; the children of wonderment look up to the stars now and can only wonderment on what it shall be like to be an astrogater.

[1:10:114] That which the children may only imagine now is that which will one day occur and be experienced by their descendants, but it is the wonderment, the actions, and the developments made by those children that make that which the descendants experience.

[1:10:115] It is therefore the duty of the ancestors to develop the philosophies, the methodologies, and the technologies in order for the descendants to utilise, apply, and subsequently experience them.

[1:10:116] The astrogators and the astrogatrixes of the future peoples shall hereby and henceforth be the icons of ages and the embodiments of wonderment for they are the first and foremost experiencers of the cosmical wonderments.

[1:10:117] It is with certainty that the process of astrogation shall become a centrality and a normality to All peoples when the time comes as destined and prophesied so, but as is true for many other aspects aforementioned and lattermentioned, we must prepare for such developments in our minds, in our spirits, in our intellects and in our societies.

[1:10:118] The principles of astrogation are from here and henceforth understood to be as follows; humanity shall explore The Cosmos with the technologies developed as destined so, and with which on their travels, they shall hold true to the philosophy they left The Earth with.

[1:10:119] In astrogation, we must explore The Cosmos, but too, understand its superiority over us, and we must too understand its universal right and will to command of us how it sees fit, and finally, we must respect, wonderment, and oblige All The Notions of The Cosmos.

[1:10:120] As all notions of thought, the minds of humanity shall interpret such according to their own wills and wants, yet the core principles shall always stand true if it is the original words from which one reads.

[1:10:121] The astrogative moments of the lives of our descendants shall be the greatest imaginable; the elements they shall see, the events they shall witness, and the discoveries they shall consequence will forevermore complement their understandings and devotions of The Cosmos in The Universe, and shall, in hope, turn back to this writing as the inspirer of the minds of their ancestors; this is All one philosopher can hope for towards the futurities of his principles.

[1:10:122] In earnest, such astrogative moments shall not occur if the works of our generation now in both philosophy, technology, and subjects abundant, are not fulfilled in ways proper, thorough, and with a clear vision of the futurity of the peoples.

[1:10:123] In minds imaginable shall the wonderments come of the futurity of the world, the peoples, and the worlds beyond our own.

[1:10:124] Finally, we must imagine the astrogators and the astrogatrixes and how in which they shall feel, think, and understand when they face, in physicality, the elements of The Cosmos, their grandity, vibrancy, and immensity.

[1:10:125] This is one of the cosmical moments to which we all strive toward for the realisation of The Cosmos in The Universe as the centrality to our existences, and as the originator of All ordered things, and all things of wonderment, is of the highest ambition in all cosmical adoration, laudation, wonderment, and philosophy.

—

[1:10:126] The Moon has been our overseer, our closest cosmical neighbour, for a time long before humanic existence, and in this, The Moon has become the vessel into which we have place much of our cosmical hopes, dreams, and wonderments.

[1:10:127] The Moon is that which we call the moon nearest to us, but the study of Selenology in the Astronist tradition is much greater in depth, scale, and diversity than the study of just our The Moon alone.

[1:10:128] Selenological study is the discipline in which one studies all aspects of moons in The Wider Cosmos beyond The Moon itself, and such moons' relations with their planetary counterparts, as well as their orderity, naturity, and functionality, as well as incorporating many other instruments of study.

[1:10:129] There are as many branches of Selenology as their moons in The Cosmos, and that which we study of moons may well lead to the eventuality of understanding the planets, the stars, and The Wider Cosmos for moons, despite their apparent inferiority compared to the other celestials, hold some of the greatest revelations about The Cosmos.

[1:10:130] Before exploring the basic principles and disciplines within Selenology, we must first discuss moons in relation to wonderment.

[1:10:131] Moon adoration and laudation is intrinsic to humanity ever since our civilisations had peered up to the night sky and saw a world bearing down upon us, eternally watching over our peoples as we fought, loved, and progressed alongside each other.

[1:10:132] Towards which the future we look is the placement of greater importance to Moon Laudation, not only just of The Moon itself, but the moons of other worlds beyond our own once our knowledges of such can grasp the structures, functionality, and naturities of such new worlds.

[1:10:133] As just aforementioned so, from our place here and now, we should recognise moons as new worlds for they constitute a distinctness from any other celestial, they hold their own topographies, functionalities, and structures that justifies their classification as new worlds as viewed through a cosmic philosophical lens.

[1:10:134] Despite moons being rotative around and dependent upon worlds larger, they do constitute their own uniqueness in geological, cosmical, and elemental structuring, and perhaps offer themselves as habitable safe havens from worlds hostile to humanic physiologies.

[1:10:135] If the planet is the brain, then its moons are its limbs; such a relationship is continuous, interdependent, and co-operational in nature, structure, and function.

[1:10:136] Begin again toward the exploration of the discipline of Selenology for its many revelations, discoveries of the nature of The Cosmos in The Universe, and all its potential understandings of the cosmical orderity, make Selenology one of the centralmost branches of knowledge within Cosmic Philosophy.

[1:10:137] The naturity of moons is that they must rotate around the planet playing the role of the offspring; the moon is forevermore dependent upon the planet and this is the cosmical orderity.

[1:10:138] The moons of The Cosmos are abundant and rare; small and great; free and dependent; the moons are the greatest oxymorons of The Cosmos, and this is the naturity of moons.

[1:10:139] Moons bear down on the planets around which they rotate, forever falling closer yet forever being held in position by the great force of gravity.

[1:10:140] By the orderial accordance on gravity in The Cosmos in The Universe, all the moons are in grand assimilation for their planetary highers; they are destined to be bound to their planetary parents.

[1:10:141] The functions of moons constitute affects on the planet around which they rotate, and like the tides of The Earth do operate in accordance with the gravity of The Moon, so too, do the gravities of All other moons constitute impacts upon their own planetary highers.

[1:10:142] Under the guise of the cosmical orderity comes the moons of The Cosmos and their lunar forms, create unique wonderments in the minds of us All.

[1:10:143] The Selenologists see moons in ways we can only hope to, for they truly see, feel, and know the intrinsic grandities of the subworlds and their uniquities and their naturities.

[1:10:144] The selenological study provides those whom participate in it to understand the functions, the roles, and the relevancies of the elements of The Cosmos known as moons.

[1:10:145] In the Humanic Exploration of The Cosmos, we cannot forget the importance of moons and the importance of establishing civilisations and developments on moons for they are waypoints along the greater journey.

[1:10:146] From our stationary perspective here and now and before, The Moon has exhibited itself in phases; revealing itself fully only once every month if we are lucky enough to witness its entirety.

[1:10:147] It is important to discuss moon phases for they highlight to us our lack of physical vision of The Cosmos for that which is closest to us and that which is dependent

upon the planet on which we reside still controls the extent we see it and at which times and in which places.

[1:10:148] Suspended in the vastity of space, The Earth and The Moon represent the greatest microcosm of The Cosmos for we now know that the planet-moon co-operation is in occurrence billions and trillions and countless more times over throughout The Cosmos, yet we witness that very co-operation here and now and have done since we could understand it.

[1:10:149] The phases of moons aforementioned not only occurs by The Moon itself, but by All other moons of The Cosmos in their own unique, ordered, and wonderful sequences, and if this is not a subject of laudation, then little else can be called as such.

[1:10:150] The orbital courses of moons demonstrate a new dimension of the concept of centricity for to the moons, their centricity lies not with the star, but with the planet around which they rotate.

[1:10:151] Moons are the offspring of the offspring; the product of products of The Cosmos, though this does not diminish the extent of their grandity in any way for it is true that we shall learn so much of The Cosmos from the moons we are destined to encounter on our cosmical exploratory journey.

[1:10:152] The duty of the selenologists of us is to see The Cosmos through the lens of moons; from the lunar perspective, and such a perspective changes the paradigms of The Cosmos and how, what, and why it exists, and functions the way we perceive it to.

[1:10:153] Whether it be within the shadow of The Earth, or facing in The Sun in All its direct divinity, The Moon and the moons beyond that which we are in proximation to, shall always be signals of cosmical orderity, and shall forevermore be symbols of The Divine Product.

[1:10:154] As the moons of The Cosmos rotate around their planets, and the planets follow their own courses around the centralities of the cosmical system, the cosmical orderity is fulfilled as Divinely instructed so.

[1:10:155] The lunarity, similar in nature to planetarity, is the instrument of study relating to the philosophical discussion of moons and their place within the wider cosmical orderity.

[1:10:156] The orbitality of the moon, and the orbitality of the planet are intrinsically dependent upon the naturity of the centrality around which they rotate.

[1:10:157] For the cosmical orderity to be understood, we must understand the intrinsicity of rotality in the system for rotation exists in almost every cosmical element.

[1:10:158] The rotality of rotalities is essence of cosmical orderity; moons rotate and orbit planets, planets rotate and orbit stars, and stars rotate and around which every other celestial in orderity orbits.

[1:10:159] We must understand the rotality of rotalities in this way in order to understand the functionality and orderity of The Cosmos as it exists to us now.

[1:10:160] The study of moons demonstrates the microcosm of this way of thinking towards The Cosmos; the anglement of moons orbiting planets is, too, another element of orderity that must be understood.

[1:10:161] The Moon is angled in relation to The Earth's orbitality within greater relation to The Sun's presence as the centrality of the system.

[1:10:162] By the shadow of The Earth, The Moon shall always rise and reveal its wonderments, and by the glory of The Sun, The Moon shall turn to darkness until its face is illuminated by the solarity once more.

[1:10:163] As it is our destiny to explore the worlds of The Cosmos as prophesied so here, now, and foreverafter, we too, must explore the subworlds of The Cosmos; the moons hold perhaps some of the greatest revelations of The Cosmos and these are such treasures that we cannot afford to ignore.

[1:10:164] So, children of the world, continue on with the wonderment of The Moon as a symbol and microcosm of All the moons of The Cosmos as your ancestors have done and as your descendants shall do in actuality and physicality.

[1:10:165] It is your wonderment, laudation, and adoration of the moons of The Cosmos now that shall lead the way for greater understanding of The Moon itself, and all its counterparts within the cosmical orderity.

—

[1:10:166] Within selenology, there are many concepts and areas of study, though one that has always caught great attention is that of the apolune; the point furthest away in the orbit of a moon.

[1:10:167] Just as there are the dynamics of solar and planetary orbitalities, there are too, the dynamics of lunar orbitality, which establishes itself as a major branch of selenology, and a branch of great philosophical discussion.

[1:10:168] The apolune; the furthest point from the moon in the lunar orbitality; the furthest point from the centre of the orbit; the furthest from that which it depends upon.

[1:10:169] Just like the aphelion point in the planetary orbitality, the apolune point is the coldest and the darkest point in lunar orbitality; the furthest reaches of the moon's gravitational influence.

[1:10:170] The great addition, however, to the concept of the apolune is that of its subject; a planet cannot orbit a moon, and neither can a star for this is just cosmical madness, and so, the commonmost subject of the apolunal point is spacecraft.

[1:10:171] The technologies of cosmic exploration are lattermentioned and discussed, though here we see an example of how in which humanic transportations and technologies would infit with the cosmical orderity.

[1:10:172] In this concept, too, we can see the relativity in size of ourselves and the cosmical elements; the star is orbited by the planet, the planet is orbited by the moon, and the moon is orbited by that which we create; we are an orbital product threefold smaller than that of the star in a typical system.

[1:10:173] If our technologies, transportation, and civilisation are to orbit the moons of The Cosmos, then we must understand the moons around which we are, in the future, destined to rotate.

[1:10:174] The moons of The Cosmos are part of our future habitats in The Cosmos; not just the planets are those which offer future homes and civilisations for humanity, but the moons of The Cosmos too.

[1:10:175] The Apolunic Principle stands as that wherein humanity must explore the moons of The Cosmos and to realise the wonderments of moons; this principle demonstrates something much larger about the relationships between humanic exploration and the moons of The Cosmos.

[1:10:176] A broad interpretation of The Apolunic Principle encompasses the entirety of All of humanity's encounterments with lunar elements of The Cosmos, and affirms that such lunar elements are intrinsic and entirely essential to successful humanic exploration of The Cosmos.

—

[1:10:177] Since humanity's first steps on a celestial other than The Earth itself, the astronauts and the cosmonauts have been the human manifestations of cosmicality and wondermentality; it is this aspiration of the children of the world that we must preserve and continue to encourage if we are to establish cosmocentricity in our societies.

[1:10:178] The astronauts and the cosmonauts, as the precursors to the astrogators and the astrogatrixes, or the cosmogators and the cosmogatrixes, must become the centralmost

iconic figures of society and must always be venerated for their bravery, wonderment, and sense of discovery.

[1:10:179] The discipline titled Astronautics, also known as Cosmonautics, references to the study of the individuals known as Astronauts and Cosmonauts, their lives, their stories, their philosophies, their methodologies, and all else concerning whom they are, as well as their venerations within certain societies.

[1:10:180] The astronauts are humanity's first representations in The Cosmos; they shall leave the first footsteps of humanity on the new worlds which we are All destined to explore.

[1:10:181] Not without the peoples of humanity shall the astronauts and the cosmonauts have in their minds during their first venturments into the new worlds of The Cosmos for they shall always remember for why and for whom they explore.

[1:10:182] For this to occur, that which we teach our offspring must change forevermore in parallel to the changes of the world as destined and prophesied so.

[1:10:183] We must teach our children of the wonderments of The Cosmos and ignite their adoration and laudation of The Cosmos so as to inspire the children and the youth to become the next generation of astronauts, discoverers, and exploratory pioneers.

[1:10:184] An aspect of the Humanic Exploration of The Cosmos which we must not forget is that it shall not take place in a vacuum, but in concurrence with other events of humanity, and the exploration shall take shape in many forms, subjects, and missions venturing off into different directions to explore distant new worlds of The Cosmos.

—

[1:10:185] An astrophile is henceforth known as an individual holding a specific, and typically obsessive fondness for the stars, and of The Cosmos, this person would be called a cosmophile, and exhibiting astrophilia and cosmophilia respectively.

[1:10:186] Showing astrophilic, or cosmophilic tendencies should not be so quickly classed an illness though it has become commonplace to designate all that does not align with normalcy as being deficient.

[1:10:187] Astrophilia and cosmophilia should instead be viewed as a gift by which certain individuals are granted by The Will of The Cosmos to envision The Cosmos in a way unique, and emphasised, and in such a way that may lead to greater wonderment, and further cosmical findings.

[1:10:188] To hold astrophilic, or cosmophilic tendencies is to see The Cosmos in a way unique to us All and in a personal way which the rest of us can only hope to experience in our existences.

[1:10:189] Astrophilia may be characterised by an excessive knowledge and memory of the names, positions, and general features of the various stars of The Cosmos.

[1:10:190] Cosmophilia may be characterised by an excessive knowledge and memory of the specific names, locations, and features of a large number of cosmical phenomena.

[1:10:191] Compared to that which seems to hold a strong sway over the current mass of peoples of the world known as both Astrophobia and Cosmophobia, both astrophilia and cosmophilia are considered great honours to be bestowed upon individuals, and greater still for the macrocosm of society, especially during philosophical reascension and cosmocentralisation.

[1:10:192] Often those whom experience astrophilia and cosmophilia as I, as Cometan, often do, the writer of Omnidoxy, experience much similarities in mind, often the greatest of wondermenters are produced for the ability of the wondermentation is often amplified beyond that which can be reached by not possessing astrophilic, or cosmophilic tendencies.

[1:10:193] And yet still, it is essential that astrophilia and cosmophilia must hold onto their rarities for to dilute a gift, is to cheapen its ability, its purpose, and its gravity to impact the receiver.

[1:10:194] Despite that which concentrations of astrophilia and cosmophilia may do to the minds of their inhabitants, their concentrative and most extreme variations in minds few are best applied and impactful to the surrounding world.

[1:10:195] Whatever the world and the peoples of the world do, we must not treat such astrophilic and cosmophilic tendencies as outcasts, as defects of abnormalities, but instead, enhancements of the mind towards greater cosmical wonderment and in the end, greater cosmical exploration and discovery.

[1:10:196] Raise the astrophiles and the cosmophiles to heights of wonderment unperceived before their time and praise their unique gifts to see The Cosmos in new ways for the greatest of minds are often tainted by the most unique of abnormalities.

[1:10:197] In essence, the astrophiles and the cosmophiles are not to be feared, but cherished, and not rejected, but accepted, even if the mass of the peoples do not understand the origins of their gifts, or why they have been chosen by The Will of The Cosmos to see The Cosmos through a greater lens.

[1:10:198] The Astrophilic (Cosmophilic) Principle encompasses the belief in the greatness and intrinsic beauty of the excessive wonderment, adoration, and laudation of The Cosmos and any one of its elements.

[1:10:199] This same principle also encompasses the belief in the uniqueness of all astrophiles and cosmophiles and the endless preservation of their rarity.

—

[1:10:200] The study of a work or treatise on astronomy, cosmology, and all relations of celestial entities, the cosmical order, and universal principle, and the most intrinsic elements of existence, an example of which being the Omnidox itself, is known as Phantasmatography.

[1:10:201] Phantasmatographical study is conducted in theory, and by applicative means in order to better understand all documentations relating to Cosmic Philosophy, and all philosophical interpretations of The Cosmos, The Universe, and humanity's role within them.

[1:10:202] Phantasmatographers are dedicated in their academic vocations in understanding and interpreting documentations in order to produce criticalities of work.

[1:10:203] Also, phantasmatographers are obliged to present these works of criticality publicly to the mass of peoples of the world in order to allow the peoples to decide whether their interpretation is logically justified, balanced, and realistically applicative to the current or the future methodologies.

[1:10:204] The interpretation of writings has formed some of the greatest and some of the worst consequences of our history, therefore demonstrating the immense importance of the accurate interpretation of writings and the skilled, balanced, and undistorted minds need to conduct such research and study by proper means and manner.

[1:10:205] The interpretations of writings are simply illusions of the originality; the fissions of the initial work; the distorted fixations of readers whom wish to change the works to suit their own means.

—

[1:10:206] As a major branch of Cosmography, the discipline of study titled Phenomenography relates to the philosophical study of the abnormal and phenomenal elements, events, and occurrences of The Cosmos and their features, functionalities, naturities, and by application to other instruments of study.

[1:10:207] Phenomenographic study encompasses the philosophical discussion of elements of The Cosmos that are new to our own perceivences and that which have never been known to us in previous times.

[1:10:208] Phenomenography consists of all that is new in The Cosmos in relation to the visions and knowledges of humanity, and relates to the philosophical discussions and studies of these new aspects of The Cosmos.

[1:10:209] As the Humanic Exploration of The Cosmos continues on in its grand trajectory, the discipline of Phenomenography shall grow in extent and in popularity for the more we explore, the more we shall discover entities not known beforehand.

[1:10:210] In the essence of phenomenographical study stands the principle of the grandity of The Cosmos and the perpetual ability of The Cosmos to reveal new dimensions, aspects, and elements of its existence to humanity, and is a study that cherishes this wholly and forms the foundations of the methodologies of phenomenographers in their vocations to study this newfound and forever developing subject.

—

[1:10:211] Planetary studies, also known as planetology, encompasses as many branches of knowledge as there are planets in The Cosmos for the unquity of each planet constitutes a new branch of study.

[1:10:212] The branches of knowledge of planetary studies within The Solar System are officially henceforth listed in order from the solar centricity outward: Mercuriology, Venology, Terrenology, Aerography, Joviology, Saturnology, Uranology, and Neptology.

[1:10:213] Under the planetary classification and appellation system of the Astronist Tradition, there shall rise an endless array of new branches of knowledges within Planetary Studies, which is the study of planets under a purely philosophical lens.

[1:10:214] Rejoice as the academia relating to The Cosmos grows in complexity, depth, and scale as our discoveries, classifications, and philosophical astuteness of The Cosmos continues to develop.

[1:10:215] In Mercuriology, the philosophical discussion of the planet of Mercury occurs, and reflects proximity to the centrality; the centre of life, heat, and light; the centre of ourselves manifested in starform.

[1:10:216] In Venology, the philosophical discussion of the planet of Venus occurs, and reflects the tempestuity of existence; the oppositism between The Cosmos and The Chaos; a reflection of humanity's inner war between orderity and disorderity.

[1:10:217] In Terrenology, the philosophical discussion of the planet of The Earth occurs in relation to its other planetary counterparts in The Solar System, and reflects perfection in The Cosmos; locational medianity; the place in The Cosmos wherein life exists, is to be cherished, and is to be destroyed one day if that is The Will of The Cosmos.

[1:10:218] In areography, as aforementioned, the philosophical discussion of the planet of Mars occurs, and reflects the planet to which humanity shall explore firstly and symbolises the immense possibilities that The Cosmos does hold with regard to the existence of life, the civilisations of new worlds, and the study of new worlds.

[1:10:219] In Joviology, the philosophical discussion of the planet of Jupiter occurs, and reflects the new worlds of moons, and the grandity of cosmical elements in their size, scale, and topography.

[1:10:220] In Saturnology, the philosophical discussion of the planet of Saturn occurs, and is a reflection of the beauty and aesthetics of The Cosmos in a planetary form due to its unique rings as symbols of cosmical wonderment.

[1:10:221] In Uranology, the philosophical discussion of the planet of Uranus occurs, and reflects cosmical obscurity, and the ability of The Cosmos to surprise, and to justify its will at any time.

[1:10:222] In Neptology, the philosophical discussion of the planet of Neptune occurs, and reflects the outermost cosmical elements of The Solar System; the coldest, the darkest, the quietest, and the distantest world in The Solar System.

—

[1:10:223] With the Humanic Exploration of The Cosmos will inevitably come the regulatory aspect of the ways in which our peoples must treat The Cosmos and all its elements, features, and the ways in which we must treat each other whilst exploring and civilising The Cosmos.

[1:10:224] With this principle in mind, Spacial Law, also known as Planetary Law, is hereby and henceforth established as the discipline of study relating to all aspects of regulation, order, and systematic rules regarding all areas of humanic interaction in The Cosmos and the new worlds of The Cosmos.

[1:10:225] The Humanic Exploration of The Cosmos and the development of humanic civilisation in new worlds shall change all aspects of law, sovereignty, and societal structure, and human interaction.

[1:10:226] This must be prepared for by the establishment of Spacial Law under the Astronist Tradition in order to develop a fair, balanced, and clear system of regulation for all aspects of societal law in The Cosmos.

[1:10:227] The nature of the minds of peoples is such that without rule and regulation, chaos shall ensue, and in order to secure our civilisations in the worlds beyond our own, we must establish newfound rules and regulations.

[1:10:228] If we are to explore new worlds, we must establish rule and regulation in these new worlds, but too, we must establish law between these new worlds and such is introduced and developed as Interspatial Law, also known as Interplanetary Law.

[1:10:229] The intrinsicities, fundamentalities, and foundations of the Astronist Tradition of Space Law is thoroughly detailed in The Treatise on the Establishment of Spacial, Planetary, Interspatial, & Interplanetary Law in a post-omnidoxical setting.

[1:10:230] As one of the centralmost and importantmost of the practical aspects of the Humanic Exploration of The Cosmos, the Astronist Tradition of Spacial Law shall henceforth stand as the first of many systems of law beyond The Earth, and many systems shall be inspired and shall descend from it.

[1:10:231] The moment the first human steps foot on a world beyond our own to establish a new civilisation, there must a suitable system of rule, regulation, and judiciary.

[1:10:232] That which must be stressed now is the vastity of Spacial Law, and its immense possibilities for as we explore new worlds, new aspects of law shall rise, and they shall be aspects never before encountered.

[1:10:233] Spacial Law is in an unexpanded state of infancy, though this shall not continue; Spacial Law and its many branches of study and applicative theories shall expanded in parallel to humanity's expansion into The Cosmos.

[1:10:234] As aforementioned, the immensity of our first steps on new worlds must not be understated; the entirety of whom we are as a people shall be tested in ways of morality, faith, philosophy, and societal order.

[1:10:235] We must prepare ourselves for these immensities of change, and we must know exactly whom we are and whom we wish to be in The Cosmos; a reflection of this will reside within Spacial Law, for it will be in the laws we make, that reflect the people we wish to be.

[1:10:236] We must establish law for reasons such as order, security, and fairness, but too, we must establish law to protect The Cosmos from the wrath of humanity for although The Cosmos is willing for us to explore it, we must respect it foremost and forevermore in its beauty and we cannot taint such directly divinity with our minds of greed.

[1:10:237] And therefore, it shall be that Cosmic Ethics must be established too, as a branch of Spacial Law, in order to develop philosophies and laws on the ways in which we are as

a peoples, as a civilisation, and as individuals, are to explore, civilise, and study The Cosmos and all its wondermental elements and phenomena.

[1:10:238] Wherein which we stand is wherein which we reside and have resided since our births, yet the frontier next, is beyond All we know and have known before; we are not traveling lands, we are not traveling oceans, we are traveling distances beyond our current comprehensions and lands and oceans whose topographies are unknown to us entirely.

[1:10:239] With this, the importance of establishing a withstanding set of laws for space exploration is demonstrated and must, with the Omnidoxy being its central inspirer, be introduced, and developed for its eventual implementation.

[1:10:240] We must protect The Cosmos, and too, we must protect ourselves from that which we know we can become with minds of greed and jealousy and corruption in leadership.

[1:10:241] Take the words of The Grand Centrality to be the precursory statements of the establishment of Spacial Law, and the precursory foundations of the details of Spacial Law and all its fundamentalities and complexities.

[1:10:242] Ever since we have walked The Earth, humanity has needed law; has thrived since lawful invention; in our civilisations beyond The Earth, there is no exception for we are still the same in our natures despite the changes of how in which, where in which, and why in which we live.

[1:10:243] Astronism shall hereby become and henceforth stand as the champion of Spacial Law of the Astronist Tradition, and shall forevermore be understood as the preservationist of Spacial Law and all its Astronist philosophical and theoretical traditions for the betterment of The Cosmos, and for the betterment of peoples.

The Observable Cosmos & The Unobservable Cosmos

[1:11:1] In this theme, the naturity of The Cosmos and The Universe shall be explored in both isolation and in their intertwined states as is their two natures to be both separate and forever connected with one another.

[1:11:2] Cosmology in Astronist/Astronic philosophy and tradition understands that The Cosmos and The Universe are separate in form, purpose, and nature, yet too, created from the same origination, by some Divine entity.

[1:11:3] The Cosmos is All that is within existence; All that can be seen, All that does exist, and All that shall be seen and shall exist until the end of The Cosmos.

[1:11:4] The Cosmos resides within The Universe for The Universe stands as All that is beyond that which can be seen; All that which exists, and so, The Universe is forever undefined in its entirety for its size, dimensions, and dynamics cannot ever be known to that which resides within The Cosmos.

[1:11:5] The Cosmos is limitation, orderity, control, and structure; The Universe is unlimitation, eternity, and is the place within which The Cosmos exists.

[1:11:6] When we speak of The Cosmos as All that can be seen and All that does exist, we speak so from the perspective of The Cosmos itself, not from the perspective of humanity for humanity cannot see All that can be seen and cannot know All that does exist within The Cosmos for there are parts of The Cosmos that shall never be visible, or known to us.

[1:11:7] Philosophical Cosmology attempts to attain clarity of cosmical origination, development, and destiny, as well as purposivity, naturity, orderity, and incorporates many other instruments of study along its theoretical discussion of The Cosmos, but insists that All that is said in Philosophical Cosmology has some grounding in that which we know from the cosmological sciences.

[1:11:8] In the Astronist Tradition, cosmology constitutes as holding a finite beginning and a finite end, and too, in reference to its dimensions, a finite point of origination, and a finite point of extremity.

[1:11:9] Humanity's Cosmos is that of The Cosmos that we know to exist; the stars, the planets, the galaxies, the cosmical phenomena, and all the space between in distance that we know to be real.

[1:11:10] However, Humanity's Cosmos is considered to be a fraction of The Cosmos in its entirety, and this important distinction must always be made between The Cosmos and Humanity's Cosmos.

[1:11:11] The Cosmos and The Universe are to be intrinsic to one another's existences forevermore until Divine Will commands it otherwise for The Cosmos exists within the underpinnings of The Universe and this is the first fundamentality in the naturity of The Cosmos in The Universe.

[1:11:12] That which exists in The Cosmos, too, exists within The Universe for All that does exist, must be within The Universe for The Universe is All things existent.

[1:11:13] That in which The Cosmos exists is The Universe, but the extent of The Universe cannot be known to anything that is within The Cosmos, therefore, only The Divine, which it could be said to be The Universe itself, is the only entity that can possibly see and know All that is The Universe and All that is within it.

[1:11:14] The naturity of The Universe is that it is All the entirety of existence; it is All that can be encompassed and All that was, is, and shall be.

[1:11:15] The naturity of The Universe is that it is in no way cosmical for in the Astronist Tradition, to cosmical is to be finite in naturity, and The Universe is the oppositism of finity; in fact, it is All that is infinite.

[1:11:16] The nature of the relationship between The Universe and The Divine is one of immense importance to the Astronist Tradition of cosmology.

[1:11:17] If The Universe is All that was, is, and shall be, and is All that could be, and All that could possibly and impossibly be, then it must hold some Divine nature.

[1:11:18] The Divine naturity of The Universe is accepted, though in the Astronist Tradition, and for the sake of here and now, The Divine is considered separate from The Universe, though The Divine and The Universe could be said to be One and the same depending upon the theological position taken; in Astronism, it is understood that The Divine's principal role is its sustainment The Universe rather than its creation of The Divine.

[1:11:19] Due to the naturity of light and our ability to perceive, there are parts of The Cosmos that we shall forever be outside our visibility and knowledge for the light from such distances shall never have enough Time to reach our location.

[1:11:20] There is an infinite amount of things that we shall never know, see, and understand and in accepting this, we begin to understand the naturity of The Universe, and The Cosmos within it.

[1:11:21] There is no end to The Universe for The Universe is the total embodiment of infinitism; there cannot be more and there cannot be less; The Universe is All there is, was and will be and therefore, cannot be anything less, or more than what it is.

[1:11:22] The Cosmos is dependent upon The Universe as is The Universe dependent upon The Divine; and although The Cosmos constitutes its own nature, it is fundamentally and eternally intertwined to the nature of The Universe.

[1:11:23] The Universe underpins All aspects of The Cosmos and all other cosmoses and forms the bounds of The Cosmos; the limitations of The Cosmos are created by The Universe and also which creates the abundances within The Cosmos in parallel to the limitations.

[1:11:24] There are four perceptual dimensions to The Cosmos in The Universe; that which can be known, that which cannot be known; that which can be seen, and that which cannot be seen; these are formed in the concept of tetradimensionality.

[1:11:25] That which can be known forevermore, holds the possibility of being so, that is from the perspective of humanity if The Cosmos is explored extensively enough.

[1:11:26] That which cannot be known forevermore holds no possibility of being, so due to the certain Divine aspects of The Cosmos in The Universe that can never been fully understood by humanity, such as the edge of The Cosmos; this dimension is the earnestmost out of All the dimensions due to the impossibility of knowing, seeing, and understanding aspects of The Cosmos in The Universe.

[1:11:27] That which can be seen forevermore holds the possibility for humanity to physically lay eyes upon such cosmical elements such as the galaxies, the stars, the planets, and many of the other cosmical phenomena.

[1:11:28] That which cannot be seen forevermore holds no possibility of being so due to the physical laws of light traveling through The Cosmos in The Universe; there are those distantmost aspects of The Cosmos that shall never be seen by humanity; they are simply too distant from us for us to ever see, although this does not mean to say we shall never know of them which demonstrates the difference in earnestness between this dimension and the second dimension as aforementioned.

[1:11:29] In the Astronist Tradition, The Observable Cosmos relates to the parts of The Cosmos that can be seen and known now, but may not be in future times.

[1:11:30] In the Astronist Tradition, The Unobservable Cosmos relates to the parts of The Cosmos that cannot be seen or known now, and will never be, even with an infinite amount of time, space, and resources.

[1:11:31] That which we know to be The Cosmos is cradled within an infinite amount of space, time, and matter beyond its boundaries called The Universe, and in this Universe, an infinite amount of possibilities may occur in an infinite amount of times, at an infinite amount of locations, and because of an infinite amount of reasons.

[1:11:32] From the perspective of the Astronist Tradition, the best and simplest distinction between that which is The Cosmos and that which is The Universe is that the former is finite and the latter is infinite.

[1:11:33] Although we may never truly know, see, or understand The Universe, we can strive to wonderment it, and we can progress forward in the exploration of that which exists within it, that which we term as The Cosmos in the Astronic cosmology.

[1:11:34] But one may ponder regularly, where does The Cosmos end and The Universe begin? It could be said that The Cosmos ends at the point of the cessation of existence as is known within The Cosmos and The Universe begins thereafter.

[1:11:35] When one has reached the extent to which the light from The Big Bang has expanded in the amount of Time since the creation of The Cosmos, then this would mark the end of The Cosmos and the beginning of The Universe.

[1:11:36] However, one distinction must be stressed which centres on the fact that The Cosmos is within The Universe according to the Astronist/Astronic Cosmology, and so, The Universe does not begin at the end of The Cosmos in the way we understand begin, but instead, The Universe leaves The Cosmos behind as a barrier is formed between cosmicality and universality.

[1:11:37] The Cosmos and The Chaos are often paired as oppositisms and this stands true still for when The Universe is incorporated into the cosmology, and even The Chaos, with its unknown naturity, disorderity, and sporadic functionality, is still within the bounds of The Cosmos although we may not understand its place, structure, and purpose within it.

[1:11:38] In Astronist/Astronic cosmology, there are what can be termed henceforth as the Four Integrants; The Chaos, The Cosmos, The Universe, and The Divine; each one of these constituents overlaps and underpins the other, and each are interconnected in ways to yet be explored philosophically.

[1:11:39] The Chaos is within the bounds of The Cosmos and constitutes All that is seemingly non-cosmical and of such a naturity that is unknown, and is typically embodied in oblivions.

[1:11:40] The Cosmos is within its own bounds and limitations as instructed so by the underpinnings of The Universe; The Cosmos is All that is known, can be known, and All that cannot be known yet remains of a cosmical nature; that is remains transient and limited.

[1:11:41] The Universe is the underpinning, the platform, the medium upon the orderity, formity, and functionality of The Cosmos is structured and that which The Cosmos is dependent upon in order to exist; Universal nature is embodied by permanence and unlimitedness.

[1:11:42] The Divine is The Overseer; The All-encompasser; that which cannot ever be known, seen, or understood by that which The Divine creates for we are just one of an infinite amount of its creations are too inferior to be able to comprehend divinity.

[1:11:43] That which is Cosmic in nature cannot be entirely Divine for varying levels of divinity exist within all entities, and so, to be Divine is to be All things and to be Cosmic is to be such in limitation; the varying levels of divinity in entities is to be explored by the discipline of study of divinology and there will be various understandings of what constitutes greater divinity or lesser divinity in different categories of beingness.

The History & Future of Astronomy

[1:12:1] The history of astronomy is long and grand and complex as are All things that are great in their natures, and this shall not cease for the future of Astronomy shall be even more so long and grand and complex, though its clarity, purpose, and organisation shall be much different from its core to its surface and beyond.

[1:12:2] The peoples of humanity have looked up to the stars for millennia in the hope of receiving guidance, inspiration, and wisdom, and it is true that they did receive such and henceforth the future of astronomy shall build upon that notion, yet also, deepen it, widen it, and transcend it to a level never before realised.

[1:12:3] Not only is the history of astronomy deeply intertwined with the providence of guidance, inspiration, and wisdom, but too, looking up toward the stars has ignited interest in them from various topics and has been used in various industries, the first of which being agriculture.

[1:12:4] From the farmers of ancient China, to the landowners of Europe, to the great mariners of the Pacific, throughout human history until the industrial age, the stars were used as waypoints in the year to indicate the time to begin a certain agricultural process.

[1:12:5] In a religious context, too, there arises astronomical references; from the story of the nativity, to the worship of certain starpatterns, to the cosmologies of each faith, astronomy and the study of the stars has been intertwined throughout religious history, perhaps more than the masses of peoples realise.

[1:12:6] From the humanic perspective, astronomy and the study of the stars has also greatly influenced horology in relation to The Earth; in fact, astronomy structured the way in which humanity interpreted time for the stars were our only reference point of change in The Cosmos that we could use to measure time.

[1:12:7] Finally, and perhaps most destructively, the culture of astrology has been intertwined into the history of astronomy; the divination of the stars has been cheapened by the establishment of horoscopic practices in many parts of The Earth.

[1:12:8] We must now bring focus and perspective to the lattermentioned points; these categorised histories of astronomy do not reflect the immensity of astronomy's future; in the establishment of this future, we must not forget astronomy's past in order to repeat it.

[1:12:9] Astronomy, under the guise of Astronism, and the natural Will of The Cosmos, shall become the centrality of our lives in philosophy, industry, business, technology and so many more topics whose intrinsicities shall become aligned with astronomy and the wider study of the stars as progeny of The Cosmos.

[1:12:10] The history of astronomy reflects as a microcosm of the future of astronomy which shall grow to become the macrocosm of the two paradigms of time.

[1:12:11] With the incorporation of new concepts such wonderment, the establishment of new institutions, the organisation of newfound cosmocentric philosophies, theories, and ideologies, and the greater discovery and exploration of The Cosmos by humanity, astronomy, not only as a discipline of study, but as a philosophy itself, shall ascend to a sociocentric and civocentric position.

[1:12:12] The children of the world have long since peered up to the stars and wondered what could be beyond their world, but with the reascension of philosophy, and the new establishment of astronomy forging its future, children shall wonder greater, but too, shall be taught what could be for astronomy shall become at the centre of our children's education.

[1:12:13] With the improvement of the education systems of the world, the parents and relatives of the world must too change in order to wonderment as their offspring do so they may also benefit spiritually, philosophically, financially, and physically for embracing a life wherein The Cosmos, Astronomy, and wonderment are centrefold.

[1:12:14] Every child of wealth shall know and so too, shall every child of poverty, and all those in-between; every child no matter whom, what, or how they are shall either possess a telescope, or have the knowledge of how to use a telescope for the purposes of astronomical observation.

[1:12:15] To all the peoples whom do not own an astronomical instrument, or to those whom do not know how to operate it, planetariums and observatories and other philosophical buildings shall hereby and henceforth be built across all nations of the world and beyond for the learning, and wonderment of the stars.

[1:12:16] As it is our destiny as prophesied so to explore the new worlds of The Cosmos, the study, usage, and application of astronomical instruments and philosophies shall forevermore be intertwined into the destiny of humanity.

[1:12:17] At the time of writing the Omnidoxy, astronomy and The Cosmos in general in our societies are passed by as though they do not exist; their study, wonderment, and purpose seem to have become niche and obscure and unorganised; the study of the stars has suddenly become an outcast in the society.

[1:12:18] By whom's doing this is, I do not know and care not to know forevermore; my chief interest is to restrain this current anti-cosmocentricity and anti-astrocentricity before it consumes the minds of the peoples any further; this is my life's mission and henceforth, I shall proceed upon this vocation no matter what dark forces may be at work against my cause.

[1:12:19] The rise of astronomy shall manifest itself in the Astronist Arts, and All that is Astronist or Astronic or Astronist shall henceforth be All that is astronomical, cosmical, and hold such related philosophies to its core.

[1:12:20] The future of astronomy that has been foreseen here and now is one of grand buildings across the globe and beyond; vast, yet clear and strong philosophies that shall lead humanity along its destined and prophesied path; a species of people whose worldview is not self-concerning, anthropocentric, or geocentric in nature, but respects The Cosmos and places the grandity of The Cosmos and all its elements at the centre of their lives.

[1:12:21] Look around you now and tell the name of that which is closest to the creator of The Universe and in result, you did not look at your books, or house, or the buildings, or governments that form your civilisation, but instead, you looked towards the stars for they are and will always be the greatest proximation we have before us of divinity.

[1:12:22] Instead of seeing the world through the lens of ourselves, we shall henceforth see, when atop the greatneses of Astronomism, the world and The Cosmos beyond through the lens of The Cosmos itself in firstmost and forefront position as it always shall be, but not always should have been.

[1:12:23] We are where we are now by The Will of The Cosmos and The Divine and as destiny turns the cogs of The Great Wheel, we shall progress on our destined and prophesied path, but remembering that we are where are by what has happened and the new philosophies that have sprouted have been inspired in some way by those previous.

[1:12:24] All that exists has come from that which existed prior to it and this is one of the naturities of our cosmic existence; this is to be henceforth known as predependence.

[1:12:25] The astronomies of the future will be much different from the astronomy we know today for on new worlds we shall establish astronomy and in new contexts astronomy shall exist; the far future of astronomy cannot and should not be foresighted here and now; only that which can be foresighted is the future of astronomy that I have seen for the world and the peoples and their societies.

[1:12:26] Whether by faith, philosophy, or otherwise, if one holds an interest in astronomy, one holds an interest in the stars, in The Cosmos, as well as their individual role and the role of humanity within and alongside such cosmical elements.

[1:12:27] The study of astronomy and all its related disciplines is not just a study of the physicalities of The Cosmos in The Universe, it is the manifestation through study of one's curiosities from where which we came, why, how, whom, and what.

[1:12:28] The questions posed in astronomy, cosmology, and the study of The Universe are questions about whom we are; they relate to the force and feeling within us All to discover whom we are and from where, what, and how we came, and why.

[1:12:29] Astronomy and cosmology tackle the same grand subject that religion has attempted throughout the course of its history; from where, how, why, who, what, and when we came into being, but instead, use the means we have before us to discover that which is not before us; that which is unknown.

[1:12:30] The Next Frontier is a leap into that very unknown for we have never yet crossed this way and we shall not do so in such naivety again; with this, we must cherish our ignorance for we know nothing of the journey we are about to embark upon, and we know nothing of the worlds that await us.

[1:12:31] Astronomy and its intrinsic implementation into our education systems, philosophies, and worldviews shall be our guiding light as we venture through a world we do not know or fully understand; we need our study of astronomy to be the beacon for our exploration of The Cosmos.

[1:12:32] If astronomy is the study of the stars, then astronomy is the study of ourselves for we are the stars in different forms, made from the same cosmical elements.

[1:12:33] Is it not fair to say that that which one is dependent upon is that which one is? If so, then we are the stars, the planets, the galaxies, and the entire Cosmos for we are dependent upon them All to exist as we do.

[1:12:34] I envision a peoples whom know, understand, and wish to learn more from that which they originate; I envision a peoples whom know who they are, where they come from, and whom they wish to be as they explore The Cosmos.

[1:12:35] The rise of astronomy and its radiant future shall open the eyes of the masses of peoples of this world and shall already be instilled in all our minds of its intrinsicity by the time we civilise the new worlds; the frontier worlds, and beyond.

[1:12:36] All children of the world shall learn of astronomy amongst each other and shall share the astronomical concepts with each other and shall learn from one another; astronomy will become a hallmark of religious and philosophical beliefs as propelled by Astronism.

[1:12:37] All children of the world shall learn of the names of cosmical elements; recite the philosophies of The Cosmos; discuss All the possibilities of The Cosmos and wonderment both alone and together.

[1:12:38] Astronomy and the study of The Cosmos shall become the beating heart of the world and its peoples, and the education of its peoples, and it shall become the highly

regarded topic of study; a cornerstone of knowledge; an essential discipline needed in all aspects of life as are mathematics, and literacy now, in order to cement our future amongst the progeny and phenomena of The Cosmos.

[1:12:39] The potential vastity of astronomy is its greatest feature for astronomy and its related disciplines encompass All other studies as is lattermentioned in this writing in The Subjects of The Cosmos.

[1:12:40] The peoples of the world shall come to see life through a cosmical lens; there shall be no need for the vices of the world for the peoples shall become embraced within the wonderment, exploration, and study of The Cosmos and all the facets of study and application that branch out from its immensity.

[1:12:41] The most exciting aspect of the rise of astronomy and its related disciplines is the greater possibility for genii; the abundance of genius people in the world is greatly understated; there are more genii in disciplines than we give credit for.

[1:12:42] But with the rise of astronomy, the concentration of nurturing such genii when found is placed centralmost in priority for those; though are more than we think they are still few in number; those are the people that shall revolutionise the world and its peoples again when it need be done so.

[1:12:43] The greatest of genii can also be the worst of people; some of the most evil peoples of our histories have been the most intelligent; never should intelligence be associated with goodness; intelligence falls not into such emotional categories.

[1:12:44] But there are, and have been, peoples in our histories that have tainted and darkened the world forevermore, though to say these people lack intelligence is simply not true; to commit evil acts resembles no parallel to their level of intelligence; in fact, if one has managed to darken the world, then one must require some intelligence in order to have such an impact.

[1:12:45] The point is that intelligence is relative to the person within which it resides and is not bound by the moralities or social standings of humanity and human societies; sometimes the world needs to experience evil and darkness in order to know which path is good and light.

[1:12:46] In astronomy and related topics after the rise of such, the genii shall be nurtured for the genii are those whom reflect to the world the natures of whom we are and more importantly, whom we could be.

[1:12:47] So the next time you see an astronomical instrument, such as a telescope, think on the words of this writing and understand that the instrument before you shall become central to the worldview of humanity as it must if we are to explore The Cosmos, and as it must if we are to progress to a stage that we were prophesied and destined to reach.

—

[1:12:48] There will always be the foresighters of the world; those whom wish to know and claim to know of the events of future times; All we can truly know of the future is that which we know in hope and faith.

[1:12:49] When speaking of the future, our minds tend to drift toward that which we feel should happen; not that which actual will happen.

[1:12:50] The greatest point of the nature of futurity is that all that can possibly happen, could happen in actuality; therefore, that which we wish to happen in future times shall do so if the physical laws of The Cosmos align and the proper means and circumstances occur in perfect precession.

[1:12:51] The Presentiments of the Peoples of the World are the foreboding thoughts in the minds of peoples which encourage the decline of world achievement and progression.

[1:12:52] Such a stance in the Astronist Tradition of philosophy is henceforth to be known as Presentimentism.

[1:12:53] Such presentimental attitudes towards the topics of philosophical and cosmical discussion are not generally held by the Astronist Tradition for the optimism of the future of humanity is held centrally to the Astronist worldview due to humanity's fulfilment of their destiny in the exploration of The Cosmos.

[1:12:54] Notions of presentimentality must be discussed for they are a central component in the achievement of that which we wish to occur; we must know that which we do not wish to happen in order to know that which we do.

[1:12:55] We must know of foreboding notions in order to understand that which we wish to avoid; stances of presentimentism serve two purposes; the first is to tell us that which we do not wish to happen, and the second purpose is revealed from which we can infer that which we do wish to happen.

[1:12:56] We must understand the presentimental perspectives on the future of astronomy so that we may envision a greater future; one in which astronomy is the centrefold, the highest, and the most important of All the Astronist envisionments.

[1:12:57] Yet fear not for we must rejoice of the envisioned future of astronomy and all it shall one day become; one of the central pillars of our societies and civilisations, and one of the centralmost tenets of whom we are and whom we wish to be.

[1:12:58] The principles of presentimentality are engrained in all aspects of thought and must always be remembered within the Astronist Tradition for it reminds us of the constant ability of the future to become the future we had not envisioned.

[1:12:59] The essence of presentimental thought is that it keeps us forever looking ahead at what could be and teaches us one of the most fundamental principles of futurity; the fact that the future is eternally in motion and that we cannot ever take for granted the future we believe we have secured for ourselves.

The Philosophy of The Cosmos

[1:13:1] The discourse of The Philosophy of The Cosmos differs from that of The Philosophy of The Grand Cosmos in that it acts as an extension of the aforementioned Philosophy; The Philosophy of The Cosmos grasps and encompasses all the further concepts of The Cosmos in ways abundant for the reader to imagine and become inspired by.

—

[1:13:2] When we speak of perfection, we most often think of divinity, and we most certainly cannot speak of ourselves in any aspect for, if anything, we are the oppositisms of perfection.

[1:13:3] We can, however, see perfection in The Cosmos and its orderity, functionality, and fundamental naturity; the planets rotate and orbit around their parent star, the star binds the system together and billions of these construct astral superstructures known as galaxies.

[1:13:4] If these cosmical operations cannot be called perfect then what can be?

[1:13:5] It is quite well established in the Astronist Tradition that cosmical and celestial entities share a greater level of divinity than we ourselves do; in this notion, such entities have greater levels of perfection than ourselves which of course relates to our subordination to cosmic progeny and phenomena.

[1:13:6] The philosophical study of perfection is henceforth known as Perfectics, and within this, we study the level of perfection of certain peoples, entities, and actions, and their interactions and relative perfections to one another.

[1:13:7] With orderity, most commonly follows perfection for perfection is usually understood to be the proper execution and flow of some process or action; The Cosmos is abundant with perfection.

[1:13:8] The grand formity of the stars and worlds and galaxies; the way in which their motions proceed; the incessant rotalities and orbitalities of all the celestials; and their wondermentful births and deaths.

[1:13:9] All of these cosmical processes and more make The Cosmos in The Universe and all their elements perfect in ways not fully imaginable to us as we are for each and every cosmical entity harbouring some greater level of divinity according to its size, functionality, and purposity.

[1:13:10] The underpinnings of The Cosmos represent its own perfections; the rotality of worlds, the distances of space, and the power of the largest cosmical elements; the quasars, the oblivions, and the pulsars of The Cosmos.

[1:13:11] The perfection of the oblivions of The Cosmos are best demonstrated in the ability of the densities and physical features of such black holes to continue on until all else ceases to exist around them.

[1:13:12] The Perfect Universe is a philosophical concept that attempts to view The Universe in its entirety with All the possibilities in All the cosmoses and dimensions of such cosmoses possible and impossible, and not without forgetting the incorporation of the concept of infinity, in the search for true, ultimate, and Divine perfection; this is considered to be an impossible feat according to the Astronist Tradition.

[1:13:13] Despite the resolute orderity of The Cosmos and its seemingly intrinsic perfection from our imperfect perspective, The Cosmos cannot and never shall reflect ultimate perfection for The Cosmos is bound, limited, and controlled by The Universe, and although there may exist entities close to infinity within The Cosmos, The Cosmos itself and all within it cannot ever reach an infinite state, neither in scale, orderity, nor dimension.

[1:13:14] In addition to this, The Chaos in The Cosmos also demonstrates the inability of The Cosmos from being perfect for disorderity of chaotic influences taints The Cosmos from achieving ultimate perfection despite its much greater perfection relative to ourselves.

[1:13:15] However, The Universe can be perfect and is in naturity for it is, was, and shall encompass All things existent now, then, and in the future, but it is the attempt of the concept of The Perfect Universe to abstractly manifest The Universe into some perfect orderity that perhaps is ultimately incomprehensible to ourselves for we are so distant in own naturities from achieving such.

[1:13:16] The Perfect Universe is The Universe in All its entirety; in every possibility, dimension, and by All impossibility too, for The Universe is All things existent and if a thought may be existent, then it may be possible.

[1:13:17] The Perfect Universe is the abstract manifestation of The Divine and the closest concept within the Astronist philosophical tradition that we can hope to proximate to understanding The Divine.

—

[1:13:18] The Cosmos is composite in naturity for it is manifested by a many great elements that structure its formity and make it as we know it to be.

[1:13:19] As you and all peoples continue to study The Cosmos, you and all shall see that there are certain features of The Cosmos that are inherent in All cosmicalities and are perfect examples of the functionality, orderity, and naturity of The Cosmos.

[1:13:20] Such features are to be henceforth described as the Cosmical Quintessence; the most abundant of which are the stars of The Cosmos; the lifegivers; the perfect examples of light, warmth, centrality, and cosmical orderity.

[1:13:21] Perhaps another less obvious form of Cosmical Quintessence is that of gravity; gravity is the great intertwiner of The Cosmos; it bounds All cosmical elements together in ways unimaginable to us as we are, and so, its Cosmical Quintessence cannot not be understated.

[1:13:22] In our cosmical studies, we can look toward the Cosmical Quintessences for guidance if ever our paths become clouded by the immensities of The Cosmos; the Cosmical Quintessences bring one's mind back to the fundamental parts of The Cosmos; those that without, The Cosmos would not be.

—

[1:13:23] In our studies of The Cosmos, we shall notice its inherences of duality; planet and star, darkness and light, distance and proximity, gravity and motionality.

[1:13:24] We see that The Cosmos is full of dual connections that are forever dependent upon each other to form and function as they do; this principle stands true even in the scale of The Cosmos itself for its dual pair would be The Universe; The Cosmos is dependent upon The Universe for its existence, but The Universe is dependent upon The Cosmos and every other cosmos for its purpose.

[1:13:25] Dualities do not need to be equal; often, they are oppositisms, but not always; in some circumstances, dualities work together by both physical and abstract means, an example of which would be the aforementioned gravity and motionality duality.

[1:13:26] Dualism in The Cosmos is abundant by The Cosmos's very naturity; there exists few cosmical elements wherein they do not require two or more entities to function, or exist.

[1:13:27] Interdependency is intrinsic to the naturity and functionality of The Cosmos, and interdependency is the centrality of Dualism.

[1:13:28] The Dualistic Cosmos outlines a cosmology in which All aspects of The Cosmos are viewed through a lens of two halves; all elements of The Cosmos are found to be dualistic in their naturities, functionalities, orderities, and in all other aspects of instrumental study.

—

[1:13:29] As an extension to the Dualistic Cosmology, the philosophical theory that The Universal Medium conceptualises the dependencies of The Cosmos and categories them into The Depender and The Dependee.

[1:13:30] Within the naturities of the elements of The Cosmos, there exists The Depender and The Dependee; The Depender is that which exists independently and that which some other entity depends upon; The Dependee is that very entity which is dependent upon The Depender.

[1:13:31] From the perspective of within, The Depender is often the chemical formations and The Dependee is often the entire entity; in the case of stars; the chemical explosions are The Depender and the entirety of the star itself is The Dependee.

[1:13:32] From without the elements of The Cosmos, and in-between them, there exists even greater abundances of Cosmical Dependence; between the planets and the stars around which they orbit, there is dependency.

[1:13:33] Between the gravities of the firmaments of The Cosmos and the largest metagalactic superstructures, there is a sense of great dependency; between the supernovae and the star from which it originated, there is dependency.

[1:13:34] In All cosmical elements, it is clear to see that dependency marks a commonality; The Depender is always dominant over The Dependee, both within and without.

[1:13:35] In order to understand the naturity of the cosmical superstructure, we must understand the concept of dependence for the cosmic is built upon this and is ironically dependent upon it.

[1:13:36] The nature of the dependencies of The Cosmos reflect the function, size, and proximity of The Dependee in question; The Dependence Cosmology understands that The Cosmos is interconnected forevermore, and All its composite parts are in some way dependent upon each other.

[1:13:37] The concept of codependency in The Cosmos relates to The Depender, an example of which would be a star in relation to the planets, holding dependence over more than one celestial in simultaneity.

[1:13:38] Whether by independency, dependency, or codependency, each of the elements of The Cosmos is interconnected with one another and are certainly forever connected to The Cosmos itself for they are bound to and exist within its territories and The Cosmos is eternally connected to The Universe until The Cosmos's existence ceases after which another will replace it, and The Universe is also dependent upon The Divine for its sustainment.

[1:13:39] The total naturity of The Universe is ultimately unknown to us for we are far too small and insignificant to understand it entirely, but not only this, our nature as cosmic does not allow us to perceive that which is universal in nature or infinite in being, though it is wondermentful to speculate of the grandities and totalities and true naturities of The Universe.

[1:13:40] The Absolute Universe is a theory within the Astronist Tradition that encompasses the concept that The Universe is ultimately absolute in its naturity for it to exist as it does from what we understand of it so far.

[1:13:41] As distinct from The Cosmos as in alignment with Astronism proper, The Universe encompasses All that is beyond the bounds of orderity, functionality, and cosmicality.

[1:13:42] In The Absolute Universe theory, The Universe is not dependent in any way on any external force, even The Divine itself, so as to infer that either The Universe is The Divine itself as aforementioned in previous concepts, or The Divine itself is encompassed within The Universe.

[1:13:43] Such a universality derives a non-theistic cosmology, yet places a greater emphasis on the absolutism of The Universe; The Universe as an inclusive, independent, and self-sustaining entity that exists according to its own will.

[1:13:44] The Universe is All there is, was, and will be; The Universe is uncreated and without beginning or end and is sustained by The Divine.

[1:13:45] Despite not knowing the extent of the entirety of The Universe, we understand by the Astronist Tradition that it encompasses All things in all possibilities, impossibilities, and in all times, spaces, matters, and states; the distinction between between The Universe and The Divine in this notion is that The Divine sustains The Universe which remains uncreated by its nature, unless The Universe is a self-creating, self-sustaining, and self-destructing entity in which case The Divine and The Universe would become one in such a pantheistic understanding of universality.

[1:13:46] The Absolute Universe concept deems The Universe to be absolute in naturity; omniencompassment, omnidimensionality, omnipossibility, omnitemporality and omniversality; these are to be henceforth collectively referred to as the Attributes of Universality and in this cosmology, there exists only The Universe as the one higher force and the controller of all things, the creator of all things, and the destructor of all things; meanwhile, the Attributes of Divinity are considered to include omnicreativity, interpenetrativity and omnisustainment; unlike in other religions, Astronism does not ascribe functions and roles of knowledge, emotion, or power to God.

—

[1:13:47] When we peer up at the stars of the night sky, we see their scintillations, their proximities and distances from one another, and we wonderment of the possibilities of worlds which rotate around them and the galaxy in which they reside.

[1:13:48] As we look around us, we see a world overwhelmed with life in every crevice; we see people, animals, and plants; beating hearts and breathing lungs.

[1:13:49] As we wonderment of the orderity of The Cosmos, we imagine the perfect orbitalities and rotalities, and the perfect functionalities, motionalities, and concentricities of the cosmical system.

[1:13:50] In this notion, one comes to the realisation that The Cosmos is alive which falls in alignment with the concept of Cosmozoism; the belief that The Cosmos is a living entity due to its constant motionalities, and the eventuality of its death, and our ever-growing knowledge about its birth.

[1:13:51] The Cosmos must be alive for the stars, and planets, and galaxies are in perfect orderity; they form a concentricity; they are structured by the orbitalities of worlds and the rotalities of stars; All underpinned and intertwined by the space, the time, and the matter as created by The Universe.

[1:13:52] To be alive is to hold a continuous existence; that which we understand to be alive is perhaps a beating heart, or breathing lungs.

[1:13:53] In this, we must expand our minds for although the elements of The Cosmos do not have beating hearts or breathing lungs, they are just as alive as we are for they follow a course of existence; they hold purpose, structure, and function and by this notion, they are alive.

[1:13:54] According to the principle of Cosmozoism, the entirety of The Cosmos is alive, but too, Extracosmozoism states that the entirety of all things that do exist are alive in this same way; such notions may be an exaggeration to some, but such notions could also be said to be true in that All that exists, possesses some level of Divine essence in order to exist as it does.

[1:13:55] If to be alive is to have a birth and a death; if to be alive is have purpose, physicality, and function; if to be alive is to be dependent on the molecularities, then are not All elements of The Cosmos alive under these definitions?

[1:13:56] If we understand that The Cosmos is alive in its entirety, then we understand the fundamental naturity of The Cosmos and its relationship with The Universe for we see

that All cosmicality is existence; birth, life and death; order, purpose, structure; function, shape, and dimension; this is All The Cosmos is and will forever be until its own cessation.

[1:13:57] But in this notion we understand that every aspect of The Cosmos is alive, not just our insignificant selves, one of many sentients of The Grand Cosmos; we understand that every rock, every ocean, every star, and every galaxy; each are alive in their own way as we are in our own way.

[1:13:58] And it is this that is the essence of Cosmozoism; in this belief, one begins on their journey toward greater wonderment and understanding of the naturity of The Cosmos, and one begins to understand purposivity, significancy, functionality, orderity, and all the other instruments of study of The Cosmos.

[1:13:59] Each and every instrument of study comes into use when The Cosmos is viewed upon in this way for The Cosmos is not just perceived as an empty, lifeless vacuum filled with giant rocks and exploding spheres; The Cosmos becomes real; it becomes closer to us which is why the importance and relevancy of Cosmozoism to the fundamentality of the new worldview cannot be understated.

[1:13:60] The greatest aspect of Cosmozoism is that it enlightens us to see The Cosmos in a way never done so before; we begin to understand its nature; we begin to see its true vastness, purpose, and function.

[1:13:61] Praise the popularity of the concept of Cosmozoism and let all the peoples of all worlds see The Cosmos in this way and closer you shall feel to The Cosmos as a living, breathing, and heart-beating entity in its entirety, and in return and reward, you shall receive a greater wonderment, that with only such foresight and hindsight granted by your enlightenment, you could ever have hoped to experience.

—

[1:13:62] The Cosmos and The Chaos exist in parallel; the cosmical elements and the chaotic elements reside within The Cosmos; they are in constant flux with one another; The Chaos breaking away from orderity and The Cosmos pulling all elements back, fulfilling its purpose to keep all things in alignment with orderity.

[1:13:63] The Chaos exists within The Cosmos in the Astronist Tradition; The Chaos is those elements of The Cosmos that do not align with the cosmical orderity, or the cosmical system.

[1:13:64] According to the Astronist Cosmology, The Cosmos is known as the Thesis and The Chaos is known as the Antithesis; in the cosmic alchemical tradition of the cosmology, the Thesis and the Antithesis must conjoin in some future to create a Synthesis, known as The Great Cosmic Battle.

[1:13:65] The Thesis is the combination of the composites of The Cosmos; the ultimate and entire physical coalescence; The Thesis is the entirety of The Cosmos in its most perfect state from the perspective of orderity.

[1:13:66] The Antithesis is the perception of The Chaos in its most potent forms; in the greatest of oblivions, and the largest elements of disorderity within The Cosmos; The Antithesis is the entirety of The Chaos in its most perfect state from the perspective of disorderity.

[1:13:67] The Great Cosmic Battle is in occurrence all around us and in all places that we cannot see; it occurs within ourselves between the forces of orderity, and disorderity; it occurs between the oblivions of The Cosmos and the gravity and light attempting to escape them.

[1:13:68] The proximate most example of The Great Cosmic Battle occurred within the history of The Earth in the destruction of the dinosaurs; the cataclysmic consequences of the impaction of the asteroid demonstrated the power of The Chaos and its potential destruction of the cosmical orderity.

[1:13:69] Like we have a destiny as prophesied so, The Cosmos in entirety is too destined as prophesied so to create a synthesis in The Great Cosmic Battle.

[1:13:70] In some time far beyond the extent of our own destinies, there shall come the moment in which The Cosmos in which it must fulfil its own destiny and must synthesise with The Chaos to form the end of The Great Cosmic Battle; The Ultimate Equilibrium.

[1:13:71] We must not press upon The Cosmos and The Chaos our human emotionalities; The Cosmos does not constitute goodness, nor does The Chaos constitute evility; that which we constitute to be good and to be evil is a concept we place upon actions taken.

[1:13:72] The only constitution of these two entireties is orderity and disorderity relating The Cosmos and The Chaos respectively.

[1:13:73] In this way, The Cosmos and The Chaos demonstrate their essences of divinity for they do not conduct function according to morality, but instead conduct function according to purpose, design, and destiny.

[1:13:74] The Cosmos creates and The Cosmos destructs, but these two actions are not constitutive of good or evil action; they are constitutive of purpose, orderity, and functionality.

[1:13:75] The Synthesis of The Cosmos and The Chaos consists of the conjoinment of oppositisms; the forcing together of entities made to be apart, but this is the struggle of The Great Cosmic Battle and it shall rage on until the end of The Cosmos itself, but shall continue on in other cosmoses depending upon their structures.

[1:13:76] For one to exist, there must always be an opposite for this is the nature of reality and existence, both in our own contexts, but too, in the context of The Cosmos, and The Chaos fills this important role of existing as the opposite to The Cosmos.

[1:13:77] The way in which The Synthesis of The Great Cosmic Battle shall occur is in the palms of the destiny of The Cosmos and The Chaos in The Universe and that is All that can tell us this, though we shall never comprehend in totality unless we could still exist at the end of Time in order to be witnesses of it.

[1:13:78] If an equilibrium of ultimatum is destined to be forged then the elements of The Chaos are prophesied to grow greater in strength, in diversity, and in their abundances and The Cosmos to meet them in direct confrontation.

[1:13:79] Time shall end in darkness surrounded by the barrier of The Universe causing light to appear around the periphery just as is the formity of that which we call oblivions.

[1:13:80] The Chaos may not be preferred in its naturity by the Astronist philosophical and cosmological tradition, yet it is highly understood, revered, and encouraged that The Chaos is the incumbent of much of the revelations of The Universe.

[1:13:81] Though we cannot understand it in totality, we can pinpoint a connection between the elements of The Chaos and the unknownness that exists within; it is there within all entities of existence; a certain obscurity that seems not forged by any pattern, yet it is still there within all things and in the chaotic elements of The Cosmos, we see this obscurity in full form.

[1:13:82] The study of The Chaos is perhaps even more so pressing than the study of The Cosmos for I believe, as a wondermenter, that there is something within the oblivions, the sporadics, and the unknowns of The Cosmos in The Universe that shall tell us that which we all wish to know; who, where, how, and why are We, The Cosmos, and The Universe as we are.

[1:13:83] As The Great Cosmic Battle ceases to end during our short existences within The Wider Cosmos, we shall see a greater role of The Chaos for the balance must be gained and The Cosmos and The Chaos must meet at the end of cosmic existence in equal measure.

[1:13:84] That which occurs after such events can only be said in speculation, but I am certain that there shall be more to The Grand Story than we will ever, and could ever know.

[1:13:85] Despite the mystologisation of this concept, its principle essence stands true forevermore as The Cosmos and The Chaos are the oppositisms of existence and they are in the wage of war on a cosmic scale.

—

[1:13:86] Much does not need to be said when one is a great enough writer to say their piece in compact terms.

[1:13:87] When speaking and writing of such grand thoughts, the mind's wonderment tangents off towards new reaches, and branches into new trees of thought; the key is the seed and once it is planted, no more shall need be said; the Omnidoxy is this seed.

—

[1:13:88] Distortions in our world are as abundant as there are peoples; and too, distortions take form in many varieties and concentrations.

[1:13:89] There are the distortions of the mind; the distortions of the past, the present, and the future; and too, the distortions of the physicality; that which exists in the formity of matter.

[1:13:90] In The Cosmos, there too exists distortion for we inherited such by our cosmical ancestors though distortions of mind are not so prevalent of the cosmical elements as they are in our own insignificancies.

[1:13:91] The malformations of The Cosmos are the greatest manifestations of distortion, though we must always remember of malformation that such does not exist from the perspective of The Cosmos; only from our own perspective does malformation exist for we like to contrast normality with abnormality; it is part of our own naturity to do so.

[1:13:92] The malformaties reflect the influence of The Chaos in the formative process, especially so if the malformation in question impacts upon the orderity and functionality of the cosmical element.

[1:13:93] If the orderity of elements in The Cosmos is a reflection of its malformation or its perfect formation, then from studying the orderities of cosmical elements, we can discover their hidden malformations that are not intelligible to the eye.

[1:13:94] From the perspective of The Cosmos, All that exists within it holds a formity according to its destined course and its purposivity in serving the cosmical system; in this notion, malformation as our minds see it is likely not considered malformation by cosmical terms.

[1:13:95] The naturity of the cosmical malformations is that they are more abundant than we know and that their existences mean nothing more to philosophical contexts than unquity in the formity of cosmical elements.

[1:13:96] There are greater symbolical gravities from cosmical malformations as they tend to represent abnormality, sporadics within cosmicalities, and the misconduct of the cosmical chemicalities and molecularities to form elements never before seen, or holding greater rarity.

—

[1:13:97] With the rise of astronomy and wider cosmical study, adoration, and wonderment, and with humanity's fulfilment of their destined and prophesied course of the exploration of The Cosmos, it is inevitable that there shall be peoples real and imperfect whom attain achievements entwined with bravery, cosmical enlightenment, and greater cosmical knowledge.

[1:13:98] These peoples shall come from the wombs of mothers from all across humanity for the wonderment of the stars is a universal act and is not selective upon those whom conduct such.

[1:13:99] Any person, or any sentient being with consciousness enough to comprehend the most basic aspects of The Cosmos can become wondermenters, lauders, adorers, and venerators of The Cosmos.

[1:13:100] The explorers of The Cosmos are those worthimost of veneration for they risk their lives to progress humanity along its destined and prophesied path.

[1:13:101] There have been those in the histories of the world whom have sacrificed themselves for a purpose or cause that is greater than themselves as they witnessed and foresaw the injustices of evility; these are three greatest of contributors for they understood the principles of contributionism that rest at the heart of Astronist transcensionist belief.

[1:13:102] The moralities of us govern the way in which we are to act against such evilities, and although this brings no bearing to the perspective of The Cosmos, it means to us as humans All we are for we are the decisions we make in times of moral contention and extremity.

[1:13:103] The venerations of people's strength, sacrifice, and their ability of wonderment and their curiosity towards cosmical knowledge shall from here now and henceforth be championed and treasured by the Astronist organisations and institutions in specialty of such accomplishments.

[1:13:104] In the Astronist Tradition, and in the envisioned future, these people whom explore and wonderment, and those whom realise and actualise the new worlds and civilisation shall be championed and treasured in such a way for the mass of the peoples of the world to see and believe in and hold hope in to one day become as they are.

[1:13:105] The greatest of peoples of our histories have been forged from the hardships they were forced to contend with and without such tribulations, their greatness would not have formed as it did.

[1:13:106] With this notion in mind, it is easy to see the importance of the education process in the development of the greatest of minds in the most potentialised of peoples.

[1:13:107] The peoples venerated shall be remembered in futures times abundant and whose faces shall be peered upon by the children of the future whom are in need of inspiration, hope, and guidance in their own vocations.

[1:13:108] Some may call this idolatry so then, in the face of such an accusation, questions must be posed; is it wrong to admire the workings of the minds of peoples? Is it wrong to adore the achievements of those whom work to discover more of The Cosmos in which our part takes up such an insignificant a place? Is it wrong that we cherish the destined course of humanity as Divinely prophesied? Is it wrong that we revere humanity's progression in our destined path and those whom most contributed to such progressions?

[1:13:109] I shall not answer these questions for I need not; your own mind, your own conscience, your own instincts and your own ambitions shall answer these questions on their own.

—

[1:13:110] Purpose, known in an Astronist philosophical context as purposivity, is the ultimatum of all existence of The Cosmos in The Universe and controls the destinies of All entities.

[1:13:111] Without purpose, one cannot exist; purpose is within all things in relatively equal measure.

[1:13:112] From a single molecule of our physiologies, to the smallest flake of snow, to the orbiters of stars, to the grandest galaxies of The Cosmos and on and on to the entirety of The Universe itself; All things existent require purpose.

[1:13:113] To be Divine is another matter for things Divine do not exist in the same way in which The Cosmos exists so purposivity in this regard is warped into the concept of being as a level above existing.

[1:13:114] The requirement of purpose in All existent things highlights a key feature of our naturities and the naturities of All cosmic elements.

[1:13:115] The purposivity of The Universe is itself true and real, though less assured than that of The Cosmos for the entirety of The Universe and its functionalities, orderities, and its divinity is not known to us so its purpose is less certain.

[1:13:116] The way in which one views The Universe's cosmology is ultimately dictative of their view of its purposivity; a theistic universal cosmology places less divinity in the naturity of The Universe, therefore its purposivity plays a similar role to that of The Cosmos.

[1:13:117] However, a non-theistic universal cosmology places greater divinity in the naturity of The Universe, perhaps by even suggesting The Universe as The Divine; in this, The Universe's purposivity is less known.

[1:13:118] Cosmical design is forever related to the visual elements of The Cosmos and their aesthetics; design acts as the postcursor to purposivity and is intrinsic to the execution of the purposivity.

[1:13:119] The way in which a cosmical element is designed, the formity of its features, and the structure of its orderity correlates to its functionality.

[1:13:120] Design is the structure of cosmical elements; we must know of purposivity in order to correlate this to the design.

[1:13:121] The belief orientation henceforth known as Teleoism is the belief that both purposivity and design in equal measure, in precursory and postcursory chronologies respectively, control the development of The Cosmos and its physical laws.

[1:13:122] In the Teleoistic view, the purposivity and design of the cosmical elements is the centralmost aspect of them and they are both equally intrinsic and apparent throughout All natural and cosmical phenomena.

[1:13:123] Related in nature to the branch of philosophical study known as Teleology, the concept of Teleoism continues on and demands a specificism in cosmology towards purpose and design as the two centralmost aspects of the cosmical system and of cosmicality in general.

[1:13:124] The Teleoists establish a two dimensional cosmology wherein purpose and design are the dual centralities and around which All cosmical existences rotate.

[1:13:125] The development of The Cosmos occurs in a multitude of complexities with the involvement of many elements and aspects, but Teleoism establishes a simplification of the cosmological development by narrowing such aspects down to just purpose and design.

[1:13:126] A Teleoist explores the basicmost aspects of cosmological development and understands that whether by some Divinity or Universality, there stands purpose and design as the intrinsicities to all cosmical existence.

[1:13:127] The concept of Teleoism provides us with a unique cosmological outlook that may be used to understand the most fundamental parts of the naturity of The Cosmos.

[1:13:128] Teleoists hold that the the natural phenomenas of The Cosmos are ultimately directed by purpose, the abstract manifestation of which would be the concept of destiny as announced by prophecy, and directed secondly by design; the physical manifestations and formity that allow the existing element to conduct its purpose.

[1:13:129] In Teleoism, All else and All other concepts, theories, and ideas of cosmology come as secondaries and tertiaries to this concept of cosmological development and fundamentality.

[1:13:130] The laws of oblivion stand so as the opposite to the laws of light, but it is when these two opposing laws encounter one another, the oblivion is so powerful that light cannot escape its field of gravitation and a lightring is created around its periphery.

[1:13:131] As aforementioned in the discussion of duality and dualism in The Cosmos, there is an apparent intrinsicity of binarity in the wider cosmology.

[1:13:132] With this notion comes alongside it the concept of The Bicosmos, or Bicosmology.

[1:13:133] The concept of bicosomology centres around the idea that The Cosmos is constructed of any two, but only two, parts; the most prominent example of which in the Astronist Tradition would be The Cosmos and The Chaos as creating a bicosmic paradigm.

[1:13:134] Bicosmological thought asserts that The Cosmos is constituted by two elements, though these are not necessarily oppositisms in their naturities as is the case in dualism.

[1:13:135] This is the first and only reality of bicosmology; there can only be two formative elements, no more and no less.

[1:13:136] Bicosmic thought stems from the idea that All existent entities hold binarity in their naturities and holds true the belief that All that does exist must have some other element to exist alongside it therefore bicosmism rejects monism.

[1:13:137] In this notion, bicosmological thought affirms that binarity is the ultimation of The Cosmos, and perhaps even The Universe depending upon the extent of divinity believed to be in the naturity of The Universe for The Divine is not bound by the cosmicality of binarity, and neither is it bound to oppositisms, dualism, or any other notion of limitation.

[1:13:138] The Bicosmos is in no opposition to the concept of The Cosmos itself for The Cosmos, in Astronist cosmology, is the entirety of ordered, yet limited, existence as underpinned by The Universe, but easily, the bicosmology could still remain true in that duality may be existent in the form of oppositisms in The Cosmos despite the entirety of The Cosmos being one whole.

[1:13:139] Despite this not being a total Bicosmos, there are certainly elements of bicosmology that cannot be ignored in both existence and in the physical laws and structure of The Cosmos itself which demonstrates the intrinsic influence of bicosmic principles in the fundamental cosmicality.

[1:13:140] As an extension of dualism in The Cosmos, the concept of bicosmology discusses the entirety of The Cosmos as holding an intrinsic binarity, whilst dualism and duality discuss the evidence for binarity in the most small and most grand of cosmical existences, though not of The Cosmos itself, in its entirety, but also in relation to oppositism.

[1:13:141] With the entirety of The Cosmos, it is traditional to perceive such as holding a monocosmology, but the concept of the bicosmology defies this and introduces The Cosmos in its entirety as consisting of two composite parts as is the naturity of All the elements of The Cosmos according to bicosmism, and even within a monocosmological paradigm.

[1:13:142] If it is affirmed that The Cosmos holds within itself countless composite parts, then it is not illogical to suggest that The Cosmos itself, in its entirety, is also composed of composite parts, and in the bicosmological view, this concept is established and evidenced with the elements of binarity throughout The Cosmos, and is further developed when tricosmology is introduced.

—

[1:13:143] In tricosmology, as a further extension and adaptation of the concept of bicosmology, it is believed that The Cosmos is not constitutive of one, or two parts in its entirety, but three.

[1:13:144] Tricosmic thought is demonstrated, in the Astronist Tradition, by the incorporations of The Cosmos, The Universe, and The Divine into one cosmology as three interdependent and codependent parts.

[1:13:145] No single idea is infinite; if it has been thought by a human, then it shall have as many limitations, imperfections, contradictions, and failures as there are stars in the night sky for our ideas are reflections of whom we are and we cannot escape our own nature.

[1:13:146] No single book holds finality; to say One book; One set of ideas, is the answer to All questions; the illogicality in this is as crisp and clear as a bright spring morning.

[1:13:147] No single word is definitive of meaning; I have tried to explore as many ideas in the Omnidoxy as possible.

[1:13:148] Perhaps some have not been totally answered; maybe that provides an opportunity for you to further explore your interests using my ideas as your base, but I shall never write in finality; I shall always write with the knowledge that new ideas will come and supersede my own for I am but a human and my ideas are as imperfect, corrupt, and contradictory as I am and we All are.

[1:13:149] The Tricosmos establishes a newfound paradigm of cosmical understanding by incorporating the three aspects: The Cosmos, The Universe, and The Divine.

[1:13:150] Tricosmological thought constitutes a paradigm in which The Cosmos, The Universe, and The Divine are treated as composite parts, but the eventuality is that they are to become as One.

[1:13:151] In The Tricosmic Paragon, The Cosmos and The Universe are considered the two central aspects of the cosmology with The Divine creating, underpinning, overpinning, and sustaining them both as representative of the entire periphery.

[1:13:152] To think in a Tricosmologic way is to understand all existence in three perceivences; in cosmic, universal, and divinical discernments.

[1:13:153] The typical theological outlook under the tricosmological philosophy tends to be non-theistic or an adherence to the aforementioned concept of The Universe being The Divine itself; either as the creator and destructor of itself, or taking a further atheistic stance wherein The Universe is not The Divine and therefore, The Divine is not existent.

[1:13:154] The furthest concept from the traditional monocosmology, The Tricosmos is unique from its dualistic counterpart in that it does not perceive the composite elements of The Cosmos in triadic form.

[1:13:155] Bicosmology perceives all the composite parts of The Cosmos in dualistic form; the planets and the stars, the galaxies and their concentricities, and the pulsars and their immense magnetisms; through the bicosmic lens, All things are considered in a dualistic paradigm.

[1:13:156] Tricosmology understands existence on three levels; in The Cosmos, in The Universe, and in The Divine.

—

[1:13:157] There are the extremities of The Cosmos and there always have been and there always will be as there are extremities in All existences; within ourselves, there are moral extremities; those acts of ourselves that we consider good and those we consider evil.

[1:13:158] These extremities are the boundaries of whom we are in moral thought, and they demonstrate in one of the most perceptible ways, the boundaries and limitations of The Cosmos; they form the naturity of The Cosmos itself.

[1:13:159] The belief in such and the understanding of extremity in cosmological development, naturity, and wider universal and Divine naturity is henceforth known as Bipolar Cosmology.

[1:13:160] In bipolar cosmology, extremity is not raised to any greater level than another of the other components of cosmological philosophy, though it is understood to play a greater role than the other cosmologies would have us believe.

[1:13:161] According to the traditional cosmology of Astronist philosophy, orderity is the nature of The Cosmos; it is the central principle upon which All aspects of The Cosmos are formed and structured, and the main way in which the purpose of each and every cosmical element is fulfilled.

[1:13:162] But in logical thought, extremity demonstrates the furthest point from the centre, or from that which is central to something in both a physical and abstract perspective; in this line of thought, it is assumed that extremity, though not acting as an oppositism to orderity, is the furthest possible point of orderity before it can be classed as sporadic, or influenced by disorderity.

[1:13:163] The naturity of extremity is that it always appears in a dualistic paradigm with the median being that which we know to be true, comprehensive, and that which is considered to hold normalcy, or expounding the epitome of orderity.

[1:13:164] One extremity cannot exist without another, and so often in our lives, we come across all kinds of extremities that we considered to be the median; to be the epitome of normalcy, yet from a stance of neutrality looking in on our lives, that which we consider the median is actually the extremity.

[1:13:165] The truest naturity of extremity is that its identification is purely based upon perspective which, to ourselves as humans, in my view, ironically limits that which the extremities can do for us.

[1:13:166] Too, extremity is bound by the knowledge we possess of the world around us, and in a cosmical context, the knowledge we possess of The Cosmos itself; that which we consider to be extreme in cosmical terms, may not be so when our knowledges of The Cosmos are extended beyond that which we held beforehand.

[1:13:167] Bipolarity is the philosophical study and implementation of the concepts of extremity in cosmologies.

[1:13:168] Bipolar Cosmology encompasses a stance of cosmological development and structure that is based solely upon extremity; this focuses on the idea that The Cosmos is entirely composed of extremities and is itself an entire extremity.

[1:13:169] Bipolar Cosmology and the wider concepts of extremity itself are wholly reliant on the concept of duality for as aforementioned, for there to be one extremity there must be another to oppose it.

[1:13:170] Bipolar Cosmology holds the traditional concepts of The Cosmos and The Chaos as the ultimations of existence, and their oppositism, the most relevant of All cosmological concepts.

[1:13:171] The Cosmos and The Chaos and their eventual Great Cosmic Battle are considered to be the centralmost aspects of The Universe and are sometimes considered to be The Universe itself; The Universe is formed by this eternal struggle between orderity and disorderity.

[1:13:172] The essence of bipolar cosmology constitutes and relates All aspects of concepts and themes to that of extremity; to that of one limitation in relation and instigation to the other.

[1:13:173] Bipolarity considers the centralmost and importantmost essence of The Cosmos to be its conflict with The Chaos and encourages further struggles in order to continue on The Great Cosmic Battle for that is seen to be that which drives The Universe along.

[1:13:174] In theological terms, there are three stances within bipolar cosmology; the first of which is considered to be an infiltration of traditional thought into the cosmology and suggests that The Divine is an exception to bipolarity and therefore, is the only oneness in existence and the only entity with inextremities.

[1:13:175] The second of which resembles the total opposite to the first and holds the belief that The Divine is the epicentre of bipolarity and sustains The Universe and therefore The Cosmos and The Chaos in The Divine's own image are a reflection of the extremities of The Divine itself.

[1:13:176] As an extensional thought, The Divine is considered to be in equal and perfect measure both aspects of extremity, and is therefore, All things which swiftly returns to more traditional ways of Astronist and Divinical theology.

[1:13:177] Lightness and darkness, goodness and evility, proximity and distance; extremity exists All around us in our lives and in the very naturities, orderities, functionalities, and structures of The Cosmos we know now.

[1:13:178] The third of which constitutes that an all-creative Divine is not in existence and holds that all existences is created by extremity itself; this theological position removes The Divine from the cosmological equation and therefore deifies extremity, or bipolarity itself as the ultimate creator and destructor of All things.

[1:13:179] Despite such a seemingly hardline atheistic, or non-theistic stance, such a belief is an extremity within itself for it places extremity to the extreme of what it could possible be which is the creator and the destructor of All things of existence and non-existence, and of possibility and impossibility.

[1:13:180] In this notion, a new paradigm is formed that ironically considers extremity to be at the centrality of All existence which, in logical terms, is not an entirely extreme stance in and of itself.

[1:13:181] It is of physical fact and law that extremity, or bipolarity, is existent in the smallest of things and in the largest.

[1:13:182] In size, scale, distance, morality, orderity, emotion, mind, function, structure and in all other aspects of existence itself in its widest understanding possible.

[1:13:183] Thus, it can be firmly concluded that in the understanding of existence, extremity is the centrality and is the concept holding the greatest level of gravity for it is existent in All things existent.

[1:13:184] The universality of extremity cannot be ignored and some aspects of bipolar cosmology would have one say that without extremity, there cannot be any existence as we know it, and this is the ultimate principle of philosophical extremity; this reaches the highestmost aspect of extremity and places it alongside its only predecessor, existence itself, which is considered to be wholly reliant upon its successor, extremity.

[1:13:185] Just as humanity has pushed through our own extremities throughout our histories, The Cosmos shall itself, and has itself, pushed through its own extremities and is doing so All the time with the continuous expansion of its size, dimensions, and scale.

[1:13:186] In bipolar cosmology, the simplest aspects of extremity and the complexmost aspects of extremity are formulated into one cosmology within which various stances exist, and although these stances may not be all true, they do represent extremities within extremity.

[1:13:187] Perhaps, above All things discussed of extremity, the greatest aspect of extremity is its infinite naturity as witnessed in no other cosmical element; there is a certain infinite naturity of extremity in both its own size, and distances, but also in its dimensions and scale when implemented into other elements of The Cosmos.

[1:13:188] This highlight of the infinite naturity of extremity reveals something much larger; a certain or seemingly uncertain aspect of extremity that is Divine in some aspect of itself for that which is infinite, under the laws of cosmicality, cannot be of The Cosmos, and so, the question rises whether extremity goes beyond The Cosmos itself, beyond its own extremes into dimensions and possibilities that are universal and furthermore, Divine in their naturities.

[1:13:189] That which we can be certain of in the topic of extremity is its own limitlessness and although one considers the naturity of extremity at first thought and sight to be the epitome of limitation and boundary, upon further thought and sight and study, it is discovered thereafter that extremity is anything but limitation in its naturity.

[1:13:190] As discovered prior and post this discourse, a group of instruments of study of The Cosmos in The Universe is beginning to form and consists of those aspects of existence that defy logic, reason, and the physical laws of The Cosmos as well as our own stereotypical manifestations of their meanings, and we are left speechless by the revelation that certain aspects of existence are defined as Divine in their naturities and extremity is the next instrument to add to this growing, yet still rare, group.

—

[1:13:191] For the development of a new system of thought, method, and structure, the certainties of the surrounding environment must be developed by precursory and preparatory means.

[1:13:192] The environment in which something develops, grows, and establishes itself is intrinsic to its overall structure, appearance, and meaning.

[1:13:193] The environment in which something is created structures its momentum to achieve its purpose; the extent to which something holds clarity is the extent to which something achieves its purpose.

[1:13:194] The cultural, political, social, and philosophical environment in which something develops is known as The Matrix and it must be understood that there are as many matrices as there are mediums and platforms to support them and as there are concepts to construct them.

[1:13:195] The philosophy of matrix studies the concept of The Matrix under a philosophical lens and discusses every aspect of matrices and how they have influenced the development of previous systems known and how they shall influence the development of future systems.

[1:13:196] Matrixian Thoughts constitutes The Cosmos, The Universe, The Chaos and the entirety of existence through the lens of matrixity.

[1:13:197] Matrixian Cosmology holds the belief that The Cosmos is structured, ordered, and natured upon a matrix, sometimes inferred and understood to be The Universe, and upon this matrix, All existence conducts its purpose.

[1:13:198] Matrixian Theology may act as an extension to Matrixian Cosmology with the introduction of The Divine into the cosmological paradigm.

[1:13:199] Non-theistic Matrixian Theology holds that that which is known as The Matrix is the replacement for The Divine itself and is especially understood to be so in The Universe as The Divine theory.

[1:13:200] Theistic Matrixian Theology holds that The Matrix, known to resemble The Universe, structures, orders, and natures The Cosmos as instructed so by some Divine entity.

[1:13:201] In Astronist philosophy, the current time and environment during which the writing of the Omnidoxy are completed is entirely intrinsic to the development, establish, and the eventual integration of Astronism, and wider Astronist methodology and thought.

[1:13:202] The Matrix of The Cosmos is established by the triad of The Common Elements including space, time, and matter and under matrixian thought, the entirety of existence is bound to this matrixial superstructure.

[1:13:203] Matrixity is established by complete orderity for the cosmical system, and due to this, The Chaos is not considered to be a valid element, or concept within the matrixian cosmology which demonstrates a huge departure from the traditional Astronist cosmology.

[1:13:204] Matrixity, as an instrument of study, understands all concepts, cosmical elements, and universal constituents in relation to their matrixial foundations and understands All things existent according to The Matrix upon which they reside.

[1:13:205] Instead, in matrixian cosmology, that which is known and distinguished as The Chaos in the Astronist Tradition, is considered to be part of The Cosmos; there exists no distinction between The Cosmos and The Chaos in matrixian cosmology for everything that does exist, does so in The Matrix and therefore, All that exists is part of this; there are no exceptions.

[1:13:206] Matrixian cosmology explains the chaotic phenomenons of The Cosmos in The Universe to simply be composites of The Cosmos that the minds of humans are not currently adapted to understand and comprehend but that they should not be considered or deemed abnormal or otherwise non-cosmic due to humanity's own lack of knowledge and understanding.

[1:13:207] The philosophy of matrix understands that All that does exist, does so upon The Matrix; The Matrix is considered to be endless by some accounts of matrixian cosmology, but in other accounts, is considered to be boundarised by The Universe.

[1:13:208] The existence of our lives has been structured by the days, the months, and the years ever since the invention of the calendar, and the organisation of our lives as according to Time.

[1:13:209] But in humanity's exploration of The Cosmos as destined and prophesied so, All things shall change again for the new worlds we find, explore, and inevitably civilise have natural rotalities, orbitalities, and distances from their parent stars that are unique to them.

[1:13:210] We must prepare for this by understanding that the calendar system we have established on this world has worked for this world and will continue to do so for other worlds; therefore, it cannot be logically implemented upon new worlds that consist of different cosmicalities.

[1:13:211] The natural and cosmical order of existence constitutes that we shall have to order our time and the lives of the peoples of these new worlds in newfound ways according to the unique cosmicality of the new world upon which they reside.

[1:13:212] Calendaration is to henceforth be known as the process by which new calendars are developed according to the unique cosmicalities of the new worlds explored and civilised by humanity during their exploration of The Cosmos.

[1:13:213] The concept of calendarism constitutes that each and every calendar of the new worlds to be explored and civilised by humanity is true and correct according to the relativism of the sentient beings living there, and thus does not support a geocentric view of humanic civilisation and organisation.

[1:13:214] The instrument of study known as calendarity focuses on the organisation of Time according to humanic perception and is dependent upon location, established culture, organised philosophy, and the general cosmicalities of the world upon which the particular calendarity relates.

[1:13:215] In the ever-quickening and noise of the world, we must not forget the intrinsic place of the calendar, and more generally, the organisation of our lives by Time for such has structured our civilisations throughout our histories and I foresee that it shall continue to do so even as we explore the new worlds of The Cosmos albeit in the formation of new calendars.

[1:13:216] In fact, the variety, diversity, and study of the calendar shall, if anything, continue to grow as the worlds we explore become further and further away from The

Earth and as a direct subsequence, also moving away from our current geocentric and anthropocentric worldviews and understandings.

—

[1:13:217] As one of the centralmost aspects of the Astronist cosmological tradition and one of the commonmost mentioned constituents of The Universe, is known as The Chaos.

[1:13:218] As aforementioned and discussed in the Omnidoxy, The Chaos is considered to be the antithesis of The Cosmos; the manifestation of disorderity, and unknownness.

[1:13:219] It is important to note that in the Astronist cosmological tradition, The Chaos that is currently known to humanity is considered to be within the bounds of The Cosmos, yet it is also understood that the entirety of The Chaos could very easily extend beyond the bounds of The Cosmos into dimensions and existences not yet known, or holding any cosmical resemblance.

[1:13:220] The naturity of The Chaos is disorderity and the philosophical study of The Chaos and its relations with The Cosmos, The Universe, The Divine, and the study of The Chaos in isolation is to henceforth be known as Sporadics.

[1:13:221] If we are to imagine All the possibilities of The Chaos, then in the naturity of such a concept, there exists no boundary or limitation to The Chaos, and is therefore, the direct oppositism to The Cosmos which is constituted by limitation, transience, and orderity.

[1:13:222] There are various elements of The Chaos that are readily existent in The Cosmos; the most widely accepted element of which would be black holes, also known as oblivions in Astronist philosophical and cosmological terminology.

[1:13:223] The inherent naturity of The Chaos is that it is based upon perception; humanity perceives such entities as black holes to be manifestations of The Chaos because we have little to no knowledge of these virtually unknown entities.

[1:13:224] Those wondermenters and philosophers whom disagree with the concept of The Chaos hold that All things are cosmical, and All those we deem not are to be, are so because of our lack of knowledge of them, not because of their own characteristics.

[1:13:225] Such a notion is understood and accepted within the broad range of Astronist cosmological traditions, yet would be counteracted by the understanding that humanity does not yet know of such entities, and therefore, they must stay shrouded in The Chaos until their true naturities, orderities, purposities, and more have been revealed to us.

[1:13:226] In wider cosmology, this does not defy the characteristics of such elements, or lower their standing in hierarchical terms, but distinguishes those celestial entities which display acosmical characteristics and functionalities.

[1:13:227] Ultimately, in the Astronist philosophical traditions of cosmology, The Chaos is a representative concept of that which is unknown, and seemingly and perceived be structured upon some disorderity as distinct from the other elements of The Cosmos.

[1:13:228] It is this unknownness that constructs and establishes The Chaos as a valid concept of philosophical cosmology by the distinction that such elements considered as part of The Chaos are only so because they hold disordered or unknown naturities, and not by humanity's inability to understand or perceive such naturities for there are countless elements of The Cosmos that are not perceivable, or comprehensible by humanity in our current state, yet they are still considered as part of The Cosmos.

[1:13:229] The elements of The Chaos, also known as phantasms, or illusories, consist of celestials in a cosmical system that cause disorderity in the system for no currently understood reason, and some celestials, although firmly considered to be part of The Cosmos, are understood and accepted to have sporadic, or Chaotic tendencies such as the meteors, the comets, and the asteroids.

[1:13:230] One of the most mysterious phantasms of The Cosmos under direct influence from The Chaos are known as rogue planets; such worlds do not follow the standard and understood cosmical system formed by star and planet.

[1:13:231] Instead, such worlds motion nomadically throughout the galaxy, purportedly rotating around the galactic centre itself, yet it stands true that such a world is without proper cosmical orderity and is thus, an agent of The Chaos.

[1:13:232] Within The Chaos also are any illusions or distortions of The Cosmos that appear to be something in their orderity, naturity, or functionality, but are in fact the opposite and instead, hold sporadic affiliations.

[1:13:233] There are various theories and concepts surrounding the overarching concept of The Chaos and its ultimate naturity; the first of which is known as Chaos Over Cosmos, which holds the belief that The Chaos, despite its relatively dispersed agents, is in fact in control of the entirety of The Cosmos.

[1:13:234] Such notions can be supported by the fact that at the centre of All galaxies exists some of the most supermassive black holes existent anywhere in The Cosmos and around which All star systems rotate.

[1:13:235] Another concept is known as the Chaotic Illusion, which understands The Chaos to be an illusion in itself and does not consider The Chaos to be anything separate from

The Cosmos, but simply only a conceptual manifestation of the lack of knowledge held by humanity about The Cosmos.

[1:13:236] A third concept of chaotic naturity is known as Chaotic Revelation, and holds the belief that The Chaos is just as much full of revelations regarding The Universe, The Divine, and answers of our overall existences as The Cosmos is, and may go further to suggest that The Chaos could potentially harbour even more revelations about existence and cosmicality than The Cosmos itself with all its orderity, control, and limitation.

[1:13:237] Some concepts seek to understand the purposivity of The Chaos: others wish to explain the variously designated chaotic elements in order to redefine them as part of The Cosmos, and other concepts hold beliefs of a Chaotic Universality; the idea that The Universe is in fact The Chaos and the black holes of The Cosmos are gateways to the exploration of new dimensions, existences, and realities that are not possible in The Cosmos as we understand it now.

[1:13:238] Another characteristic of The Chaos is that of ataxia; the loss of movement, or motion in celestial entities, or the abnormalities in the motionalities of celestial entities.

[1:13:239] Ataxy appears in many forms, but the most common of which is the shooting meteors and comets that reveal themselves throughout The Cosmos and whose trajectories are sporadic and unknown, and are seemingly uncontrolled.

[1:13:240] A less abundant example of ataxia would be the loss of rotality, orbitality, or motionality in a cosmical element; the actuality of such an occurrence is without evidence, yet if it was to occur, the ordered cosmical system would collapse.

[1:13:241] It is the naturity of The Chaos to revel in pandemoniums caused to the cosmical system, or simply orderity in general; in contrast, it is the naturity of The Cosmos to revel in the orderity, control, and proper organisation of the cosmical elements and their systems; this is the fundamental incongruity between the naturities of The Cosmos and The Chaos.

[1:13:242] The Chaos is not simply All that is unknown for there are countless aspects of the elements of The Cosmos that are unknown, but it is the sporadic behaviours of the chaotic elements that forces their conscription into the category of The Chaos.

[1:13:243] In conclusion, the study of The Chaos is just as important to the wondermenters of us as is the study of The Cosmos for in The Chaos, we have the potential to understand some of the most unknown parts and aspects of The Cosmos in The Universe, and in this notion, we must realise that the study of The Chaos must be placed in equal measure and abundance to the study of The Cosmos in All its wondermentful glory.

—

[1:13:244] Throughout all parts of wonderment and general perception from the limitations of The Earth, there exists the aspect of clouds and their ability to stop the wonderment of the stars.

[1:13:245] The study of the clouds under a philosophical lens is known as Nephology; within this discipline, the naturity of clouds and their obtrusivity in the practices of wonderment, and wider perception of the stars.

[1:13:246] In all Astronist writings and philosophies, the centralmost and commonmost of limitations to The Earth, or the limitations to one's perception, or a character's perception involves the appearance of cloud cover.

[1:13:247] Nephological study encompasses the understanding of the clouds and how their naturities cause the obstruction of the stars, and subsequently, of wonderment.

[1:13:248] Although the clouds are categorised as cosmical, their orderity, naturity, and functionality are fundamentally obstructive to The Cosmos, and may be considered chaotical due to this.

[1:13:249] The role of a nephologist is to understand and comprehend the extent to which clouds have an obtrusive impact on the wondermenters and their practices, as well as astronomy and general star study on a firmly philosophical basis.

[1:13:250] The clouds and their obtrusive naturities offer an insight into the possible inconsistencies between terrestrial elements and cosmical elements; there seems to be a disconnection between the fulfilment of wonderment and one of The Earth's most abundant elements obtruding into this fulfilment.

[1:13:251] When the night sky is covered, my mind, my heart, and my soul are closed off from the possibilities of The Cosmos for I cannot see the stars I hope to know, explore, and understand.

[1:13:252] The discipline of study of Nephology is one of the most important philosophical studies in present time for we are, for the time's current, stagnated to The Earth's limitations, and until we burst into The Cosmos, we are bound to its elements and its naturities; one of which is the clouds and their obtrusivity, although it may be disheartening for the wondermenters, it is part of The Earth's internal functionalities, and for this, we must understand their place.

[1:13:253] Do not fear though, the wondermenters and astronomers of us for the times of nepholicity, the times of cloud cover, can be used productively and wisely by the theorising and imaginement of The Cosmos.

[1:13:254] Perhaps the clouds do teach us a greater lesson; to understand and accept when to look away from The Cosmos and instead, theorise on the ideas that we have imagined,

read about The Cosmos that we cannot see when we look up, and to speak to others of our love and wonderment of The Cosmos; these actions should be just as imperative to the wondermenters and the astronomers as the wondermentation itself.

[1:13:255] The nepholic skies are therefore present a great teaching for our mind's of impatience and naive love for The Cosmos; the lesson of when to know to halt that which we love and to share our love of such to the world; without this, the world will continue on and shall never know of the grand treasures that wonderment and astronomy may bring.

[1:13:256] Thus, it is with an optimistic eye that we shall view the nepholic sky, and although we may not ever like its presence, we shall continue to understand its natural necessity and the opportunity that its presence brings to us; like many things unpleasant, unwanted, or disused, in the optimistic vision, there exists a great many things more than can be pleasant, wanted, and used about that same entity.

[1:13:257] Within the studies of nephology, there exists the nepholic sky; the sky in cloud cover and the empyric sky; the sky without clouds, also known as the cosmicover.

[1:13:258] Though we now understand and accept the sky of nepholicity and its natural necessities and usages, the sky of empyricity has, and shall always be the sky that which we, as the entirety of humanity, wonderment towards, laud, adore, and look up towards for guidance, understanding, and knowledge of The Cosmos and the new worlds beyond The Earth.

[1:13:259] The empyric night sky has provided us with All our knowledge of The Cosmos so far, all our understandings, wonderments, and visualities of the stars, which have formed the cosmologies of the faiths and shall form now and beyond the philosophical cosmologies.

[1:13:260] The empyric night sky has been humanity's greatest visual connection to The Cosmos and has formed the foundations of All that we know of The Cosmos.

[1:13:261] The sky of empyricity has enlightened our minds for generations and shall does so in the same ways and in new ways, especially so when the worldview of astronomy and The Cosmos change with the reascension of philosophy and with the arrival of cosmocentricity.

[1:13:262] If it is philosophy that is to reascend, then its purpose shall stand true since its founding; to search for universal truth and in the empyric sky, we shall be granted the ability to see and know and understand such truth unlike during the times of the nepholic sky, which is a time of realisation of the truths interpreted from the times of empyricity.

[1:13:263] The best way to summarise nephology is herein described; the time when which the sky is without cloud is the time in which we see All that we can become and are

destined and prophesied to explore, and the time when which the sky is with cloud is the time in which we are to share with the world the wonderments of the world beyond.

[1:13:264] With empyricity and nepholicity, therein exists a dynamic of perception; the way in which we are to perceive The Cosmos; in nepholicity, we may not see The Cosmos with our eyes, but we may see it still and even more greatly, with our minds.

[1:13:265] All that wonderment is, is the visual aspects of The Cosmos interpreted by our wonderments through ambition and imagination of possibility and potential.

[1:13:266] The greatest and most gifted of the wondermenters are, in fact, those whom do not need to physically see The Cosmos to imagine its wonderments and treasures; these rare individuals instead form their own mental images of The Cosmos as they understand it, and from, there they speak of their thoughts, and write of their theories to share with the world about the new world beyond our own.

[1:13:267] In essence, the entirety of nephology is about perception; the way in which humanity views The Cosmos and the way in which it is allowed to view The Cosmos according to its current means, ability, and vision to do so as granted so by the natural elements of The Earth.

[1:13:268] To see is not always to know; perhaps the times of nepholicity shall spotlight the greatest of minds and the most gifted of wondermenters for their abilities to stay focused on that which The Cosmos truly is and where that which The Cosmos belongs, for the inferior minds shall dissolve their wonderments when the times of empyricity pass.

[1:13:269] All that we do know is that nephological naturity understands to us that the clouds shall always exist in their motionalities and shall never become stagnated, and in this, the empyric wondermenters shall find relief for their wonderments will reignite and the treasures of The Cosmos shall return to their minds and imaginations.

—

[1:13:270] One shall notice of the naturity of the peoples of the world, and the world itself, and the world beyond our own that all of these entities experience one overarching commonality that seemingly forces them forwards towards achieving their purposities and using the designs by which they were formed; this commonality is conflict.

[1:13:271] In All things, especially so in the naturity of humanity, conflict exists; whether this be by means of opinion, thought, appearance, proximity, emotion, wealth or otherwise, conflict shall always arise for it always has and that seems to be the naturity of us, to not necessarily desire conflict, but to incessantly, ignorantly, and uncontrollable gravitate towards confliction in a way resembling light and its inability to escape the gravitation of the oblivion into which it is destined to exist forevermore.

[1:13:272] There is conflict in humanity; there is conflict in the natures of The Earth; and there exists omnifold conflict in The Cosmos; in fact, it is not farfetched to consider that confliction is the abstract driving force of All cosmical entities.

[1:13:273] Whether it be by gravitational conflict, molecular conflict, conflict of temperature, lightness, darkness, matterness, and nothingness; All aspects of existence seem to gravitate themselves towards conflict.

[1:13:274] From this, two newfound theories form in consequence and these two aspects are described as Chaotic Confliction, and Cosmic Confliction; the former understands The Chaos to be the controller, initiator, and the ultimator of conflict, and the latter understands confliction to simply be one of many of the driving forces of The Cosmos that forms the orderities of The Cosmos.

[1:13:275] There are parts of a conflict that are destructive to both sides which may well be the conflict itself; this is also known as the internecine; the aspect of the conflict that does not create betterment or superiority for either side, and is thus known as Dual Destructive.

[1:13:276] The concept of the internecine demonstrates something larger about the naturity of confliction itself; in a logical notion, to fight and kill and attempt to destroy one another is not bettering either party; in fact, this only lowers the reputation, integrity, and dignity of the two conflictive parties.

[1:13:277] In a nephological context, the internecine is reflected in the unproductive notion that during times nepholicity, there cannot be wonderment; this attitude, though it may be true on one level, is destructive to all aspects and parties involved for the overall wonderment is thoroughly reduced.

[1:13:278] In a wider cosmical context, the internecine may relate to the conflict between The Cosmos and The Chaos and a view of Internecism would understand such a conflict to be destructive to both sides.

[1:13:279] An internecinal view is seemingly geared towards the goal of peace between conflicting parties, and this may be supported by logic, however, the goal of internecism is not strictly one of culmination, but one of indication; simply a markation of the disadvantageous and detrimental consequences of such a confliction.

[1:13:280] We can always look toward internecinal thought for a balanced and neutral view of confliction and with the nature of the human mind to obsess and become intrinsically bound to the elements of a confliction whilst during its occurrence, it becomes even more so important to take a stand back from the confliction and view its consequences rationally, and in this, Internecism assists and fulfils.

—

[1:13:281] Throughout the histories of humanity, All that has happened to us, All the people that have ever lived, and All the events that have ever occurred by us, have done so on The Earth, and from the perspective of being on The Earth.

[1:13:282] With the rise of our minds to new cosmical heights and with the actual exploration of The Cosmos by the pioneers of humanity and technological progression underpinned by a strong and clear philosophical foundation, this limited perspective on The Cosmos is inevitable to end.

[1:13:283] In all of this time, we have developed practices, systems, and methods of seeing, knowing, feeling, and understanding the stars above us, and with the introduction of wonderment as the philosophical contemplation of the stars, we are faced with two oppositisms of an ability, or inability to do so.

[1:13:284] The ability to wonderment the stars is aforeferenced and latterferenced throughout the Omnidoxy, and the action therein is considered central to all the practices and philosophies of a cosmical setting, and foundation.

[1:13:285] Therefore, the ability to wonderment the stars is the ability to engage in cosmic philosophical thought, imagination, and understanding, and is therefore not only foundational, but intrinsic to all Cosmic Philosophy.

[1:13:286] If one does not possess such an ability to wonderment the stars initially, they shall do so with the help of philosophy and with the assistance and guidance of those around them, the architectures, cultures, and systems of their societies, and the educational institutions that support the civilisation in which they reside.

[1:13:287] That which is known as the wondermentation of the stars is known as holding the ability of Astrality and that which is known as not possessing such an ability is known as Inastrality.

[1:13:288] We are all astralites in our naturity for we are all descendant from The Cosmos and are destined and prophesied to learn and wonderment of the stars of The Cosmos, but to practice astrality is unique for us all and the times in which we gain such an ability do not always occur in simultaneity.

[1:13:289] Astrality is the end goal for all humanic interaction with the stars and The Cosmos, and although inastrality is prevalent in the times of this writing, such an epidemic shall be extinguished forthwith as philosophy and cosmocentricity ascend to take their places in the minds of humanity.

[1:13:290] In better definition, inastrality is not simply an inability, but an ignorance of the stars of The Cosmos; it is the primary goal of philosophy, cosmocentricity, and the study of astronomy to end such ignorance of that which where we came in our originations.

[1:13:291] With all things existent, all such are in motion and the evolutions of such existents are inevitable and this is no different for that of astrality.

[1:13:292] Astrality shall continue to develop and in the humanic exploration of The Cosmos, it shall do so omnifold for astrality on the new worlds beyond our own will demonstrate uniqueness forevermore for current astrality relates to the perception of the stars from the perspective of The Earth; this shall change with humanity's exploration of The Cosmos in The Universe.

[1:13:293] As the concept of astrality grows and develops and spreads throughout the minds of the peoples of the world, and throughout the societies and civilisations of this world and the new worlds beyond, the inastralites shall grow smaller and smaller in their virality.

[1:13:294] The wondermenters of us and those whom have the ability, gift, and enlightenment of astrality shall see the greatest of the philosophical buildings and walk into them and hold the contents of learning and knowledge within such as the architectural, ornamental, and renditional manifestations of the cosmical philosophies.

[1:13:295] One such of these philosophical buildings are the starhouses and found along the coasts of the countries of the world and the new worlds beyond our own; their connections to water, to the seas, and the oceans and all that such subjects of symbolism derive, is undeniable and intrinsic to the purpose of such buildings.

[1:13:296] The starhouses of the world and the new worlds beyond stand as beacons of hope, guidance, and knowledge as did their maritime counterparts for centuries, but the starhouses do so now in new ways cosmical and for the purpose of wonderment and cosmotime.

[1:13:297] Champion the starhouses for their beauty; adore the starhouses for their purpose; preserve the starhouses for the betterments they provide for the peoples of the world; and finally, visit the starhouses and let go of your inastrality to welcome the newfound understanding of astrality and all its many cosmical treasures.

—

[1:13:298] As aforementioned and lattermentioned throughout the Omnidoxy, The Chaos is the epitome of the disorderities of The Cosmos, but such disorderity is also known as entropy when in relation to process of gradual disorderity of a cosmical element and focuses itself on the specificisms of such a process rather than disorderities of The Cosmos as a whole as focused on by the root concept known as The Chaos.

[1:13:299] Entropics, also known as Entropology, is the official study on the philosophical contemplation of the gradual decline of a cosmical element from being in orderity to disorderity.

[1:13:300] Some cosmical elements hold disorderity in their naturities from the moment of their formations and some other cosmical elements have developed disorderity during their existences; some elements of disorderity have not always been so and it is that which entropics focuses upon and studies.

[1:13:301] The process of turning toward disorderity is a process of diversity, complexity, and multi-consequential for the cosmical system in which it resides.

[1:13:302] The first stage of the entropic process is the breakdown of the rotality and the orbitality of the cosmical element; these fundamentals are the basis of all cosmical orderity, and therefore, are the first to collapse.

[1:13:303] The second stage of the entropic process is the distortion of the formity of such elements; this does not pertain to abnormal appearance, but to incompleteness, or disflowness in such formities, and in turn, results in the breakdown of orderity in the topography of such an element affected by entropy.

[1:13:304] The third and final stage of the entropic process is the devolution of a cosmical element into something of unknown naturity; this is most commonly evident in the death of a star and its collapsation into an oblivion after its supernovae.

[1:13:305] This state of unknown naturity, or sporadicity is then the final condition of the entropised element and it shall exist in this way for the remainder of its existence as it is not cosmically possible to return to orderity once disorderity has taken its complete hold.

[1:13:306] Do not mistake the numerical labels of these stages as to relate to chronology; as the orderities and disorderities of the elements of The Cosmos are diversity, it is thus logical that the process by which such elements degrade into disorderity is just as diverse.

[1:13:307] Entropical thought allows for the greater understanding of The Chaos and wider disorderity by contemplating the processes and conditions by which and in which the chaotic and sporadic elements of The Cosmos exist.

—

[1:13:308] That which is henceforth known as The Ciscosmos is a type of perception of The Cosmos that relates to The Cosmos known to be nearest oneself; one's own perception; The Cosmos in the immediate surroundings; The Cosmos in the closest proximity.

[1:13:309] The Ciscosmos is also the closest Cosmos to oneself; one's own vision of The Cosmos and one's own Cosmos Mind; the way in which one perceives The Cosmos; this is another interpretation of The Ciscosmos.

[1:13:310] The cisgalaxy is the galaxy in which one resides and in which a civilisation stretches across, and may also be in relation to one's perception of the galaxy in which one resides.

[1:13:311] For example, from the perception of being on The Earth, we see The Milky Way's disc structure from within it, from being part of it which relates to the cisgalaxy; the cisgalaxy is therefore the way in which one perceives the galaxy in which they reside in the closest proximity to their vision.

[1:13:312] The cisuniverse, cistime, and cisspace are an additional triad of concepts in extension to the aforementioned concepts within this discourse.

[1:13:313] The cisuniverse is The Universe that is proximatest to one's perception of The Universe; the cistime concept is that which corresponds most proximately to one's own perception of Time and the way lens through which Time perceived through a particular element, or cosmology; this is the same of cisspace in relation to one's proximatest understanding of space.

[1:13:314] Overall, that which is coupled with the prefix of cis- relates to the element in question according to its proximatest perceivance from the perspective of the individual.

—

[1:13:315] There exists binate concepts throughout Astronist philosophy and cosmology, and on the topic of universality, this is no exception, and upon this notion, the Closed Universe, and the Open Universe concepts are manifested.

[1:13:316] The Closed Universe consists of a universality holding that The Universe is ultimately finite in its naturity and therefore, is not all-encompassing, all-space, or omnixistent, and tears The Universe away from any notion of it possessing some Divine aspects.

[1:13:317] The Closed Universe, therefore, insists that The Universe and The Cosmos are fundamentally different in that The Universe does underpin The Cosmos, but the Closed Universe concept holds that The Universe does not represent the entirety of existence like its counterpart concept of The Open Universe.

[1:13:318] The centralmost concept within the Closed Universe is its understanding of The Universe in such a way that is finite in naturity, and beyond which Divine entity exists and controls, or further existence exists beyond The Universe itself.

[1:13:319] In direct and equal oppositism, the Open Universe concept of universality understands The Universe to be infinite in its naturity, and thus, closer in naturity to

something Divine for the characteristic of infiniteness is one of the main associations with divinity.

[1:13:320] The Open Universe perceives The Universe to be encompassing of All existence; All that is, was, and will be; All the space, the time, and the matter of existence, and All that is beyond.

[1:13:321] The Open Universe understands The Universe to be the underpinning of The Cosmos, but goes further by understanding The Universe to be infinite in time, space, matter, and existence.

[1:13:322] The perfect quote to understanding the Open Universe concept is as follows; All that is to exist, All that does exist, and All that will, could, or is possible to exist is All that is within The Universe; The Universe is the ultimatum of existence.

[1:13:323] Such concepts as the Open Universe tend to divert their thoughts towards that of fusing The Universe with The Divine itself; understanding that The Universe is The Divine; that they are One and All, and The Cosmos exists beneath as the physical manifestation of Divine and Universal creation, as underpinned by The Divine and The Universe as One and All.

[1:13:324] When discussing the expansive naturity of The Universe as we understand it now, the Closed Universe holds that The Universe is expanding into space precreated by The Divine and believes that in some future time, The Universe will reach its own limitations and will eventually collapse in on itself.

[1:13:325] However, in the Open Universe concept of universality, the space into which The Universe is expanding is considered to be created by The Universe itself simultaneous to its own expansion and upholds the notion that The Universe shall go on forever in this way of self-creation, known as universal autocreationsism.

[1:13:326] But the key idea with the Open Universe concept is that if The Universe was left, it could and it would continue on forever in a self-creating modality that holds a distinct infinite and eternal naturity as part of the core Astronist belief regarding the structure and ontology of The Universe.

—

[1:13:327] That which is the known as The Composite Cosmos is a structural cosmology holding that The Cosmos, although we understand it to be in its wholeness and entirety, is ultimately made up from a vast abundance of composite parts without which it could not exist and is therefore existentially dependent upon.

[1:13:328] The concept of The Composite Cosmos explores the relationship between the concept known as The Cosmos, viewing The Cosmos in its entirety, completion, and

wholeness as one, and the concept of composity, viewing The Cosmos by the parts that structure it, not by its entirety, or wholeness, or oneness.

[1:13:329] The Composite Cosmos reveals to us the naturity of The Cosmos, and its ultimate dependence upon the edifices of its cosmical functionality, structure, and orderity.

[1:13:330] That which is known as The Composite Cosmos is that which is understood to be The Cosmos as constructed by many parts; never just one; such parts may form one finite cosmical system, but with these parts, the One System could not exist; therefore, is it not a Multi-system perceived to be One System?

[1:13:331] Can we really call One System one if it is structure by multiple systems? This is the ultimate ponderance of the concept of The Composite Cosmos, and one that delves into the naturity and the system which form The Cosmos.

[1:13:332] It is the naturity of cosmical existence for elements to reside only due to the existence of another element; this relationship can be spotted amongst All things, but most prominently between the planets and the stars around which they orbit, the galaxies and the oblivions at their centres, and the firmaments of The Cosmos and gravity's pull held upon them.

[1:13:333] The Composite Cosmos also incorporates variety and diversity of element by the notion that there exists unique and varying levels of significance for each element of The Cosmos.

[1:13:334] The composite cosmology considers The Cosmos in a form that still understands The Universe to be the underpinning of it, and some Divine entity as the creator of All of existence, but it views The Cosmos not as its wholeness, or oneness, but as an entity formed of systems of countless abundance, yet notably, not infinite as in alignment with the traditional Astronist view of cosmology.

[1:13:335] The concept of The Composite Cosmos and wider composity can be found throughout Astronist cosmological and philosophical thought, and is therefore an important instrument of study.

—

[1:13:336] The Philosophy of Abundance understands the naturity of things as they are in scale for it is difficult for our minute minds to understand such things as stars, planets, galaxies, and even the entirety of The Cosmos, The Universe, and The Divine as they do really exist in scale and abundance to ourselves.

[1:13:337] There is a certain boundary to our minds, and although our minds are magnificent in relation to that which they created, the imaginment of all the planets, all the stars, all the galaxies, all the oblivions and all the entireties of The Cosmos and its

firmaments, The Universe and its dimensions, and The Divine and its divinity; to imagine All of these things in one thought is one ability that we do not possess.

[1:13:338] In this notion, abundancy in its very core naturity is one instrument of study whose mental manifestation is largely beyond current humanic capabilities.

[1:13:339] Though this is considered to be correct in that humanity should not be able to comprehend the entirety of The Cosmos and all its elements, as well as The Universe and The Divine for humanity is neither worthy, nor ready to do so, and nor is it in the capacity of our natures.

[1:13:340] The official study of the philosophical and cosmological approach to abundance and abundancy is to be henceforth known as Abundology, and all philosophical aspects of abundance are considered in the Philosophy of Abundance.

[1:13:341] When we speak of abundance in philosophy, we must think of it on three distinct levels; the first of which is Physical Abundance, the second of which is Mental or Abstract Abundance, and the third of which is Cosmical Abundance.

[1:13:342] Physical Abundance deals with the scales and amounts of physical attributes of elements, such as the amount of stars of a galaxy, or the amount of galaxies in The Cosmos.

[1:13:343] Mental Abundance, also known as Abstract Abundance, deals with the understanding of physical abundances by the mind, as opposed to the visualisation of physical abundances, and may also relate to the abundances of the mind and our ability to comprehend only a certain amount of abundances at any one time.

[1:13:344] Finally, Cosmical Abundance relates to the abundance of The Cosmos as a whole rather than the abundance of its composite parts, and is typically the least comprehensive of all the abundances, and the hardest to mentally formulate due to the largely unknown vastity of The Cosmos.

[1:13:345] Abundance Inability relates to the point at which one human mind cannot comprehend abundance passed said point, and attempts to pinpoint the stage at which comprehension becomes incomprehension.

[1:13:346] Due to The Cosmos holding so many abundances, it is logical to notionise that The Cosmos itself is abundant, and what we know to be The Cosmos, is in fact just one of many abundant Cosmoses underpinned by the entirety of The Universe; this is not only possible, but logical, for an abundance of things is an abundance of that which such things exist within.

[1:13:347] We cannot know the totality of abundance for in doing so, we must know the entirety of All existence, and such is a Divine ability that no cosmical product can ever achieve for it is not in our natures, purposes, or functionalities to do so.

[1:13:348] The philosophy of abundance reaffirms an earlier statement on the oneness of current faiths; if The Cosmos in The Universe created by The Divine is so abundant that All thoughts, words, physicalities, mentalities, products, and elements so countlessly abundant in variation, diversity, structure, purpose, functionality, and in many more realms, then is it ultimately illogical and incoherent to such that one book, one system, and one set of ideas is culpable and capable for All that exists and its explanations?

[1:13:349] This notion has been proven omnifold throughout our history with the revelations of many aspects of the world and The Cosmos coming into common knowledge through an abundance of books, and systems, and multifaceted paradigm of ideas, thus abolishing any one book, one system, one set of ideas notion that itself attempts to defy logic.

[1:13:350] Philosophy of abundance perceives cosmology and the overall purposes, natures, and orderities of The Cosmos in The Universe in relation to the numbers of, the scale of, and the dimensions of whichever element is under philosophical examination and contemplation.

[1:13:351] Another contemplation of the philosophy of abundance is the apparent abundance that exists in futurity; whether one believes in the predestination of all things, or the future in relativity to one's own decisions, it cannot be ignored that the future is abundant in possibility, and potentiality.

[1:13:352] Though we do not know the true nature of the future for in doing so, we become as The Divine, and this we cannot, we can begin to understand futurity by the abundance of it from our perspective.

[1:13:353] All we can surmise about anything that is beyond us in scale, in size, in nature, and in comprehension is that its possibilities and potentialities could be infinite.

[1:13:354] If we take a pessimistic worldview, we find that we do not know the true nature of anything; we cannot know of their true abundances for we are not that which created them.

—

[1:13:355] Loosely coupled with the concepts and philosophies of abundance follow that of frequency; to mind's unpracticed in philosophical thought, abundance and frequency are often concocted together in singularity, however, in this notion, we lose a great discussion on the ideas of frequency.

[1:13:356] First we must distinguish, then, this proposed difference between abundancy and frequency; the former of which focuses on the extent to which elements exist within a given realm, and the latter of which focuses on the proximities of said elements in relation to another element of the same kind, or the proximity of said elements within a given expanse, such as The Cosmos itself.

[1:13:357] With abundancy, there will always be an aspect of unknownness; that which is possible to exist, but we do not know and cannot ever know.

[1:13:358] With frequency however, the primary of study is that which already exists and how we are to approach the measurement of such; despite this, there is an aspect of unknownness within frequential study, as there exists such unknownness throughout all studies.

[1:13:359] The unknownnesses within frequential study arrive in such that we do not know the fullest existent of The Cosmos, or The Universe, or The Divine itself, therefore, we cannot know the true, or absolute frequencies of any cosmical element; we can only know their frequencies according to our own knowledge relative to our own perspective in and of The Cosmos.

[1:13:360] The frequency of the elements of The Cosmos do not correspond to size, scale, or significancy, but instead to the overall structure of The Cosmos; it is logical that some of the rarities of The Cosmos are the most prominent in size, scale, and significancy.

[1:13:361] That which is frequent is not always the most important in appearance, or scale, but frequency can be a measurement of cosmical significancy.

[1:13:362] The frequencies of cosmical entities does, however, reflect the dependency The Cosmos holds for said entity for those which are most frequent; gravity, space, stars, galaxies, and the firmaments of The Cosmos are those which structure the functionalities, orderities, and naturities of The Cosmos and the wider Universe.

[1:13:363] This reveals the importance of frequency in The Cosmos and foretells that frequency's measurement can reveal many a contemplations about The Cosmos's purposivity, naturity, and orderity.

[1:13:364] When we speak of frequency, we speak of the extent to which an element, or an event reoccurs after the first is confirmed to be real.

[1:13:365] The frequencies of novae, supernovae, and hypernovae are an exemplar of a similar kind of astronomical event decreasing in frequency, but increasing in size, scale, and cosmical impact.

[1:13:366] The frequencies of cosmical elements are understood to be a direct reflection of their relevancy within a particular cosmical system; this does not associate abundance, but

the frequency at which the said cosmical elements is require to keep the cosmical system functioning.

[1:13:367] For example, the frequency of The Sun in The Solar System far outweighs all the planets of the system due to the ultimate dependency that the system has on The Sun's existence for it exists as the centrality of the system and is the one element which all other elements of the system depend upon for their existences to continue.

[1:13:368] There are the overarching frequencies of The Cosmos such as those certain elements that exist within all systems, an exemplar of which would be gravity.

[1:13:369] Ultimately, it is the collective frequencies of the types of cosmical elements that are responsible for generating their functionality in The Wider Cosmos for the high frequency of relevancy of the stars of The Cosmos raises them to become one of the most important parts of the entirety of The Cosmos in The Universe.

—

[1:13:370] Some of the elements of The Cosmos exist and function in the conjunction of two or more elements to help them become that which we know them to be and how which we know them to exist in their orderity.

[1:13:371] The instrument of study known as fusionality contemplates the idea of the joining together of two or more elements to create a single entity by viewing such elements under a philosophical lens, which in turn, forms the stance of cosmology to be henceforth known as Fusionism.

[1:13:372] Fusionism understands The Cosmos only in relation to elements mixed together to form one entity and views the entirety of The Cosmos in Oneness, but as the greatest of all conjunctions as a vast amount of elements come together to join and form as one whole known as The Cosmos.

[1:13:373] The stance of fusionism in cosmology can be found in various places throughout Astronist philosophical cosmology for its understandings are both logical and widely foundational, therefore establishing its widespread influence throughout philosophical cosmology.

[1:13:374] The instrument of study of fusionality understands all aspects of cosmology; the birth, the life, and the death of The Cosmos under the lens of the belief that All that does exist within The Cosmos, does so by the conjunction of composite elements.

[1:13:375] Fusionism also holds the belief that the destiny of all that does exist within The Cosmos follows a course that shall inevitably lead to its conjunction with one or more other elements and holds this to be the central purposivity of all elements in existence.

[1:13:376] Universal Fusionism understands also that the relationship between The Cosmos and The Universe is ultimately formed upon a conjoined structure, thus holding that The Cosmos and The Universe are separate now, but the inevitability is that they shall in some time conjoin to become One.

[1:13:377] Divinical Fusionism adds further to the cosmology of Universal Fusionism by adding The Divine into the paradigm and understands that each of the three (The Cosmos, The Universe, and The Divine) are separate, but there is an inescapable inevitability that in some future time, All three shall combine to become as One.

[1:13:378] Like the stars are exploding spheres of the fusions of the gases and chemicalities and the galaxies too, are themselves melting pots of cosmical reactions, eruptions, and all manner of diverse cosmical elements that reside within the galactic disc and hold and bind it together.

[1:13:379] Fusionist Cosmology relates to the lens through which one perceives The Cosmos, and in this, one perceives The Cosmos to hold a structure and naturity that corresponds with a distinct and unique mixture of elements and holds the belief that All that does exist, does so by a fusional structure of entities already in existence.

[1:13:380] The most fundamental principle of fusionism stands that for entities to exist, they must ultimately be formed by two or more elements conjoining and developing as one entity; in this notion, it would be illogical of us to deny or ignore as this principle stands true in All things of existence.

[1:13:381] No single entity of existence does so exist without other elements of existence forming it; this is true of All things cosmical and chaotic, though that which is Divine is not imprisoned by such compounds of physical formity.

[1:13:382] There are no entities of cosmical or chaotic, or of universal existence that do not consist of two more elements, chemicalities, or dimensions; there can be an aspect of dualism and multitude in All existing things.

[1:13:383] We can look towards the principles of fusionism to form a newfound cosmology that not only relates to a multitudinal perception of The Universe, but also understands the naturity of All existent things to be of multitude in their core naturities.

[1:13:384] It is understood of ourselves that humans are not just reflect in one emotion, or one personality, or one characteristic; we are form by the fusion of many aspects of our experiences, the many emotions we feel, and the many characteristics we portray in natural reaction to that which happens to us.

[1:13:385] We can see the complexities of The Cosmos as reflected in ourselves for the minds of humanity are some of the most complex, contradictory, and convoluted entities ever created and in this, we see the quintessence of fusionism and its main principles.

[1:13:386] We understand ourselves to be complex, and with this notion, we see The Cosmos itself in its own style of complexity; complexity in the formity, structure, orderity, and motionality of it and in such, we see its greatest aspect; we see its grand nature as an entity with so much vastness that our minds cannot comprehend, but too, we understand it to be of some Divine naturity.

[1:13:387] Furthermore, in these various notions with which we speak in regards to the deeper constructs of fusionism and fusionality, we understand the concept of fusion to be somehow intrinsically bonded to the constructs of The Cosmos and The Universe and in an even wider context, bonded to the constructs of All the very existences that have been and shall ever be.

[1:13:388] There is further and greater works to be done in the realm of fusionism and fusionality for this concept and instrument respectively, are bound to greater heights of a cosmical, universal, divinical, and existential nature, though the Omnidoxy shall always stand as the founder of such new concepts and aspects of thought with regards to fusionism, fusionist cosmology, and fusionality.

—

[1:13:389] For one to know truly of one's own work, one must criticise it as one writes it; with this notion, therein arrives the philosopher's framework of criticalism.

[1:13:390] Criticalism encompasses a framework of writing that holds the primary principle of criticising one's own concepts, writings, and muses as one constructs them, and this can be seen throughout the Omnidoxy and the writing style that I have naturally taken to my liking.

[1:13:391] This is perhaps because I have seen the thoughts of philosopher's passed whom have elevated their words to ultimate and Divine heights and with which no word or concept they construct could ever be wrong as a result.

[1:13:392] In this, a weakness is formed in the philosopher's words for closing one's writings away from criticism, development, improvement, and motionality, one forms their own inability to allow their writings and thoughts and philosophies to develop to greater heights upon their own merit and not through fear, restriction, or constriction.

[1:13:393] Instead, I wish for my writings and those of the Omnidoxy foremostly to be open to the world and the worlds beyond our world and the criticisms they shall have of my writings for that is the only purpose I see of writing; to inspire future minds to write to make their worlds, their lives, and their societies better, but also to critique and to build upon those of writings of writers' passed.

[1:13:394] As philosophers, we corrupt and contradict the core nature of the title itself in the constriction of one's words and the world's ability to challenge one's words.

[1:13:395] I have seen and studied the mistakes of the writers and philosophers of the past and I see it as my foremost duty to never repeat such mistakes again for I have been afforded the gift of retrospect and this is a tool that most people could do to use more in whichever realm of study they reside within.

[1:13:396] Criticalism and its founding principles encourage the world to logically criticise my writings and philosophies, but in equal measure, it also allows myself to logically criticise myself and my writings and philosophies first.

[1:13:397] Perhaps they shall say a great deal more about my writings and philosophies, and in much more hurtful ways I imagine, but by the notions of criticalism, I shall have laid the first stone upon which their house shall be built, and with this, I am lead to be content for I shall always know that I had the first criticism for myself.

[1:13:398] The most shrewd of minds laugh not the loudest, nor do they laugh last, but they instead laugh before the rest of the world has caught up to them; and in this notion, we understand why the greatest of minds are often those which are the most misunderstood.

[1:13:399] And so, as a final grounding for the foundations of criticalism, I denote here, now, and forevermore the wondrous gift criticalism provides the philosophers and writers of us in that when in which we see our faults, we become stronger in whom we are and whom we wish to be and this greater strength, is all we can ever hope to accomplish as we are now in ourselves as human beings.

—

[1:13:400] Like many of the cosmologies and concepts of the Astronist Tradition, there exists a distinct and seemingly inescapable hierarchy of elements, fissions, and fusions that stand intrinsic to the overall cosmological processes.

[1:13:401] As is the structure of our own lives and anatomies, there is a hierarchical rank to all things of existence and within this, the relative functionalities, authorities, and statuses of the various elements are designated their respective roles.

[1:13:402] The Hierarchical Cosmology understands The Cosmos in The Universe according to a verdict of rank in alignment with the significancy of elements in a proposed system; this is exemplified by the cosmical hierarchal of The Sun to The Earth to The Moon and to ourselves as dependees of each of these cosmical entities though not so in equal measure.

[1:13:403] Hierarchical Cosmology presents rank, in particular chronology and superiority, according to size, scale, functionality, orderity, motionality, abundancy, frequency, and dimension.

[1:13:404] It is understood that The Hierarchy of The Cosmos is closely related to the concept of Cosmical, or Divine Product; that way in which one exists from another existent entity just as we are; we are products of The Earth which is a product of The Sun which is a product of The Milky Way and so on until we reach that which is to be henceforth known as the Hierarchical Ultimatum which is either manifested as The Universe, or The Divine depending upon the theological nature of the particular Hierarchical Cosmology in question.

[1:13:405] It is the nature of The Hierarchy of The Cosmos to be varied and complex, though the structure of the hierarchy shall largely stay the same of the elements of The Cosmos; the galaxies shall always be above the stars and the stars always above the planets.

[1:13:406] The wondermenters of us can look towards Hierarchical Cosmology for guidance on the comprehension of the levels of relevancy that each cosmical element holds in relation to and in comparison of other cosmical elements.

[1:13:407] It is logical to uphold the notion that The Cosmos is structured upon a distinct hierarchy of cosmical elements according to their functionalities, size, scale, frequency, and abundancy, and in this, we further learn of the naturity of The Cosmos.

[1:13:408] In that Hierarchical Cosmology understands The Cosmos according to rank, it is logical to consider functionality as the prominentmost aspect of the hierarchy due to the understanding that function is a direct contributor to size, scale etcetera of all the other aspects of the hierarchy and acts as their precursor.

[1:13:409] Hierarchical Cosmology can be understood according to two principle agents; potentiality and physicality; Hierarchy of Potentiality and Hierarchy of Physicality.

[1:13:410] The first of which understands the cosmical hierarchy according to the capacities of the elements in question to further develop in the future; it is understood here that black holes typically always take the pinnacle rank when measured according to potentiality due to their expanding and all-enveloping naturities.

[1:13:411] The second of which understands the cosmical hierarchy according to the physical attributes of the element in question and typically conducts this measurement according to present time as future physicalities are reserved for the Hierarchy of Potentiality.

[1:13:412] Another aspect of Hierarchical Cosmology is its motionality as distinct from other cosmologies; the positions of cosmical elements according to their rank will

inevitably shift throughout the extent of their existences, and there is the possibility and inevitability that certain occurrences will take place that shall raise the rank of a cosmical element for a short time before it returns to its original position which therefore affirms the importancy of motionality in the overall Hierarchical Cosmology.

[1:13:413] In conclusion, it can be understood of Hierarchical Cosmology that The Cosmos is an entire system based upon function, size, scale, frequency, and abundancy and that this is just part of its overall naturity, thus demonstrating the intrinsicity of hierarchical thought across all cosmologies.

—

[1:13:414] Though the naturity of the entirety of The Universe and existence is, and perhaps shall forever be shrouded from our understanding, it is imperative that the alternate dimensions of reality and existence are discussed in order to better understand the existence in which we reside as ourselves now.

[1:13:415] Alternate existences and realities manifest themselves in the Astronist Tradition within what shall be henceforth known as Inverse Cosmology; a cosmology in which all existences is in an opposite position, functionality, orderity, direction, effect, purposivity and naturity to that which we know in our own reality.

[1:13:416] The instrument of study henceforth known as inversivity deals with all possible alternative realities and dimensions of existence and understands The Cosmos to be encompassing of the reality in which understand and all its orderities.

[1:13:417] The inverse view of The Cosmos typically revolves around the concept that the elements of The Chaos in The Cosmos are indicators of alternative realities and dimensions.

[1:13:418] Inverse Cosmology establishes the concept henceforth known as The New Cosmos which considers a Cosmos outside The Cosmos to exist and describes these collectively with the precursory principle that there could be infinite New Cosmoses and infinite possibilities within The New Cosmos.

[1:13:419] In the inverse cosmology, it is considered that the oblivions of The Cosmos are portals to new realities unknown to our comprehensions which are collectively described as The New Cosmos.

[1:13:420] It is important to note that The New Cosmos is still existent within The Universe according to traditional inverse cosmology, and depending upon belief, under the sustainment of The Divine.

[1:13:421] The entirety of inverse cosmology is an important concept to wider Astronist Cosmology in that it completely reverses, reorientates, and redirects the entirety of

existences and realities on courses of newfound trajectory that are inconceivable in The Cosmos within which we reside.

[1:13:422] More broadly, inversivity itself represents alternative thought, understanding, perception, and logic in All subjects, measurements, and matters of discussion, and thus fulfils an intrinsic role in Astronist Philosophy for to understand that which is opposite to one's own understanding, or to that which one studies is to realise the entirety of that which is studied.

[1:13:423] We cannot truthfully say that we know of something in its entirety if we have not yet considered it in the context of its alternatives.

[1:13:424] All alternatives hold variety which demonstrates a further dimension to the concept of alternatives, and too, highlights a rare eternality in that an alternative may have an alternative which also have its own unique alternatives and so on indefinitely.

[1:13:425] It is important to focus for a moment on the association between that which is alternative or the alternate cosmology in general and the concept of infinity; this association understands that which is alternative to be non-cosmical in its naturity for all that is associated with The Cosmos must be finite in its naturity, and it is thus revealed that alternativity is not so.

[1:13:426] To conduct inversion towards cosmical concepts is to construct the oppositisms of the said concepts and typically reverses the characteristics, functionalities, and the orderities of the cosmical elements.

[1:13:427] We must look at that which something is not in order to better understand that which it actually is; this is the importance of inversion in philosophical cosmology.

[1:13:428] The application of the instrument of study of inversivity in philosophical cosmology lets us understand whom we are and how we are; that which we are not; and too, those which could be alternate realities and existences.

[1:13:429] We can direct our thoughts towards Inverse Cosmology and it shall always provide us with an alternative understanding of that which is presently understood, and in this, it provides us with an alternative knowledge of all things which will be forever invaluable to all philosophical thought and practice.

—

[1:13:430] It is the primary naturity of The Cosmos and that which is cosmical in essence to be limited by the confines of the physical laws of The Cosmos in The Universe.

[1:13:431] As one of the branches of Astronist Philosophy, the general study of concepts surrounding limitation in cosmology and wider philosophy is to be henceforth known as Limitology.

[1:13:432] It is the role of limitologists to discuss and discover the limits associated with the naturity of The Cosmos and subsequently, all cosmical elements, and more widely, all concepts involving notions of limitation.

[1:13:433] Limitological study understands The Cosmos and wider existence in subject by limitational means and under a lens of limitation.

[1:13:434] In the Astronist Tradition, the distinction between The Cosmos and The Universe is found through the application of limitological study for The Cosmos is forever understood to be in limitation, or finity, and The Universe is forever understood to be in limitlessness and infinity.

[1:13:435] We can look to all concepts as aforementioned, and lattermentioned throughout the Omnidoxy limitologically, and by such a notion, we can understand all the elements of The Cosmos and all universalities according to their limitations and their limitlessnesses.

[1:13:436] It is first best to study limitation and its manifestations in ourselves as human beings for we see in ourselves, the greatest of limitations and limitations of great abundance.

[1:13:437] In our minds, we exist by limitation of that which we can remember, comprehend, and extend our knowledges toward and at these points of varying limitation, therein exists the manifestation of limitology relative to ourselves.

[1:13:438] With this understanding of the limitations of ourselves, we learn of the grander limitations and those which do not lie within our spectrum of current understanding and vision.

[1:13:439] In the philosophy of limitation, these different disciplines branch out from the limitations of humanity; the limitation of mind, of knowledge, and of perception.

[1:13:440] Due to limitation existing in all existents within The Cosmos, so all that is around us, then the discipline of limitological study is most vast.

[1:13:441] It is best to study limitation in a secondary order in relation to the limitations of various cosmical elements; the limitations of the planets, of the stars, and of the galaxies of The Cosmos in The Universe.

[1:13:442] If we understand limitation to be that which forms a circumference around one or all existing entities, then we must understand the actual consequences of such a restriction, and both the physical and abstract points wherein limitation reveals itself.

[1:13:443] It is also important to study the naturity of the limitation itself; depending upon the circumstances, limitation can exist in many forms; some limitations are stagnant and universal while others are motional, yet isolated, or vice versa.

[1:13:444] Understanding and accepting the variations within the concept of limitation shall result in a greater continuity in what it means to be limited in whatever the contextualisation may be.

[1:13:445] It is a mistake to perceive limitation as weakness; one whom is limited to their disciplines may master their restricted studies far greater and faster than one who's studies covers an unlimited amount of disciplines.

[1:13:446] We must also not misperceive limitation as an inability; The Cosmos is the ultimate physical manifestation of limitation and its beauty, functionality, orderity, and purposity are all in conjunction with one another and operate in coefficiency, and therefore, by no means does the limitation of The Cosmos's naturity hold any disadvantageous consequences for the functionality of The Cosmos.

[1:13:447] Despite these notions, there are, however, versions of limitation that do correspond to perceived weakness according to our own measurements of weakness; such is embodied in the limitation of mind in relation to the accumulation of knowledge, and another is the limitation of strength in relation to the maximisation of resources.

[1:13:448] With regards to the limitational naturity of The Cosmos, it is fundamental to notionise that although we understand The Cosmos to be the manifestation of limitation, we do not know, or understand the extent to which it is limited, or how much it is limited by, for we do not see the entirety of All existence and All potentiality, and therefore, we shall never truly know from what The Cosmos is restricted.

[1:13:449] Furthermore, if The Universe is understood to be the entirety of All things, and we, as we are here and now during this writing, do not know the entirety of The Universe and all its facets and potentialities and possibilities, then we cannot truly know by how much, or from that which we are restricted.

[1:13:450] Ultimately, due to our perception of The Universe stemming from within The Cosmos as the embodiment of limitation, it is thus logical and proper that we do not perceive the entirety of limitation, or that which exists beyond limitation, for we exist within that very same limitation and our perceivences are not natured to conceive of such things that are beyond the limitation in which we reside.

[1:13:451] The greatest limitation of ourselves is the extent of our knowledge of The Cosmos and its elements and the illusions of knowledge that have been formed throughout our histories have provided some answers, though their illusory natures are becoming more and more obvious to the peoples of the world.

[1:13:452] Until we have explored and understood every crevice of The Cosmos, our knowledge shall be forever limited for we have explored many things, but whether we have truly understood such, is another type of exploration in and of itself.

[1:13:453] Some say they know of God, but it is the principle of All whom understand Cosmic Philosophy that until one has witnessed the oblivions of eternal unknownness, the galactic discs home to the beacons of life, and the grand voids of nothingness, All face to face, then one cannot truly know of God.

[1:13:454] To say one knows of God reveals both our greatest limitation and our greatest insult to God; our greatest limitation to reveal that we know nothing and our greatest insult to reveal our lack of understanding, reverence, and belief in the ultimate grandness of God.

[1:13:455] Despite this, those whom wonderment and rejoice for one of our greatest limitations, the geocentricity of humanity, is imminent to end with the exploration of The Cosmos approach forthwith.

[1:13:456] We cannot ever hope to be without limitation in some form for in this, we hope to be as The Divine, and this cannot ever achieve, for what we are is of The Cosmos and that, it shall be forevermore, though we can learn, through the philosophical discipline of limitology, the naturity of limitation and its intrinsic function in the entire of existence.

—

[1:13:457] Monocentricity is plainly evident throughout many different aspects of the Astronist Tradition, and in a philosophical context, can be defined as understanding The Universe, The Cosmos, existence in general, or any other concepts, in terms of their centricity, or origination to oneness.

[1:13:458] It can be understood that the philosophical discipline henceforth known as Monocentrics encompasses all concepts and thought systems considered to believe that all that exists does so from an original oneness, such as Oneness Cosmology, and does so in oneness, such as in one orderity of the cosmical system.

[1:13:459] Mono meaning one understands The Cosmos and its elements under a lens of oneness and perceives all cosmicality under the central verdict that oneness is at the centre of all things existent.

[1:13:460] It is a logical notion to suggest that all things share a distinct oneness to their being; on the most minute of levels is the oneness of molecules of our physiologies and on the largest of levels is the oneness perceived of The Cosmos in The Universe, the perceived oneness of The Universe itself, and the perceived oneness of The Divine.

[1:13:461] Monocentric thought upholds the principle that all existence originated from some oneness, typically exemplified as The Big Bang, and shall end in oneness, typically exemplified in black hole cosmology, or in universal collapse theory.

[1:13:462] Monocentricity in The Cosmos can be found in a variety of forms; it can be found in the concentricity of the cosmical system in the form of multiple planets with one centrality

[1:13:463] It is deemed a mistake to understand binarity as the antithesis to monocentricity, for even in binarity, there exists a greater centrality, or a dominant entity, or a single origination point, unless of course, the binarity exists in perfect equilibrium.

[1:13:464] A studier of monocentrics holds their primary goal as to certify that The Cosmos in The Universe, and generally All existence, to be originative, functionative, and orderative from a distinct oneness.

[1:13:465] In a theological contextualisation, monocentricity can be found in many faiths, but from a purely philosophical point of view, we can understand The Divine to be the ultimate epicentre of monocentricity.

[1:13:466] A monocentric cosmology understands The Cosmos as a singularity; in a oneness state as a well-ordered, controlled, limited, and conscious whole that, although consists of composite parts, is ultimately One in its naturity, functionality, and orderity.

[1:13:467] In the Astronist Tradition of monocentric thought, we understand The Cosmos to be this and to exist upon this principle characteristic for it is the most important of all its features; its oneness and its uniqueness and its perfect order.

[1:13:468] Pancentricity and pancentric thought acts as the most appropriate antithesis to monocentricity and monocentric thought for it understands The Cosmos and the entirety of existence always under more than one perceivence and accuses monocentricity of simplifying The Cosmos.

[1:13:469] Perhaps the simplification of The Cosmos will always be needed for our inferior minds to hope to understand it, but it is logical of pancentric thought to notionise this idea, for to say The Cosmos and wider existence is ultimately something, or ultimately of oneness, then we are ultimately constraining its existence and naturity to being something, or to being one entity.

[1:13:470] Despite monocentric thought intrincating itself throughout the Astronist Tradition and wider cosmology and world faiths, it must be understood that monocentricity is nothing more than a lens through which we can look to gain a view of The Cosmos and wider existence that prioritises oneness and original oneness over all else.

[1:13:471] Therefore, monocentricity, in its philosophical understanding, is a concept of perception into which we can place further ideas and beliefs, but it is not in and of itself the ultimatum of existence, or the ultimate answer, for there is no concept, or idea that achieves such, especially so in the study of true philosophy.

[1:13:472] However, it cannot be denied that monocentricity exists All around us in evidence throughout The Cosmos for we perceive it in the immense gravitational attractors and at the singularities of the oblivions.

[1:13:473] These elements of The Cosmos demonstrate some of the most potent forms of monocentricity in The Cosmos, and it is such a concept seemingly so well-engrained in the functionalities of the elements of The Cosmos that it is inescapable to witness.

[1:13:474] Go forth, All young and old alike in mind and interest, towards the study of monocentrics to discover whether the true nativity of The Cosmos is to be as oneness, or otherwise, and why so?

[1:13:475] The philosophers and wondermenters of us must always ask why; why by which does something occur? Why in which way does this function? Why are the natures the way they seem to be to our current perception?

[1:13:476] In monocentrics, akin to all others philosophical studies aforementioned and lattermentioned, the question of why is paramount and must always be considered despite the mental hardships it may bring to answer it, but do not concede, for the testing of our minds remains the only way to expand them.

[1:13:477] And in practicing the question of why, we can expand our minds in many ways in all times and places and discussions, and furthermore, we can encourage the expansion of the people's minds around us, and this conduct must remain a primarity to All the philosophers and thinkers and wondermenters of us if we are to continue our works and efforts and ambitions.

—

[1:13:478] Self-obsession, self-absorption, and conceitedness are traits no more attractive of the masses than they are the individuals whom also display them.

[1:13:479] Unfortunately for the time of the world in which I was born, it is readily apparent in all aspects of life that humanity is not only now, but has seemingly always been the ultimate reflector of these three characteristics.

[1:13:480] In the faiths of the peoples, these have been encouraged; please do not understand that I mean of individual ethics, but herein I speak of the ethics of humanity as a whole, as a entire worldview and cosmology; we have been told that we are at the centrality of All things.

[1:13:481] To be told something that boosts one's ego is never ignored and always accepted, even though the opposite may be true, and in this notion, we can see what has occurred of our humanity; our entire ego has been boosted and we have indulged it to make ourselves feel better.

[1:13:482] It perhaps is the nature of man and woman to want to be ego boosted, yet like many of our natures, they need to be suppressed and not encouraged, for in doing so, we do not solve problems, but create them, and such problems we face in our world and in our current worldview.

[1:13:483] If I am the one to change it, then let this be the work that does it for I see the current self-obsession, self-absorption, and conceitedness of humanity for I have lived amongst it for the entirety of my life and its toxicity is almost overwhelming and it seems only to be worsening.

[1:13:484] First, we must begin with understanding how we are now and in what we seem to believe, which manifests itself into the Anthropocentric Principle; the belief that humanity is at the centre of creation and that The Cosmos was created for us, or that in some abstract way, we are centre to The Cosmos despite not being physically central.

[1:13:485] Anthropocentricity has thrived throughout our histories under science and reason and logic arose again, yet its claws seem to have sunk in again and this time, in the current times of this writing, the claws seem to have sunk further than ever before.

[1:13:486] Anthropocentrism acts as the formal organised philosophical branch of all anthropocentric thought and principle, and considers humanity to be central in some abstract, physical, or existential way as a certainty of existence, and reality.

[1:13:487] We go about our lives in our one-world and we forget of the world and worlds beyond our own and the following is the best analogy to describe such a notion; the closer we view a painting, the less we see of it, and this is the same of our view of The Cosmos, for we view The Cosmos from within it, as a part of it, and during this, we forget our minute place.

[1:13:488] In the face of this incongruity with our destined and prophesied selves, the principle of anti-anthropocentricity arises and shall become engrained in the minds of the masses of the peoples of this world and beyond for the inner betterment of all our minds and consciences.

[1:13:489] The ethics of our peoples shall be upheld by this newfound principle of honesty, self-effacement, and self-understanding of our position within The Cosmos in The Universe.

[1:13:490] One should not mistake anti-anthropocentrism as an antihuman, or misanthropic principle, but instead, the greatest reflection of the love of humanity and a greater understanding of our true position and purpose of existence.

[1:13:491] With this principle, we can begin to perceive ourselves from the perception of The Cosmos, and like it was that The Earth is not at the centre of The Universe, or that The Sun does not rotate around The Earth, we shall understand that we are no centrality to anything of The Cosmos; only ourselves perhaps.

[1:13:492] But as we begin the embarkation of humanity's exploration of The Cosmos as destined and prophesied so, we must understand ourselves in a modest measure in order to gain greater respect for The Cosmos as it is rightly deserved.

[1:13:493] We speak of the prophecy of humanity's exploration of The Cosmos, and some may ask of such a prophecy and question its validity; throughout all our histories, there have been the chosen few whom have enlightened us all on the ways of The Cosmos, and throughout all regions of The Earth, there have always been the stargazers, the wonderers, and the contemplators of what The Cosmos is, and could be.

[1:13:494] We cannot seem to see whom we are in truth and reality underpinned by reason; we seem to see only that which warms our own hearts and pacifies our own minds; like the tragic truths of this world, so too, may reality exist in such sharp contrast and oppositism to that which we wish it to be.

[1:13:495] Anti-anthropocentricity does not tell us what is not, rather it tells us what is; in truth and in reality and in sincerity for the betterment of us, our minds, and our societies.

[1:13:496] It tells us whom we are in relation to The Cosmos; it focuses on our minds not within, but without; it reminds us of our insignificancy in a world that is far beyond our own in all aspects; it cherishes, it binds us together, and ultimately, it tells us whom we are; a precious, minute, imperfect, ignorant, and inconsequential offspring of The Cosmos in The Universe.

—

[1:13:497] To discuss Naturalism, we must first define it according to an Astronist philosophical contextualisation; it is the belief that humans are simply part of nature with no higher purpose in The Cosmos, or The Universe, beyond being a product of The Cosmos in The Universe.

[1:13:498] Furthermore, there exists no afterlife according to naturalistic philosophy, however, it is a mistake to label all whom follow naturalism to be atheistic for there exists three distinct theological derivations of naturalism.

[1:13:499] The first of which is Theistic Naturalism; this holds that humanity is still just part of The Cosmos in The Universe as one its many offspring, but believes that there is one overarching power, or God, that controls The Cosmos and The Universe, and has a destined path for each and every one of us, but too, believes that we shall never meet the God that created us.

[1:13:500] In this, reverence and worship for God, or The Divine, is still most important when one is alive and is following their destined and prophesied path, but holds that there is no afterlife.

[1:13:501] This is the most orthodox form of Theistic Naturalism; there exists many other derivations; some believing in predestination, others not so; some believing that God is in direct contact with each and every one of us, and others do not believe this; some believe in multiple gods, while others do not, yet all are still considered to be part of Theistic Naturalism as their philosophical orientation.

[1:13:502] The second of which is Atheistic Naturalism; as evidenced in its title, this derivation of naturalism removes all references and attributes of God, The Divine, or some higher power from all concepts, theories, and cosmologies.

[1:13:503] Atheistic Naturalism understands that humans are simply part of The Cosmos in The Universe and hold no higher purpose, or relevance than being just that, and does not believe in the afterlife, but also, does not believe in any God, and thus, which we shall neither meet, nor be destined by for any inference to God is considered a mythology.

[1:13:504] Some whom adhere to Atheistic Naturalism believe The Universe to be God, or The Divine itself, and so, in this way, they channel the concept of God into a real and proven entity, rather than something of unproven, or irrational origination.

[1:13:505] Agnostic Naturalism takes the position as the third and final derivation of naturalism and expounds that we, as mere humans, are not of knowledge enough, nor are we of enough relevance, to even attempt to understand the complexities of God; it is clear that Agnostic Naturalist still do not believe in the afterlife, but the question of God's existence, is disputed and considered too hard to comprehend by the mere products of The Cosmos.

[1:13:506] Amongst these different derivations of naturalism, all are united by the assumption of one question; why do humans need to meet their creator in order for their creator to exist?

[1:13:507] Orthodox Naturalism understands, and more so encourages, that there is certainly a God, or some kind of creating entity that organised and ordered the entirety of The Cosmos, The Universe, and existence itself, but the question aforementioned challenges many assumptions of the faiths present in our world.

[1:13:508] Naturalism considers that we have held ourselves far too highly for the majority of our existences, and in this tradition, the assumption that we shall one day meet and interact with the creator of the entirety of The Cosmos, The Universe, existence itself, has developed and become engrained as the theological foundation of many faiths of the world.

[1:13:509] Naturalism, in its essence, entirely underpinned by the aforementioned, opposes such assumptions, and flips the table on these established and engrained concepts of theology.

[1:13:510] Perhaps that is the greatest of functions of naturalism; its staunch ability in the removal of the anthropogenesis, with the aim of leaving behind only those elements of a cosmical origination; it stipulates that all mythological inferences must be eradicated from certain areas of discussion; its allies are reason, logic, and The Cosmos, and forevermore shall their goals be intertwined.

[1:13:511] Naturalism returns our minds, thoughts, and systems back to that which we originated from; from the phenomena of the physical world; in this, we are returned to nature and from that which all ordered things originated; The Cosmos.

[1:13:512] Foolhardy attempts have been made to separate us from the bounds that are so deep within that they shall never be cut; we have assumed ourselves as we have worshipped others, and in this, we have created systems of thought and faith that suit our own intentions and grievances; not those which suit reality, logic, rationality, physical law, The Cosmos, or existence itself.

[1:13:513] Continue down such paths and forever will your demons haunt you for in such faith, you do not attempt to answer and overcome your inner worries with reality, but instead, you create false realities to suit your own endeavours, and fears; in the end, these shall inevitably reveal themselves and overwhelm you in your unprepared state.

[1:13:514] Naturalism attempts to repel such thought from the minds of the peoples by introducing a system whereby anthropogenic principles and concepts are faded out, and introduced are newfound principles suiting all types of theological outlooks, yet remaining true and real to The Cosmos and its naturity, and its principles, and purposities, rather than our own self-establishments.

[1:13:515] Perhaps one of the greatest failings of naturalism is its inherent urge to appease all people's theological outlooks; in this, we must heed for caution for it is the nature of things that to become All things, in doing so, one becomes nothing in return.

[1:13:516] Naturalism is the philosophical manifestation of logic, reason, and The Cosmos combined under one set of understandings, and incorporates all aspects of theology, existence, and what it means to be moral under one combinatory philosophical derivation.

[1:13:517] As we embark upon our exploration of The Cosmos, we shall inevitably grow closer to the tenets of naturalism as we see more of The Cosmos in its current state, and in its well-ordered and beautiful system.

[1:13:518] Praise naturalism for that which it stands; for the appropriation of what already exists; for the resetting of the pieces of the mind towards a new trajectory; does it not seem logical to you that our minds must change if we are to embark on a journey that shall change our very existence?

[1:13:519] Naturalism can be applied in whatever way one feels is suitable to their current philosophical circumstance, but the way in which naturalism is manifested, is the way in which it shall be interpreted by the world, so manifesting it in a way that is progressive and positive and appropriately applied is an important philosophical and academic task.

[1:13:520] Embrace and rejoice for naturalism is the culmination of the wonderments of The Cosmos and it reaches into every aspect of our lives and our thoughts, and so, it is most understood when looked upon with our own eyes for we are part of its makings; we considered important, but we also understand and accept our place as products of a product of a product of The Cosmos; such derivations demonstrate our insignificance.

[1:13:521] May The Cosmos, and all its elements that look down upon us in all our lives, reveal themselves to us further as we begin to perceive and understand them in ways proper and true.

[1:13:522] Can we begin to understand The Cosmos in such a way that considers it in its true grandeur? Perhaps it is only naturalism that can take a realistic, yet wonderful perception on The Cosmos.

[1:13:523] Perhaps there is only one way to perceive something in its genuine form despite some of the minds of the past glorifying themselves by the concepts of relativism; naturalism doesn't consider itself to be an oppositism of relativism, but prefers to perceive things in their one, true, and realistic state.

—

[1:13:524] There are the fundamentalities of The Cosmos; they are inescapable to see and know for they exist in all aspects of The Cosmos and are therefore essential to gain knowledge of.

[1:13:525] One of the most important of the fundamentalities are the Cycles of The Cosmos; a set of repeating occurrences in the cosmical system that can be identified as manifestations of cosmical orderity.

[1:13:526] The philosophical study of such cycles is known as Cyclometrics, and secondarily known as Cycleseology; individual cycles of cosmical origination are known

as Cyclometries; the belief that cycles are the centres of cosmicity and the belief that cycles are central to all cosmical orderity, naturity, and functionality is henceforth known as Cyclicism.

[1:13:527] As understood in the principles of orderity, rotality, orbitality, and general cosmical functionality, all cosmical systems can be found to be based upon a distinct cycle.

[1:13:528] As exemplars, the birth and the death of all cosmical entities is inevitable, even that of The Cosmos itself; all the orbitalities of the celestials rest on a cyclical system so as to form the traditional concentric shape and structure; the rotalities also exist by cyclicity for they function to reach their full revolutions.

[1:13:529] Closer to ourselves, there exists cycles all around us; the evolution of life on The Earth; the days and the nights; the births, the lives, and the deaths of us; the turn of a wheel; our needs and our wants; the molecules of our physiologies; All of these and many more are based upon a cyclical structure and by this notion, we reveal one of the most fundamental constructs of The Cosmos.

[1:13:530] Therefore, the philosophical study of cyclometrics is forevermore revered as one of the most important philosophical disciplines in cosmological structure and function; we require the cyclometrists to devise theories, concepts, and discoveries of the ways in which The Cosmos works according to a cyclical cosmology.

[1:13:531] Cyclicism understands The Cosmos according to a cyclical cosmology; the idea that the entire superstructure of The Cosmos is constructed upon and functions according to a network of cycles that, although they operate independently, they are ultimately considered to be as One.

[1:13:532] As perceived by the exemplars aforementioned, all cycles are wide in variation and purposivity with their appearances and functions considered to be dispersed, yet All holding some underlying connection with one another; similarly, there are the cycles that coexist with one another and even overlap in their functionality and purposivity.

[1:13:533] Cyclical structures are found in all areas of cosmicity and are typically obvious in their revelation to studiers such as the orbitality of The Earth around The Sun, and the rotality of The Earth and all the other planets of The Cosmos.

[1:13:534] A sign of some elements holding chaotic intrafactions is the breakdown, or the total non-existence, of a cyclical structure, or an intrinsic cycle to their function.

[1:13:535] There are, just as equally, cycles of The Cosmos that are unknown, and may never be known to us; these cycles, when studied under a traditional philosophical lens, are considered to be chaotic in their naturities, and functionalities.

[1:13:536] A cyclical structure is a good indicator of proper functionality and proper functionality is a good indicator of orderity, control, and limitation in accordance with purposivity and cosmicality.

[1:13:537] It may be logically notioned in accordance with Cyclicism, that the entirety of the orderity of The Cosmos is not only structured by, but is dependent upon cyclicality in order to fulfil its orderity; without cycles, it is believed that the functional superstructure of The Cosmos would collapse, and The Universe, as its underpinning, would collapse along with it.

[1:13:538] The Cycles of The Cosmos that occur between two or more cosmical entities are the next items to be explored; these types of cosmical cycles are known as Relational Cycles, and an exemplar of which is the triadic rotalities of The Moon, The Earth, and The Sun, which are all interdependent, and whose functionalities are largely based upon a cyclical structure.

[1:13:539] Cyclocentricity, as a derivative concept from cyclicism, understands cosmology only according to the centrality of cycles, and sees cycles as the centralmost element of The Cosmos in all functionalities, orderities, motionalities, and naturities.

[1:13:540] Universal Cyclometrics deals with the cycles related to, or forming The Universe itself, both in isolation from The Cosmos, and together in unity with The Cosmos.

[1:13:541] Cosmo-Universal Cyclometrics considers The Cycles of The Cosmos to be within, and part of the cycles of The Universe as one whole cycle, whereas Non-universal Cyclometrics considers The Cycles of The Cosmos to be separate in their naturity, orderity, and functionality of those of The Universe and thus supports a Composite Cycle.

[1:13:542] Composite Cyclicism understands cycles only in their isolated forms, never as wholes or as interconnected with other cycles.

[1:13:543] The Cycles of The Universe are largely unknown to us in our knowledges due to the general mysteriousity of The Universe itself, but the best of exemplars of The Cycles of The Universe can be found in the assumptions of universal expansion and diminution; the idea that The Universe is currently expanding, but at some point in its existence, it shall contract and shrink, or collapse due to its expansion.

[1:13:544] Due to the lack of our understanding of The Universe, we are left with speculation as to what its cycles may consist of, and more generally, its functionalities, naturities, and orderities.

[1:13:545] There are, however, logical assumptions that can be derived from the cycles we see of The Cosmos; it is assumed that all things existent have a beginning and an end; in this assumption, we identify that The Universe must have a beginning and it must have an end in order for it be in existence, thus demonstrating a fundamental universal cycle.

[1:13:546] Typically, a Universal Cycle is a type of cycle that can be found beyond The Cosmos, or can be assumed to be beyond cosmicality; in this notion, assumptions of universality must be made.

[1:13:547] Cosmical Cycles, however, are the most common of cycles that we encounter regularly and can confirm their real existences; these are the cycles of ourselves, the celestials, and all that is within The Cosmos, or holds cosmical naturity.

[1:13:548] Divine Cycles are the final type of cyclometry to be discussed in this discourse, and are the kind of cycle of which we know the least for they are Divine in naturity, and anything that is Divine is all but unknown to ourselves as cosmical products, holding cosmical naturities.

[1:13:549] For the atheistic thinkers, Divine Cycles may not be considered to come into existence, or they may be paired with and consumed by Universal Cycles, though in the Astronist Tradition, they are considered separate.

[1:13:550] There are two ways to understand Divine Cycles; the first of which is henceforth known as Divine Contomplance; this understands all cycles to be Divine in some core aspect of their naturities, that may not always be visible to any entity less than Divine, but they are always in existence.

[1:13:551] The second of which is henceforth known as Divine Inconnesence; the understanding that all Divine Cycles are separate from those of a cosmical, or universal naturity, and that the Divine Cycles are entirely parted from all other cycles, so much so that Divine Cycles have no direct interaction with the cosmical, or universal cycles.

[1:13:552] Whether by chance, or by some vocational motivation by which one stumbles upon the study of Cyclometrics, its philosophical discipline is so intrinsic to All aspects of philosophical cosmology that most other disciplines of study of Cosmic Philosophy and wider philosophy exist within it, or in some way connected to it.

[1:13:553] In this discourse, we have largely focused on Cyclical Cosmology and The Cycles of The Cosmos without perhaps outlining clearly enough the impact of cycles in all other forms and branches of philosophy.

[1:13:554] Cycles and their functional, orderative, and naturative consequence have not only cosmological gravity, but moral, aesthetic, metaphysical, and logical depth in all measures, and so, the study of cycles in all other aspects of philosophy is absolutely essential in the formulation of one's philosophical outlook.

[1:13:555] Therefore, in a more topically appropriate discourse, the cycles of all other aspects of philosophy shall be discussion.

[1:13:556] Finally, the application of cycles and the concepts derived from cyclometrics and cyclicism are imperative to the larger understanding of cycles in our lives and actions, in The Cosmos, in The Universe, and in existence itself for cycles can be applied to many areas of study that perhaps has not considered their imperativity before.

[1:13:557] Ultimately, the application of cycles is the primary way in which they shall be more widely studied and understood, but beginning the subject of cycles in cosmological terms is perhaps the best of ways to begin such a discussion of a topic of concepts so broad and complex.

—

[1:13:558] As an extension to the introduction of the subject of cyclometrics and the subsequent concepts of cyclicism, we turn our minds towards two philosophical additions that understand and consider The Cosmos, firstly by many of its cycles in simultaneity, known as polycyclicality, and secondly, by all of its cycles in simultaneity, known as omnicyclicity.

[1:13:559] Polycyclic Cosmology understands and considers The Cosmos according to a multitude of cycles resulting in the formation of The Cosmos and holds that without this multitude of cycles overlapping and underpinning one another, The Cosmos would not be as it is and how we see it and know it to be.

[1:13:560] Polycyclical understanding relates to a version of cosmology that is considered multifaceted; in that multiple cosmical cycles are interconnected in multiple ways and this continues on countlessly and infinitely.

[1:13:561] Polycyclicism, as the organised version of polycyclic thought and cosmology, holds that there never exists just one cycle in anything, but instead, a multitude of cycles are in constant existence, and it is argued that without this polycyclicality, that which is in question shall not, or cannot exist.

[1:13:562] The study of Polycyclic Cosmology, and wider polycyclic thought, is henceforth encompassed in the philosophical study and discipline of Polycyclics, and therefore, it now and hereafter rests with the polycyclicists to explore the nature of the multitudes of cycles in a cosmical context, and in a more general sense.

[1:13:563] Moving on to discuss the second of the two philosophical extensions of the discipline of study of cyclometrics, we now come to understand omnicyclic thought and cosmology; this encompasses a study of All cycles of existence, not just simple one, or even a multitude, but the entirety of All cycles that do exist, and could possibly ever exist.

[1:13:564] The most mentally and philosophically challenging of the three cyclical studies, omnicyclics encompasses the study of cycles in their entireties and in their potential

infinities for omnicyclicity is not bound by cosmical laws as is the reality for the two previous discipline of cyclical study.

[1:13:565] There is a strong sense of universality and divinity when studying the fundamentals of omnicyclicity due to the meaning of the prefix omni; of All things, and in this context, means of All cycles in all times, possibilities, dimensions, and perspectives.

[1:13:566] To comprehend the entirety of All the cycles in existence and in the possibility of existence is a feat humans can only hope and wish to accomplish for to know of All things is not to be of a cosmical naturity, and that is what we are, so in this way, we go against our own natures and our purpositities as cosmical products.

[1:13:567] As the organised philosophical version of the discipline of study of omnicyclics, omnicyclicism is all-encompassing in its most basic form and is all-understanding too; the omnicyclicists should be praised and rejoiced for their attempts at understanding existences that are far beyond themselves.

[1:13:568] That is one of the most honourable parts of human naturity; throughout our lives we attempt to understand things that are much greater than us in comprehension, yet we try and try again after we fail and fail again to understand such grand concepts and entities; we must appreciate this of ourselves and some of the greatest of minds of humanity.

[1:13:569] Perhaps that is a pattern found in the way in which we function; perhaps the greatest of us are those whom attempt to understand things that are so far beyond the rest of us that we have given up trying to discover them, though we mustn't give up, and these great minds remind us of this; we must never give up in our struggle for knowledge of that which is currently beyond and unknown to us.

The Stars of The Cosmos

(Heliology)

[1:14:1] Beginning a brand new discourse, we come to a region of study of cosmic philosophy that deals with the most important of all the cosmical entities to our own survivals; these are the stars of The Cosmos, and their functionalities, rotalities, naturities, purposities, orderities and more, are all discussion and studied within the grand philosophical discipline of Heliology.

[1:14:2] Heliological study is all the study of the stars other than The Sun itself; stars close by and stars so distant that their light has not yet had enough time to reach our visions.

[1:14:3] The stars of the night sky are now, and have been always, the guiding lights of our lives and civilisations since humans could first walk, talk, and think for themselves, and in this way, as a reflection of what has been, the stars shall continue to guide us forevermore, and with the philosophical study of heliology, we come to know the stars and use the stars in a newfound way.

[1:14:4] In many ways we can see the stars of The Cosmos; in wonderment, in study, in actuality, and in many more ways, and heliology teaches us that the stars and their meanings to us can defer so greatly depending upon the eyes of vision we lay upon them.

[1:14:5] For a moment, can we now begin to comprehend the grand magnificence of the stars for first we must appreciate their immensities before we can begin to study their intrinsicities.

[1:14:6] Stars are giant spheres of an inconceivable profusion of explosions and constant regenerations of energy with an abundant offspring of heat and light that provide our lives with all we are to exist.

[1:14:7] It is a notion of logic to assume that that which created something is that in all ways; to exemplify, The Sun is the creator of The Earth as we know it be; full of life; in this way, The Earth is The Sun in its naturity and formity as it is now.

[1:14:8] That which is the undoing of The Earth and that which The Earth is dependent upon is The Sun, and this is the same for all the planets and their respective stars in All the of The Cosmos; by this notion, the planets are the stars by their naturity, formity, and function, and in this, we understand ourselves to be the stars for we are the life of the planet and one of its many products; we are the stuff of stars as has been said since time immemorial.

[1:14:9] Immemoriality is defined as an important instrument of study relating to the application of immeasurable or properly inconceivable time in relation to some topic, or concept; an exemplar of which would be the age of The Universe as we know it to be

approximately fourteen billions years; we can quantify this figure, but we cannot current conceive of it by its proper means.

[1:14:10] The night sky that most of us can see, and have seen, from The Earth does not reflect the grandiosity and abundance of the stars of The Cosmos due to the lights of our civilisations outlighting those of the stars.

[1:14:11] If we could see the true abundance and the true grandness of the stars of The Cosmos, the wonderment we would experience is beyond All the wonderment we can ever hope to experience in our short lives.

[1:14:12] However, this lack of vision of the stars is an important microcosm for we, as the civilisations we have built, are responsible for our own blindness to the grandness of the stars, and the wider Cosmos; it is by our own doing that we blind ourselves, and this is also true for many of the others parts of our lives.

[1:14:13] In not attempting to learn, in not engaging in wonderment, in not wanting to understand The Cosmos due to the words and opinions of others and their institutions, we blind ourselves in many ways by our own decisions; we must urge each other to think on these decisions and to refrain from making decisions that shall ultimately blind ourself in gaining more knowledge.

[1:14:14] The stars are to be the centralmost depictive subject of all Astronist Art and are at the centre of most philosophical discussions of The Cosmos and within most Astronist cosmologies; this widespread intrinsicity throughout all Astronist domains demonstrates the centrality of stars and that which they mean to us and their central role in The Cosmos.

[1:14:15] Stars form the physical centres of the cosmical systems and form, too, the structures of life itself, and therefore, they structure ourselves; they serve as the beacons of orderity in each and every cosmical system.

[1:14:16] In the context of history, our entire histories are dependent upon the existence of The Earth, but The Earth's history is too, dependent upon The Sun; by this notion, productism is found in the context of history.

[1:14:17] This thus forms historicism; the histories of histories of histories and so on and so forth just like there exists the products of products of products of The Cosmos; this pattern is similar in all things of cosmical existence.

[1:14:18] All we are is that which came before us and so one and so forth and so, all we is that which The Earth and so, all we are and all The Earth is that which The Sun is, and this is the same for all the life on planets and all the planets of their parent stars in all the cosmical systems of The Cosmos that is a characteristic of cosmicality and orderity.

[1:14:19] In concentric terms, stars are held in the most high of regards for they are considered, again, central to all concentricity for without stars, we must begin to wonder whether concentricity would even exist as a concept of cosmical orderity and pattern; to lose the centre of something is to lose the part upon which all other parts dependent, and therefore, a collapse of the system begins.

[1:14:20] In oblivionic cosmologies, stars are given less attention as the centralmost elements of The Cosmos, for greater importance is appointed to black holes, which is not illogical in essence.

[1:14:21] The black holes of The Cosmos, although largely chaotic in naturity, do form the larger metagalactic structures and are those entities around which star systems do rotate in the galactic disc.

[1:14:22] By this notion, stars are understood to be merely be the offspring of the oblivions, or controlled by the oblivions to succumb to their orderity; in this, the concept that stars are centralmost to the functionalities and naturities of The Cosmos is banished.

[1:14:23] In relation to The Chaos, stable and properly affixed and structured stars of cosmical systems are considered the primary manifestations of the antithesis of The Chaos for they are the central physicalities of all cosmical systems and wider cosmical orderity; they are the icons of pattern, structure, orbitality, and functionality.

[1:14:24] By these various notions aforementioned, it is clear to see that the stars and their naturities and purposities within cosmical systems are varied by interpretation, and their role in cosmology and cosmogony is also vast in understanding for it may always be said that the stars are how which one views and are which one places upon them.

[1:14:25] Setting aside alternative interpretations for a moment and focusing only on our own relations with the stars, we must understand, in principal, that the entirety of our existence is dependent upon The Sun, but not only The Sun itself, but All the others stars that form the Astral Panorama.

[1:14:26] In understanding, knowing, feeling, and accepting this fact, one begins their journey towards a larger view of who we are and why perhaps we are in existence; by this notion, one takes their first step towards wonderment and greater appreciation and adoration for the stars of the night sky.

[1:14:27] In the philosophical discipline of heliology, this basic concept exists at the heart and runs throughout all heliological study for it is true that we must first understand the role of the stars in The Cosmos if we are to understand our place within The Cosmos.

[1:14:28] Converging on the concept of Star Centricity, heliology as a discipline is vast for it can be said to encompass the stars of The Cosmos collectively, but too, the study of each

individual star and its formity, naturity, orderity, and all the other relevant instruments of study which we can use to learn more of the stars.

[1:14:29] When we speak of stars in the context of heliology, we speak of them by their proper means and measures; without actually approaching a star, or seeing it in comparison to another celestial, we cannot truly know of its dimensions in actuality, and therefore, we cannot wonderment it to the grandest extent.

[1:14:30] Therefore, we need the study of heliology to enlighten us as to the true proportions and scales of the stars of The Cosmos so that our wondermentation levels can be raised higher ever before.

[1:14:31] A cosmology understood heliologically is a cosmology that holds stars and their functionalities, naturities, and orderities as the central reason for the evolution of The Cosmos.

[1:14:32] It is true to say that the cores of the stars are the cores of The Cosmos for without them, The Cosmos would be a void of darkness, silence, and coldness.

[1:14:33] It is also true to say that there exists an intrinsic energy in all the stars of The Cosmos; some core life, or light, or fight for existence that may only be found when studying the stars.

[1:14:34] This unpinpointable aspect of stars is their greatest of secrets; it is what makes them the centrality of the concentric cosmical structure; it is what makes them the creator of life on worlds; it is what makes them the shining beacons of existence in the darkness and coldness and lifelessness of the voids of space.

[1:14:35] By this consciousness, we can justify the intrinsicity of the stars to the functionality of The Cosmos as we know it; perhaps this is a point that the cosmologies disregarding the stars should take upon their theories and concepts.

[1:14:36] The heliologists study both the births and the deaths of stars; their formations and their degradations for in understanding these, we understand the cycles of stars and we start to comprehend their naturities.

[1:14:37] It is a quality of stars, and many other celestial entities of The Cosmos, that concentration and dispersion are central to the beginnings and the ends of such giant celestial such as the stars.

[1:14:38] Stars are formed by the concentrating motions of dense mixtures of gas and dust; these form the molecular clouds which develop into the stars we know and see and wonderment over.

[1:14:39] The key understanding is that of the concentration; in the formation of cosmical entities, the concentration of elements in the most densely compacted way is essential to creation of such dynamic celestials; without these immense, and totally inconceivable amounts of pressure, density, and concentration, we would not have the celestials we know and wonderment.

[1:14:40] By this notion, a cosmology of concentration begins to develop; in that all formity is considered according to the concentration of elements that have existed to create said entity.

[1:14:41] Furthermore, Concentrative Cosmology considers the concentration of elements to be the most important part of cosmical creation, and holds that all existing entity are dependent upon this concentration.

[1:14:42] Oppositely, but in the completion of the concept of concentration, arrives the concept of dispersion as the second of the two part concept of starbirth; with the introduction of this second counterpart concept, therein forms a cycle; a cyclical formation structure existing between intense concentrations and immense dispersions of matter.

[1:14:43] Like the structure of The Universe itself as we understand it, there exists a dispersive motion wherein The Universe is expanding at rates and in ways we cannot fully comprehend.

[1:14:44] This Dispersive Cosmology is just as apparent when relating to the death sequences of stars; by this notion, we speak of the way in which stars begin to expand into red giants as the star enters its latter stages of their evolution.

[1:14:45] The star grows so large that the planets orbiting around it are consumed by its overwhelming size, heat, and light; in this, we speak of our own inevitable fate of The Earth; we must remind ourselves of the fate of The Earth at All times for it is an inevitability, not a perhapence.

[1:14:46] However, it doesn't need to be the fate of ourselves as humanity; it is the fate of The Earth for The Earth is not removable from its orbitality around The Earth; we, however, are motional in our naturities, and thus, we can remove ourselves from The Earth to avoid this inevitable fate.

[1:14:47] On our return to the explanation of the exequy of stardeath, the size of the star continues to grow, and as it does, it moves closer toward collapse.

[1:14:48] As the star does reach the point at which it is to collapse, it is at Full Dispersion; it is at its fullest physical extent and must therefore, in order to continue along in cosmical naturity, destruct which in turn causes a supernovae, or even the rarer and more violent, hypernova.

[1:14:49] This unbelievably large spectacle of light and violent explosion returns to a concentrative state and herein the star may perhaps form a black hole, or become a pulsar, depending upon the initial size of the star.

[1:14:50] From this process, we can derive many concepts about the naturity, cosmicality, and orderity of stars; the first of which relates to that which is known as a pulsar; a neutron star compressed into a space that is conceivable by our perception is a star that is so unbelievably concentrated on a cosmical level that it becomes the ultimate physical manifestation of the concept of concentration.

[1:14:51] Concentrative Cosmology is exemplified by the pulsars of The Cosmos, but ultimately, it is the oscillation between the dispersive and concentrative states of a star that reveals the interaction between these two concepts in the cosmical system.

[1:14:52] The fact that a star so dispersed can devolve and collapse into a black hole demonstrates a proven point for the Black Hole Cosmology holding that the ultimation of all things cosmical lies in black holes.

[1:14:53] The fact that a cosmical entity so intrinsic to the entirety of the cosmical system could devolve into one of the most chaotically influenced entities of The Cosmos is both shocking and revealing of the true naturity of The Cosmos and its ultimate fate.

[1:14:54] Perhaps in the largest and brightest of stars, we discover the darkest naturity of The Cosmos; it is in this seemingly oxymoronic idea that we find the most true of concepts; the most ultimate reality of what The Cosmos is now and what it may be in some future time.

[1:14:55] The deconstruction of the orderity of the star as it enacts its deathly state illuminates us to the complete naturity of the star; its unrivalled ability to concentrate and disperse, to be the essence of cosmicality and to transform into the most chaotic of entities; furthermore, this highlights the extremity of stars and their intrinsic naturity to contradict and surprise the studier.

[1:14:56] Further so, this describes the essence of the wondrous study of heliology and its subsequent ability to surprise, defy, and contradict the studier as a reflection of the abilities of the stars themselves.

[1:14:57] Another important feature of the formation of a star is the oppositism of temperature; during the development of the stars in its early stages, the temperature reaches almost absolute frozen relative to the heat of the stars we know and understand.

[1:14:58] This distinct oppositism is important and perhaps highlights a consistent pattern of that which creates something often is something opposite in its nature, temperature, purpose, or appearance.

[1:14:59] Further so, this is exemplified in the transformation of some giant stars into oblivions; to go from being an entity of brightness and heat to one of ultimate darkness and coldness; in this single transformative exemplar, we can begin to understand the extreme naturity of The Cosmos itself.

[1:14:60] If we return to thinking in terms of a simple Solar Cosmology, we understand stars to be the controllers of those entities which orbit around them; during their times of activity, they are the greatest tools that The Cosmos can wage to ensure the longevity of the cosmical system.

[1:14:61] If we think of The Sun itself in relation to ourselves and The Earth, we understand that its functions allow the entirety of our civilisations' functions and the functions of The Earth to occur as they do.

[1:14:62] We join in unity when we speak of the intrinsicity of The Sun to ourselves and whom we have become in our entirety.

[1:14:63] As the most abundant and most frequent entities of matter in The Cosmos, the stars form the essence of the cosmical system and although their formations, dimensions, and may differ so vastly, the naturity, the purposivity, and the functionality they hold stays the same.

[1:14:64] And if one thinks the most distant stars are not relevant to us and The Solar System then one makes a mistake of great proportions for the most distant of stars are often the oldest and it is to these stars that we owe our whole existence for they have formed the galactic structure as we know it.

[1:14:65] The stars of The Cosmos that have been and gone are the stars that have formed whom we are for it is from the remnants of the most violent of stardeaths that the dusts and gases and cosmical elements and chemicalities that The Solar System formed, and as a consequence, we formed for we are the stuff of stars.

[1:14:66] We owe All we are to the oldest of stars of The Cosmos for they are the most wise of all the cosmical entities in a similar way that some of the oldest of us are the most wise; as we say the same of the oldest of trees of The Earth, what if the oldest of stars of The Cosmos could tell us all they know and have witnessed? Think of the knowledge we would hold; think of the things we would know.

[1:14:67] It is essential that we wonderment of these, the oldest of stars of The Cosmos for they are the grandest by measure of their knowledge, their relevance to The Cosmos as we know it, and their overall cosmicality.

[1:14:68] If the importance of the stars to wondermentation, Cosmic Philosophy, and The Cosmos in general was not understood by you before this discourse, then now, it must

surely be secured in one's mind as the centralmost element, entity, and concept of The Cosmos.

[1:14:69] Forevermore shall heliology stand as one of the centralmost aspects of Cosmic Philosophy, and even wider Astronist Philosophy, for the stars are our guardians and they always have been and shall always be.

[1:14:70] They are the lights of our lives and we must know to champion them mosthigh when the time comes for the world and All our peoples to be guided to new heights; the stars are our centres, the passions of our wonderment, and the lanterns of the cosmic night; they guide us, they teach us, and they form us All and the planets we are destined and prophesied to civilise.

—

[1:14:71] To see the stars collectively is the most great of all sights one can ever hope to see for to see the stars in their entirety, amongst their brothers and sisters and their relativities, is the most wondermentful of envisionments and is something all peoples from all corners of all worlds should want to witness for themselves.

[1:14:72] Sidereal contemplation relates to the understanding of the most distant of stars, both collectively and individually, and refers to concepts and measurements of these stars in isolation to their proximate celestial counterparts.

[1:14:73] If we are to discover the wonderments of the most distant of cosmical entities, we must, in principal, study the distantmost of stars; this is why sidereal study is most important to the philosophical understanding of the stars themselves, their natures, and the wider orderity of The Cosmos.

—

[1:14:74] It is a mistake to include the specific philosophical study of The Sun in the discipline of heliology for heliology studies the stars generally and is extremely vast in its purpose and nature.

[1:14:75] Instead, we must carve out a distinct discipline to study The Sun itself in isolation as a vast entity of philosophical study and interest on its own; this discipline of philosophical study shall henceforth be known as solarology.

[1:14:76] To clarify, solarology encompasses the philosophical study and contemplations of The Sun and the various concepts, theories, and instruments of study that surround its existence, and also includes all the interrelations between humanity and The Sun, and all the celestial entities whose existences cross paths with The Sun's own existence.

[1:14:77] Solarological study could be said to be a precursor to heliological study due to its concentration on just a single star as opposed to multiple or all of the stars of The Cosmos, though solarology is not considered a branch of heliology, but a distinct discipline in its own right.

[1:14:78] Principally, The Sun is the centre of The Solar System and by this notion, is the centre of the cosmical system in its microcosmic form.

[1:14:79] There cannot exist any type of solar system with a star present, and The Solar System in which The Earth exists is not different; The Sun is at the centre, as the central podium of the concentric pattern and structure, and this is the same for all other cosmical systems; this is the universality of the cosmical system.

[1:14:80] There may be variations on the cosmical system, such as the binarity of stars, but fundamentally, the structure of the cosmical system stands true and proper in all plains of cosmicality that we know now.

[1:14:81] The Sun as playing the role of the centre is also significant, though is largely overlooked in other areas of cosmic philosophical study.

[1:14:82] Since the concept of heliocentricity was wondermented and introduced to the world by one of the great minds, The Sun has been perceived to be our centre, but since its inception, it has been centre of All else in the system, so much so that without the centre, there cannot exist the rest of the system.

[1:14:83] All the revolutions of the celestials of The Solar System move around The Sun as the centre, so physically, The Sun is the centre, but it is also central in many other formats.

[1:14:84] Secondly, The Sun is the centre aspect of our existences and the existences on each and every planet of The Solar System; without the existence of The Sun, the histories of each planet would not have occurred.

[1:14:85] Every tree on every land, every creature in every ocean, every idea from every mind; All of them can trace their originations back to The Sun for All that exists and has existed on The Earth holds origination from The Sun by default for without The Sun, The Earth would not exist and so, by a notion of logic, All that exists on The Earth must originate from The Sun.

[1:14:86] Everyday that passes by, we see The Sun rise and set as did our ancestors and as shall our descendants in times to come; from this, we derive a cycle, perhaps the most important of all the cycles of The Cosmos to our current civilisation on The Sun.

[1:14:87] The rising and the setting of The Sun has shaped and structured our entire histories and civilisations though perhaps we do not know this, or appreciate it enough for its truth.

[1:14:88] From the moment we wake to the moment we sleep, our whole existence is structured by The Sun and its overarching ability across all humanic existence.

[1:14:89] This shall not change forevermore for we shall always be, in some way, either directly as now, or indirectly, be associated to, or dependent upon a star for light, for heat, and for philosophical and wondermentational guidance.

[1:14:90] Heliocentricity was one of the greatest realisations of our existence, now we must take it a step further to say that The Sun is not only physically central to us, but philosophically, educationally, industrially, and to encompass all else, existentially central to All of us.

[1:14:91] Omnicentricity understands that The Sun, or another star, shall always be central to life in all ways as we know it to exist; stars, and The Sun as our most proximate, shall always be interconnected with cosmical existence itself.

[1:14:92] There is no function of ours that we do not depend upon The Sun to complete in some way and in this, we cannot fault our ancient ancestors for perceiving The Sun to be God; in fact, they perhaps understood The Cosmos greater back then than we do today.

[1:14:93] If God is gives us everything we need and has formed All we are then does this not fit with what The Sun has provided us throughout our entire existence? By this notion, we understand The Sun to be the perfect microcosm of The Cosmos to be Divine to us.

[1:14:94] Thirdly, The Sun is both the creator of The Earth and its destructor; it has moulded The Earth from the ashes of stardust and ancient debris and breathed life on a world we would not recognise today.

[1:14:95] We owe all we are to The Sun as the product of The Cosmos that we derivate from and we owe all we are to The Sun as the microcosm of The Cosmos to which we are proximate and upon which we depend.

[1:14:96] To all the wondermenters, we must first understand The Sun and its functionality to us and our existences and its completion of the orderity of the cosmical system before we can continue on any other cosmic philosophical discussion.

[1:14:97] Solarology is the most fundamental of all cosmic philosophical disciplines for it studies that which is centralmost to all of our existence as humanity.

[1:14:98] Despite the falsities of proclamations made by some, we are under the heel of The Sun; it formed The Earth and The Earth formed us; The Sun was not created for the benefit of us, but for the completion of just one cosmical system amongst the countless systems of The Cosmos.

[1:14:99] The sequence shall forever be The Sun, The Earth, and Humanity; we can rearrange this to suit our own endeavours and fears, but the cosmical reality shall forevermore stay the same.

[1:14:100] Like The Earth and the planets of The Solar System revolve around The Sun physically, we revolve around The Sun existentially for the days and the nights, and the cities and their lights are all in sequence with the will of The Sun.

[1:14:101] To adore and revere The Sun is not the same as to worship it, but instead, it means to see The Sun in a way that raises it higher than the peoples of the world seem to see it currently; by this, we mean to see The Sun as our existential dependence, but yet, simply a microcosm of The Cosmos.

[1:14:102] Ultimately, this is the message of the philosophical discipline of solarology; it exists to change the way in which the peoples of the world we perceive The Sun, and by extension, the way we see The Cosmos by acting as a precursor, a fundamental study of the most important part of The Solar System; a precursory study from all other disciplines branch.

[1:14:103] As the quintessence of cosmical orderity, The Sun acts as the provider and the receiver for it provides us with heat and light, and The Earth, and all the others planets reciprocate with their orbitalities and rotalities as it has been since days way before our existence.

[1:14:104] The solarologists of us, despite studying one of the most fundamental parts of cosmic philosophical academics, have a much greater and much wider role in the reality of the world itself.

[1:14:105] They must show the world that the current worldview is not in the best interests of the people's of the world; that we must move towards omniscentricity; understanding the centricity of The Sun in every aspect of our lives, especially towards achieving the philosophical grounding we desire and are destined to require.

[1:14:106] Yes, it is the grand duty of the solarologists to change the current worldview by gaining inspirations from the minds great long ago to forge a future in which a world and its peoples understand that which they depend upon.

[1:14:107] By understanding and accepting this, we move ever so excitingly closer to greater wonderment and greater worthiness of fulfilling the exploration of The Cosmos for it is only a logical notion to raise that if one wishes to understand something much greater than themselves, they must understand, first, that which is more proximate and fundamental to the topic at hand.

[1:14:108] In this, the purpose of solarology is founded and shall henceforth continue upon a path that shall lead the world along its destined and prophesied course for I cannot see

our civilisations and the peoples of this world be ignorant any longer when the answers are above us in plain sight.

[1:14:109] The Sun is our connection to the more distant stars beyond for if we can understand the naturity of The Sun and its functions, then we can project this upon the stars not so proximate to us.

[1:14:110] Ultimately, solarology is the philosophical contemplation of The Sun and due to its proximity to The Earth and humanity's known origination, The Sun plays a foundational role in all of Cosmic Philosophy.

[1:14:111] The most fundamental solarological understandings persist in every facet of cosmological discussion for The Sun is just a star we know, and its functionalities, orderities, purposities, and naturities are reflected forevermore in the stars that we know not so much of.

—

[1:14:112] There were those with the greatest of minds who looked up and wondered of our place in the stars, but all the people of the world today seem to do now is look down at the dirt and think only of themselves.

[1:14:113] The more we look up, the more we know of the stars; the more we look down, the less we know of anything.

[1:14:114] The world has changed and it shall continue to do so forevermore; by which means that it changes can only be determined by the greatest of minds and the bravest of hearts.

[1:14:115] As many much as I love and revere The Earth for its unique function and beauty, this world has never been enough for me when an abundance of worlds beyond is right in front of us if we just look up; humanity was born on The Earth, but it was never meant to die here.

[1:14:116] We must accept that there shall be sacrifices greater than any made before; there shall be confrontations with the most beauteous of entities and the most nightmarish.

[1:14:117] We must accept that the distances we shall travel will be greater than any before; the times we live through shall be distorted unlike anything ever before; and the philosophies we hold in our hearts and minds shall be more important to us than any ever before.

[1:14:118] I love the feeling of home, like most of us do; in the same way, I love my existence on The Earth cocooned by the gravity, heat, and light provided by The Sun, but I must accept, as we all must accept, that there comes a time in all of our lives when we

must leave the fruits of the comforts we know to venture towards the hardships we do not understand.

[1:14:119] The venturers into the unknown are the greatest of us for they go to a place that is both natural and unnatural for them; natural in the sense that we are destined and prophesied to reach that place, but unnatural in the sense that it takes only a brave few to overcome the fear of the unknown, and to not only overcome this, but go into it and venture beyond it.

—

[1:14:120] Throughout the Astronist Tradition, we have defined the entity known to be The Cosmos and the entity known to be The Universe, and by this, we form the study of the naturity of The Universe as distinct from The Cosmos and this study shall henceforth be known as Unology.

[1:14:121] It is understood that The Universe underpins The Cosmos and encompasses it wholly and involves the entirety of space, time, and matter, thus inferring the principle that The Cosmos is limited in its naturity by space, time, and matter themselves.

[1:14:122] There is a finite amount of things that may exist within The Cosmos and it is this finity that allows for The Cosmos to be as it is; this finity holds it and bounds it to a fixed set of a physical laws that allow the cosmical system to exist and flourish as we know it.

[1:14:123] Like all things existent, they must begin and they must end; The Universe itself is not exempt from this principle for whether by some Divine force, or by autocreation, The Universe began and it shall in some time and plain, end.

[1:14:124] The Cosmos is all that we know to exist in the physical laws of space, time, and matter; The Chaos is all that we do not know and that defies cosmical system, structure, and function; The Universe exists on a plain beyond this, one that encompasses the entirety of these two oppositisms.

[1:14:125] If it is the naturity of The Universe to encompass All things, then from this, we form a universal cosmology wherein all things cosmic and chaotic hold a formity, functionality, and orderity that understands reality on an infinite amount of levels by a infinite amount of time, space, matter, and circumstance.

[1:14:126] The Cosmos is bound by the principles of finity, yet The Universe is not; because The Universe is all things, it is infinite in its naturity.

[1:14:127] The expansion of The Universe is its secondary function beyond being the all-encompasser of physicality, law, and reality; by this expansion, we understand the infinite naturity of The Universe for it infinitely expands into infinite dimensions of possibility.

[1:14:128] In this, I do not speak of the expansion of The Cosmos; there is a difference in scale here for the expansion of The Cosmos is merely an expansion into The Universe; the expansion of The Universe is an expansion into all dimensions, yet the expansion of The Cosmos is an expansion into just one dimension.

[1:14:129] The Universe goes beyond all we know in all ways; The Cosmos is all we know in a finite amount of ways.

[1:14:130] When we tackle the concept of The Big Bang, we often pose the question of what existed before The Big Bang.

[1:14:131] In one interpretation of the Astronist Tradition, it is considered that The Big Bang was creation of The Cosmos, but not The Universe; The Universe existed for an infinite time before The Big Bang happened and was infinite in scale and dimension before The Big Bang.

[1:14:132] The Big Bang marked the formation of the reality we know; it formed the cosmical system we understand and exist within, but The Universe is infinite and so it exists on a level beyond this.

[1:14:133] The question of the beginning and the end of The Universe is a question of theology rather than cosmology; the Law of Cosmic Existence stands that everything existent must begin and must end, but the naturity of such a beginning and such an end can be varied by interpretation and theological belief.

[1:14:134] In this, the study of Epochology is born which philosophically studies the age of The Universe and encompasses all the various concepts and theories surrounding its beginning and its end which shall be latterdiscoursed.

[1:14:135] Some may ponder, if The Universe is infinite in its naturity, then how is it possible for it to have a beginning and an end for these two occurrences bound it to time, do they not?

[1:14:136] The answer yes, but by this notion, time is considered only through the means by which we understand it; time in its essence is much greater and vaster than we know it to be; we see glimpses of this in The Cosmos through time's distortion, bending, and rewinding.

[1:14:137] Yes, the Law of Cosmic Existence understands that everything that does exist must begin and must end, but we then must consider that the beginning and the ending themselves are infinite in sequence; by this notion, we understand that from the end, another begins and so on and so forth; this establishes both an autocreative and an omnicreative universality.

[1:14:138] By this exemplar, we begin to comprehend The Universe and Time by their proper means; by means that are not bound to a cosmical reality, but only to realities of existence itself, which is infinite in its own nature.

[1:14:139] Unological studies underpins all we know of cosmical law and time and space and matter, just as The Universe underpins all that The Cosmos is and will be.

[1:14:140] If we understand The Universe to be the cocoon within which The Cosmos exists and expands, we perceive The Universe to be outside The Cosmos, but bounding The Cosmos to its finite nature.

[1:14:141] By this notion, we understand that that which exists beyond The Cosmos is The Universe and the edge of The Cosmos is the boundary between cosmicality and universality; the major difference between these two realities being that the former is finite and the latter is infinite.

[1:14:142] This separation, and reorganisation of the concepts of what it means to be The Cosmos and The Universe is the central distinction between Astronist Cosmologies and mainstream scientific definitions and terminology.

[1:14:143] But it is believed and perceived that this separation and redistinction of The Cosmos and The Universe is necessary in understanding the nature of The Universe for at present, we perceive The Universe to be The Cosmos, but in the Astronist Tradition, that which we understand to be The Universe is actually The Cosmos, and The Universe itself is something much greater.

[1:14:144] Multiverse and Omniverse universalities go further in their hypotheses for they venture even beyond The Universe as beyond The Cosmos, and suggest that that which is The Universe that exists beyond The Cosmos just one of a multitude, or just one of an infinite amount according to multiverse and omniverse universalities respectively.

[1:14:145] Due to the fact that in Astronist Cosmology, the term The Cosmos actually relates to the universe in non-Astronist terminology, and the term The Universe actually relates to all things beyond The Cosmos, we shall not speak of the physical and cosmical aspects in this discourse such as diameter, temperature, shape, contents, mass, and density for these are cosmical in their natures, not universal.

[1:14:146] In the Astronist Tradition, the term universal is provided a much higher meaning than in mainstream scientific terminology for to be universal relates to all existence in all realms, realities, times, and possibilities.

[1:14:147] The universe considered from a non-Astronist perspective is understood to be cosmical in its nature; bound by some unknown force of evolutionary expansion.

[1:14:148] Furthererso, to clarify, in an Astronist Cosmology, The Cosmos exists within The Universe, and although there are many theories of possible Cosmoses and Universes, it is principally assumed that both The Cosmos and The Universe are solitary in their natures.

[1:14:149] That which is known as the observable universe in current terminologies is termed The Observable Cosmos in the Astronist Tradition and encompasses all that humanity can see, know, and realise about The Cosmos.

[1:14:150] An exemplar of something beyond The Observable Cosmos is a galaxy that is so distant from our current location that there shall never be enough time for the light from that galaxy to reach us; this defines the difference between that which is observable, The Observable Cosmos, and that which is unobservable, The Unobservable Cosmos.

[1:14:151] To study something unologically is to approach it by means of universality; for example, to study a galaxy unologically is to theorise that there may be galaxies existing beyond The Cosmos and from this, we speculate of their natures, orderities, functionalities, and all the instruments of study thereafter.

[1:14:152] Ultimately, to engage in unological study, or to perceive lens constructed unologically is to understand something according to its possible infinity; this, of course, exists beyond cosmical means for just because something we know to exist within The Cosmos is cosmical, such a galaxy, does not mean that something of a similar kind does not exist outside The Cosmos in The Universe with a different nature.

[1:14:153] Fundamentally, the instruments of study of unology consist of space, time, matter, and possibility; these are the foundational building blocks of reality and existence and even though their measures and appearances may differ dramatically according to place, function, and purpose, they exist in all ways for they form existence itself.

[1:14:154] Universality is the means by which we relate to that which is universal in its nature; infinity by some means of scale, time, dimension, and possibility.

[1:14:155] In philosophical cosmology, specifically in the Astronist cosmological tradition, all concepts and theories and hypotheses are derived from a scientific grounding; the way in which one wishes to interpret unology and cosmology is a personal preference according to universality, theology, or atheism.

[1:14:156] Due to the nature of philosophy, there are as many interpretations of what The Universe is, what it was, and what is shall be, as there are people to perceive it.

[1:14:157] Whether by Divine creation, self-creation, or something other creational hypothesis, The Universe is considered to exist beyond, yet in perfect flux with The Cosmos, as its underpinning.

[1:14:158] Unlike in many other non-Astronist cosmologies, The Universe is clouded in much greater mystery of what it actually is made of; its shape, the extent to which we know it to exist only so far as the shape of The Cosmos it encompasses and underpins.

[1:14:159] Its purpose, we hold greater understanding of; to encompass, underpin, and bind The Cosmos, reality, and existence together.

[1:14:160] As a philosophical discipline of study, unology is formed by ideas and concepts; these ideas and concepts shall inevitably change in proportion to the knowledge we gain and hold and attempt to prove.

[1:14:161] The point at which a discipline of study changes from philosophical to scientific is that at which proof is injected into the concept; before this moment, all the concept consists of is an idea which is philosophical in its nature.

[1:14:162] As a philosophical cosmology, the Astronist Tradition converges philosophy and scientific concepts; it does not create mythologies to answer realities; it uses the possibilities of realities to answer the question of reality, existence, cosmology, and universality.

[1:14:163] As the necessary and formative precursor to science, the philosophers of us are the expounders of the ideas that the scientists shall work to prove, or disprove.

[1:14:164] A philosophical idea does not require proof to exist for there have been many philosophies throughout history that have existed in falsehood; however, grounding one's philosophical orientation by means of scientific discovery, knowledge, and understanding is a way of forming an advanced philosophy that goes beyond simple ideas and reaches a higher plain wherein philosophies merge with scientific theories and building upon each other to reach greater knowledge of the subject at hand.

[1:14:165] There is a profound difference between truth and reality; the latter is superior to the former as it the former which is speculative upon perception, while the latter is forever fixed and can be said to be the ultimate truth for there are truths that have been told to be truths, yet they have ruptured by reality; this has occurred many a time throughout histories.

—

[1:14:166] To that which a miracle has been ascribed is merely a rarer form of The Cosmos, or that which our minds cannot comprehend, but never beyond The Cosmos for that which exists within is that which cannot exist without.

[1:14:167] To prewise the events and times of the future has been a staple feature of miracles since their manifestation in ancient times, but it is this prevision that constitutes the most dangerous part about the concept of a miracle.

[1:14:168] Miracles were devised to push a certain intention and ideal towards its realisation; the believers of such miracles are introduced into a narrative that suits the miracle-maker, which is why all peoples of logical thought must be wary of those whom proclaim a miracle that connects to the furtherance of some narrative.

[1:14:169] Depending upon one's rational and logical orientation, they disagree entirely with the concept of miracles, or they may show some favour towards such concepts to be true.

[1:14:170] The interpretation one derives from the concept of miracles is to their own preference, but with the incorporation of knowledge, rationality, and logicity into their interpretation, they are much likelier to show caution at the announcement of a miracle, or at the suggestion of miracles happening in history.

[1:14:171] Not dissimilar to the fact that we do not know of what happens beyond the event horizon of a black hole, we do not know for absolute certainty that certain so-called miracles happened; all we can do as philosophers and thinkers is apply rationality and logicity to the question at hand and attempt to answer that which is true and reality with the information provided.

[1:14:172] Ultimately, if one wishes to create a miracle, whether it happened or not, they publicise the fact in order to push a certain narrative and this true of all people with an agenda; as humans with missions, we aim to fulfil our duties and we shall do so by any means of narrative necessary.

[1:14:173] To create false miracles isn't inherently evil unless we are forced to believe, but instead, they often provide people with symbols of morality and guidance in situations of Ethical Decay.

[1:14:174] The true evility of miracles comes in the form of what is called a False Reality, or Simulative Existence, or Simulative World; this encompasses the idea that the creation of miracles may have taught us from right and wrong, but simultaneously, we have been lulled into a false sense of security about the world in which live.

[1:14:175] Throughout the generations, we have told that such miracles are true, and not just symbolical narrative; the line between mythology and reality has been blurred and the different worlds of this world have been forced to go head to head about questions of reality, truth, and existence.

[1:14:176] In essence, we must believe miracles for what they are and in accordance with notions of logic and rationality; they were created to show us what is right and what is wrong and they shall continue to do so for generations of us forevermore as new miracles and icons are created to replace them.

[1:14:177] The moment we step into dangerous territory is the moment we classify miracles as holding some higher authority of over us; by this notion, we allow entities that we do not know exist control our lives for the benefit of the entity that first devised them.

[1:14:178] This does not mean to say that we must know the entirety of entities in order to believe in them for, in truth, we do not know a great deal about The Cosmos in which we live, but the difference is that we know The Cosmos to be in existence for we can see it with our own eyes, but we know not that such miracles happened for we did not witness them with our own eyes.

[1:14:179] I, myself, am always wary of that which is unphysical and created by humans; I know the tendencies of man is to create falsities to further his own agenda, and by this notion, I am therefore cautious of all proclamations of miracles.

[1:14:180] Some may confuse and attempt to combine miracles with wonderments; this is perhaps one of the most ignorant of notions; miracles relate to supernatural apparitions; wonderments relate to cosmical phenomena that is forevermore grounded in reality.

—

[1:14:181] As aforementioned in earlier discourses and lattermentioned in discourses ahead, the instrument of study and concept of cosmicality relates to the application of the cosmical system onto topics and discussions.

[1:14:182] Cosmicality is essentially the extent to which an entity or concept reflects being part of the overall cosmical system, or cosmical orderity; this is the term's abstract meaning, but in visual and physical terms, it may refer to the extent to which something is physically assimilative to The Cosmos and its system.

[1:14:183] There exists a multitude of cosmicalities according to the topic in question; there is celestial cosmicality which describes the extent to which a cosmic entity or celestial such as a planet, or star holds a cosmical naturity.

[1:14:184] Another version is galactic cosmicality which describes the extent to which a galaxy and all its intronants are cosmical in their naturities.

[1:14:185] Ultimately, cosmicality is an important applicative concept and instrument that allows its studiers to measures cosmicness and the extent to which something conforms to the cosmical system and orderity.

—

[1:14:186] Metacosmology is defined as the perception of cosmology on a level beyond that which has been previously discoursed; the understanding of a cosmology, or The Cosmos itself, according to the most principal of elements that form it.

[1:14:187] These elements can be categorised as time, space, matter, knowledge, existence, reality, and instrument.

[1:14:188] The first and foremost of which is time, which is also an element of metaphysical study, but in metacosmological terms, is applied in relation to the creation of The Cosmos according to time in isolation; how long did The Cosmos take to form? How long does it have before it collapses? How long are certain cosmical entities destined to exist?

[1:14:189] The second of which is space which is applied in relation to the fact that space is the medium of The Cosmos and structures the physical existence of the cosmical system; is The Cosmos bound by the space within it? Does space dictate that which occurs and that which does not?

[1:14:190] The third of which is matter which is applied in relation to the fact that matter is the most abundant and most visual aspect of The Cosmos; is it matter that shall ultimately decide the fate of The Cosmos? Is the matter that is unknown to us such as Dark Matter, and Dark Energy, controlling the entirety of The Cosmos and thus structured it entirely?

[1:14:191] The fourth of which is knowledge which is applied in relation to the principle that the cosmologies we form are eternally bound by the knowledge we hold; are there cosmologies that are both true and real that we simply cannot yet know because we haven't the correct knowledge? Are we ultimately limited in our cosmological concepts by our apparent lack of knowledge? To what extent do we lack knowledge of The Cosmos?

[1:14:192] The fifth of which is existence which is applied in relation to the principle and fact that The Cosmos does indeed exist, but the question remains in what measure? In what form? By which function? And for which purpose?

[1:14:193] The sixth of which is reality which is applied in relation to the true and ultimate naturity of reality being non-relative, non-perceptive, and non-interpretative; in sequence, non-relative by the notion that true reality is singular, meaning there cannot be two true realities; a true difference in reality is simply part of the same overall and all-encompassing reality.

[1:14:194] Non-perceptive reality relates to a reality by which perception must not shape truth; we can perhaps have our own realities, but the true reality shall forever be different in this case, unless of course we follow, understand, and accept the true reality.

[1:14:195] Non-interpretative reality is an extension to this concept and holds that interpretation of reality is a distortion of true reality and is therefore immediately untrue and non-ultimate in its naturity.

[1:14:196] The seventh and final element of metacosmology rests with the instruments of study and all their many branches and facets; in truth, this final element opens up the

philosophical discipline to all other aspects of applicative study for one can now from hereon apply concepts of motionality, functionality, orderity, naturity, concentricity, and all the other instruments of study.

[1:14:197] In essence, metacosmology provides a platform for a studier or a thinker to enjoy conceptualising The Cosmos and its many forms through the application of these seven elements and thus, opens up the study of The Cosmos to a medium greater and wider.

[1:14:198] Metacosmologists perhaps choose metacosmological study for they can open their philosopher's minds to an infinite amount of ideas and possibilities of what The Cosmos is, was, and shall be through the application of these seven elements, all of which is underpinned by logic, and rationality.

[1:14:199] Go forth and enjoy the mental fruits of studying metacosmology and open one's mind and other's minds up to the potentialities and possibilities of The Cosmos; the mysteries of The Cosmos are a many in scale, abundance, and frequency and so, their revelation is a mission ongoing and a philosophical subject of great interest and numerous work.

—

[1:14:200] To adore non-religious icons has been considered for many years before my time to be conducting idolatry, but one whom thinks this way is simply mistaken.

[1:14:201] To adore The Cosmos and all its many elements and products is to revere and venerate that which is real and there to be wondermented upon.

[1:14:202] Cosmic Adoration is the philosophical and wondermentful love and respect offered up to The Cosmos as an entire entity itself, or to one of its many elements, or products to enhance one's own wondermentation.

[1:14:203] Adoration of The Cosmos is simply another facet one may utilise to gain greater wonderment; to speak well of the stars is to know of their greatness; to marvel and to encourage others to marvel of the creation of The Cosmos and its many progeny is the principal aim.

[1:14:204] To any whom say that we conduct idolatry are speaking from falsehood; we adore and revere and venerate the actual creations of God whilst those whom speak these words venerate humanity and that which humans created; I prefer to revere trueness, not idols riddled with bloodshed, evility, and human impurities.

[1:14:205] Cosmic Adoration is the most pure reverence of God's creations; Cosmic Adoration is the adorance of the most directly Divine entities that we may lay our inferior

eyes upon; Cosmic Adoration is the closest we can ever hope to come to seeing, to knowing, and to understanding something much larger than that which we are.

[1:14:206] I would go as far to say that Cosmic Adoration is the greatest and most fundamental practice of All; it acts as a necessary precursory to wonderment; the feeling to want to adore where we can from exists within all of us as our inherent nature; it costs nothing yet it means so much and in that, we find the best of all things.

[1:14:207] People around me today speak of a looming civil war, divided communities, and a segregated world caused by divisive faiths; it may be said that the naturity of faith is to be territorial by its very founding for if not, how else can it withstand the test of time?

[1:14:208] As logical and rational thinkers, we may default to doubting speculation, but often the phrase, no smoke without fire, is somewhat true; if one is a real philosopher, one will not be able to resist unravelling the speculation to reveal any hidden truths.

[1:14:209] Often speculation is derived by people from what they have witnessed, seen, or heard; this doesn't give the speculation any greater gravity, but it does infer the notion that, All whom pluck the courage to speak are worthy of our ears.

[1:14:210] Perhaps, after a deeper philosophical study of their speculation, it shall be quickly found out to be false, but perhaps parts of it will be found to be true in some way; without first listening and studying the speculation, we cannot ignore its potential trueness.

[1:14:211] This brings us onto a greater question of trueness which shall be latterdiscoursed, but shall be so here briefly; all that is said holds some potential of truth; to view all things by this notion is to be open to every possibility of concept; as philosophers, we must initially be open to concepts in order to agree or disagree with them.

[1:14:212] If one wishes not to hear of any new concept that perhaps may challenge their worldview, then a philosopher they cannot call themselves.

[1:14:213] As distinct from reality, truth and trueness are based upon perspective; a truth to I may not be a truth to you; this is how all things have some potential of truth.

[1:14:214] When we base our discussion upon reality, however, we change the paradigm upon which we speak for now there exists a basis upon which all other concepts must conform; by this addition, there can only be certain truths that are in concordance with the basis of reality.

[1:14:215] The originally biological term of commensalism can actually be found in many exemplars throughout The Cosmos, and so, in this discourse, we bring the term into a philosophical and cosmological context.

[1:14:216] For those whom did not know before now, commensalism relates to associations between two entities in which first benefits from the interaction and the second neither benefits nor takes harm from the interaction.

[1:14:217] In the context of The Cosmos, we see this happening at the most fundamental of levels and at the most vast of heights and scales; between The Sun and The Earth; between

[1:14:218] The Earth and ourselves; between each other for we are as much as The Cosmos as the stars themselves.

[1:14:219] In a Commensal Cosmology, it is understood that each and every interaction of The Cosmos is in some way commensal, whether entirely or partly; the principle is that all that exists in The Cosmos is commensal in its nativity; it provides without benefit or harm, and argues that the entirety of The Cosmos is based upon this principle.

[1:14:220] The nativity of humanity, however, is much different for we often do not provide without thought of benefit, or without the inevitability of harm either to ourselves or some other party; commensalism ends with humanity's introduction.

[1:14:221] Perhaps this strikes up a discourse of something larger; perhaps The Cosmos would be a much different place without humanity's involvement; without humanity's stains on the pure medium that is The Cosmos.

[1:14:222] We are told that we are killing our world, but should we be surprised? It is in our nativity to want to progress and succeed, and in doing so, as long as we are not harmed, we are happy and fine to proceed.

[1:14:223] Perhaps commensalism can only exist in a non-human cosmology, for although we are part of the cosmical system, we do not share its nativity in the way of morality; we serve to achieve our own ideals, no matter the consequence.

[1:14:224] By this discourse, we reveal an even greater discussion; one that centres around the question whether we as humanity as a whole, are truly part of the cosmical system and its orderity.

[1:14:225] If it is that we are unique, however unlike that may be, if that does turn out to be so, then are we not the abnormality? Are we not the entity that defies moral law, physical boundaries, and sentiental aptitudes?

[1:14:226] Are the greatest manifestation of The Chaos? A radical notion perhaps, but one worth at least some consideration as all ideas are by a philosopher's mind.

[1:14:227] Moving on, but still within the same related discourse, we come to the concept of concinnity; of The Cosmos, the seemingly harmonious arrangement of cosmical entities according to their functionality, naturity, and purposivity, and the fitting together of All the cosmical entities to form the entirety of The Cosmos.

[1:14:228] This concept of perfect organisation of The Cosmos is one at the heart of the overall cosmical system and of overall cosmical orderity for these could exist without the former.

[1:14:229] Ultimately, concinnity forms the essence of what The Cosmos is; a well-ordered and structure whole of a countless amount of interconnected entities that have formed and fit together to establish a superstructure known to us as The Cosmos.

[1:14:230] This wholeness, and oneness, and entirety is the most ultimate naturity of The Cosmos and must form the basis of all cosmical thought, understanding, and philosophy.

[1:14:231] By this notion, we consider concinnity to be the most important concept relative to the naturity of The Cosmos for without it, The Cosmos could not be as it is.

[1:14:232] If any does doubt the concinnity of The Cosmos in The Universe, just look around you, or better still, gaze up at a clear night sky, and you shall see the stars of The Cosmos brightly shining, conveying their perfect positions, yet too, hiding the planets that rotate around them and the cosmical orderity of which they are the centre and of which they form the concentric shape.

[1:14:233] In the most simple of things and in the most complex of things, we find an interconnectedness that defines the reality and existence we know; from the palms of our hands, to the clouds of the sky, to the most distant of galaxies in the filaments of The Cosmos, we see a structure, an inherent and total cohesive pattern that defines ultimate cosmicality.

[1:14:234] An even larger question is whether this concinnity of The Cosmos goes beyond, and infiltrates that which is universal in its naturity and is not only the structure of The Cosmos, but is too, the structure of the entirety of The Universe.

—

[1:14:235] To constellate in philosophical means and to constellate in cosmological means are similar in their natures, but different in their applications.

[1:14:236] To philosophically constellate, one combines abstractions into groups according to some measure, whether that be their nature, their purpose, or some other measure.

[1:14:237] To cosmologically constellate, the stars have conducted this since their very beginnings, and means to come together in groups to form clusters and is therefore, the more physical of the two definitions.

[1:14:238] When we constellate ideas, we are able to form groups that make it easier for us to constitute some hypothesis, or theory.

[1:14:239] When the stars constellate, we see their patterns and structures and functions in much greater clarity than if they had no form or shape or pattern to them.

[1:14:240] Constellating is perhaps one of the greatest visual representations of cosmical orderity and system and it is a process of cosmical function that is essential to understanding The Cosmos.

[1:14:241] Through the visual components of constellating, we can derive much wonderment, and I would recommend to wonderment over these constellations first to any new wondermenter for these are the most fundamental and proximately visual progenies of The Cosmos.

[1:14:242] Moving on, we turn to an interesting concept known as deisality, relating to the apparent course of The Sun, and exemplar of which in our own terms would be a clockwise motion, and in cosmical terms, the apparent rising and setting of The Sun.

[1:14:243] Deisal thought considers the course of The Sun to be a reflection of perfect cosmical orderity and insists that its course is the principal element of its functionality.

[1:14:244] Deisal thought is given a special position in Cosmic Philosophy due to the fact that in all the discussions of the orbitalities and rotalities of the planets in the cosmical system, the course of The Sun is often forgotten.

[1:14:245] The main issue with deisal thought is that it is based upon perspective understanding; it is not The Sun that causes its rising and setting, it is the movement of The Earth orbiting it, but from our perspective on The Earth, it seems as though it is The Sun that is moving.

[1:14:246] Despite this, we can still use deisal thought on every planet we inhabit to provide a basic understanding of the movements and motions of The Sun and its planetary correlatives.

[1:14:247] However, this does not mean to say The Sun has no motion and no course for these concepts can be interpreted in many different ways; The Sun, of course, does have motion; it rotates and dictates the motions and orbitalities of all the progeny in its system.

[1:14:248] The Sun, despite it not orbiting in its own system, decides the orbitalities of the planets and moons, and is therefore, the centre of motion, path, and course in its system for all the other motions, paths, and courses depend upon its existence for them to function properly.

[1:14:249] This positions The Sun and any other star as what is known as the Deisal Centre; the physical manifestations of the course of a star that dictates the entirety of all other courses in its system.

[1:14:250] Many practices and systems of our own creation have been constructed as so as reflections of The Sun's course for the entirety of all of our existences depend upon The Sun's course.

[1:14:251] In a more abstract contextualisation, there exists many more different aspects of deisality; The Sun's life journey, The Sun's birth and death, but perhaps one that is most often overlooked, or simply forgotten about, is the orbitality of The Sun.

[1:14:252] It is correct to say that The Sun holds no orbit in its own system, but once our vision's enlarged and we begin to see the entirety of The Milky Way galaxy, we soon remember that The Sun does indeed orbit; it orbits, like all the other stars of the galaxy, the central supermassive black hole at the galactic core.

[1:14:253] One rotation of The Sun around the galaxy is of course known as the cosmic year, and by this notion, The Sun and all the others star assimilate the functions of the planets; they rotate and they orbit a centrality; a centrepoint that dictates their positions, motions, and orbital functions just as the stars conduct their decrees over their planetary subjects.

[1:14:254] We begin to drift towards black hole cosmology tendencies when we speak of The Sun as the centre of the planets and the sentients, and the black holes as the centre of the stars and galactic orderity, despite being considered chaotically influenced.

[1:14:255] Like the stars are the centralities to the planets, the black holes are the centralities of the stars; this infers a notion of the Cosmic Hierarchy; the centralities of the centralities, and the further out we perceive, the greater the centralities therein become as reflected in The Earth being our centrality, The Sun being The Earth's and Gargantua being The Sun's.

[1:14:256] Spend time thinking on this development of hierarchy and you shall find a message about the naturity of The Sun and all the stars, and about the naturity of The Cosmos, but perhaps ending such thought with more questions than when you began, yet this is a sign of a great philosophical contemplation.

—

[1:14:257] In the Astronist Tradition, we often speak of vision and envisionment as the pillars of perspective and perception, and just as equally, we treat having vision as an ability with immense uniqueness and skill and natural talent.

[1:14:258] In the Astronist Tradition, to raise vision to an adorative position and to have vision is considered the centralmost goal of all philosophical discipline and thought for without vision, philosophers are empty vessels of directionless ideas.

[1:14:259] Further to this concept, in Astronist Philosophy, there exists a state attainable only by the most enknowledgeed, wise, receptive, and understanding of us and this state encompasses that which is known as Perfect Vision, and is henceforth known as Emmetropia.

[1:14:260] Emmetropia is the state in which one reaches a perfect vision of what the world is, whom we are as peoples, where we are to go, what The Cosmos is, how it exists, why, who, and when.

[1:14:261] In reaching emmetropia, one must begin with wondermentation; this is the principal action of the emmetropian journey, and this is something that many in today's world have forgotten to do; they have forgotten from which we came and towards which we are destined and where which the answers exist.

[1:14:262] Emmetropia and its concept of the attainment of perfect vision develops its own philosophical standing known as Emmetropian Thought; this focuses on the idea that the achievement of emmetropia is the ultimate and inevitable purpose of humanity as a whole and as individuals.

[1:14:263] An emmetropian view constitutes that vision is ultimately gained through knowledge which is gained through ideas and receptivity and holds that without continuing to progress towards emmetropia, we as a peoples, a nation, a world, are ultimately regressive.

[1:14:264] Whether emmetropia can actually ever be attained by an individual is a source of contention from Astronist Thought for to know of all things and to see all things by some perfect state is similar in description to the abilities of The Divine.

[1:14:265] However, to achieve emmetropia across a number of individuals is perhaps a more realistic achievement.

[1:14:266] Therein also rises the question of the actual definition of perfect vision; is perfect vision the achievement of knowledge and understanding of the extent to which one is able or destined to know, or is perfect vision the achievement of knowledge and understanding of the entirety of all things?

[1:14:267] Whether the first option or the second is correct, there remains a constant contention between that which is correct and that which is incorrect with regards to the definition and achievement of emmetropia.

[1:14:268] Emmetropian Thought can be found throughout much of the ethical, moral, and cosmical philosophies, theories, and concepts of the Astronist Tradition, and is therefore a significant component of ambition and purpose for the greatest of minds and wondermenters.

The Educative Mission (The Cosmechesis)

[1:15:1] Throughout the ages, the peoples of the world have needed to be taught certainties of systems and philosophies; from the young to the old, people have been taught new ways of seeing, knowing, and understanding the world around them and in the context of Astronism, Cosmic Philosophy, and the practices of wondermentation, this is no different.

[1:15:2] The children of the world, the youth of the world, the adults of the world, and the seniors of the world; they all must be taught new ways for this is the cycle of knowledge; to be taught new ways of knowledge and vision.

[1:15:3] With education and pedagogy being central to the Astronist philosophical and cultural structure, it is imperative that we place the education of the peoples in the studies of philosophy and wonderment at the forefront of our efforts to create betterment for the world and its peoples.

[1:15:4] In response to this, a poeticism has been made to describe the nature of the Astronist worldview and the practices of wondermentation and provides a nebulous foundation for the way in which one is to think if one understands and associates themselves with cosmic philosophical concepts and worldviews.

[1:15:5] This short poeticism, henceforth known as The Cosmechesis, stands as the precursory text that forms the basis of the wider Astronist philosophical tradition in its educative format, the full and completed version of which is to be henceforth known as The Cosmechism.

[1:15:6] The Cosmechesis is the short poeticism of the tenets of wonderment and the traditional cosmechismal text is as written below.

[1:15:6a] Around which we rotate; upon which we depend.

[1:15:6b] Throughout which it creates; over which All presides.

[1:15:6c] Inside which we breathe; from which we are blind.

[1:15:6d] About which we exist; behind which we know.

[1:15:6e] Against which we struggle; ahead which we look.

[1:15:6f] Atop which we achieve; beneath which we foundate.

[1:15:6g] From which we come; progress which we will.

[1:15:6h] With which we carry; forever which we cherish.

[1:15:6i] Through which we conduct; within which we preserve.

[1:15:6j] Herein which one peruses; therein which one discovers.

[1:15:6k] Above which All exists; beyond which we comprehend.

[1:15:6l] Under which we live; towards which we wonder.

[1:15:7] The Cosmechesis is a reflection of the elements of The Cosmos from the perspective of humanity and its wonderers; its interpretations and applications are vast in both abundance and differentiation, but its essences and purpose remain the same; to show a newfound perspective of The Cosmos from the perspective of humanity.

[1:15:8] The traditional interpretation of this shall herein be described line by line.

[1:15:9] That which we rotate around is The Sun and upon The Earth and humanity depend.

[1:15:10] That which is created throughout is The Cosmos and over which all things cosmical it does preside under a cosmical system and orderity.

[1:15:11] We, as humanity, breathe the air of The Earth and it is upon this that we are also dependent, but too, we are blind from the perspective of being upon The Earth alone to the grand wonderments of The Cosmos above.

[1:15:12] We exist by the good nature of The Cosmos and of this our knowledge is behind that which it should be.

[1:15:13] We are amidst the struggle to explore The Cosmos and change the minds of the peoples of this world to show them the wonderments of The Cosmos and our destined path to explore it and all its many progenies and it is towards this which look.

[1:15:14] If we are to achieve most high of heights of our destined path of peoples of humanity, then we are to foundate a philosophy and system that supports our destined and prophesied path and values The Cosmos all its mysteries and possibilities and the sentience within it.

[1:15:15] The history of our knowledge of The Cosmos has been built upon the greatest of minds and shall be henceforth and forevermore and it is from where came in knowledge to that which we progress towards.

[1:15:16] That which we carry is our destiny, our knowledge, and our ability to wonderment and we shall forever be in cherishment of these qualities.

[1:15:17] The way by which we take action and the ambition, curiosity, and determination that we show in what we do is something that must forever be preserve if we to stay true to whom we are and whom we wish to be.

[1:15:18] As one reads the *Omnidoxy*, one will notice that it speaks about the world and The Cosmos and humanity in a way never done so before as it reaches new heights of perception, and only by this introduction of new ideas and philosophies, shall we discover more about The Cosmos in which we reside and more about ourselves.

[1:15:19] With inferences to some Divine being, the Astronist philosophical tradition largely references some higher being somewhere; some creator of The Cosmos in The Universe, but admits that the comprehension of such is beyond how we are, what we are, and what we could ever be and know and see.

[1:15:20] The final sentence of *The Cosmechesis* underlines and underpins the entirety of Astronist Philosophy, Culture, and Thought for The Cosmos exists above us from our perspective from The Earth, and it is towards The Cosmos that we have done, do now, and shall continue to wonderment, adore, and gain knowledge of.

The Prospection Principles

[1:16:1] As humanity begins to fulfil its destined and prophesied path of the exploration of The Cosmos, it is inevitable that the flora and fauna on new worlds shall become more valuable to study and research than even that of our world now.

[1:16:2] An industry shall rise forth; one that centres itself on the search, discovery, and study of new plant and animal species from the environments of new worlds.

[1:16:3] In the name of the preservation of these new worlds and their natural phenomena, organisations of a regulatory nature shall herein and henceforth be lawfully established for the securement of the proper execution of prospection.

[1:16:4] The essential principle of prospecting is that all the nature of the new worlds must be respected, preserved, and understood for the betterment of peoples; unnecessary procedures whose reasons for action are purely profit-driven are not justifiable in this sense.

[1:16:5] The principle of prospecting can be summed up in one single sentence; that which existed before humanity must be left after research and usage as it was as if humanity had never existed for it is wrong that humans should think of themselves as owners of The Cosmos and all its phenomena; we own nothing for we are own ourselves.

[1:16:6] The prospectors and prospectrixes are henceforth bound to these ethical principles of exploring and studying of the phenomena of The Cosmos.

[1:16:7] As aforementioned and lattermentioned, we as humanity are destined and prophesied to explore and study The Cosmos, but we must understand the next aspect to this prophecy and herein it shall be explained.

[1:16:8] As sentient life, we are bound to our duty of understanding The Cosmos and all its progeny, but we are also bound to the duty of preserving and protecting it from all sentients and from ourselves for it is humanity that is the most dangerous of entities when equipped with weaponry and greed.

[1:16:9] The practice of prospection is one that shall inevitably and continually grow as humanity explores more and more new worlds of The Cosmos; it shall take many forms; that of a hobby, a business, an industry, and a vibrant and vast area of academic study.

[1:16:10] Prospology is henceforth known as the academic and scholarly study of the entirety of prospection in all its many forms and derivative branches depending upon that which is being prospected.

[1:16:11] With new worlds, new species of bird, fish, mammal, insect, reptiles and wholly new groups of animals that we have yet to witness and this is the same for the flora of the

new worlds; the plant life will perhaps show similarities to that of The Earth's, but it will be majoratively different.

[1:16:12] This is something we must both understand and accept; The Earth has had a unique evolutionary path to form the sentience that it has on its lands and in its sky and in its ocean today.

[1:16:13] The new worlds that we speak of will share certain similarities in their evolutionary paths, but due to the uniqueness of life, the evolutions of the sentient life of the new worlds shall be majoratively different from that of The Earth's.

[1:16:14] In this, all things change, for the new world's natural order, as aforementioned, shall be similar to The Earth's, but will be different in some many ways due to the differing evolutionary paths of worlds which demonstrates a distinct feature of uniqueness in all the worlds of The Cosmos whether they be inhabitable or not.

[1:16:15] Each and every planet is unique in its history just as each of us are unique in our personalities and pasts and presents and futures; the genes of the planets are the evolutionary patterns that occur.

[1:16:16] It can be known henceforth that the ideas and actions and principles of prospection were outlined in the Omnidoxy as a major portion of the inevitable activities of humanity during The Humanic Exploration of The Cosmos.

[1:16:17] It is important to note that prospective activities can emerge in many different forms whether in flora, or fauna, or in mining, or in Planetary Prospection; the search for planets with some specific feature for utilisation, typically with a habitable zone on the surface, or particular type of mining prospect, or some specific kind of environment for agriculture, and cultivation.

[1:16:18] The zoologies of The Earth are complex and vast and as we explore new worlds, they shall only get more and more so with the introduction of new flora, faunas, environments, biomes and habitats.

[1:16:19] The process of searching for, categorising, and recording the fauna and flora of new worlds from which medicinal and commercially valuable compounds can be obtained is henceforth known as bioprospection, and it is this type of prospection that is likely to be most popular due to the possibility of its monetary rewards.

[1:16:20] The bioprospectors, and prospectors in general, demonstrate themselves as the explorers of The Cosmos and its phenomena physically, whilst the wondermenters are the explorers of The Cosmos and its phenomena mentally, and philosophically.

[1:16:21] In this, we see the vastness of the activities of prospection, and its various forms, practitioners, and principles, and from this, we can understand that in The Grand

Centrality, in this one writing, from the perspective of now at this current time of nascence, the explanation of the entirety of such a vast practice and industry is not possible for all that can be said is speculative and predictive.

[1:16:22] That which we can be certain of is the inevitability of the popularity, necessity, and intrinsicity of prospection during humanity's exploration of The Cosmos in The Universe, and it is a practice that is important in Astronist philosophical ethics as will be lattermentioned.

[1:16:23] The exploration, recordation, and categorisation of all the prospectory findings shall lead to an archive of grand proportions and with strict regulatory measures, also shall lead to a humanity that respects that which they explore, record, and categorise for the betterment of the people, but equally so, for the preservation of the beauteous phenomena of The Cosmos.

[1:16:24] It is the prospect of this exploration in The Cosmos that drives our wonderment from the lands of The Earth for the purest, and yet most basic form of wonderment is to look up at the stars and imagine the possibilities of the planets that orbit around them.

[1:16:25] Prospection is simple the finding of that which is already there and waiting to be discovered and to enknowledge oneself of its many newnesses; physically uncovering the possibilities that were envisioned upon by wondermenters generations beforehand.

[1:16:26] Prospectors shall be some of the most courageous of us; they see the value in the exploratory philosophy that humanity is destined and prophesied to underpin itself upon; they know and understand of the potentialities of the new worlds beyond our own; and finally, they fight for the establishment of civilisations and they believe in All the grandness, the possibilities, and the mysteries of The Cosmos in The Universe.

—

[1:16:27] As aforementioned and lattermentioned, there are three main forms of emotional interaction with The Cosmos at present times; the first of which has been discussed goes by Cosmic Adoration, the second of which has been omnimentioned in the Omnidoxy and lies at the heart of Astronism and that is Cosmic Wonderment, and the third of which goes by the term Cosmic Laudation.

[1:16:28] After all that has been theorised and conceptualised and philosophised about The Cosmos and the world and humanity and all their various ways, that which lays at the heart of Astronist Philosophy and Cosmic Philosophy are these three components of philosophising in cosmical context; wonderment, adoration, and laudation.

[1:16:29] In these three actions, one's understanding, acceptance, and knowledge of The Cosmos is enhanced to levels beyond all other action; in order to understand the

differentiations between these three actions, we must overview them and construct an explanation.

[1:16:30] Principally, we must begin with wonderment; the commonmost of the three actions and arguably from which the two others branch, wonderment describes one's philosophical, visual, and mental interactions with The Cosmos and its phenomena.

[1:16:31] Wonderment in itself is purely respect for The Cosmos, a proper understanding of The Cosmos, a true knowledge of The Cosmos, and an acceptance of The Cosmos for what it is, what it means, and how it is.

[1:16:32] Wonderment can be conducted both internally and externally as well as individually and collectively; it takes form internally through our emotions and knowledge; it takes externally through our projections of such emotions and knowledge; it is conducted individually through one's wonderment of The Cosmos when alone; it is conducted collectively through a group's wonderment of The Cosmos by sharing wonderments, knowledges, and understandings with one another.

[1:16:33] Ultimately, it is wonderment that stands as the precursor for all that follows it regarding The Cosmos; every idea, piece of knowledge, and every interpretation stems from the extent of one's wonderment and the kind of wonderment enacted.

[1:16:34] The second of the three actions mentioned in this discourse is known as Cosmic Adoration, or simply adoration; to adore The Cosmos in a way in which one loves it as an entity in and of itself; to hold respect for The Cosmos in knowing that one wishes to enknowledge oneself of its mysteries in parallel to accepting that perhaps total enknowledgement will never be reached.

[1:16:35] In the enactment of adoration, one may look upon The Cosmos with their mind's imagination, or be within it, amidst its adorative phenomena.

[1:16:36] The real distinction of adoration from the other two actions is that adoration is primarily based upon love and thus demonstrates a greater closeness and personalism between oneself and The Cosmos.

[1:16:37] One's reasons for the adoration of The Cosmos are typically personal and individually unique to one's own beliefs, dreams, ambitions, and wonderments.

[1:16:38] Finally, the action of Cosmic Laudation, also just known as veneration, is the third of three actions related to one's interactions with The Cosmos, and laudation is most primarily formed upon the concept of veneration which, in an Astronist and cosmic philosophical context, means to physically go to The Cosmos progenies with which we share adoration and wonderment over.

[1:16:39] To laud The Cosmos is to perceive The Cosmos for what it truly is; an incomprehensible and immense entity of perfect orderity, function, and structure, whose nature is directly Divine, and whose mysteries shall remain so forevermore.

[1:16:40] To regard something with great respect is to understand the many forms it takes, to accept its inevitable incomprehensibility, and to ponder upon its many possibilities and potentialities.

[1:16:41] In the context of The Cosmos, we derive laudation from the concept of worship, though not deity worship, but cosmical worship; an expression of reverence towards the appearance, functionality, and orderity of The Cosmos.

[1:16:42] To worship by means of laudation is to raise up The Cosmos to a level upon which one's understanding of The Cosmos is somewhat directly Divine in nature by some means of measure whether by functionality, orderity, appearance, or by some other instrument.

[1:16:43] Venerative means of interaction with The Cosmos are characterised by their physical actions; perhaps the setting of a telescope to view the stars, or the entering of a planetarium to learn of The Cosmos, or actually travelling into space to visit the most highly wondermented parts of The Cosmos.

[1:16:44] The wondermenters, the adorers, and the venerators are characterised by only one feature; they wish to have always a greater knowledge, understanding, and acceptance of The Cosmos than they do presently.

[1:16:45] As they stand at the heart of Astronist philosophical adherence, the practices of wondermentation, adoration, and laudation are often practiced unknowingly for these actions are part of human nature; they shall become intrinsic parts of our lives if they are not so already.

—

[1:16:46] The Observable Cosmos holds both a naturity of knowingness and unknownness in parallel for it is the fundamental principle of The Cosmos that light's speed is limited, and so, forever will there be a part of The Cosmos in The Universe that we cannot see.

[1:16:47] Even if humanity lives forever; for an infinite amount of years; we will still never see the entirety of The Universe for light cannot travel fast enough to reach us on The Earth.

[1:16:48] As all else in The Cosmos, light is bound by the fundamentalities of Time and as such, there hasn't existed enough Time for the light to return from the most distant of edges of The Observable Cosmos.

[1:16:49] For a moment, just imagine the possibilities that exist beyond The Observable Cosmos; beyond that which we see and can ever truly know.

[1:16:50] It is the naturity of The Expanding Cosmos that such distant cosmicals are expanding away from The Earth so much so that we will never see them, even in an infinite amount of Time for The Cosmos will continue to expand, and as it does, each celestial separates further and further away from one another.

[1:16:51] This means that there are the unknowns of The Cosmos that will remain unknown forever to ourselves as we are now; this is both the naturity of The Cosmos and The Expanding Cosmos.

The Cosmical Schematism

[1:17:1] Omnimentioned throughout the Omnidoxy is the orderity of The Cosmos, but to be ordered, a plan must be enacted first for without such, we are left with directionless order; an orderity without purposivity; an orderity plagued by misallocation and disorganisation.

[1:17:2] To circumvent this distorted version of orderity, The Cosmical Schematism is introduced as the scheme upon The Cosmos is constituted and is accorded to at all times.

[1:17:3] There is a distinct orderity to All progenies of The Cosmos; a particular pattern, form, function, structure, and trajectory to all the phenomena of The Cosmos in alignment with some strict, yet majoratively shadowed scheme.

[1:17:4] This scheme cements the orderity of The Cosmos and forms a lining and underpinning of its entire ordered system, without which the cosmical orderity would not function.

[1:17:5] The Cosmical Schematism can be viewed upon in two different ways; The Cosmical Arrangement and The Cosmical Presentation; it is these two components that form the orderity of The Cosmos.

[1:17:6] The Cosmical Arrangement relates to the partitioning and apportionment of gravity, and matter relative to the space and time sanctioned by the schema.

[1:17:7] The Cosmical Presentation relates to the physical manifestations of The Cosmical Schematism through the semblance of the cosmical progenies and phenomena.

[1:17:8] The Cosmical Schematism has formed and evolved since the inception of The Cosmos but whether it existed beforehand is a matter of theological and universal debate.

[1:17:9] Either The Cosmical Schematism was created by some Divine means, it created itself, or it had always existed as an intrinsic quality of The Universe.

[1:17:10] In the Astronist Cosmology pertaining The Cosmos in The Universe, The Cosmical Schematism forms this underpinning and courts a paradigm in which The Cosmos is revealed to be finite.

[1:17:11] Yes, it is The Cosmical Schematism that reveals the finity of The Cosmos for its schema designates a limitation; it the reveals that The Cosmos has an extent despite our current knowledge not being developed enough to pinpoint it.

[1:17:12] It is The Cosmical Schematism that uncovers the finity of The Cosmos for if there is to be an orderity then there is to be a plan and if there is a plan it must have a perimeter;

an extent to which its dominion extends; this relates directly to the boundary of The Cosmos; The Expansion of The Cosmos into The Universe.

[1:17:13] The schematics of The Cosmos are the blueprints we will never get to see in their entirety, yet we witness in every day we live and breathe and look up at the stars; we see the schematics in the rise and set of The Sun, in the rotalities, orbitalities, and functionalities of the worlds of The Cosmos; we see the cosmical schematics in All things of a cosmic naturity and existence.

[1:17:14] The stance of view that pertains the schematics of The Cosmos towards the centricity of all that is cosmical shall be henceforth known as Schematicism and holds in great belief that the orderity of The Cosmos by its naturity is constructed and established according to a particular formula of ideas relating to cosmical structure, function, and distribution according to space, time, and matter.

[1:17:15] Furthererso, this may be deemed as an entirely distinct cosmology in its own right, henceforth known as Schematic Cosmology, whilst others may view it as an inherent part of all cosmologies, and is therefore non-distinct to form its own by their interpretation.

[1:17:16] Often, it is a Schematic Cosmology that follows a course of natural theology, depending upon the interpreter, as do many other Astronist cosmologies and theories, but the question still remains of natural theology, from where did the nature come? From what does nature originate?

[1:17:17] Whether by some theistic, atheistic, or naturalistic answer, there is a truth, and even though none of us know of it, it is still there to be found at some time, some place, and by some means of grand knowledge.

[1:17:18] It is the ambition and duty of The Philosopher to explore all natures and the nature of nature too, and to go beyond the braveries of the minds of others to forge new systems of thought with the betterment of peoples always in mind of anything one attempts to surmount.

[1:17:19] Furthererso, a traditional Astronist view of natural theology extends into the philosophy of nature itself and typically pertains an understanding by which nature is considered the centrality of existence, and that nature in and of itself is autocreational, but that which nature is, is not so defined.

[1:17:20] By this notion, nature itself could be what we come to call The Divine, or God, or by this notion also, nature is a self-perpetuating entity that created itself from nothingness and has continued to create all other things and shall continue to do so eternally.

[1:17:21] Due to the centricity of nature in all of philosophy, a discourse on the matter holds the tendency to inevitably branch out into many different avenues of thought and

discussion, and so the discourse on nature shall continue on through the many different discourses of the Omnidoxo that deal with its topic.

—

[1:17:22] The consequences of philosophical discussion and discourse lies in one's tendency to be distracted by the most challenging and thought-provoking concepts whilst the smaller concepts lose out on our attention.

[1:17:23] In this discourse, this issue is attempted to change for we discuss the ideas of that which we see around us and above us in The Solar System and we imagine to be in all other solar systems of The Cosmos; the first part of which is the philosophy of terrestrial planets, also known as terrestrialism.

[1:17:24] In terrestrialism, discussed are the different formities of planets and these various different types are compared and contrasted with one another to form an Astronist overview of the different forms of planetary bodies.

[1:17:25] Before describing each kind of planet, we must touch upon the philosophical stance of terrestrialism for it does not just simply encompasses the formities of planet, but furtherso, its believers, the terrestrialists, hold that the planets of the cosmical systems of The Cosmos are the centrality to The Cosmos.

[1:17:26] It is held that planets, by their loyal orderity, vast unquity, and abundance of contents, are the prevailing reflection of The Cosmos and what it means to be cosmical, especially in the overshadowing of other celestial entities such as the stars, the nebulae, and the black holes.

[1:17:27] In this notion, a type of Planetary Cosmology is introduced whereby planets are placed at the centre, not physically of course, for that position shall always be taken by stars in alignment with the scientific reality, but philosophically, planets are considered the hubs of The Cosmos and its system of orderity.

[1:17:28] Whether oneself holds these terrestrialist beliefs or not, it is not illogical to suggest that the planets are the central reflections of The Cosmos as well as general cosmicality, but neither does this quasicosmology conform with the cosmologies aforementioned, and perhaps deviates the most from their understandings of The Cosmos.

[1:17:29] Nevertheless, Planetary Cosmology exists and is encouraged to develop to become one of the standard cosmologies of the Astronist Tradition, but now we must speak of the planets themselves and their various formities.

[1:17:30] The first is known as a Carbon Planet and as its title suggests, is a planetary body that contains more carbon than it does oxygen; such a planet would of course be difficult

for sentient life to develop, but with a mindset of prospection, its carbonic contents could be used for many other purposes.

[1:17:31] This draws upon a larger principle; just because a planet or another celestial cannot support sentience does not mean that it is void of purpose; all things of The Cosmos have some purpose and although it may not directly serve the development life, it does still exist and has done since before we did.

[1:17:32] We must remember that all things have more than just one purpose to their existence and perhaps such purposes may not be so obvious, in which case, it falls as our duty to enact an exploration to find the concealed purposes of such entities.

[1:17:33] And in this, we shall discover purposes that we had not initially perceived; a second and deeper look at something tends to conjure new insights not before seen; it is a philosopher's attribute to look and search again for some undiscovered truffle of purpose, knowledge, or understanding.

[1:17:34] The second planet of this discourse is that which is known as a Coreless Planet; a planetary body without a metallic core, and is thus only a giant rocky mantle.

[1:17:35] Such a planet, as long as it follows a orbitality and rotality as accorded to the cosmical system is considered non-chaotic, despite its coreless nature and formity which is most often considered a chaotic attribute.

[1:17:36] The next planet of terrestrialism focuses not on the planet's formity, but the contents of the environment of its surface, and a planet is majoratively sandy wasteland is known as a Desert Planet.

[1:17:37] With the potential for small pockets of sentient life and civilisation the least harsh of regions, these planets perhaps act as a beacon of light in the cold and dark voids of space.

[1:17:38] The greatest contribution a Desert Planet can offer is its potentiality; a wasteland can soon become a thriving civilisation with proper means of development, population, and a vision to make it so.

[1:17:39] Perhaps not the most ideal of civilisational candidates, but the Desert Planets of The Cosmos may harbour compact civilisations in future times, especially if the planet holds key resources which we shall only gain knowledge of if we explore such planets.

[1:17:40] Another major type of planetary body of terrestrialism is that known as a Dwarf Planet and although their formities lack the size, scale, and dimension to be considered standard planets, they still hold great abundance of potentiality for these planets hold their own environments, and thus a distinct uniqueness and a certain level of development to possibly support sentience.

[1:17:41] The Dwarf Planets of the systems we explore shall fulfil the role of waystations and planetports for the purpose of refuelling, colony development, and other industrial related activities.

[1:17:42] Again, here is introduced into terrestrialism another planet focusing on its contents, and strikes an oppositism to a Desert Planet and is known as an Ice Planet.

[1:17:43] As derived from its name, an Ice Planet is majoratively covered in ice and similar to its desert planetary oppositistic counterpart, the Ice Planets hold great potentiality, perhaps even more so due to the natural ability of ice to preserve that which it encompasses.

[1:17:44] Think of the truffles of knowledge that could help us solve the cosmical mysteries that are right now frozen on planets such as these?

[1:17:45] This and this only justifies a good enough reason to explore such planets of apparent barrenness, but as aforementioned, it is only when we take a second and deeper look at some large canvas that we see the treasures concealed within it.

[1:17:46] This opens up are larger principle about humanity's exploration of The Cosmos about the fact that we, as the pioneers of this destined and prophesied path, shall need to sacrifice our own comforts to go to worlds wherein the environment may not naturally or initially suit our wants and needs.

[1:17:47] But this draws upon the essence of what it means to explore; to find new worlds and to understands such worlds in an envisionment that foresees civilisations new and adaptive.

[1:17:48] The point of the exploration of new worlds is to hold the vision to see what they can become for without this continuous vision, we do not hold the ambition, or the understanding of what it means to explore and what it means to discover the wonderments of The Cosmos.

[1:17:49] The worlds beyond our own shall be exactly that, beyond our own; they shall not be the same or evolve in the same way as ours has and by this, the environments will be different from which we are used to.

[1:17:50] We must explore these worlds with a knowledge and acceptance that everything we discover shall be different from All that which we know from The Earth; but it is the love for the unquity and diversity of the progenies of The Cosmos that we must master and the greater knowledge we hold of this love, the greater explorers and discoverers we shall be.

[1:17:51] The next two planets of terrestrialism, those categorised as Iron Planets and Lava Planets, hold contents of some of the most fundamental elements of The Cosmos for the metal of iron is found in our own physiologies and in the foods of life, and it is found as the majorative content of some of the dead stars of The Cosmos; a compact star whose mass is iron.

[1:17:52] The second of these two planet type, Lava Planets, still hold great potentiality in the industry of prospection for it is these types of planets that often harbour the most utility of resources of The Cosmos.

[1:17:53] We must therefore overcome the natural boundaries and challenges that we shall face on these lavaic worlds and although this example is the most extreme of environments, it cements the teachings aforementioned; that there exists worlds perhaps not naturally suited to us, but suit our needs in ways we know and in a way we do not yet know.

[1:17:54] To build such civilisations on worlds so extreme is perhaps curtails as the ambition of a fool, but I believe in the minds of the people and the minds of the future generations that we shall be instrumental in the development of.

[1:17:55] I believe in our innovative nature to form solutions to the problems we face for this is perhaps the coremost of our nature as humans; to hold the initiative, imagination, and vision to overcome the obstacles before us.

[1:17:56] These worlds of extremity are just more obstacles that we shall overcome when the time is right and our knowledge and competence has reached the levels needed; as we have overcome the obstacles of our past, we shall overcome those of the future.

[1:17:57] There are those whom will doubt our abilities to do so and there are those whom shall position themselves in the way of our path with their motivations of greed and jealousy, but as it is our nature to explore, we shall, in some way and in some time, overcome these impediments for that is nature of nature; it shall always find a way to complete its own nature.

[1:17:58] The types of planets that have received the most attention thus far in our short observation of The Cosmos are those which are named as Mega-Earths.

[1:17:59] To qualify as a Mega-Earth, a terrestrial planet must be at least ten times the mass of The Earth itself and hold a resemblance to The Earth and its structure, environment, and its position in the cosmical system.

[1:17:60] In the Astronist Tradition, there is no such comedicism to name the region of the cosmical system in which The Earth resides with such inserty.

[1:17:61] Instead, in the Astronist Tradition, this zone is henceforth known as the miderior as sandwiched by that which is known as the interior and the exterior of the cosmical system.

[1:17:62] For the purpose of civilisation-building alone, these Mega-Earths offer extremely exciting new opportunities for wonderment and human exploration and progression.

[1:17:63] For the entirety of the history of humanity, we have fought rivals for the lands of The Earth to call them our own, but with the discovery of these Mega-Earths, the territories available are beyond the wildest of our dreams.

[1:17:64] It is the nature of humanity to be territorial and this is something that will never change for it is our nature to be this way and our nature shouldn't be distorted, interrupted, or curtailed for the motivations of others to achieve their ambitions.

[1:17:65] We are drawn to the worlds that resemble our own and it is in these worlds that we see the greatest potentiality for life beyond The Earth that has evolved in separation from our own evolutionary paths.

[1:17:66] Just as the explorers of this world come across new peoples with new cultures, appearances, and faiths, we shall repeat this same type of discovery in our entrance to these new worlds populated by peoples we have yet to meet.

[1:17:67] The role of the Mega-Earth is one that reflects our history and draws upon an interesting realisation; that there are worlds beyond our own which are tens of times larger than our own in many different ways whether by their age, size, population, or land mass.

[1:17:68] This notion realises that on these Mega-Earths exists world of peoples and civilisations and cultures of new philosophies, religions, and races that we have never yet encountered on our own world for our evolutionary path is different.

[1:17:69] We realise, understand and must accept that by the discovery of the Mega-Earths, we find out about ourselves and our own position within The Cosmos; our place as one of many worlds indulged by sentience.

[1:17:70] The next of the worlds of terrestrialism is the Ocean Planet; the planet with the highest possibility of sentience in its marine form; this is not to say that marine forms of sentience cannot be as intelligent as ourselves, but that their civilisations are concealed by the very mass that provides them life.

[1:17:71] From our perspective of the explorer, we cannot see the civilisations of the ocean worlds until we go below the oceans and discover the potential for civilisations of submarinity.

[1:17:72] Water is one of the most principal signs of life or the possibility of life at some time past, present, or future and with the confirmation of the existence of such oceanwide worlds, we find that life is in existence in The Cosmos for the worlds are principal proof of that by the structure of their planet of the most fundamental part of sentient life.

[1:17:73] The waters of our world that are teeming with life, so why should these oceans of much larger size, scale, depth, breadth, and age be void of such life; to deny life is to deny inevitability for life, as is the principle of nature, will always find a way to survive and develop.

[1:17:74] There is no point in denying that which is natural for that which is natural will always find a way to exist as nature's mission is relentless, merciless, and repetitive.

[1:17:75] The third to last world of terrestrialism is so named as a Sub-Earth; this categorises worlds that are significantly smaller than The Earth, but are still considered planets, such as the world of Mercury in The Solar System.

[1:17:76] The Sub-Earths are perhaps the most abundant of planets for sentient life to exist and it is the principle that the smallest of things may hold the largest of answers and knowledges that we must make clear to our explorers.

[1:17:77] We understand this principle when we think about The Earth from the perspective of The Cosmos; The Earth so small and The Cosmos so large, yet The Earth holds a grand uniqueness; a great evolutionary path but if all we were to look at of The Cosmos were the largest of its progeny, the greatneses of The Earth would be overlooked and forgotten.

[1:17:78] The second to last of the planets of terrestrialism is henceforth appellated as a Super-Earth; this category is not to be mistaken with that of Mega-Earth and sits somewhere between this and the size of the actual Earth itself.

[1:17:79] The principles aforementioned in relation to the Mega-Earth category stand true for this category in the same form as humanity forges its way through The Cosmos to discover new homes of worlds that resemble our own and those which do not.

[1:17:80] Before writing of the final category of planet within terrestrialism, we must first speak of the underlying principle of terrestrialism and the humanic exploration of The Cosmos in wider terms.

[1:17:81] And that is the principle of adaptation; throughout human history on The Earth, we have propelled ourselves to new lands despite fears of death and the unknown; there were those who doubted such exploratory ambitions and spoke of human nature being stationary and unadaptive, but their falsities were proven so by the braveries of the few and the fulfilment of our natures to be curious and to discover that which is waiting to be discovered.

[1:17:82] We adapted then and we shall do so in the future regarding the new worlds we shall come across; we shall have to adapt in greater scale, but by better measure for the betterment of peoples as we explore The Cosmos in The Universe.

[1:17:83] The final planetary body of the Contental Philosophy of terrestrialism is accordingly named a Boscage Planet; this relates to a planet whose landscape is majoratively made up of forestries, woodlands, and greenery.

[1:17:84] This surface type is the most diverse of all for with the development of forests comes the development of lakes, mountains, rivers, and other natural phenomena, and is the type of surface most suitable for sentient and intelligent life.

[1:17:85] It is from these planets that are most in tune with natural phenomena that we shall become most prevalent in our ambitions for bioprospection and it is from these planets we shall discover the most exotic new species of fauna and flora which will change our entire perspective on evolutionary processes, zoology, biology, as well as physiology.

[1:17:86] It is of the Boscage Planets that I wonderment over the most for they are the planets with the most natural phenomena currently existing upon them and they are the planets which I always wonder what could be happening on them right now, no matter how far away they are.

[1:17:87] This draws upon another principle and that is of distance; it is common human default to ascribe less importance to that which exists furthest away from oneself and one's own circumstances, yet this is a mindset that we must not overhaul, but divide into two parts.

[1:17:88] The first of which resides in the mindset of the present time which is aforementioned in the previous insentensation and the second of which resides in the mindset that distance does not decrease relevancy and although these planets may be light years away, that which is happening on them or the life that could possible exist upon them is no less relevant to us than that which exists around us and affects us directly.

[1:17:89] In essence, it is the boscagial planets that offer some of the highest rates of wonderment for they largely reflect the planet upon which we reside and they are the symbol of sentience and the epitome of life beyond The Earth.

[1:17:90] It is the Boscage Planets that will form our greater understanding of The Cosmos as a place abundant of life and a diversity of life that puts our own diversity on this single world in its place.

—

[1:17:91] As the second Contental Philosophy after that of terrestrialism is name Gasism, it is immediately clear that we shall be focusing now on the planets which do not have a surface, but are instead formed purely of billions of years of the combinations of gas and dust and celestial particulars.

[1:17:92] Gasists may believe that the gas planets of The Cosmos demonstrate supremacy of cosmicality over their terrestrial neighbours and therefore stand the greater of the pair.

[1:17:93] By this notion, it is believed that the gas worlds of The Cosmos can provide us with a greater knowledge of The Cosmos than those of terrestrialism, or alternatism, which is the third and final of the Contental Philosophies and is latterdiscoursed.

[1:17:94] Presently, let us discourse the first of the gaseous planets which details a gaseous planet in perhaps its worst state; that which is named a Chthonian Planet; a planetary body whose proximity to a star strips away its hydrogen and helium atmosphere known as the Hydrodynamic Escape to leave a metallic and rocky core.

[1:17:95] This stripping away of the gaseous attributes and elements of the celestial demonstrates the immensities and extremities of the forces of stars and denotes the most extreme phase of a planet's evolutionary life; the destruction of its outermost layers, thus revealing its most bear and raw appearance.

[1:17:96] Within this notion too, the eventual fates of each of the planets of every cosmical system is revealed; their gradual destruction by that which they depend upon; by that which they orbit around; the extinction of the progeny by their originator.

[1:17:97] This concept is henceforth known in the Astronist Tradition as the Chthonian Process, or the Chthonic Process; the gradual eradication of a celestial by that which it is dependent upon, or by that which created it, or sustained it during its existence.

[1:17:98] The next of the planets of Gasism is known as an Eccentric Jupiter; this relates to a jovian type and sized planet that orbits its centrality, its star, in an obscure way such as having a largely imbalanced orbit on either the aphelion and perihelion sides.

[1:17:99] An Eccentric Jupiter is perhaps influenced by some chaotic attributions but ultimately, these gaseous worlds still follow a distinct orbitality and rotality despite this not totally conforming to a standard orbitality or rotality which conclusive categorises these worlds as being cosmical in naturity with some chaotic features.

[1:17:100] The Gas Dwarf planets are the next worlds of the Gasism branch of Contental Philosophy and like with all smaller worlds, we must hold the principle that there is no world unworthy of exploration for the most seemingly insignificant of worlds may hold the most significant of knowledge and treasures of The Cosmos.

[1:17:101] Such Gas Dwarf stand as suitable candidates as locations for orbital stations for refuelling, industrial works, and providing rejuvenations for travellers during their journeys through The Cosmos.

[1:17:102] The gas worlds that we know of in The Solar System, such as those we have appellated as Jupiter and Saturn, are primarily made up of hydrogen, yet there are the gaseous worlds of The Cosmos that are primarily made up of helium instead which introduces the next worlds of Gasism, those which are known as Helium Planets.

[1:17:103] The main point of discourse on these worlds of Gasism are that they demonstrate diversity and variety of gaseous structure in the cosmical system and as we explore The Cosmos further, we shall discover new worlds that are made of different gaseous elements; those of which we thought could never have existed.

[1:17:104] Throughout the entirety of our histories, there have been those whom have spoken of that which cannot exist, such as the incentrality of The Earth in the cosmical system, but they were proven wrong and their falsities were revealed to the world for the people to see what they really were.

[1:17:105] The next two categories of planet of Gasism as known as Hot Jupiters and Hot Neptunes respectively and derive a variation on the two classical planets after which they are named.

[1:17:106] This category of planetary body resembles Jupiter and Neptune, but are named Hot because these planets are found in close proximity to the star around which they orbit, therefore justifying the moniker given, yet are not so close to the star that chthonic processes begin to take place.

[1:17:107] Overall, these two categories of Gasism demonstrate the way in which temperature can cause fundamental changes to the structures, formities, orderities, and naturities of the planets.

[1:17:108] As well as this, these also show the potentiality of the progenies of The Cosmos to not only introduce new worlds entirely, but to introduce new derivations of worlds already in existence.

[1:17:109] The next of the gaseous planets within the Contental Philosophy of Gasism is appellated as an Ice Giant; an exemplar of this would be the planet of Uranus that we all know of to be in The Solar System in which we reside, but do not be mistake that Ice Giants have an icy surface for this is actually the opposite.

[1:17:110] They are composed of elements heavier than hydrogen and helium and do not have a surface like the terrestrials, but a liquid icy center covered by an upper atmosphere of hydrogen and helium.

[1:17:111] In the outer regions of cosmical systems, Ice Giants are the most prevalent types of planets, and so we must use what we can of them when we do eventually reach them.

[1:17:112] We must remember, like all the planetary structural types mentioned in both Terrestrialism and Gasism, the planets themselves may not be initially overabundant with potentiality but many of these larger worlds have rocky moons, and it is on these lunar bodies that we must search in prospection or for civilisational purposes.

[1:17:113] The second to last of the planets of Gasism are categorised as Mini-Neptunes; these planets are essentially in resemblance of the classical planet of Neptune, but much smaller in their scale and dimensions.

[1:17:114] This does not mean to say that they themselves have less treasures to reveal, or that their moons do not have any potential for civilism as to stay in accordance with the tenet that all that is smaller is not all that is lesser; henceforth known as The Lesser Principle.

[1:17:115] The final planetary type of Gasism is titled as a Super-Jupiter and as the appellation suggests, is an even larger version of the giant that is Jupiter itself.

[1:17:116] With the introduction of this final type of gaseous planetary body, it must be clear now to all readers that with The Cosmos there is always something bigger; just when you think that there a planet, or a star couldn't get any bigger and is at the extremity of our comprehension, we discover another planet, or star that is twice as large, or twice as distant as the original.

[1:17:117] This demonstrates a wonderment of The Cosmos that shall be forever marvelled upon by the wondermenters of us and shall be forever searched for by the explorers of us.

—

[1:17:118] The next and final derivation of Contental Philosophy is that of Alternatism and involves the planetary bodies that are more obscure, or whose unquities deserve a category separated from that of terrestrialism and gasism.

[1:17:119] The first of the planetary bodies of Alternatism is known as a Brown Dwarf and whose structure lays in fusionalty and intermediacy.

[1:17:120] Firstly, the stars of The Cosmos are structured as they are by the compaction occurring at their cores thus forming fusional processes, whilst nearly all the planets of The Cosmos are not large enough in mass to initiate these processes of fusionalty.

[1:17:121] A Brown Dwarf is essentially the middle ground between these two oppositism and therefore is not a planet, but also, not massive enough to a fully formed star.

[1:17:122] In Astronist cosmological and philosophical terms, Brown Dwarf are considered to be half cosmical and half chaotically influenced as a reflection of their intermediary between being stars and planets.

[1:17:123] Brown Dwarfs are cosmical in that they do form part of cosmical systems and whether by astral or planetary origin, they do still follow a cosmical orderity, but they are equally as chaotic due to their indistinction in colour, functionality, naturity, purposivity, and their general intermediacy.

[1:17:124] One characteristic of cosmicality is to be something in distinction from another, but the Brown Dwarfs do not achieve this and for they are forever trapped in an endless cycle of intermediacy; stuck between being classified as one entity and another.

[1:17:125] Perhaps one the most mysterious of the celestials, Brown Dwarf are a perfect exemplar of what it means to be part of the alternatism category as distinct from terrestrialism and gasism.

[1:17:126] The binarity of stars has been aforementioned but here we focus our attentions on the planet which around such stars it orbits and this type of planet is known as a Circumbinary Planet.

[1:17:127] The reason for this planet category to be placed within that of alternatism is due the planet's inconclusivity of its orderial centrality.

[1:17:128] The planets of a singular centrality are bound to this centrality and are most cosmicality because of their Cosmical Bond with the astral centrality around which they rotate, and therefore, due to the circumbinarity of this such planet, the cosmical bond exists with less clarity and firmness.

[1:17:129] The Circumbinary Planets are still considered cosmical by their naturities, functionalities, and formities, but the orderity by which these planets abide is less conclusive and so, it cannot be placed in either of the other planetary categories of terrestrialism and gasism.

[1:17:130] As a product of binarity in The Cosmos, the Circumbinary Planet is one of the most important progenies of The Cosmos to be studied for its structural and functional unicity is most revealing about binary cosmology and the binarity of cosmical function, orderity, and naturity.

[1:17:131] The next of the planetary classifications of alternatism is known as a mesoplanet and these are defined by their size of linear dimension that must be smaller than that of the classical planet of Mercury, but larger than the asteroid of Ceres.

[1:17:132] Perhaps it is these mesoplanets that are most abundant and frequent of planetary bodies throughout The Cosmos and like the moons and the smaller planets and

the larger asteroids, this classification of planet shall hold a vast amount of potential for prospection, as well as revealing some of the largest mysteries of The Cosmos to us.

[1:17:133] These planetoids are certainly cosmical by their naturities and orderities for they follow the cosmical system through a proper course of orbitality and rotality as do all other the planets of the cosmical system.

[1:17:134] Similar in its naturity to that of a Brown Dwarf, the next of the categories of alternatism is known a planemo; an astronomical object with enough mass to achieve hydrostatic equilibrium, but not enough to initiate core fusion at any time during its existence.

[1:17:135] The essence of what makes a planemo is steeped in the idea of potentiality, and this is the same for that of the brown dwarfs, although they are fundamentally different.

[1:17:136] The brown dwarf has some greater potentiality to achieve fusion than that of the planemos, but a true brown dwarf never actualises this, while a planemo has no potentiality in the entirety of its existence to create fusion; there exists no possibility for it to achieve this.

[1:17:137] Planemos teach us a great lesson about the naturity of formation in The Cosmos by their very own formity; they can be described as an astronomical object of potentiality, so they are in existence like the other standard celestials, but their formation is tinged with obscurity.

[1:17:138] The naturity of the formation of celestial entities in The Cosmos is entirely based upon the extent of potentiality that the entity in question holds, with gravitational potential being the most fundamental of all the types of potentiality, of which physical potential, kinetic potentiality, magnetic potential, and fusional potential follow.

[1:17:139] We can, by this notion, view formations in The Cosmos according to their potential to form into their ultimate states, an exemplar of which would be the successful formation of a star, but the brown dwarfs and the planemos are examples of the failure of a celestial to do this and reach its ultimate state, and is therefore left in obscurity.

[1:17:140] As aforementioned in the discussion of brown dwarfs, there exists a distinct chaosity that reveals itself in the non-conformative naturity of its formation to any other distinct categorisation.

[1:17:141] It is this non-conformity that highlights the inability of the planemos and the brown dwarfs to be totally cosmical and to be completely of a cosmical naturity.

[1:17:142] The planemos of The Cosmos sit between being; they are not stars, and they cannot be said to be planets; their best title is an astronomical object lacking the potential

to become that which it may be otherwise if the processes of fusionality in its core were to take hold fully.

[1:17:143] In these astronomical objects of some chaotic influence, the extent to which it is chaotic is unknown itself, we see the diversity of The Cosmos and its continuous ability to demonstrate its compulsion towards the manifestation of entities considered to be incosmical to our current knowledges.

[1:17:144] Despite their partially chaotic natures, it is the planetesimals and the brown dwarfs that we can perhaps learn the most from in regards to the nature of The Cosmos and the formities of its progeny.

[1:17:145] Equally, the planetesimals may still hold functions for us through civilisation development, prospection, and generally cosmical study for despite their incosmicity, they are still very much in existence and it is this very existence, and the very possibilities they hold, that make them important stopping points in our journey through The Cosmos, both in terms of wonderment and exploration.

[1:17:146] The next of the progeny of alternatism are known as planetesimals and their manifestations are interchangeable in that they are categorised as minute planets which have formed in the same way as standard planets, but by means of smaller size, scale, and dimension.

[1:17:147] The reason for the planetesimals to be categorised into alternatism is not due to any chaosity that may exist within them, but due to their interchangeability of classification and their overarching nature, such as a dwarf planet may be classified as a planetesimal, and a categorised planet such as Mercury may also be described as planetesimal when compared with the giants of Jupiter and Saturn.

[1:17:148] It is for this reason that the term planetesimal is considered one of alternatism and not one of terrestrialism or gasism.

[1:17:149] That which is categorised as a protoplanet, which is the next of the forms of the Contentual Philosophy of alternatism, is classified as a planet in its most embryonic of stages and is therefore not able to be placed into the terrestrialism or gasism categories.

[1:17:150] In the protoplanet, we see manifested the formative processes of planetary structure, formity, and the development of planetary nature, and the role that of category that a protoplanet plays is important in the revelation of the ways of The Cosmos and the development of its progenies.

[1:17:151] The protoplanets are an important symbolism for the formity of worlds and the protoplanets are those celestial entities that hold the most potentiality in their futurity of development into a world of civilisations, habitations, and of importance to the overall cosmical system.

[1:17:152] The prefix of proto- means original and primitive and by this notion, its usage in relation to a planet is proper, true, and justified; furthermore, the protoism of the planetary formation demonstrates the pure cosmicality of the planets and it reveals a parallel between ourselves and the sentient of The Earth and the naturity of the planets.

[1:17:153] The protoplanet stage of the planetary formation demonstrates the initial stages of cosmical existence and this relates to ourselves and our own embryonic stages of development; all that is cosmical has developed in this way of gradual stages of growth and so did the The Cosmos itself hold a form henceforth known as the protocosmos.

[1:17:154] The Big Bang, by this same notion, and the events immediately thereafter relate to the protoism found in The Cosmos; its most initial and primitive of stages and forms; its most fundamental phases of development; the times of the most rapid cosmical developments.

[1:17:155] In this, we see the protoism of all things of The Cosmos and we see this stage of development universally, and links back to The Cosmic Existence Principle; All that does exist must begin and it must end, and protoism is the stage of development at the most primordial of times of the existence of whichever cosmical entity.

[1:17:156] We know the standard cosmical system to be made up of stars, planets, moons, and other smaller astronomical objects and phenomena, but there are those systems which differ and one exemplar is that of a Pulsar System, in which Pulsar Planets, the second to last planetary entity within alternatism, are orbiting a pulsar.

[1:17:157] These Pulsar Planets are considered to be part of alternatism due to their centralities being non-conforming to the standard cosmical system; pulsars are, of course, stars in their serial stages, but the naturity of pulsars are much different from those of the standard stars.

[1:17:158] For a planet to orbit a pulsar, it is of great differentiation from the standard planetary systems due to the survival of the planet after the expansion of the star during its extinction stages and the violent formations of the pulsar.

[1:17:159] The orbitality of such a planet is so dissimilar to that of our own orbitality that if the star around which we rotate was to turn into a pulsar, perhaps the world in which we reside and the world we depend upon would not be recognisable to us.

[1:17:160] The planets of pulsars are so different into their contental developments that they do not resemble a standard cosmical planet with cosmical contents.

[1:17:161] Again, we look towards the Pulsar Planets for a manifestation of variety in The Cosmos and we are in the understanding that pulsars may be allowed to take the positions

in orderity of the standard stars, but the consequences they reap relate to the distortion of worlds that orbit them.

[1:17:162] The final planetary body of alternatism is found in the Ultra-cool Dwarfs that dot the panorama of The Cosmos; these are characterised by their deficiency in temperature compared to a full stellar object and further demonstrates the ability of temperature to be the culminal factor in the categorisation of celestial entities.

[1:17:163] We end our discourse on alternatism by speaking of the constention on the discussion of planets and other celestial phenomena that perhaps do not totally conform to our understanding of what is deemed cosmical, but they do in reality exist and from this fact, we cannot turn away.

[1:17:164] Alternatism, the third and final element of Contental Philosophy, demonstrates an overall principle of cosmical study that insists upon the continual remersion of cosmical progeny that we had not known to exist beforehand.

[1:17:165] Alternatism teaches us that all that we think we know of The Cosmos and its ways shall be proven to be not All that The Cosmos consists of due to the revelations of new planetary types and celestial formations that do not conform to our standard view of The Cosmos and its systems.

[1:17:166] Ultimately, it is Contental Philosophy, or Contental Cosmic Philosophy, through its three main branches of terrestrialism, gasism, and alternatism, that we are able to categorise the parts of The Cosmos we perceive, yet perhaps do not understand and also, this philosophical discipline allows us to study each planetary type or celestial entity by measure of its appearancial features, functionalities, naturities, orderities, and fusalionalities.

Formationism & Evolutionism

[1:18:1] Planetary Formationism is a fundamental construction of The Cosmos for without the formation of planets, the entire functionality, naturity, orderity, and purposivity of The Cosmos is called into question.

[1:18:2] The formation of planets may be one of the last of constructs in the formation of a cosmical system, but their significance is often misunderstood.

[1:18:3] The standard cosmical system is formed by the planets and the star around which the planets orbit, but without the formation of planets, we are left without a proper cosmical system that can be said to lack orbitality and orderity.

[1:18:4] It stands equally true for the removal of planets towards the breakdown of the cosmical system just as it does for the removal of stars, or the centralities, from the cosmical system.

[1:18:5] If there exists a centrality, but there does not exist planets for the centrality to be the centre of, then we are missing the second counterpart of what makes a cosmical system ordered, whole, and properly functioning.

[1:18:6] Planetary Formationism denotes the physicalities of planets and the way by which they have been corporeally manifested and its counterpart concept, Planetary Evolutionism, relates to the journey of development that the planet has undergone in order to reach the physicality as denoted in Planetary Formationism.

[1:18:7] Planetary Evolutionism upholds the belief that planets, like animals, plants, and humans, have followed a path of evolution throughout their existences and have therefore not always been the same throughout the entirety of their existences.

[1:18:8] This belief is manifested through studying the history of The Earth itself; during the primordial days of The Earth's existence, it was unbelievably violent and scorching hot with volcanic eruptions, asteroid impacts, and boiling wastelands covering its surface.

[1:18:9] Comparing this to The Earth we see today when we look through the windows of our homes and we would not believe these two worlds could ever have been the same, and by this notion, the fact that The Earth has seen billions of years of development to get to where it is today from the stage at which it began, is an evolutionary path if ever there was one.

[1:18:10] Planetary Formationism holds that the formity of planets is a direct reflection of the naturity, purposivity, and orderity of The Cosmos and holds planetary formations to be central to the proper functionality of The Cosmos and suggests that without planetary formations The Cosmos would not function, or exist as we know it to.

[1:18:11] Like the revelation and discovery of the theory of evolution about all life on The Earth by one of the greatest of human minds that every existed, it is logical to notion that the planets exist in the same evolutionary journey for they are exist in much greater cosmicality than the life of The Earth ever could.

[1:18:12] Further, evolutionism is raised as being the essence of what it means to be cosmical by naturity and orderity and functionality; evolutionism is considered the most fundamental of cosmical procedures.

[1:18:13] Evolutionists can perhaps become some of the greatest of wondermenters for they see The Cosmos according to its evolutionary processes and understand cosmology and cosmogony through a lens of cosmical developmentations occurring from earlier cosmical forms, all leading backwards to a singularity, and all leading forwards to a singularity.

[1:18:14] This system of thought is known by a number of names according to the theme; the cosmology is known as Evolution Cosmology, or Evolutionary Cosmology; the concept is known as The Evolutionary Cosmos, or Cosmic Evolution; the philosophical standing is known as Evolutionism, or Cosmic Evolutionism.

[1:18:15] As we continue on with this discourse, we speak of the various physical manifestations of Cosmic Evolutionism and the ways by which we can link evolutionary processes to the elemental progeny of The Cosmos

[1:18:16] As aforesaid within the philosophical study of Gravitology, the fundamental ability of gravity to bond together and structure the entirety of all the progenies of The Cosmos is wholly confirmed and explored, but when in discourse of Cosmic Evolutionism, the first exemplar of which we must discuss is that of the process of accretion.

[1:18:17] Accretional processes occur throughout the entirety of The Cosmos in the formative times of all that exists because although accretion is primarily associated with larger celestial bodies, its essential function is found in the creation of all celestial entities through the compulsion of gravity and its intertwining ability in togethering of matter.

[1:18:18] Accretional processes are inherently conformed by gravity's conjoinment of the matter it insumes; by what force does gravity conduct its cosmical wonderments may be venture to ask, and the question remains unknown, except for the affirmation that gravity is the greatest tool used by The Cosmos to form all that is cosmical by naturity and functionality and orderity.

[1:18:19] The pure cosmical procedure of accretion stands as a product of evolutionistic cosmology by the notion that the accretional processes occur at the very beginning of the existence of a celestial entity, even before the protoform is manifested.

[1:18:20] The accretional processes of the formation of a celestial entity trigger the evolutionary process from the matters of The Cosmos already in existence in forms long past; the rocks and the dusts and the gases may well have been part of other celestial entities in some past cosmical primordality.

[1:18:21] The beliefs of accretionism place the most emphasis on the process of the same name and suggest that accretion is the centralmost process in The Cosmos from which all celestial entities are made and with gravitation as its primary ally, these beliefs of the process of accretion are justified and stand upon logicity.

[1:18:22] It is a notion of logic to place forward that the smallest of matter culminates together to form some of the largest constitutions of matter in The Cosmos.

[1:18:23] By this notion, that which is smaller creates that which is larger, and we see this in the evolutionistic paths of the life on The Earth through the formation of complex lifeforms from those lifeforms of the greatest simplicity.

[1:18:24] The evolutionaries relate to the composite parts of the overall evolutionary processes and this includes that of accretion; an Accumulative Cosmology persist that in order for the progenies of The Cosmos to exist as they do, an accumulation of elements to form the cosmical progeniture and phenomenii we know and devote to.

[1:18:25] Accretion is perhaps the most fundamental process of structure, formity, naturity, and orderity in The Cosmos for it is the accretional process that forms the way in which each cosmical progeny is natured, ordered, and structured.

[1:18:26] A physical exemplar of an evolutionistic cosmology is known as a Merging Star, or Stellar Collision; the gradual amalgamation of two stars due to Cosmic Mechanisms including gravitation and gravitational radiation.

[1:18:27] This relates both to a Collisional Cosmology, focusing on the belief held that all cosmological processes and cumulations are caused by collisions, and supports an evolutionistic cosmology through the formation of a new stellar entity from two previous stellar formities.

[1:18:28] Stellar Collisions involve the degeneration of stars through the inclining of these objects from the gravitational influences forcing them together, often a cumulation of a binary star system.

[1:18:29] The evolutionary processes in the merging of stars is proven by their physical mergence together, thus marking the end of the lives of two stars and the beginning of one new stellar entity.

[1:18:30] The proximity of the two stars must be close enough for the gravitational influences of each of the stars to reach each other's gravitational boundary to start the stellar cumulative process which eventually forces the collision of the stars to occur.

[1:18:31] The intensification of potentiality is another aspect of stellar collision and mergence that is consequential of the process; the potentiality of the stars are so high due to the inevitability of the formation of a new star twice as large as the two initial stars.

[1:18:32] Stellar Collision is another branch of Stellar Formation, or Star Formation, but the merging of stars strikes an eruptive compulsion that is similar in characteristic to most other star formations, but stands in unquity as the binary formation of stars through the coming together of two stars.

[1:18:33] In all, evolutionism in stars is found by their mergence and the demonstration of stars in a transformational state which marks their end, but marks the beginning of a brand new stellar entity.

[1:18:34] The collisions of stars are dependent upon that which most other cosmicalities are dependent upon and that is gravity; the mergence of stars constitutes the ultimatum of an evolutionary journey that is based upon the gradual development of the celestial from those cosmical elements which existed before it.

[1:18:35] In this Stellar Collision, we see that destruction, eruption, and explosion is tantamount to creation in cosmical terms and through the lens of the minds of the evolutionists, we are able to understand The Cosmos and all its progenies in an interconnected way and further develops the concept of the Cosmic Web.

[1:18:36] Further to the discourse of Stellar Collisions, we delve our thoughts into what is known as the Nebular Hypothesis; this theory holds that The Solar System within which we reside, and furtherso, all the other cosmical systems, are formed through nebulaic matter.

[1:18:37] The Nebular Hypothesis demonstrates humanity's current understanding of the evolutionary cosmogony and further solidifies theories about Cosmic Evolutionism and the creation of the cosmical systems and progenies from that which existed before them.

[1:18:38] As developed by one of the greatest of minds of the history of humanity, the Nebular Hypothesis creates a cosmology whereby nebular formations are considered the most fundamental structural element of what forms The Cosmos to be as we know it.

[1:18:39] Again, from The Cosmic Existence Principle we derive that for something to exist cosmically, there must be a beginning and an end, but there must first be something before it, and by the notion of the Nebular Hypothesis, we understand that for the cosmical systems to form, they had to develop from the grand nebulas of The Cosmos that the

wondermenters, adorers, and venerators look upon for inspiration and for cosmical understanding.

[1:18:40] We see evolutionism throughout The Cosmos and certainly not all exemplars are considered here in the writings of the Omnidoxy, but by no means does this suggest that they are any less relevant than those mentioned.

[1:18:41] It is one of the central principle of Cosmic Philosophy and Astronist Philosophy in a wider sense that all that does exist in The Cosmos, does so by a cosmical orderity, naturity, and purposity, and therefore relevant in all of its aspects, even by the aspects that we do not yet understand, or those we may never comprehend.

The Systems of The Cosmos

(Systemics)

[1:19:1] Systemics, in Astronist and Cosmic Philosophy, deals with the philosophical study of the motionalities of celestial entities as well as dealing with their fundamental orderities and the courses upon which they follow to complete their orderities.

[1:19:2] Systemicists must study the motions, functions, and orderities of the celestial entities and derive philosophical meanings and understandings from these entities in order to establish a greater overall comprehension of the cosmical system and its overarching functionalities.

[1:19:3] There are six major components of systemics that shall be discussed during the discourse on the topic and the first of which are known as exocomets.

[1:19:4] Exocomets are named as such because they are comets from outside The Solar System in which we reside and for the purposes of the study of systemics, its title shall be tolerated, but it must be grounded now that the use of such a title is not encouraged throughout wider Cosmic and Astronist Philosophy.

[1:19:5] This is because by the nature of its inferences, it suggests a centrality of The Solar System in which we reside and all else outside it is to be considered foreign, or external to us, though this very notion does not support the general nature of Astronist Philosophy and Thought.

[1:19:6] It is within Astronist Philosophy and thought systems that we are within The Cosmos, and The Cosmos is not some foreign entity outside the boundaries of The Solar System.

[1:19:7] This skew towards an anthropocentric and geocentric view of The Cosmos is not encouraged by Astronist Philosophy though as aforementioned, its title shall be tolerated, but only for the purposes of this discourse and no other.

[1:19:8] Exocomets and comets within The Solar System have varied motionalities and courses; there are those comets which hold seemingly no orderity and certainly do not hold any orbitality due to them speeding through space at velocities unimaginable and holding a trajectory whereby anything in the comets way shall be obliterated.

[1:19:9] In these types of comets there exists no orbitality or seemingly any orderity and are known as Interstellar Comets, but there are those comets of The Cosmos that orbit stars and planets and moons and these types of comets are favoured through a lens of cosmicality for they demonstrate their orbitalities, orderities, and naturities just like the planets and moons of systems.

[1:19:10] This reveals why the naturity of comets is largely undetermined due to their ability to be the champions of cosmical orderity in one scenario and the next, they hurtle through space under a certain chaotic influence.

[1:19:11] But the comets of The Cosmos are truly the greatest exemplars of the study of celestial motionalities and orderities due to the wide range of motions, trajectories, and orders that they continue to display as we discover more and more of these important astronomical objects.

[1:19:12] The exomoons are next, and the policy on such a title, as aforementioned, remains the same in this context too; the term exomoon relates to the moons of The Cosmos that are beyond The Solar System in which The Earth resides.

[1:19:13] The systemic study of the motions of moons provides us with greater knowledge about the entirety of the functions and orderities of the cosmical system as a whole.

[1:19:14] Moons are the beacons of orderity; by their very naturity, they are coupled with a planet upon which they dependent for their own existence and they not only orbit their parent planet, but subsequently so, they orbit their parent star as well.

[1:19:15] By the motions of moons, the planet around which it revolves is impacted upon second only to the star around which the planet itself revolves around.

[1:19:16] Despite the abundance of moons around some larger planets, they all keep to their destined path of orderity and it is a motion in The Cosmos rare to be seen wherein celestials of such closer proximity to one another, yet too, their distinct awareness and disinclinement towards one another.

[1:19:17] It is the moons that we must look towards if we wish to witness the truest and yet most quickly forgotten example of orderity in The Cosmos and although The Moon we know and love to wonderment over holds a simple orbitality and motionality due to its aloneness, there are moons of The Cosmos that we have yet discovered which must navigate must greater odds against them in order to fulfil their orderities.

[1:19:18] The next component of systemics that we shall explore is the phenomenon known as mean-motion resonance in the orbitality of planets around their parent star; this is the phenomena in which two planetary celestials have periods of revolution that are the same as each other but one celestial is closer to the centrality than the other and this phenomena can either stabilise or destabilise the orbitality.

[1:19:19] This phenomenon of The Cosmos demonstrates a Twin Motionality; a parallel of motions in the cosmical system that reflects an ability of The Cosmos to mirror one another.

[1:19:20] In this, we see symmetry in The Cosmos for the orbitalities of these two celestials are in almost perfect conjunction with each other and forge the understanding that certain progenies of The Cosmos are constructed upon a mechanism in which their orbitalities are not only in symmetry with another, but are therefore dependent upon one another.

[1:19:21] The ability of this phenomena to either stabilise or destabilise the entire orbitality demonstrates the nature of the paradigm of The Cosmos to be teetering on the boundary between stability and instability and is indicated by many a progeny of The Cosmos and their functionalities, orderities, and naturities.

[1:19:22] The resonance of cosmical entities holds a unique meaning in that it relates to the extent of simultaneity and parallelism in the functionalities and motionalities of cosmical entities.

[1:19:23] The resonances of the cosmical entities reveals something about The Cosmos that perhaps we have not witnessed in any other aspect of cosmical studies; the connection between cosmical orderity and resonance.

[1:19:24] Before now, much of the cosmical orderities, although they are structured to form a fully functioning whole, are composite and unique of each other, yet the idea of cosmical resonance reveals that there are certain orderities in The Cosmos that not only depend upon each other, but mirror each other by their orbitalities.

[1:19:25] In this, we see the beauty of The Cosmos and its progeny to be all things; to be both unique and alike; to be both mirrorous and asymmetrical; to be both dependent and independent; this is the truest beauty of The Cosmos and all its offspring of wonderment.

[1:19:26] Just like most the motionalities of the planets following the same orbital direction, there exists less commonly, motionalities of planets following orbital courses of the opposite direction to all the other planetary bodies of the cosmical system.

[1:19:27] These such celestials are known as Retrograde Planets and although one's initial perception may be to see them as chaotically influenced, this is a novicial mistake for they are just as much cosmical as their counterparts.

[1:19:28] The extent of an entity's chaosity is defined by its unordered functionality, its wayward motionalty, and its general unknown naturity.

[1:19:29] However, the retrogradial planets belong to an ordered functionality, and their motionalities, although opposite in their direction, are not wayward for they still continue along on a common course of motion, and not unlike their planetary and lunar counterparts in the system, their naturities are known to us.

[1:19:30] Retrogradial processes are therefore cosmical by their functionalities, orderities, and naturities for they exist in similarity to their progradial counterparts, with their orbital direction only defining their differentiation.

[1:19:31] The relationship between the retrogrades and the progrades not only relate to the orbitality of celestials, but their principle relates us in our lives.

[1:19:32] The majority of us go about our lives in the direction all those whom surround us for it is easier to go the way of the masses than it is to forge one's own path.

[1:19:33] There are those of us, however, whom take paths of difference, of change, and of unquity and although we may not be aware of it in the present time, the path we choose may well become the path of the many in time's beyond the current.

[1:19:34] By this notion, it is principled that there is no harm in acting against the flow of the crowd or in thinking in such a way that does not conform, but as long as the intention with which we conduct such a retrograde are genuine and proper, then these people are some of the best of us.

[1:19:35] If you look at the majority of those of our histories that have made a change and fought for their ambitions, they will describe their journey in isolation from the paths of the people of the world around them.

[1:19:36] Be not mistaken for we cannot all be retrogradial in our natures, but there are the few that do show resilience in the face of mass conformation and there are the few that have changed the world because of it and those few we speak of shall continue to appear in the largest of populations just as they have done for the majority of our histories.

[1:19:37] By some cosmical miracle, the Retrograde Planets were formed and structured upon a course that differed from those of all the other celestials and in this occurrence, we are able to wonderment, adore, and laud the celestial because it is for this very aptitude of non-conformity that we see the beauty of The Cosmos and our lack of knowledge of its true functionalities, motionalities, orderities, and naturities.

[1:19:38] It is perhaps most logical to notion that both the retrogradial and the progradial directions of motionalities are in fact ambipholous; this reveals perhaps the truest naturity of The Cosmos by the understanding that all that exists within it is true and those elements we think not to be true, are simply beyond our current knowledges of what it means to be cosmical.

[1:19:39] The second to last component of the philosophical discipline of systemics is that which is known as a Rogue Planet; these entities are considered fully chaotic in terms of solarly, but depending upon their interpretation, may be considered the most galactically cosmical entities of all.

[1:19:40] Rogue Planets are planetary bodies that do not orbit around a star like the traditional planetary entities in the standard cosmical system and structure, but instead, they orbit around the entire galaxy in an unfixated position.

[1:19:41] In terms of solarly, the planets that orbit the stars of The Cosmos are considered by most Astronist cosmologies to be cosmical according to their solar centralities and so, by their disjunction and disconnection to any solar centrality, the Rogue Planets of The Cosmos are considered highly chaotic when viewed upon by a pure lens of solarly.

[1:19:42] Due to their outcastation from their former solar centrality, or their total disassociation from a solar centrality for the entirety of their existences, the Rogue Planets are often considered to be anti-solar, and by this pseudocosmology, it is derived that there is no need for the stars by the Rogue Planets' fixation and centrality around the galaxy itself.

[1:19:43] Therefore, from under a purely galactical lens, Rogue Planets are considered more cosmical than any other planet type for their centrality is not just a single star in the billions of systems, but it is the galaxy itself.

[1:19:44] This is derived to be much more highly cosmical due to the ability of the Rogue Planet to orbit a centrality of such distance from it and of such greater size in comparison to itself.

[1:19:45] However, the more orthodoxal view of Rogue Planets denotes them to be agents of The Chaos for they exist not in proper cosmical orderity by the grace of the stars, but instead, they follow and centre themselves by the centrality of the galaxy which is always a super massive black hole.

[1:19:46] The setting of the Rogue Planet's centricity on the largest of oblivions of The Cosmos is revelatory about the naturity of Rogue Planets and their true allegiances.

[1:19:47] It is staunchly argued within this writing, especially when a traditional view is undertaken, that the Rogue Planets are chaotic manifestations and bases this on their largely unknown trajectories, their unknown orderities, functionalities, purposities, and most of all, their unknown motionalities when studied upon in the discipline of Systemics.

[1:19:48] The motionalities of the Rogue Planets are unknown due to their unbelievable orbital periphery.

[1:19:49] Looking upon Rogue Planets with a gentler lens, one may find it logical to place upon the Rogue Planets the aforementioned Retrogradial Principle; the praising of the cosmical entities that show an redirection in their functions and motions.

[1:19:50] Again, even with this principle applied, the argument still remains that the Rogue Planets are much different in their naturities than to the Retrogradial Planets for the

Retrogradal Planets still orbit a star and they still hold a distinct orbital, functional, and motional role.

[1:19:51] Having written all this of the Rogue Planets, we must, however, cherish their existences as philosophers and wondermenters for their introduction of the semistrument of roguity as a branch of chaosity forms a whole new discussion about planetary naturity, general orbitality, and motional structure and functionality.

[1:19:52] In the vast conpunction of Astronist Cosmology, however, the Rogue Planets are categorised as firmly chaotic by their entire naturities, orderities, functionalities, motionalities, and by all other accounts and measures of instrument.

[1:19:53] To end this discourse on Systemics, we must focus our attention on that which is known as a Trojan Planet; these worlds, typically minor planets and moons, share the same orbitality as a planet or larger moon, but exist either behind or in front of the larger celestial which separates this category into Background Trojans, or Foreground Trojans depending upon its position relative to the larger celestial.

[1:19:54] The Trojan Planets may also be logically argued to hold the greatest of orderity for they exist as the orderity of orderity; the dependers upon those which depend upon the centrality of the system.

[1:19:55] The stability of the Trojan Planet, however, is based upon the mass of the celestial to which it is subject, and depending upon the extent of the disproportion of mass between the two, the larger the perturbations of the orbit, and thus, greater the instability.

[1:19:56] It is a Trojan Planet that is perhaps the greatest exemplar of what it means to be a Cosmical Mirror; the greatest manifestation of simultaneity and reflection for they are in constant foresymicity or postymicity with the celestial to which they trojanically associated.

[1:19:57] The discussion of the Trojan Planet introduces another instrument of study henceforth known as trojanicity, or trojanity; this relates to the extent to which a celestial holds some foresymic or postymic relation with another celestial.

[1:19:58] In the Trojan Planet, we see a small celestial that intends to fit in with the cosmical system in some way, but hadn't built enough gravitational potential and matter of its own to construct its own orbitality, and therefore, shares an orbitality with a larger celestial.

[1:19:59] This struggle to conform is seen as one of the greatest champions of cosmicality and therefore, the Trojan Planet is considered highly cosmical according to the Astronist cosmological view which understands The Cosmos according to the extent that the cosmical progenies conform to the cosmical system and paradigm.

[1:19:60] In the Trojan Planet, we also see the variety of cosmical motionalities that are available in systems of solarly and by this notion, we understand motionalities in conjunction with a celestial proximity and its connections with other celestials and the solar centre, unlike chaotic motionalities which are generally disconnective and disproximate to other celestials.

[1:19:61] As an extension on the discussion of the Trojan Planet and its motionalities, we come to discuss, as a direct subsequence, that which is known as Lagrangian Point; the five-point orbital configuration of two larger celestials holding that by gravitation affectance only, a smaller celestial is able to maintain its position relative to its larger consociate.

[1:19:62] The Lagrangian Points form the basis for the consociation of the three celestials and allow us to understand the functionality and motionalities of Trojan Planets and all other smaller celestial entities that are not gravitationally potential enough to form their own orbitalities.

[1:19:63] By the study of the Lagrangian Point, revealed is the true dependence of the Trojan Planet upon its larger consociates and by this revelation, it is proven that all that is cosmical in its naturity is coexistent and codependent upon other celestials in an omnidependent structure that forms both The Cosmic Panorama and The Cosmic Web.

[1:19:64] Held highly is the study of systemics for minds strong and visionary it requires in order to understand it wonders vividly and in proper terms so go forth the systemicists of us and philosophically study further the motionalities of the celestials of The Cosmos and reflect upon your findings how you view the entirety of the cosmological structure.

[1:19:65] From these smaller steps made by the greatest of minds, we discover the most wondrous parts of The Cosmos and in this, we reveal more about ourselves, our existences, and our abilities to perceive The Cosmos and how it works shall greater evermore, and so this is why we must cherish the philosophical study of systemics and all the other topics mentioned throughout the writings of the Omnidoxy about the way in which the world beyond our own works.

The Cosmic Territories (Territorialism)

[1:20:1] Throughout the history of humanity, we have one another for the lands of The Earth; we have fought across deserts and mountain ranges; across the skies and the seas; peoples have always marked their territories since the tribes of the first us marked this world and even more so resemble this today.

[1:20:2] Our civilisations have come a long way in their development and the way in which we live has progressed longwidth, but there are certain elements of ourselves that will never change for there are those parts of us that exist as our naturity; one of these components of our naturities is that of our need for territory.

[1:20:3] In the Humanic Exploration of The Cosmos, this naturity of ours will not change for the worlds of The Cosmos are not different from our own in this respect; in this notion, the concept and philosophical study of the human need for territory is herein introduced and established and is henceforth known as Territorialism.

[1:20:4] Whether by territory of land or by territory of mind, there exists an eternal desire within us all for the defence of our lands, our principles, and our most valuable possessions and so, it is not logical to presume that this desire shall so suddenly cease to be so intrinsic to our naturities.

[1:20:5] And therefore, in humanity's exploration of The Cosmos and the worlds to come our way, this intrinsicity shall not only continue on, but it is more likely to accelerate than to reduce in its intensity.

[1:20:6] The human need for territory exists so deeply within conscioues that we often forget of our compulsions towards protecting our territories.

[1:20:7] We all begin with good intentions, but the vices of the world distort our visions, and we may well become someone that our former selves would not ever recognise.

[1:20:8] The territories of the lands are the most common of territories, but there exists also the Territory of Mind, as aforementioned, and relates not to physical territory, but to the territory of the abstract; this type of territory is just as relevant as its physical counterpart.

[1:20:9] Throughout the histories of human existence, there have developed faiths, philosophies, and systems of thought and the establishments thereafter, have attempted to mark their territories according to their followers.

[1:20:10] Whether by physicality, or mentality, the naturity of humanity is to hold its lands, philosophies, peoples, and culture close to its chest; to defend and preserve them.

[1:20:11] Just like one's need of the home, one's need to know that the lands on which they live, the government which presides over them, and the philosophies upon which their society is build, are reflective of one's own beliefs, and wants, and needs, and principles.

[1:20:12] The worlds of The Cosmos are large and vast and those habitable are even more disparate and just as The Earth has been populated, encultured, and civilised by our people, so shall the other worlds of The Cosmos and so shall these new worlds be separated according to territory of the physicality and the mentality, so has The Earth.

[1:20:13] The principle and concept of territorialism holds that humanity, by its very naturity, is in need to know the territory in which it lives and is in to relate to the territory in which it lives; this is why the civilisations and nations of the world are structured upon the principles, beliefs, and systems that the people feel they want to associate themselves with.

[1:20:14] One may wish for the faults of humanity not to infect the worlds of The Cosmos like we have stained The Earth with our greedious ambitions, but if this would be possible, then this is what would have been written of and supported during this discourse, but this writing does not attempt to speak of things against the inevitability of the human naturity.

[1:20:15] By this notion, revealed is the naturity of humanity; to want to explore worlds and the lands of worlds, but with the ambition of calling such lands our own and due to this being a naturity of the human mind and body, words of this discourse shall not be wasted on attempting to discourage it.

[1:20:16] When we speak of territorialism, it is often a mistake of our own temerariousness that we underpin it with negativity and unethicality, but in doing so, we forget of its centrality to whom we are and whom we always have been.

[1:20:17] It has been the conquerers and the founders of nations that have been the constructors of the civilisations in which we reside now and depend upon; these peoples have push us to become what we are and those of a similar personality shall continue to do so for humanity has always needed leadership and forevermore it shall do so.

[1:20:18] Whatever the future territories of the worlds of The Cosmos be, one aspect of territory that we must all not forget is that territory, by its own very naturity, is continuously motion as the within it change their beliefs and philosophies.

[1:20:19] It is only by the true knowledge of the naturity of humanity that in this discourse, we speak of the genuine reality that shall come by that which we understand of the present and that we derive from the past.

[1:20:20] It is the territory of the peoples that marks the foundations of the civilisation in which they reside and upon this institution that we call the state, the land, the air, and the

sea upon which, under which, and besides which it stands, there exists a lifelong connection between the faiths, the philosophies, the cultures, and heritages of the territory.

[1:20:21] It is all these things that humans find intrinsic to their natures to want to protect and preserve that the territorialists attempt to understand and study and therefore, we need the study of territorialism in order to learn further about the naturity of humanity.

Habitabilitism

[1:21:1] This next discourse is entitled as such due to its discussion of the concept and philosophical branch of Habitabilitism; this encompasses a focus on the habitability of the worlds of The Cosmos beyond The Earth itself and what this means in a philosophical context for humanity.

[1:21:2] As a key instrument of study, habitability affords us to quantify the extent to which the possibility of civilisations stands in measure to the exigencies required by the peoples of the civilisation.

[1:21:3] Habitabilitism upholds the principle that the discovery of habitable worlds is the foremost aim of cosmic exploration and takes the view that the exploration of inhabitable worlds is irrequisite to the overall purpose of cosmic exploration.

[1:21:4] Although the orthodox views of habitabilitists are generally in oppositism to the Astronist Tradition, they form an important continuum from the ideas consisting of valuing all celestial entities for whatever their features provide, and not to fall into the confinements of seeing only the habitability of a world as its primary functionality and purposivity.

[1:21:5] To avoid the comedicism as aforementioned, the Astronist Tradition understands what is also known as the Circumstellar Habitable Zone, to be known as The Miderior.

[1:21:6] That which is known as the miderior is the primarity of habitability and is the zone towards which habitabilitists pose their knowledge due to its functionality resulting in life on worlds.

[1:21:7] The miderior is one of the greatest manifestations of the cosmical orderity in a system of solarity for the scale and extent of the miderior is prescribed by the centrality of the system.

[1:21:8] The mideriority is dependent upon the size, and intensity of the centrality around which it exists.

[1:21:9] It is in the miderior that the habitabilitists look to find the truest forms of cosmicality in the hope of the discovery of life on new worlds other than the world on which we now reside.

[1:21:10] The Earth, the world on which we reside, is located in the miderior of The Solar System, but it is not to say that life, in whichever form it may take, cannot exist beyond the boundaries of the miderior.

[1:21:11] Mideriority does not constitute habitability, but the possibility of life is known to be greater in the miderior and this is why it has been name so for the cosmical system of

solarity has been ordered in such a way that the elements of life are more onerous to exist beyond it.

[1:21:12] Circumstellar zones relate to the solarity disc and the regions which surround the centrality and as it is an inherent habit of the human consciousness to categorise, the regions of a system of solarity is no different.

[1:21:13] The entire concept of habitabilitism in relation to the miderior is reflective of the importance of cosmical temperature and its ability, and purposivity in the causation of cosmical phenomena; by this notion, we understand temperature to be a valuable tool of cosmical functionality.

[1:21:14] In the Humanic Exploration of The Cosmos, it is logical for our explorers to discover first the worlds in the miderior with the hope of finding habitable lands, and it is a primary wonderment of The Cosmos to imagine the worlds filled with life and all that is occurring upon them at this very moment.

[1:21:15] We must follow our logic and if we are to do so, we are will be inevitable drawn to the celestials holding their existence in the miderior of the system, but what we must equally remember is the vastness and diversity of worlds beyond the miderior.

[1:21:16] The Humanic Exploration of The Cosmos cannot be constituted by the miderior and the possible progeny that exist within its boundaries for in this, we narrow our exploratory means when the time comes for us to broaden it more than it ever has been before.

[1:21:17] Equally, the habitabilitists and the fundamental principles of habitabilitism function upon the idea that the miderior is the centralmost region of the cosmical system; not physically, of course, but it is the centralmost region to our perception and to our objectives as humanity.

[1:21:18] If we are to change humanity and the history of humanity forever in the discovery of life beyond The Earth, we must look towards the mideriors of systems beyond our own and we must focus on intent on these regions if we are to find worlds that resemble our own in colour, size, and content.

[1:21:19] In the mideriors of the systems in The Cosmos, we shall discover worlds beyond our current comprehensions of what can and does exist and in this one single discovery, the entirety of our existences as lifeforms, as sentient beings, shall be forever changed.

[1:21:20] To embark upon a path from which we know we shall never return is both a decision of bravery, and equally, one of transformation; by this notion, the discovery of habitable worlds beyond The Earth is the most ultimate discovery that we can ever make for in this discovery, we mark the beginning of possibility transforming into reality.

[1:21:21] It is the role and studial discipline of the habitabilitists to raise the immediacy and the philosophical contemplations about the importance of the discovery of habitable worlds beyond The Earth and the gravity such a discovery shall hold.

[1:21:22] Despite the incongruence of the possibility of this discovery, our civilisation and the institutions that our civilisation has built must accept reality if we are to progress towards a future in which our civilisations beyond The Earth are built upon logic, morality, and knowledge.

[1:21:23] The inevitability of this discovery and the intrinsic role it plays in our destiny as a people affords habitabilitism a strong grounding upon which habitabilitist thought can flourish which is wholly positive because the more we discuss and the more we spark thought of such discoveries, the greater the chance of nearer that discovery sooner we become.

[1:21:24] It is intrinsic to human nature that just when we think we know who we are, we are faced with something that tells us or shows us to be otherwise; the discovery of the habitability of new worlds is an exemplar of this and we will have to change in mind, in body, and in soul towards new inherencies of whom we are.

[1:21:25] Upon my final breath, only then shall the last of my ideas escape my mind.

[1:21:26] The twinstruments of study entitled Progressivity and Regressivity are two sides of a thin and sometimes overlapping coin that divides itself not only by these two measures, but by the nature, the perception, and the knowledge of humanity.

[1:21:27] In fact, the instruments of progressivity and regressivity are bound to these three factors for if we are to be progressive, we must emulate a certain nature, perception, and knowledge, and if we are to be regressive, we must do so emulate, but in oppositism those of progressivity.

[1:21:28] The main element of progressivity and regressivity to also take into consideration when studying them philosophically is their dependence upon the intentions and motivations of the perceiver.

[1:21:29] It remains logically true that for one's progressivity remains another's regressivity, but the forging of a united progression stands true now and beyond if we are to achieve progressions ambitioned.

[1:21:30] Progressivity shall remain at the heart of the entirety of Astronist philosophical conception and application whilst at all times never pretermittting the importance of regressivity.

[1:21:31] It remains also logically true that in order to stay on course and direction towards our united progressivity, we must always remember that which leads us in the opposite direction.

[1:21:32] The paradigm of progression and regression is complex and thinly defined; the minds of many in our history have hoped and planned for progression, but that which they have ended up working towards manifests itself only in regression.

[1:21:33] It is poignant to highlight that complacencies in progression can easily lead to its oppositism.

[1:21:34] The key towards a United Progression is for all peoples to hold the same principles at heart, but due to the diversity of the minds of humanity, perhaps this shall never be secured.

[1:21:35] Perhaps it is the nature of progression to only succeed in isolation for the further it is diluted to the masses, the greater the chances of its transition in regression.

[1:21:36] In this, we find the principle holding that many minds do not always make the right decision that a smaller number can more easily conceive.

[1:21:37] The people's mind is most often concentrated in the minds of the few and we see this today in the governments of the world.

[1:21:38] Whether towards one version of progression or another that we direct ourselves, there shall forever exist a mental compartment within all of ourselves that believes in some version and taking action upon this belief to realise one's version of progression shall see us witness the making of a new generation of leaders.

[1:21:39] From a purely Astronist philosophical perspective on the elements of life, it is found that there exists a distinct set of elements that are considered to retain their relevant role in our lives and equally so, those elements that are considered to be gradually removed from our lives in future civilisations.

[1:21:40] The measurement of these two perceptions herein forges new pair of twinstruments of study that shall be henceforth entitled as accelerity and decelerity.

[1:21:41] The former relates to those parts of our lives that shall retain their relevancies and perhaps even accelerate in their relevance, and the latter relates to those parts of our lives that are considered to lose their relevancies in our lives, whether partly or completely.

[1:21:42] There are the considerances of accelerity that are upheld by the Astronist Tradition and there are the considerances of decelerity that are equally upheld by the Astronist Tradition.

[1:21:43] It is up to the systems of thought of the world to construct the accelerities and the decelerities in alignment with the beliefs of their system and not without degrading the importance of all other aspects of Astronist Philosophy, the accelerities and the decelerities stand centrally and exist intrinsically to all other aspects of the philosophical system.

[1:21:44] The accelerities are reflected in the entirety of the proponents of Astronist Culture in the form of cosmical art and architecture, as well as propaganda, social order, education, and throughout the penetralia of Astronism.

[1:21:45] In all things that form that which can be called Astronist, we find the accelerities there for the accelerities of all things form naturally as intrinsicities to that which is in question.

[1:21:46] Those elements of life which are chosen to be exenuated are automatically considered accelerities for they are the elements in which monies, and efforts are poured into and which philosophies and systems are built upon.

[1:21:47] In the Astronist Tradition, The Cosmos as an entity of ultimate wonderment is considered centralmost to all Astronist expression, as well as The Five Astronist Characters as the reflectors of humanity in all its diversity.

[1:21:48] As inspired by the beauteous arts and architectures of time's past, Astronist Art and Architecture derives a newfound interpretation and representative subject for artistic and architectural expression, and wider cultural expression, and this is found in the subject of The Cosmos and all its many progenies.

[1:21:49] Equally so, the decelerities are considered so by their distinct in centrality and absence from Astronist Art, Architecture, Culture, and Philosophy.

[1:21:50] In Astronist Architecture specifically, an exemplar of a decelerity would consist of patternless and unornamented architectures and artistic expressions without the inclusion of cosmical ornamentations and accompaniments.

[1:21:51] Whether by opinion of some system of thought or by one's own opinions that a decelerity is formed, it remains an important tool of direction for philosophers to contemplate, and when coupled with its Twin Instrument of accelerity, a distinct directionality is proposed in accordance to the established ambitions, intentions, and motivations.

[1:21:52] The development of a Thought Culture is intrinsic to the entirety of the Astronist philosophical tradition due to the importance of the people's open minds to new knowledges, new realities, and new lives for ourselves, our families, and our descendants.

[1:21:53] A culture of thought is a culture wherein an uplift of knowledge is made paramount and forefront in every aspect of our lives, and as we begin to embark upon a

journey that shall be more grand, more dangerous, and more unknown than any other journey ever embarked upon before, we must position knowledge as our most steadfast ally.

[1:21:54] A deep appreciation for thought and knowledge reflects an even deeper comprehension to the tools we shall need to combat the adversities of the journey ahead.

[1:21:55] Beyond our own knowledge is beyond who we are for our knowledge defines we are and the extent to which we can interact with the world around us and the world of worlds beyond.

[1:21:56] If the creation of a Thought Culture is paramount, then the development and eventual establishment of this culture is equally as important as its precursor.

[1:21:57] To think and to that which one thinks about in philosophical terms is never negative, no matter its nature and content, but not to think, or interest, or enthuse about contemplations of concepts is the most stagnant and negative habit of humanity.

[1:21:58] A Thought Culture directed towards the stars is the ultimate aim for the Astronist Philosophical Ambition, but beginning with the galvanisation of the minds of the people towards thought of general philosophical concepts is an acceptable precursor to the aforementioned ambition.

[1:21:59] The Omnidoxy can be considered that which is henceforth known as a derivational text; a document considered central to the understandings of Astronism and derivative of all aspects of Astronism, but also that it does not encompass the entirety of Astronic or Astronist philosophy and thought.

[1:21:60] Perceiving the Omnidoxy as a derivational text allows us to understand the distinctions between Astronism, and Astronic philosophy, and Astronist philosophy, for although they seem the same to a nescient eye, they are distinct from one another.

[1:21:61] Astronism encompasses all the denominations, instruments, branches, schools, sampanas, periods, and wings and is encapsulated by the Omnidoxy.

[1:21:62] Astronist philosophy, Astronic philosophy, or Astronist thought, transcends this, as it relates to the Thought Culture in the undercurrent of Astronism and cannot be defined by just one philosophy, but encompasses many which is encompassed by the Astronic tradition.

[1:21:63] At our return to habitabilitist thought, we embark upon a contemplation of Earth Analog; a planet, other than The Earth itself, that resembles the size, distance from the centrality, and the overall environmental and topographical conditions that The Earth possesses.

[1:21:64] The relevance of the Earth Analog forms itself in that it is the ultimate ambition of habitabilist contemplations of The Cosmos to discover and explore such worlds for life new, and for the colonisation of such worlds by our own peoples.

[1:21:65] This may be seen as proposing a great injustice to The Cosmos and its progenies by analogising The Earth to all other planets and it could be interpreted as bordering on a geocentric thoughtpath.

[1:21:66] Whatever one's philosophical views of the existence of the concepts may be, we are bound to inhabiting worlds only that are the same as The Earth for our current biological and technological advancements and reconditions have not been propelled enough to cope with worlds much different.

[1:21:67] By this notion, humanity is bound to what humanity can create and produce and in this, we find our greatest of obstacles, though do not be disheartened for the minds of the world must first change before the creations and the productions of the world can materialise, and in this, we find our Philosophical Struggle.

[1:21:68] Is it logical to notionise that there exists Earth Analogs in The Cosmos, but whether one chooses to centralise their contemplations on The New Earths is a matter of philosophical stance, rather than belief or disbelief in their existence.

[1:21:69] Adoration, wonderment, and laudation of The New Earths beyond that which we call our home is one of the commonmost expressions of cosmical wonderment due to the proximity and relevancy to the wants, needs, and beliefs of the masses of peoples.

[1:21:70] As the centralmost component of habitabilist philosophy, the concept of Earth Analog plays an ever-prominent role in questions surrounding sentience beyond The Earth, planetology, and contemplations about the purposivity, and naturity of The Cosmos and humanity's destined role within it.

[1:21:71] As an extension to the concept of the Earth Analog and sentience in The Cosmos in general, the scientific and philosophical study of the existence of life in The Cosmos, which is known as Astrobiology.

[1:21:72] With the philosophical form consisting of contemplations on existence, possibility, knowledge, ethics, perception, and aesthetics of life beyond The Earth in The Cosmos and raises a multitude of questions relating to many instruments of study.

[1:21:73] The study of astrobiology is destined to grow by countless measure when the humanic exploration of The Cosmos initiates and the discovery new worlds and new kinds of life and sentience emerges thereafter.

[1:21:74] First, on the contemplation of existence in relation to astrobiology, the discovery of life beyond The Earth shall forever redefine the tenets and mindset by which the civilisations of The Earth have been constructed upon.

[1:21:75] Such a momentous discovery will plunge the greatest minds of the time into questions about humanity's purpose in The Cosmos and humanity's relevancy in The Cosmos, which stem from ideas of existence.

[1:21:76] We shall have to redistinguish our understanding of humanity's existence, with questions of why becoming more and more prominent in the capitulations of those whom have denied inevitability since such possibilities first arose.

[1:21:77] What we have been told; what we have held faith in; what we have told our children about whom we are, how we are, and why we are, shall be forced to be corrected in the light of such a newfound discovery.

[1:21:78] The presumption of peace and harmony between peoples of such new worlds is so hoped, but we cannot be certain that the peoples of the worlds beyond our own shall welcome us so easily.

[1:21:79] We have to begin to contemplate how we would welcome peoples from another world and all the subsequences afford from such an encounter and the all embroilments that shall inevitably ensue.

[1:21:80] Astrobiological understandings relate to the propulsion of humanity's mindset towards non-anthropocentricity and with the knowledge we shall gain of the worlds of wonderment beyond our own wondermental world, a host of new discipline within astrobiology shall emerge and become centre stage in academia and in the philosophies of the peoples of this world.

[1:21:81] It is inevitable that there shall come a time when the words of this text are no longer useful to people, and when the time is correct, it shall be superseded by an even greater work, but presently, this document preserves its mission; a mission of change, on the larger of scales, in the most abstract and most physical of ways.

[1:21:82] If we are to discover worlds and open such doors from which we may never return, then we must be philosophically equipped as a human peoples to overcome the challenges that shall inevitably face us when the dreams and wonderments we have suddenly become real.

[1:21:83] Relating to possibility, if life on other worlds is proven then this prescribes a notion that shall forever change the logic of possibility.

[1:21:84] If that which is possible to exist, like life on other planets, is discovered then it is a logical notion to suggest that all else that is possible to exist, or is possible to occur, shall do so in an infinitism of time and space and matter such as The Universe.

[1:21:85] Perception shall also be impacted upon, especially our perception both of ourselves and whom we are, and whom we wish to be as humanity, and of The Cosmos itself.

[1:21:86] What role are we to play in a cosmos full of life like our own and unlike our own; whom we are wishing to become and how we are to become so?

[1:21:87] The discovery of one world beyond our own with life evolutioned upon it is not just a single world, but by means of logic, a countless multiplier for if one world exists with life upon it, then logic prevails that there must be others with enough time, space, and matter to engineer such amounts of life.

[1:21:88] The doubters shall be curtailed, the falsifiers exposed, and the wonderers, the believers, and the philosophers shall be enthralled upon such new discovers and shall be embraced by not only our own world, but by all worlds beyond our own.

[1:21:89] What could be happening on a countless amount of other planets with life on them right now? What religions do they hold faith in? What histories have they left behind? What cities have they built? What diversity do they hold?

[1:21:90] These are the questions I have and many more along the same line of notion for my mind of wonder runs wild with the possibilities beyond our own world.

[1:21:91] I imagine such worlds inhabited beyond our own in a logical sense; they shall have their own everything just as we do; the unquity of their civilisation shall shine, but their similarity to us shall forever underpin whom they are and whom we are.

[1:21:92] Rest upon these questions and ponder them for that is the basis of Astronist Philosophy; to create such questions for the peoples of this world and the worlds beyond to wonder upon them and realise the answers in some time and in some place that we do not yet know.

[1:21:93] What a wondrous mission this text has been set; to put humanity's mind on a course towards betterment, discovery, knowledge, and fulfilment of our destiny.

[1:21:94] We must praise the astrobiologists for their efforts in a field still so young, but to all the people of humanity that hold an eternal wonderment in their hearts for the study of life and sentience beyond the atmosphere of The Earth, fear not for your discipline is only just beginning and shall become centrefold in times to come.

[1:21:95] The flow of the river, the waves of the sea, the ripples of the pond, and the ocean horizon; all we have become is because of the aquas of The Earth; we are physiologically made from the element of water and all we are and wish to become is dependent upon something we often taken for granted without any thought at all.

[1:21:96] Central, therefore, to all habitabilitist contemplation and enquiry about life beyond The Earth is the existence of liquid water on such worlds, and for it is water that remains the most initial and necessary element of life.

[1:21:97] Extraterrestrial liquid water is already a reality on many worlds discovered for there exists planets we know that are entirely oceanic and there are planets that resemble The Earth as mixtures of green and blue elements.

[1:21:98] It is towards water that we point our attention as habitabilitists for with water, most often follows life in some form.

[1:21:99] In fact, now that we know there exists ocean planets, we know the existence of life beyond The Earth must be logically apparent for it would be illogical to notion that oceans many times larger than our own largest oceans do not harbour some sort of lifeforms for there exists more life in oceans than there does on all lands.

[1:21:100] Nature's greatest offspring of vitality is water and this shall remain so forevermore as this continues to be an element of functionality and cosmicity in The Cosmos.

[1:21:101] That which is categorised as a Natural Satellite is any non-technological object that orbits a planet so this may manifest itself in the form of a moon, asteroid, or some smaller rock, or dust particles.

[1:21:102] Although the overall Astronist Tradition tends to hold a preference for natural phenomena over technological phenomena, the habitabilitist philosophy holds a strong view of supremacy of natural phenomena over technology.

[1:21:103] The underlying battle between nature and technology isn't truly a battle, but the greatest exemplar of that which is directly Divine and that which is not; that which is natural is infused with an untouchable Divine substance and that which is humanly created is infused with much less of this same substance.

[1:21:104] The supposed confrontation between nature and technology is not considered so prominent in the Astronist Tradition, but instead, an emphasis is placed upon the describing the distinctions between the two as mentioned in the previous insentensation.

[1:21:105] In the Astronist philosophical tradition, nature does not constitute goodness and neither does technology constitutes evility, but divinity and indivinity respectively as a more Astronist differentiation between the two.

[1:21:106] In more basic terms, technology is that which humanity, or any other peoples, creates in order to construct their civilisations and live their lives, but nature, created in The Cosmos by some Divine entity, is the constructor of our entire reality in The Cosmos.

[1:21:107] In finality, we come to some insentations on those cosmical progenies which are known as Superhabitable Planets; the greatest ambition of an habitabilitist is to discover a planet that is better suited to life than even The Earth itself.

[1:21:108] Flipping the table on all we know and all that many have placed their faith and hope upon is exemplified by the discovery of worlds such as these and is the best quantifier of The Earth's inuniquity compared to all the planets of The Cosmos.

The Seven Tenets of Association

[1:22:1] Like in all other properly organised systems of thought, there are stipulations made to define the core and fundamental tenets of a thought system, and one's association with such a thought system.

[1:22:2] In the Astronist Tradition, these are known as The Seven Tenets of Association, and although they are not officially applied to individuals, one may wish to associate themselves with Astronism by the choosing to define their thoughts according to at least one of the seven tenets as lattermentioned in this discourse.

[1:22:3] One's inability to believe in at least one of these seven tenets does not default them as an unassociative due to the fundamental nature of thought being invisible to the human eye.

[1:22:4] The expression, however, of one's dislike, dissimilarity, or dismissal of the seven tenets establishes grounds to be considered unassociated with the overall thought system.

[1:22:5] Due to the nature of philosophy and its fundamentality in thought development rather than physical worship and deity contruntance, there exists little need for dogmatism in one's association with a particular philosophy.

[1:22:6] This explains the role of the seven tenets as merely a personal identification of one's likeness to Astronist thought, and not some criterion one must fulfil to become part of the system, or the philosophy for that notion in itself, is counter to the nature, purpose, and role of philosophy.

[1:22:7] Philosophy shall forever remain a canvas into which one may place their interests, enthusiasms, beliefs, and ambitions.

[1:22:8] One really cannot follow philosophy, for philosophy is oneself; the organised philosophies of the world are a structure and guideline in the development of each of our own personal philosophies.

[1:22:9] We united together under organised philosophies to associate ourselves with those whom share our principles, values, ambitions, motivations, ethics, morals, wonderments, imaginations, and dreams, but always, our own personal philosophies shall remain and supersede all the organised philosophies.

[1:22:10] The main reason for this supersession is that our own personal philosophies shall always remain more complex and contradictory than those of an organised nature for those organised are idealistic and superimposed upon the events and issues occurring at their time of organisation.

[1:22:11] This is why organised philosophies shall be forever dependent upon personal philosophies for personal philosophies hold much greater motionalty than that of organised philosophies, but organised philosophies and their Institution of Parentage can continue to work towards greater motionalty.

[1:22:12] There are seven tenets, as established, but each of these seven tenets must be outlined in this discourse if one is to be able to associate one's likeness to such principles.

[1:22:13] Listed below are The Seven Tenets of Association of Astronism in concordance with greater Astronist philosophy and the Thought Culture:

[1:22:13a] The Centrality of Humanity's Exploration of The Cosmos

[1:22:13b] The Centrality of Philosophy in Society & Civilisation

[1:22:13c] The Belief in Cosmocentricity

[1:22:13d] The Belief in The Cosmos Holding The Answers of Existence

[1:22:13e] The Belief in the Greater Possibility of Sentience in The Cosmos

[1:22:13f] Holding an Adoration & Wonderment, as well as general Devotions to The Cosmos

[1:22:13g] A Greater Knowledge Equals a Greater Understanding of God, Being, & Reality

[1:22:14] Although it is traditionally kept that at least one of these tenets has to be held by an individual to describe themselves as Astronist-minded, there exists no single official definition of these tenets and the descriptions given below are simply interpretations of these tenets at the time of this writing.

[1:22:15] All words change, and so do their applications and meanings, and so with this, arrives the logical idea that philosophies and thought cultures are bound to change along with the words that founded them.

[1:22:16] The first of The Seven Tenets of Association is named such due to the distinct abundance of mentions made about humanity's exploration of The Cosmos throughout Astronist Philosophy, and throughout the Omnidoxy as its derivational text.

[1:22:17] Humanity's exploration of The Cosmos shall realise the majority of the concepts and philosophical statements outlined in The Grand Centrality and shall be the central aim and ambition for the enhancement of our knowledge, perception, and wonderment of The Cosmos.

[1:22:18] It is centrally held that the exploration of The Cosmos is humanity's destiny as prophesied so just as we were destined to explore this world, populate it, and civilise it, so too, it is our destiny to do the same for the worlds beyond the one on which we reside now.

[1:22:19] Upon this journey we must embark, and do this must and will for The Earth is beautiful and worthy of our greatest wonderment, but the world beyond our own is calling for us to explore and wonderment of it and this is what we shall do.

[1:22:20] All that is stated in Astronism in some way relates back to the Humanic Exploration of The Cosmos; its intrinsic association with the eschatology of Astronism and the overall futurity is forever withstanding and shall not be compromised upon due to its centrality in the entirety of Astronist Thought.

[1:22:21] It is not only the destiny of humanity to explore The Cosmos, but in fact, it is the naturity of humanity to want to explore that which has been unexplored for so long; that which is unknown is the greatest temptation of the human mind for we all want to know that which is not.

[1:22:22] The belief in the solemn centricity of humanity's exploration of The Cosmos is to be Astronist in thoughtpath, but also, it is to be something much greater; a champion of knowledge, a believer in the trueness and divinity of The Cosmos, and an imaginer, a dreamer of what could be beyond that which we reside, know, and understand.

[1:22:23] The most central of centralities, humanity's exploration of The Cosmos is the necessary precursor to our greater understanding, knowledge, and belief in, not only The Cosmos, but ourselves, our own existence, and the creator of being.

[1:22:24] The faiths of the world have always proclaimed that the answers to the largest questions of The Universe reside upon The Earth, but how can we let such an illogical notion stand in today's era of greater knowledge; the answer is that we cannot.

[1:22:25] We cannot allow such notions of falsity to spread throughout the lands of The Earth into the minds of all good peoples; we must take action through thought against such regressive notions of self-absorption, self-obsession, and self-centricity.

[1:22:26] By forging a new mindset for the peoples of the world towards understanding the centrality of humanity's exploration of The Cosmos, we remove such regressions from our path and we strive forward towards progression, greater knowledge, and an understanding of where the true answers lie to the grandest of questions of The Universe.

[1:22:27] The scariest part about the peoples of this world is that many know, understand, or want to understand that which is true and that which is real.

[1:22:28] There are many peoples of this world who do not know of the world beyond on that which they reside; they do not understand the immensity, and complexity of the world beyond.

[1:22:29] There will be many peoples of this world who do not believe in the existence of the planets, the stars, the galaxies, and all the other elements of The Cosmos we know, believe in, and wonderment upon.

[1:22:30] For these minds of ignorance, we must not become angered, but we must pity them for they do not know and they do not cherish and wonderment upon that which we do; feel compassion for their lack of vision and hope that in some future time, it shall be restored.

[1:22:31] For too long we have been told to look down and look within for the answers, but now it is time to look up and look without.

[1:22:32] The second of the seven tenets of association relates to centrality of philosophy in society and civilisation; notice that no specific reference to humans was made, for all that is sentient requires philosophy, as the postgenitor of thought, develop their minds to achieve sentience.

[1:22:33] Notice too, that not only is philosophy the centrality of society, but also, civilisation, and by the foundation of a civilised world of peoples, there must exist a philosophy as its precursor, and that is upon which the civilisation is established.

[1:22:34] By the construction of a civilised world, or nation state, the application of a philosophy must be made; this is at the heart of many nation states of the world, and it shall continue to play a centric role in the establishment of civilisations both on this planets, and all the others of The Cosmos.

[1:22:35] By the nature of Astronism itself and by all the words of the Omnidoxy, nobody shall mistake the Astronist view that philosophy will now take the baton and lead the establishment of civilisations on many planets of The Cosmos, as well as the civilisations on The Earth itself.

[1:22:36] If one understands, comprehends, and believes in this principle that philosophy, never confined to an Astronist Philosophy, is poised to fulfil its own vocation to lead humanity to new heights, and societal and civilisational structures, then one fulfils the second tenet of association.

[1:22:37] The third tenet of association known as one's belief in cosmocentricity exists at the heart of the principles of Astronism; in the very depth of its mindset and worldview.

[1:22:38] Cosmocentricity is a worldview that understands concepts, theories, and the largest of questions in relation to The Cosmos, not in sole relation to humanity, or The Earth.

[1:22:39] This is why we find cosmocentricity to be the distinct oppositism to anthropocentricity and geocentricity; by believing in such, does that ascribe one's disinterest, or even a dislike for The Earth and humanity, no, it most certainly does not.

[1:22:40] Instead, a cosmocentric understanding views humanity and The Earth in their true, proper, and real forms, bound by logic, rationality, and one's primitive understanding of The Divine's overall Cosmic and Universal Plan.

[1:22:41] A cosmocentric understanding views The Earth as exactly what it is; one planet amongst quintillions in The Cosmos and perhaps amongst an infinite amount in The Universe.

[1:22:42] A cosmocentric understanding views humanity as exactly what it is; a sentient product of The Earth by means of an evolutionary path, and a destiny to explore The Cosmos.

[1:22:43] To view anything according to its place in The Cosmos is cosmocentric; to view anything on a larger scale than that which originates from humanity, or even from that which originates from The Earth, is to cosmocentric viewpoint.

[1:22:44] To see existence and being through a lens that is wider than the histories of humanity and The Earth is to understanding the principle foundation of cosmocentricity.

[1:22:45] The Cosmos is considered central and that all else that exists as we do, does so within The Cosmos; The Earth and humanity upon it are as significant in The Cosmos as their scale, size, and scope suggest.

[1:22:46] Humanity's destiny far outweighs that of The Earth's in both scale and scope for it is humanity's destiny to explore and discover the many worlds of The Cosmos, whilst also remembering our own origination on The Earth.

[1:22:47] We stand now at this origination point, looking out towards a world of which we know so little, but that very fact is what draws in our curiosities and by our heart, and minds, we shall explore that which we know so little of so that we may one day so the opposite is true.

[1:22:48] We are in the midst of understanding whom we are, from where we came, and discovering why to all manner of questions.

[1:22:49] In essence, it is the worldview and mindset of cosmocentricity that enables us to believe in the grandness of The Cosmos, the role we are destined to play within it, and the knowledge which we are to gain from its exploration.

[1:22:50] The fourth of the Seven Tenets of Association manifests itself as the belief in the fact that it is The Cosmos and The Universe which holds the answers to existence, knowledge, being, and reality, as opposed to ideas that The Earth and humanity are the epitome of answers.

[1:22:51] The Great Mystery is not ever defined by one single idea, or entity, and this shall remain the same forevermore.

[1:22:52] The Earth is important in relation to itself and the lifeforms upon and The Solar System in which it functions, but beyond this, like all other planets of The Cosmos, it is one piece of an incomprehensibly large and complex jigsaw.

[1:22:53] Knowing who we are and understanding who we are remain two different parts of the same paradigm; that is, the paradigm questioning our belief of ourselves.

[1:22:54] The main difference between the two is that knowing is bound by knowledge, but understanding is bound only by the extent of our imaginations and our ability to think.

[1:22:55] In the belief outlined in the fourth tenet, we understand ourselves in accordance with what we know of The Cosmos, or what we imagine The Cosmos could hold in knowledge, or what we believe The Cosmos to be, to hold, and to exist by.

[1:22:56] Believing in the fourth tenet is not about disregarding all else other than The Cosmos for all things existent can provide knowledge, but instead, it reorders and reorientates our worldview towards understanding The Cosmos in The Universe to be the ultimate provider of definite answers and accurate certainties about existence, knowledge, and being.

[1:22:57] By this notion, one understands the tandem purposivity of The Cosmos to our own perspective; the first of which is its role as our habitor, and the second of which is its role as our enknower; the entity from which we gain all the knowledge we hold.

[1:22:58] As its habitee, we, and all the other progenies of The Cosmos, are bound to its destiny as we are to our own, and we are instructed to where which we are to proceed according to its whim, and will.

[1:22:59] We often want that which we cannot have, and for knowledge, this principle stands the same for it is only through the smaller discoveries of knowledge that we may build our minds up to the larger ones.

[1:22:60] By the fourth tenet, you are placing your belief in The Cosmos in The Universe as the beholder of knowledge about all things cosmical, though not that which is universal, or Divine.

[1:22:61] The fifth of the Seven Tenets of Association reveals itself in the form of a belief in one's affirmation of the possibility of sentient beings beyond The Earth in The Cosmos.

[1:22:62] Despite the comedicisms present in some facets of today's culture, from which origins I do suspect to be institutional, the belief in the fifth tenet prides itself upon notions of logic, rationality, reason, and wonderment to form its conclusions about the existence of life beyond The Earth.

[1:22:63] All the notions that this tenet hold are based upon the facts of current knowledge and that which can be logically derived from them.

[1:22:64] The conformity of one's views towards the comedicisms of the day is unfortunate, though not for the world and its peoples for they shall make their decisions, but it is unfortunate for yourself and your individual level of knowledge and wonderment, that is wholly restricted by such conformity through fear of rejection and isolation for one's worldview.

[1:22:65] The comedicism here exists in that the belief in the existence of life beyond The Earth has been distorted into some obscure belief held by the strange, the few, and the illogical thinkers of the world.

[1:22:66] To whom ever this comedicism stands motivative to create is whom stands in the way of progression; fingers shall not be pointed for we may only state according to facts of what we know; speculative notions on whom is to blame in no way progresses us towards our true goal of eliminating such a comedicism.

[1:22:67] The belief in sentience is not a belief in just that alone, but a belief in the grandness of The Cosmos, its ability to be so diverse, full of possibilities, and holding many secrets, some of which shall never be fully revealed to us.

[1:22:68] If there are countless amounts of planets in The Cosmos, it is not an illogical notion to suggest and believe that there are millions of worlds upon which sentient beings walk the lands and breath the air as so do we ourselves.

[1:22:69] The existence of life beyond The Earth is made reference to throughout the entirety of Astronist philosophy, as an inevitability of humanity's exploration of The Cosmos.

[1:22:70] As one of the most frequent subjects of wonderment, sentient life and its discovery is one of the centralmost aspects of Astronist philosophy's theories, concepts, and philosophical stances.

[1:22:71] As an intrinsic conviction of Astronist thoughtpath and worldview, the belief in sentient life shall continue to be given attention in Astronist Art, Architecture, Philosophy, Culture, and Literature, and shall therefore remain as one of the most important tenets of association.

[1:22:72] The sixth of the Seven Tenets of Association almost completes the septenary by stating the principle of both the adoration and wonderment for The Cosmos, notably missing out laudation as the third part of the triad, due to laudational acts holding much larger gravity, and a need for greater practition and knowledge.

[1:22:73] Aforementioned, it has been, the importance of adoration and wonderment to the manifestation of Astronist philosophical stances and concepts, but by adding these two practitions to become part of the Seven Tenets of Association raises their importance further, and solidifies their intrinsic role throughout Astronist thought.

[1:22:74] This is perhaps the most relatable to all the Seven Tenets due to its applicability to all peoples, and therefore, is perhaps the easiest to tenet to declare one's association with.

[1:22:75] To look upon The Cosmos with eyes so wide and naive of its grandities and untold truths, is the greatest of adoration and wonderment for to see The Cosmos in this pure way, without any poisons of human greed, guile, and jealousy like we see in all other parts of our lives, demonstrates to us the internal remedies that the practitions of adoration and wonderment can provide.

[1:22:76] The adorers and the wondermenters are some of the strongest in their philosophical convictions for they see physically the manifestations of abstract ideas and concepts and theories.

[1:22:77] As soon as one witnesses the cosmical elements in plain sight above them in the night sky, they realise the trueness, the grandity, and the supremacy of their being above all else we can conjure.

[1:22:78] In truth, adoration and wonderment are the precursors to a sharpened philosophical outlook following an Astronist Tradition, and they are great champions of Thought Culture in relation to cosmocentricity, and all other Astronist concepts and stances relating to The Cosmos.

[1:22:79] For these reasons, the practitions of adoration and wonderment are positioned as the sixth tenets of association due to their underpinning nature as they lay at the heart of all that is Astronist by their appearance, conceptualisation, and application.

[1:22:80] The final of the Seven Tenets of Association is titled as a statement of belief; A Greater Knowledge Equals a Greater Understanding of God, Being, & Reality.

[1:22:81] It is the interpretation and explanation of this statement that provides a greater understanding of its meaning, and this is the only one of the seven tenets that is given a distinct and official interpretation according to an Astronist traditional philosophical viewpoint.

[1:22:82] Firstly, the concept of knowledge and understanding reappears from the fourth tenet with an emphasis on the precursory nature of knowledge in relation to understanding.

[1:22:83] Here, knowledge is considered a synonym for philosophy, especially knowledge of the philosophy of The Cosmos, and largely reiterates the idea that a greater understanding of The Cosmos results in a greater understanding of god, being, and reality.

[1:22:84] God, a rarely used term in the Astronist philosophical tradition, symbolises, in this particular usage, the entirety of questions regarding the naturity of The Cosmos and The Universe, their origins, fates, and their possible creator.

[1:22:85] Being, in this sense, relates to the philosophical exploration of the nature of existence, while reality relates to human perceptions of the world and The Cosmos beyond it, as well as knowledge itself and its largely restrictive nature in relation to human perception.

[1:22:86] This final tenet of association is marked with a conclusive undertone as it includes the conceptual flavours of each of the other tenets preceding it, though this is not to say that one's association with the seventh tenet is an automatic association with them all.

[1:22:87] Although this final tenet is given an official interpretative and symbolical grounding, it remains vague for the reason that one can still continue to forge their own understanding of each of these words and concepts.

[1:22:88] One's agreement with the words and official interpretative meaning of the words grants them an associator with the final tenet of association.

[1:22:89] We must not let the social constructions of the past, created with false intent, to dictate and stagnate our futures and destinies filled with exploration, discovery, and greater knowledge.

[1:22:90] If it be true that the philosophers were only interpreters of the world, then it be the philosophers of the Astronist Tradition whom are poised to change the world and all the others of The Cosmos and how we ought to perceive them.

[1:22:91] All a true philosopher requires is their mind, and their ability to change it, from time to time.

[1:22:92] I am a philosopher; logic is my ally, faith is my key, reason is my juror, hope is in my heart, and wonderment is the manifestation of my philosophy.

[1:22:93] The instruments of study are the abstract utensils through which a philosopher perceives and intends to construct their logic upon, in the creation of new ways of thinking.

[1:22:94] As a philosopher, my story is not about who I am, but whom I wish humanity to be, for you shall see that it is a trait of philosophers to think not inwardly, but outwardly, throughout all aspects of humanity, the world, and The Beyond.

[1:22:95] The greatest differentiation between a philosopher's mind and a normal mind is that of scale; the philosopher thinks not of themselves, but of the people of the world and humanity; the normal mind thinks only of themselves, never contemplating the ways in which their people and those of each world should act, think, and live.

The Five Bonds of Society

[1:23:1] There are many parts of our societies that make them what they are, but ultimately, it is found, that there exists five distinct and universal bonds that can be found in all well-functioning societies and each of these bonds shall be introduced and later described in this discourse.

[1:23:2] The first of these five bonds to be found in all societies is that of the Educator-Student interaction; the most significant of all the bonds, this interaction transcends humanity, for the educator is able to take many forms; not just a teacher in a classroom.

[1:23:3] It is the sole purposity and duty of the educator, in whichever form it may take, to provide instruction and knowledge of particulars for the listening student; ultimately, it is the educator that is responsible for the passing on of knowledge; for keeping the knowledge alive.

[1:23:4] Without enknowledgers, the knowledge expounded by the greatest of minds shall be lost, and in this, we find the most vulnerable part of knowledge; without its relay to new minds, it shall become forever forgotten.

[1:23:5] The Educator-Student bond is intrinsic to society; the churning of knowledge from those whom know to those whom do not is a naturity of the human consciousness; in this, we found ourselves and whom we are as seekers of knowledge.

[1:23:6] It remains the responsibility of the educator to teach the student of the most fundamental truths, yet forever allowing the student to go beyond and think of their own ideas and truths.

[1:23:7] Without this leeway, the educator soon becomes an insulator of knowledge; never allowing the knowledge to pass and be let free in the mind of one so young and naive and full of imagination.

[1:23:8] Just as the student must craft the way they learn, the educator must craft the way they teach, and it is the way in which they craft such that can make the difference between a generation whom appreciate knowledge and understand its naturity, and a generation whom do not.

[1:23:9] The educators have been entrusted with the knowledge they possess for it remains a great responsibility to hold knowledge, and an even greater responsibility to free it to new minds.

[1:23:10] If the leader of thought in a society is the philosopher, then we must not forget the educator with whom they studied for it is within forgetting from where we came that we forget what is most important and where we are headed.

[1:23:11] We shall always understand that the educator is a role which anyone, or anything, can play; its place is motional, though its purposivity is immobile for it shall always remain that the educator relays the knowledge they possess.

[1:23:12] In this notion, we uncover the greatest restriction of one educator; the knowledge they possess shall never encompass the entirety of knowledge and ideas available and possible, and it is the responsibility of the student to remember this.

[1:23:13] The educator should not be in the business of producing clones of their own knowledge in the form of students, instead, they should encourage the students to think and imagine upon the knowledge they have been given in order to form their own thoughtpaths.

[1:23:14] If we ever forget the role of the educator, or one's role as the student, we must remind ourselves by reading this discourse, and remembering that the role of the educator, and that of the student is intrinsic to whom we are and whom we wish to be.

[1:23:15] The second of the Five Bonds of Society manifests itself by the interaction between the philosopher and the peoples of a society.

[1:23:16] It remains true, and it shall foreverafter remain true that the philosopher stands between the pillars of society as its founder, habitator, and sustainer.

[1:23:17] The philosophers provide the ideas to form the society; they establish systems of conduct, thought, and action; they devise codes, principles, and philosophies that the peoples of the society are to consume and decide upon their consciences whether they agree or disagree with the proposed truth.

[1:23:18] The Philosopher-Peoples interaction is the next of the Five Bonds of Society and is the most important bond to me personally, and all other philosophers of the world, for it is the one bond that only the philosophers will be able to comprehend and completely understand.

[1:23:19] Opening the minds of the worlds to new systems of thought, and new ways perceiving and understanding is the primary role of the philosopher in any given society, and ultimately, it is the philosopher's relationship between the peoples of the society that is most interest to discuss.

[1:23:20] Whom shall devise the methodologies of our economics? Whom shall tackle the largest of questions? Whom shall create and establish systems of thinking, being, and doing that help us in our lives to be better a peoples? Whom shall point us in the right direction?

[1:23:21] It is the philosophers of the world whom assume and fulfil such roles, and it is upon their shoulders that the world rests; the most saddening part of all is that it seems the peoples of the world and most societies have forgotten this.

[1:23:22] In reaction to this, the People's Philosopher is devised herein and henceforth as a role that Astronist Philosophers shall fulfil if they so feel such a vocation; this is a philosopher whom actively concorts the civilisation within which they live and interact with the peoples of the civilisation in many ways open, personal, and for the betterment of the peoples at all times.

[1:23:23] The Philosopher's Mind is a direct reflection of the voice of the collective peoples and the way in which they see their futures; it is the duty of the philosopher to understand, devise, and act upon this.

[1:23:24] There can be two types of People's Philosopher; the first of which is a philosopher whom reflects what the people know they want, and the second is a philosopher whom shows the people that which they never thought they wanted, or could ever become, or achieve.

[1:23:25] The latter of the two philosopher types, the people may easily resent for to be told that which they do not yet realise is often a point a contention in any context; a true People's Philosopher, however, should dispense further so in the face of such indignation, never hesitating to speak of the correct path towards which the society should strive.

[1:23:26] In every society, there have been the leaders of the physicality, and the leaders of the mentality; the former is the soldier and the latter is the philosopher, a soldier of an abstract world; a world in which bullets turn into words and guns turn into ideas; both of which worlds are just as dangerous as one another.

[1:23:27] The Philosopher's World is a world in which words can begin rebellions against the established order; it is a world in which ideas can form new orders and newfound systems of thought, action, and belief; it is a dangerous world of consequences, though one of necessity still and thereafter.

[1:23:28] It is most often the philosopher whom notices the cracks in society first; it is most often the philosopher whom understands the problems and the possible improvements; and it is most often the philosopher whom is the first stand up and speak of such issues before any other shall dare to stand.

[1:23:29] The peoples of future societies and civilisations shall raise philosophers to heights of heroism and champion their efforts in thought, system, order, and wisdom; for their bravery in times of resentment; for their dedication in times of obstacle; for their conscious efforts to betterment; and for their resilience in times of repression.

[1:23:30] For it is the greatest of minds that shall build the greatest of societies on both this world and the many others of The Cosmos and the children shall look upon the philosophers and hope to be like them one day in ways new, or follow in the same direction that a philosopher has set forth.

[1:23:31] Ultimately, it is the Philosopher-Peoples relationship that binds the society and civilisation together; it is that which forms the ambitions of young; it is that which sharpens the minds the mature; it is that which brings forth hope, knowledge, joy, unity, and structure; it is the natural way by which a society can develop and churn the old out for the new to arrive to take their places.

[1:23:32] The third of the Five Bonds of Society is aptly entitled as Parent-Child; the relationship between a mature individual and the child which they rear, in whichever circumstances this relationship may form.

[1:23:33] The bond between a parent and their offspring is perhaps the most obvious, the most raw, and the strongest of all the bonds spoken of in this discourse.

[1:23:34] Whether by blood or water, this bond is something that must be grown from the birth of the child to the moment they mature, and even thereafter; this bond remains to be eternal for even once the child becomes a parent, the bond still exists, and is perhaps even stronger still.

[1:23:35] There is no bond that can match this in both strength and natural raw emotion, but we must not let complacency prevail; this bond so equally fester and turn rotten if neglected so although this bond is the strongest, it is perhaps the most in need of nurturement.

[1:23:36] Whether father and child, or mother and child, the Parent-Child relationship exists as the central aspect of humanity, for without this, human would not have expanded as it has across this globe, and it would not have diversified and multiplied as it has done so.

[1:23:37] Creating a coherent place for the Parent-Child relationship to exist is imperative for the development of strong families; that is one aspect of today's world that many have lost the necessity for; a strong family unit.

[1:23:38] Some families have made things work and have grown better for it, while others have become divided, and estranged, and bitter towards one another, and even worse, some have been ripped apart by the vices created by some peoples of this world.

[1:23:39] If we are to see our civilisation to new worlds, we shall need to cherish again the family unit, and appreciate once again what it means to be a family, and also, what the conception of a child truly means; a life of possibility, that should never be extinguished.

[1:23:40] To kill an embryo is to extinguish the possibilities of the person into which that embryo shall grow; it is to cut off the possibility of existence; it is to stop the person from having a chance to exist.

[1:23:41] All that should be said therein is that if an embryo is conceived and is birthed into a difficult circumstance, then it is not only up to the parent to support the child so the same mistakes aren't made twice, but it is also the responsibility of the institutions of a society to care for that child so that its future shall not resemble the difficulties into which it was born.

[1:23:42] This is not about helping the parent; this is about helping the child to become better for the world; it is never the child's fault for the circumstance into which they were born.

[1:23:43] Stopping the chance for the existence of a child is stopping the ability to bring new minds into the world that may one day betterment the peoples and forge new discoveries, progressions, and knowledges; there is no difference between this and the atrocities of The Holocaust, and all other genocides.

[1:23:44] The scale and the circumstances are different, yes, but the principle remains the same; to terminate, to end the life of a child is to cut off all the possibilities, discoveries, and progressions that their life could have brought to the world.

[1:23:45] The world will never know what was lost, or who was lost when an embryo is disposed of like an accessory; what could have been and what was not; what was lost.

[1:23:46] The future has been shut down for those people; taken away from them by no choice of their own, and if we begin to imagine what we have lost in the killing of innocence, then all the world would shed a tear for each and every loss of life and the Divine potential and possibilities that each and every life holds.

[1:23:47] When you stop the chance of life, you stop the entirety of the life of that child and the adult they could have become; they stop their chances to become the next doctors, scientists, philosophers, astronomers, and maybe a new occupation that would have been created if they had had the chance to create it.

[1:23:48] The capabilities of the parent(s) must be taken into consideration by the institutions of the society, however, and the appropriate support shall be given to the child, and the child alone, for their proper and stable upbringing.

[1:23:49] Whichever view you may take, the sacred relationship of the parent and child remains and even if the child is lost by means of murder, the conscience of the parent shall be forever tainted by the act.

[1:23:50] We have created a society in which it has become second nature to us to harm others in some way in order to succeed; we harm each other mentally, spiritually, and physically.

[1:23:51] We have created this, and so it is a logical notion to put forward that we, and we alone, must be the ones to recreate it.

[1:23:52] There is nothing evil about competition, but when we are made to feel like we have to harm others, in whichever sense this may be, in order to achieve our goals, we lose who we are; we lose our unity, and we lose our humanity.

[1:23:53] The vices of the world, money, sex, drugs, alcohol, and power, have, for many years, been blamed for the creation of this kind of society, but this is a falsity in and of itself.

[1:23:54] We are the ones who have created this world; we are the ones to blame for the murders, the thievery, and the rampant evility; we cannot blame inanimate objects for the type of society we have allied ourselves with.

[1:23:55] It wasn't any of the aforementioned vices that made the world the way it is today; it is the way in which we interpret, use, and act upon those vices that have created the society in which we reside.

[1:23:56] It isn't about removing those vices; it is about changing the way in which we see them and it is about encouraging the youth of the world to understand that the vices of the world will not make them happy, content, and nor will they ever help them to achieve their highest of goals.

[1:23:57] We can go on forever blaming the vices for our mistakes, but by doing this, we shall never accept the responsibility of being a human, of existing; and we shall never blame ourselves for the way in which we have decided to act.

[1:23:58] It is a notion of illogicality to suggest that the decisions **we** have made and the decisions **we** have acted upon are the fault of others.

[1:23:59] Due to knowledge being wholly dependent upon perception; complexity is therefore also based upon perception.

[1:23:60] Good and evil are another Conceptual Pair that are based upon ideas of perception; one that is good may be equally, or more so evil from another pair of eyes.

[1:23:61] The fourth of the Five Bonds of Society is entitled as the Sibling-Sibling relationship bond and is too, like the bond before it, variable according to the circumstances in which it is applied with neither blood, or water always constituting that which is known as true siblingry.

[1:23:62] The Sibling-Sibling relationship centres itself on three main priorities, also known as The Three E's; the first is henceforth known as Entrusted Reliance; a sibling is an individual onto which one may place their worries, their sorrows, and the grievances, knowing that all that is said shall be spoke of no further to any other person and that the advice provided by the elder is true, genuine, and beneficial.

[1:23:63] The second of the three main priorities is henceforth known as the Essential Hand; the hand of our sibling is that onto which we reach in times of need in our life to pull us through our darkest of hours, and the same shall be provided back to one's sibling.

[1:23:64] The third of the three main priorities is henceforth known as the Eternal Friend; despite all the obstacles and distances that may come along in our lives, there shall forever exist that relation and no matter the circumstances that may draw us apart from our siblings, we shall always be able to return to them in the knowledge that, despite everything, they shall still be our friend.

[1:23:65] Many of our friends leave our lives for newfound paths, but our siblings shall always remain so even after we have all long gone, and when people remember us, they shall say they were brothers, and they were sisters and what a precious gift that is.

[1:23:66] Be proud to call your sibling your friend; find in them the light that you see in others and cherish that light forever; it has been said many times before that we are born alone and that we die alone, but the greatest truth is that we are forever with siblings in our hearts, minds and souls, here and hereafter.

[1:23:67] The fifth and final bond of society is henceforth entitled as the Partner-Partner relationship; the most indistinctly titled of the five bonds due to its wide-ranging application to the many partnerships of life.

[1:23:68] First and foremostly, we may think of marriage; the most solemn of partnerships that should be eternal, but there are many others; partners in business, in philosophy, in activism, in politics, and in all other aspects of life, we find the Partner-Partner relationship.

[1:23:69] If we interpret in such that the Partner-Partner relationship is a reflection of what it means to be part of humanity, then we understand its true gravity; it exists in the knowledge that we are forever dependent upon one another and that our civilisation, and all others in The Cosmos, are dependent upon the fact that we are dependent upon one another.

[1:23:70] A world of interconnection is what we call ourselves and this is reinforced by the Partner-Partner relationship; all our lives, we are dependent upon the connections we make, and the partnership we forge, and that is the way of the world and all others.

[1:23:71] As a writer, I can tell you that we often wish to be left alone, in our own small worlds, but the truth is that we are the greater yearners of partnership; the partners in our lives hold the greatest of magnitudes to us because partnership is what we write about in all our stories.

[1:23:72] Partnership between characters, between events, between objects and animals, but also, the Partner-Partner relationship transcend even all of this, and strives on towards The Cosmos, in which it is central to the functionality of all cosmical things.

[1:23:73] The moons are in partnership with the planets, the planets with the stars, the stars with the galaxies, and the galaxies with the filaments, and so on and so forth, until we reach the entirety of The Cosmos, and we understand that all cosmicality is, is simply partnership.

Dark Matter & Dark Energy Philosophical Understanding

[1:24:1] How can it be that some say they know and understand the creator of The Universe when in reality, the vast majority of the matter in The Cosmos in The Universe is completely invisible and currently unknowable to us.

[1:24:2] Therefore, it strikes illogicality to say that we understand and know the creator of that which we do not understand or know; this is a paradigm of falsity that some peoples of this world have created and when applied to logic, its true identity is revealed instantly.

[1:24:3] There are those that we know and there are those, even more so, that we do not know, and there is an infinite amount of things that we neither and shall never know; this is the triadic paradigm of how we are to properly perceive knowledge.

[1:24:4] We cannot see, we cannot know, and we cannot understand, at present, The Cosmos and its greatest of secrets and two of these secrets that seemed to have stumbled upon, but cannot yet expect to comprehend, are known as Dark Matter and Dark Energy.

[1:24:5] The human mind works according to that which it already knows and understands and builds upon this knowledge and understanding throughout the length of its life, but when the human mind comes in contact with something that is totally unknown and never before contacted, it often falls to the greatest of minds to try and interpret this new and unknown entity.

[1:24:6] We see this in the discussion of Dark Matter and Dark Energy; there exists no true solidity in any of the current theories for what these two elements could be.

[1:24:7] From a purely Astronist cosmological perspective, due to the apparent and current unknownness, invisibility, and unquantifiability of these two entities, they must therefore be categorised into The Chaos, though we understand them to possess the overwhelming majority of the matter in The Cosmos.

[1:24:8] This realisation inevitably changes our understanding of what The Cosmos and could be and further demonstrates our complete lack of understanding of the world beyond our own in which all other worlds reside.

[1:24:9] Both Dark Matter and Dark Energy are found to be the ultimate contradictories; they are intrinsic, for they are thought to hold the stars in their positions, but they are extrinsic, for they are invisible and not so obviously affecting our existence.

[1:24:10] They are unknown, yet their discovery could be the epitome of all knowledge; they are the most abundant part of The Cosmos, yet they are the least understood; they are understood to play an instrumental role in the structure of The Cosmos, yet the majority of the peoples of our world perhaps do not know they even exist.

[1:24:11] The current understanding of Dark Matter is dualistic in that it takes a weak interacting form, known as Cold Dark Matter, and a high interacting form, known as Hot Dark Matter, and so we see, by this notion, that there exist variations, even in the most unknown of elements in The Cosmos.

[1:24:12] It is very rare to find an entity that is not dualistic in some way, whether by interpretation, or by its own fundamental structure.

[1:24:13] Dark Energy is currently considered to be the opposite of gravity, and this, we strike logic for in all things cosmical, there must exist an opposition, a friction from which a reaction is created, and the opposition to gravity exists as Dark Energy.

[1:24:14] Otherwise, how can it be that gravity alone, without any opposition, is controlling the motionality, structure, and order of the stars and the galaxies, but with this opposition introduced, we understand the nature of gravity by its true form; a force against which another force acts.

[1:24:15] But still, our understanding of Dark Energy continues to be wholly restricted and the currently proposed notion that Dark Energy plays an intrinsic role in the acceleration of the expansion of The Cosmos demonstrates the depth and breadth of Dark Energy and its possible universality.

[1:24:16] Perhaps it is gravity that has been found subordinate to Dark Energy by these notions of Dark Energy holding total cosmical influence and perhaps even beyond The Cosmos itself.

[1:24:17] It is completely irrational that we would attempt to know that which is unknown, or unknowable, but we continue to do it because that is the nature of humanity as it always has been and as it always will be.

[1:24:18] There is nothing more I wish to say in this particular discourse because I want to open this particular topic up to the thinkers, even more so than all the other topics because there trying to explain the unknown is like living without the five senses.

[1:24:19] And so you must go and you must explore this subject, and all the others, by whichever means you wish.

[1:24:20] Use and build my ideas, or create your own for in a true philosopher's consciousness, there is no need to be territorial for philosophy is simply knowledge and knowledge is what drives the philosopher towards his destination and if the words of another philosopher can provide him or her with a greater knowledge, then accept this they will.

[1:24:21] We must speak of things that trouble us and make us curious about the ways in which we are to live and the ways in which our minds work, our beingness, our consciousness, and all else that is grasping our mind and reeling in our curiosities.

The Amalgamations of The Cosmos (Mergenics)

[1:25:1] The majority of what has occurred in the history of The Cosmos has taken the form of the coming together of celestials in the creation of a newfound cosmical entity and the study of these processes and their philosophical interpretations and naturities is to be henceforth known as Mergenics.

[1:25:2] The Mergenicists are tasked with attempting to understand the philosophical considerations of the mergence of celestial entities by deriving their philosophical concepts from scientific understandings, as well as from logic, rationality, and pure imagination.

[1:25:3] The study of mergenics also encompasses the inferences of how merging celestials impact upon the naturity of The Cosmos, the orderity of cosmical systems, and their functionalities, motionalities, and in relation to all the other instruments of study.

[1:25:4] Principally, mergenics is determined by and dependent upon gravity and its functions and it is understood here in completely clarity that gravity is the central physical component of celestial and cosmical mergence in The Cosmos.

[1:25:5] The functionality of gravity is what is henceforth known as The Assumption of Mergenics; all discussion of cosmical mergence is under the assumption of gravity's role, unless otherwise stipulated so.

[1:25:6] This is to afford no confusions about gravity's fundamental role, and allows for greater clarity of meaning and context when speaking of mergencial processes with a constant gravitational underpinning.

[1:25:7] To discuss mergenics on a higher and more philosophical level, we must discuss why and how; we must discuss the impacts of such mergences on the overall cosmical system, and we must apply instruments of study to the mergencial processes that allow us to carve a wider view of mergence in The Cosmos.

[1:25:8] To digress for a moment, I must say that in order to write of such newfound things, I had to close myself off from the world and only feed my mind with the ideas that it could handle during a time in which this philosophy was being developed and before a term in which my mind held answers to queries, and held counter responses to statements of doubt, jealousy, and disbelief.

[1:25:9] I had put myself into a vacuum for some time before I could open myself up to the world and I write while in this vacuum now, simply flowing in the midst of emptiness with only my ideas to comfort my heart, mind, and soul.

[1:25:10] To create purely new ideas, I had to censor myself from those which already existed and from the debates I intend to one day join, but the time of this writing, I knew that the process to create complete newness is to purifying one's mind by eliminating all outside influence as much as possible, and leaving only the subject matter for my mind to contemplate.

[1:25:11] However, I shall digress no further for the discourse of mergenics must continue though my worrisome mind may rest a little now knowing that the readers of this writing understand a small portion of the journey and the sacrifices involved with this writing and the construction of the entire philosophy.

[1:25:12] We shall begin our discussion at home for home is always the easiest to relate to for our little minds so The Earth and The Moon, in billions of years passed, demonstrate a perfect exemplar of a mergence to form a moon and a planet.

[1:25:13] Mergences don't just occur in the most grand and large of scales in the impact of giant rocks and the collisions of worlds, no, for in fact, it is the smaller mergences that make for the most important, especially in the creation of The Earth.

[1:25:14] As the dusts and gases and the particles of rocks and larger rocks began to spin and bind together over the course of millions of years from the sole gravity of The Sun, we can witness here the smallest of mergences in the formation of the largest of celestials.

[1:25:15] This type of mergence, the process forcing the smaller elements together in the eventual development of the larger ones in the early creation of a celestial is henceforth known as an Incipient Mergence.

[1:25:16] The second type of mergence, henceforth known as a Collisional Mergence, is exemplified by the impact of a large celestial body into The Earth during its early planetary evolutionary stages which caused some parts of the young planet's mantle to propel into space.

[1:25:17] From this, due to gravity's intrinsic naturity to bind such pieces together, we are left with the formation of The Moon at its most primitive of stages, and so by looking just at our own home and our nearest celestial neighbour, we discover two types of mergence.

[1:25:18] Considering the size of The Cosmos, and The Universe beyond it, it is logical to notionise that there shall be many other mergencial scenarios that we just won't have come across yet, but it is nevertheless exciting for this secures the philosophical discipline of Mergenics for many years into the future.

[1:25:19] On our return to The Earth and The Moon, we understand that orbitality and its own unique naturities begin to quickly submerge over both the celestial entities discussed as the Early Moon begins to orbit around The Earth, and the Early Earth begins its Proper Orbit around The Sun.

[1:25:20] All the stars of the galaxies that exist now, have existed, and shall exist forevermore merge in contradiction for they merge in almost absolute zero temperatures, yet their cores will one day become one of the hottest celestials to exist in The Cosmos; from coldness comes heat, and from darkness comes light.

[1:25:21] Density signifies mergence for the closest together elements are, the greatest chance of collision there will be and as a type of Incipient Mergence, the binding interstellar gases and dust to form molecular clouds will, in some future, form a star; the most common of centralities in The Cosmos.

[1:25:22] In Collisional Mergence, the most violent of impacts create the most beautiful of celestials; the destructor can so soon become the creator, and Collisional Mergence is the perfect exemplar of this principle.

[1:25:23] Mergence is the commencement of formity, and only until the balance between the amount of matter present, the time to combine it, and the space in which it resides, has been achieved, then the mergencial process shall continue.

[1:25:24] One part we notice about formity in The Cosmos is that the celestials seem to reach a point of balance and a satisfaction of gravity before they can stop their initial formation, but this leads us onto the notion that the celestials never truly reach the end of their formation.

[1:25:25] Even now, The Earth is changing in its formity, and although we don't see the changes so obviously, we can see that from The Earth's initial formation to the present day, it has changed in its formity on a grand scale.

[1:25:26] Even the oldest of celestials are still new in their formities for they too continue on their formative journeys throughout their existences; this describes the formative motionalilty of celestials, as distinct from their physical motionalities.

[1:25:27] Mergences are an abundant process in The Cosmos for it is imperative that they exist in all parts of The Cosmos and they do so without exception; all celestials are formed by mergences, whether that be with other celestials, or with the tiniest of elements of The Cosmos.

[1:25:28] Dyadicity is the fundamental essence of mergencial processes; to merge, there must be two elements, or entities; a mergence cannot occur with a single entity; this is the fundamentality of mergence in any of its variational forms.

[1:25:29] Mergencial processes do not differentiate between centricity and incentricity for they do occur in the centres of systems and galaxies, and just as equally, they occur in the furthest reaches of systems and in the furthest distances in The Cosmos as part of quasarial formation.

[1:25:30] Another fundamentality of mergence is composity; it is the naturity of mergencial processes to form from several parts, but also to occur across several stages, and in this, we clearly see the composite nature of both types of mergencial processes.

[1:25:31] When we speak of cosmicality, we measure the extent to which a process, event, or entity is integral to the cosmical system, and by this notion, it is logical to understand that mergencial processes are central to the cosmical system, for without them, the entities of the cosmical system would not exist.

[1:25:32] Mergences are the most cosmical of cosmical processes, and exist at the heart of all that is cosmical for all things that are cosmical are formed by mergences.

[1:25:33] If it can be argued that mergences are the essential part of the cosmical system, then it is also logical to notionise that their focality is extremely high for without mergencial processes, there would not exist planets, stars, galaxies, and all other cosmical progeny, and with focality being a measure of importance, then mergence is an exemplar of this.

[1:25:34] Mergencial processes are the manifestations of functionality; the rawest part of functionality; they are the precursors to proper functionality as we know it to exist in the cosmical system and so mergences form functionality.

[1:25:35] Mergences are themselves a functionality in that they form the celestials and they fulfil their functions by the creation of celestials that will endeavour to impart their own functionalities.

[1:25:36] Whether mergences play a role in the functionalities of the celestials they create is a larger question of consideration; it could be said they do for without their existence, the functionalities of the celestials they create would not occur, but whether the mergencial processes have a direct impact upon the nature of the functionalities of the celestials they create is more ambiguous.

[1:25:37] Mergence is fusionality for it describes two or more entities coming together to form a single entity, but it is also distinct from the other forms of fusionality found in The Cosmos.

[1:25:38] Whether mergence is part of fusionality, or fusionality is simply a branch of mergence is another wider question to be considered.

[1:25:39] In these wider questions, we must apply logic to derive conclusion, so if mergences are the interactions between two or more entities to form a whole, then we describe fusionality, but if our view of fusionality is orthodox, we would view fusionality is only a process occur in entities once they have fully formed, such as those occur in the stars of The Cosmos right now.

[1:25:40] Further so, we can describe fusionality as the manifestation of the motionalality of mergence; mergence being the precursor to fusionality and fusionality being the process that continues to change the formity of the celestial, especially in relation to stars.

[1:25:41] The inversivity of cosmical mergence is an interesting paradox for the oppositism of mergence is separation, but in the mergencial process, that which can merge must first become of something, often through separation, an exemplar of which would be the formation of The Moon.

[1:25:42] And so, we are left with the concept holding that the inevitability of separation is mergence and vice versa; they are one and the same and recurrative of each other like a cycle.

[1:25:43] Though inversities are oppositions to one another, it is more often found that they are closer in their natures than any other relating part.

[1:25:44] Mergence and motionalality, as aforeinferred, are closely intertwined with one another for it is the principle of formative motionalality that the entity formed shall be forever changing and forever in formational motion throughout the entirety of its existence.

[1:25:45] The nature of the mergence dictates the nature of the motionalality thereafter, for a most violent of mergence can cause a most obscure orbitality and rotality, as derivations of motionalality themselves.

[1:25:46] When we arrive at orderity, we must understand that the nature and occurrences surrounding the mergencial processes of a particular entity hold direct impacts upon its orderity, and the orderity of the entirety of the cosmical system in which it resides.

[1:25:47] The consequences of the mergence form a continuum in which the formity, orderity, orbitality, and rotality of all the other entities of a cosmical system are affected; whether the mergence was incipient, or collisional, whether it took far longer than natural, or far shorter than natural, and the proximity of the mergence to other entities within the system.

[1:25:48] All of these factors must be taken into considerations when attempting to determine the extent to which a particular mergence has had over the orderity of a particular entity and over the orderity of the cosmical system in which it resides overall.

[1:25:49] We derive the purposivity of cosmical mergence to be the creation of the progenies of The Cosmos, and by this notion of understanding, we contemplate that mergence is more closely defined and associated with the naturity of The Cosmos and its fundamentalities than many other functions we know to exist in The Cosmos.

[1:25:50] The centrality of mergence shall continue to be held firmly with the respect to the entirety of The Cosmos for if it were not for the existence of mergence, there would be no cosmical system as we see and understand it so the primarity, centrality, and focality, as all measures of relevance, physical centrality, and importance respectively, are all fulfilled in this way.

[1:25:51] The instrument of study of reciprocity principally exists in the mergencial processes of The Cosmos for in the collisional mergences, a collision occurs and from that a creation is caused, and with the separation of entities, so eventually do they begin to regravitate towards one another, or another entity, thus forming a reciprocative mergence.

[1:25:52] It is logical to notionise the centrality of the reciprocity of mergencial processes for reciprocity is a natural and intrinsic function of The Cosmos and starts to highlight what it means to hold cosmicality.

[1:25:53] The interconnection of The Cosmos is reflected by its reciprocative naturity; most cosmical entities and their inherent naturities are dependent upon the naturities of other entities.

[1:25:54] The Earth's naturity is dependent upon that of The Sun's, and The Sun's naturity dependent upon the naturity of The Milky Way, and forever thereafter; many of the naturities of The Cosmos are interconnected and reciprocative in this way, which provides a primary role for reciprocity in The Cosmos.

[1:25:55] In Mergenics, this reciprocity is exemplified by the different types of mergences and their interconnectedness and their naturities of function, motion, and creation from destruction.

[1:25:56] Solar Mergenics focuses one's thoughts and ideas on the mergences in the formation of stars, Planetary Mergenics deals with the mergences involved in the formation of planets, and Galactic Mergenics deals with the mergences involved with the formation of galaxies as a whole as distinct from the entities within the galaxy.

[1:25:57] Finally, we see vastity in the mergences of The Cosmos for there exists a wide-ranging spectrum of variation in the mergencial processes; we witness this in the collisional and incipient forms, as well as in the time, space, and matter of mergences as factors that impact the naturity of the mergences and its subsequent qualities and consequences.

[1:25:58] It is logical to pinpoint vastity in the mergences of The Cosmos because the entities of The Cosmos that the mergences create are vast in their naturities, orderities, and appearances, and so, it is perfectly logical to notionise that the mergences that form such entities should hold vastity in both equal and outweighing measures.

Orthogonalism

[1:26:1] Although it is well known that perfect right angles do not exist in nature, we can still derive philosophical meanings from the concept of right angles and an instrument of study is established to tackle such questions of right angular shapes and shall be henceforth known as Orthogonality.

[1:26:2] Approximate right angles and cubic structures are thus the only exemplars of orthogonality in nature in The Cosmos; there are very few natural entities that exist in perfection; the stars are not perfect spheres, and neither are the planets, or the moons, and neither are the galaxies perfect discs.

[1:26:3] Perfectionism is rare in nature, and this is the view we must derive from the study of right angles, because right angles, but their very purposivity, naturity, and structure, are perfect.

[1:26:4] As a concept established herein, Orthogonalism attempts to locate the right angles of The Cosmos and attempts to infer philosophical meaning, measure, and circumstance from such a perfect structure.

[1:26:5] Notice that cubic shapes are almost nonexistent in the structures of the entities in The Cosmos; circularity and spherical shapes dominate the structure of The Cosmos; cubic shapes seem to be a product of largely human construction in our attempt to fulfil function, practicality, and conformity.

[1:26:6] Orthogonalists are herein tasked with answering why the question of the lack of abundancy of right angles and more general cubic structures in The Cosmos.

Scientificism

[1:27:1] Scientificism, also known as prosubstantiation, is the construction and continual association of Astronism, especially with regard to Cosmic Philosophy, with all up-to-date scientific concepts, theories, hypotheses, and proven facts about cosmical phenomena.

[1:27:2] Prosubstantiation fulfils its purpose to eternally bound The Philosophy to the findings and discoveries of astronomical and cosmological sciences whilst underpinning philosophical instruments such as logic, rationality, and all other instruments of study to the concepts established.

[1:27:3] Another set of Twin Instruments is herein established due to prosubstantiation, and these are henceforth entitled as Innemnity and Disinnemnity; these both structure a spectrum of determining the extent to which a concept, or philosophical stance falls in alignment with current scientific and empirical knowledge.

[1:27:4] Inneminence and disinneminence are defined as an adherence and inference to scientific concepts in the establishment of a philosophical principle, or the inadherence, and disinference to such if one takes a stance of disinneminence.

[1:27:5] It is the primary goal of Astronism, by following principles held by prosubstantiation, to always align the philosophy with the findings and knowledges derived from scientific methods so as to sustain the innemnity of the philosophy.

[1:27:6] However, there are times of inevitability wherein the disinnemnity shall prevail and the philosophical ideas and mindset and method shall overcome that of the scientific, especially in fields wherein science's knowledge holds great restrictions upon one's ability to interpret ideas and to strive towards new understandings.

[1:27:7] Prosubstantiation reaffirms the role of science in Astronism and its valued place as one of the largest sources from which much of the concepts of Cosmic Philosophy are based upon.

[1:27:8] In the history of philosophy, its relationship with science has been somewhat strong, but always distant; with the introduction of scientificism into the Astronist Tradition, this distance between philosophy and science is shortened and two are celebrated as in a two sides of the same coin concept.

[1:27:9] It is the role and responsibility of the prosubstantiator to regulate the scientific associations with Astronism and it remains their duty to secure this relationship and to reflect the changes in scientific knowledge through the creation of officialised texts.

[1:27:10] Please always take note of how easy it remains for the revelation of intent to distort the kindest of gestures.

Sporadics

[1:28:1] In the Astronist Cosmology, existence is divided into two components forming the Astronist Paradigm; these two components are The Cosmos and The Chaos, and it is the sole conviction of all whom the philosophical discipline henceforth known as Sporadics to delve into the depth, darkest, and most equivocal corners of The Chaos.

[1:28:2] Therefore, sporadics is the overarching study of both The Chaos as a distinct and whole entity, and the elements and parts of elements of The Cosmos that are considered to be chaotically influenced.

[1:28:3] By this definition, sporadics is integral to many parts of Cosmic Philosophy, and has aforeinferred and is latterinferred throughout the Omnidoxy, for it is an important aspect to consideration for many concepts and disciplines of cosmological philosophy

[1:28:4] It is in this discourse, however, that we shall speak of it by its own measures and means and in distinct separation from all the others concepts of Cosmic Philosophy in order to draw a clearer and wider picture of its naturity, purposity, and ultimation in relation to The Cosmos itself, but also in relation to The Universe and The Divine.

[1:28:5] That which is henceforth known as Chaos Theory in Astronist Philosophy defines the entirety of the concept of The Chaos; the concept that there exists certain entities, and certain elements of entities that do not fit into the cosmical system because they do not conform to paths of orderity, functionality, and purposity, and their naturities are largely unknown.

[1:28:6] Unknowability is the primary factor of that which is considered to be part of The Chaos; an exemplar of which is a black hole; its nature is largely unknown, its functionality and the results of entering one are largely incompetent of providing meaning to a cosmical system; and finally, its purposity also unknown, though speculation about all its factors and aspects is rampant at present.

[1:28:7] Often, it is the entities and elements of The Chaos that are the most speculative, yet too, are the most abundant of philosophical contemplation and conceptualisation.

[1:28:8] The Cosmos and The Chaos exist in the Astronist Cosmology as equal components of the same concept; a concept of reality and existence; The Cosmos and The Chaos depart one another's side in almost every way, except when they return and are united under the concept of The Universe; the all-encompassing superstructure in which they both reside.

[1:28:9] Essentially, the Chaos Theory is a manifestation of the lack of human knowledge of certain elements and entities within The Cosmos; it is the attempt of Astronist Cosmology to categorise that which we do not know separately from that which we do not.

[1:28:10] The Cosmos exists as a structured and well-ordered whole and the extent of the cosmicality reveals this in each and every cosmical entity, but there are those parts that exist which do not seem to share the same qualities as that of the stars, the planets, the galaxies, and their orderities, orbitalities, motionalities, and naturities.

[1:28:11] All that does not conform to this perception of cosmicality is designated as being chaotically influenced.

[1:28:12] It is a mistake, however, to confuse chaosity with evility, or inferiority, for it is clarified herein and remains true hereafter that that which is labelled as chaotic is simply an element of The Cosmos that we do not comprehend and does not fit into the cosmical structure that we have perceived.

[1:28:13] It may be the goal of some philosophers of The Cosmos to eradicate all the members of the list designated as chaotic by discovering all their current incomprehensions and reveal true meaning, and this is surely a goal of the entirety of Astronist Philosophy and Cosmic Philosophy, but the following principle of knowledge remains.

[1:28:14] Humanity shall never both know, accept, and understand All things for in doing so, we become as the creator of The Universe; it is part of the naturity of the human mind to all have more to know, to accept, and to understand.

[1:28:15] This does not mean to say that the philosophers with such ambitions should stop their convictions, no, in fact, the opposite is true; go forth and uncover all the incomprehensions of The Chaos and The Cosmos, but so equally know, accept, and understand, that there shall be just as much incomprehension when you breathe your last breath than there was when you began your Philosophical Quest.

[1:28:16] Again, this does not mean to say that no progression has been made; it is a principle simply stating that with the achievement of knowledge comes more unanswered questions; we must strive towards the achievement of knowledge in the acceptance and understanding that knowledge is eternal for us.

[1:28:17] The more we know, the less know, for the questions our advanced minds pose are greater still than the knowledge we possess; this is not a matter of choice, or decision, but a matter of whom we are and our collectively shared naturity as humans.

[1:28:18] That which is known as The Chaos is known so by its lack of orderity as aforeaffirmed, yet too, we see gaps in this notion for it is the supermassive black holes that exist at the centre of all galaxies and it is these that around which all cosmical progeny ultimately orbit as the Dark Centralities.

[1:28:19] It is logical for one to pose the notion that if black holes are the centralities of our galaxies, then how can they be lacking in orderity; in this, we see the greatest exemplar of the criterium of The Chaos; the lack of human knowledge of the entity in question.

[1:28:20] Black holes are categorised as so due to the lack of human comprehension relating to them, and even though this constitutes a valid reason for their chaosity, it isn't conclusive of what they truly are; for these, we must turn to the philosophical discipline of Obliviology as latterdiscoursed.

[1:28:21] By these collected notions, we understand that The Chaos and The Cosmos are as One; The Chaos exists as the unknown elements and entities of The Cosmos, though it must be said that The Chaos cannot be totally encompassed by The Cosmos because the entirety of the existence of The Chaos is not known and therefore, it cannot yet be known as to whether it extends beyond that which is henceforth known as Cosmical Reality.

[1:28:22] We do not know whether the entities and elements of The Chaos lead to alternate dimensions of existence and reality, and until we confirm this true, or disprove it as false, we cannot say that the entirety of The Chaos is encompassed by The Cosmos.

[1:28:23] The Chaos is The Chaos because we do not yet understand its naturity, and because we do not yet understand its naturity, we cannot say that it is finite like The Cosmos, nor we can see it is universal, or infinite.

[1:28:24] By adding the concept of The Chaos to discussions regarding fundamental reality, existence, and cosmology, we form a newfound paradigm of understanding that is henceforth known as the Quaternion Perception and is constituted by the Four Integrants; The Cosmos, The Chaos, The Universe, and The Divine.

[1:28:25] The establishment of the concept of The Chaos is vital to the establishment of the overall Astronist Cosmology and demonstrates itself as a newfound understanding of existence and reality; without The Chaos, we are left with a void in which disorderity is not given any philosophical grounding and is merely left without direction.

[1:28:26] As part of Sporadics, we must also introduce the concept of oscillation in The Cosmos and its sporadic naturity; if an entity is in constant oscillity, as an instrument of study that is distinct from that of motionality, it struggles between concepts of cosmicality and chaosity.

[1:28:27] Oscillation is bound by a regular rhythm by which it occurs and is therefore limited by its own naturity; this demonstrates a hint of cosmicality, but the chaosity of oscillation remains true in the lack of understanding of its purposity, and the general lack of stability in relation to oscillatory entities.

[1:28:28] In close connection with the instrument of study of oscillity, is that of torsity; the extent to which an entity makes, or is involved with, some type of twisting motion, especially in relation to another entity.

[1:28:29] The existence of torsions in The Cosmos are perhaps best manifested as wormholes, which are henceforth known as ingenators in the Astronist Tradition; in these, time, space, matter, and the entirety of reality and existence as we currently perceive it are reversed through the torsion between two points in spacetime.

[1:28:30] Torsity, as an instrument of study, is now also broadened in its definition to encompass the idea that it relates to the extent of the natural manipulations in either space, time, matter, or existence, or the manipulation of some, or all of these components.

[1:28:31] Torsion and torsity are considered to be part of The Chaos because they allow for the contrusion of reality and the cosmical system; the very fact that torsity relates to natural manipulations links torsion to The Cosmos, but our perception remains the same, and that is bound by our lack of knowledge on this issue.

[1:28:32] Perhaps it is only when we have experienced the ingenators of The Cosmos that we shall truly comprehend their purposivity, naturity, functionality, and orderity, but until this understanding is achieved, torsion, and ingenators shall remain in The Chaos.

[1:28:33] This leads us on to discuss a principle that must be made clear on behalf of the entirety of the Astronist Tradition; we can perceive purposivity in two ways in relation to a particular entity.

[1:28:34] The first relates to how we, as a sentient species, are able to use the entity in question for our own purpose; this is henceforth known as Anthropic Purposivity.

[1:28:35] The second relates to how the said entity holds a purpose from the perspective of The Cosmos itself which is always very different from how we can utilise the entity for our own purpose; this is henceforth known as Cosmic Purposivity.

[1:28:36] Herein, a principle arises and is one that is firmly held in the Astronist Tradition and it henceforth states that when in a philosophical discussion and contemplation of the purposivity of an cosmic entity, unless precursory disclaimed otherwise, we must decide its purposivity according to a cosmical criteria, not that of an anthropic criteria; this is henceforth known as the Cosmic Criterion Principle.

[1:28:37] By viewing an entity in terms of an anthropic criteria, we lower the entity and its purpose to our own means, knowledge, measure, and motivation which does not afford its true, cosmical purposivity.

[1:28:38] As an example, the true and cosmic purposivity of an ingenator is not simply to allow for matter to reach across large distances in spacetime quickly, for this is the

anthropic purposivity of the ingenators; that potential is what forms their purposivity to us from our perspective because we have a motivation to exploit that natural phenomenon.

[1:28:39] The true purposivity of the ingenators is currently unknown, which is why this phenomena is, at the time of this writing, categorised as part of The Chaos; we know its anthropic purposivity and relevance and its potential to benefit us, as humanity, but we do not quite yet understand its cosmical purposivity, which is a purposivity not bound by motivation, benefit, or intent.

[1:28:40] To bring this closer to home yet again, we see this paradigm exemplified by the purposivities of The Earth, of which there exist two in this particular argument.

[1:28:41] The first purposivity stems from the human perspective of The Earth; The Earth is here as our source of existence and it is upon The Earth that we are dependent for our survival as a species and as a civilisation.

[1:28:42] However, the second purposivity originates from the perspective of The Cosmos; to The Cosmos, The Earth's purposivity is much less significant for The Earth exists as one planet out of a countless abundance in The Cosmos and if The Earth were to suddenly disappear, it would cause very little difference to the entirety of The Cosmos, but from our anthropic perspective, we would no longer be in existence.

[1:28:43] Therefore, it is the purposivity of The Earth from the perspective of The Cosmos to rotate and to orbit around its parent star, The Sun, and to allow The Moon to orbit around it, and that is the extent of the purposivity of The Earth from the empirical perspective of The Cosmos.

[1:28:44] We must be careful not to layer our motivations and intent from which we derive purposivity over that of the true and pure purposivity of a cosmical entity, or phenomena.

[1:28:45] As the philosophical measure of purpose, purposivity is bound by perspective, like many other instruments of study, but studying purposivities of different entities allows us to establish our change in mindset and the widening of our perspective, which subsequently leads to the development of the ability in our minds to practice that which is henceforth known as cosmopathy; the ability to see an issue from the perspective of The Cosmos, and not solely from our perspective as humanity.

[1:28:46] In an astronomical and cosmological contextualisation, a phantom is defined as any type of illusory phenomena found in The Cosmos; illusory in that the appearance, purposivity, naturity, orderity, or functionality of some cosmical entity is not the same in reality as it is from the perception of humanity.

[1:28:47] An exemplar of an illusory nature is that of a nebulaic cloud; the Pillars of Creation are no longer in existence as they appeared to be for their gas and dust elements are in constant motionality.

[1:28:48] Not only are their shapes illusory, but too, their appearancial colours for the beauteous interconnections of hue between the filaments of gas and dust are not as such in reality for their colourings are enhanced by our photographic editors.

[1:28:49] Due to the illusory naturities of nebulae, their categorisation as chaotically influenced is justified and although their label as phantoms of The Cosmos may be considered exacerbatory, their phantomic demonstration is clear.

[1:28:50] Phantomism is a cosmic philosophical stance holding that the phantoms of The Cosmos are the greatest exemplars of chaosity for their true naturities are unknown to us until we physically see them.

[1:28:51] The Phantomists attempt to understand the illusions present in The Cosmos and attempt to derive both meaning and measure to illusory occurrences and phenomena through the application of the instruments of study.

[1:28:52] Phantomity, an instrument of study henceforth entitled, measures the extent to which an entity is phantomic and studies the consequences of being a phantom in The Cosmos, and the application of other concepts and theories onto that of the phantasmal.

[1:28:53] Phantomism also attempts to derive phantomic characteristics in all aspects of cosmical entities and phenomena by the application of human perception and cosmical reality.

[1:28:54] Phantomism exerts an expression of The Cosmos by phantomic means and its progeny by means and measure of their perceived state in comparison to the reality by which they reside.

[1:28:55] Although closely connected to, and largely derived from, the concept of The Chaos and chaosity, phantomism specifically relates to the juxtaposition between idealism and realism in a cosmical context, whereas chaosity is largely the measure and extent to which an entity conforms to the standard cosmical orderity and system.

[1:28:56] Phantomic phenomena in The Cosmos are largely associated with The Chaos, but in truth, they are of a distinct branch; to be chaotic is not always to be phantomic.

[1:28:57] Nebulaic clouds, although they demonstrate a very high rate of phantomity, they are no more chaotic than any other entity in The Cosmos.

[1:28:58] Phantomism and phantomity are majoratively based upon anthropic perception and the level at which something is defined as phantomic is in direct appropriation with our own perception of its appearance, function, nature, and purpose when contrasted with its appearance, function, nature, and purpose in reality.

[1:28:59] Phantomity hinges on perception; without holding our own clear perception on a cosmical entity, or phenomena, we cannot compare such with the reality of the said entity, or phenomena.

[1:28:60] Phantomism is a clause of its own cosmology; a Phantomic Cosmology, in which The Cosmos is perceived under a lens according to the illusory naturities of its entities and phenomena.

[1:28:61] In addition, Phantomic Cosmology is structured by the understanding that all entities and phenomena of The Cosmos hold an aspect of phantomity, and goes on to argue that it is this phantomity of all cosmical entities and phenomena that forms what they are, how they function, their naturities, and their orderities.

[1:28:62] Essentially, the Phantomic Cosmology derives all cosmicality down to phantomity and argues that the perception of The Cosmos and the discovery of the realities of The Cosmos, for the purpose of direct juxtaposition, should be held most highly for it is only the discovery of the reality of The Cosmos that shall forge a greater knowledge and understanding of how The Cosmos truly works.

[1:28:63] By this notion, our minds are led to the principles of Puristic Phantomism, which steadfastly holds that the ultimate goal of phantomism is to draw the truest and purest of realities of The Cosmos in all aspects of its entities and phenomena.

[1:28:64] It holds that perception is the greatest of distractions and distortions from the genuinities of The Cosmos and all its progeny, and therefore in Puristic Phantomism, it is held that phantomism the greatest way of uncovering our Anthropic Vacancy and reaffirming that which is known as The True Cosmos.

[1:28:65] Puristic views on art, architecture, and culture are that The Cosmos and its progeny should not be displayed in embellishment, but in their true, unaltered, and unornamented forms, only as they are viewed through our observations, and this movement and artistic stance is henceforth known as Puristicism, or Cosmic Realism.

[1:28:66] The abundancy of phantomic entities and phenomena is steeped in chaosity for it is only until we understand our own perception of The Cosmos, and until we have experimented on such perceptions to be true through the physical discovery of The Cosmos, that we can derive a conclusive comparison of our anthropic perception and the reality.

[1:28:67] Until we achieve this, there is no way of us quantifying the abundancy of phantomity in The Cosmos, and so does the measurement of frequency suffer in its contemplations.

[1:28:68] We can derive a great amount of bipolarity in the study of the phantomic entities and phenomena in The Cosmos; this is seen by the contrast between perception and

reality, the most unforgiving and hemic of juxtapositions for this demonstrates the intrinsic and inescapable differences between idealism and realism.

[1:28:69] The measure of the cosmicality of the phantomics is another important contemplation for if high phantomy is a greater difference between the anthropic perception of an entity and its actual reality, then this does not constitute incosmicality.

[1:28:70] In this, we must decide from which perspective we wish to view The Cosmos; from that of an anthropic perspective, or from a cosmical perspective.

[1:28:71] Nebulaic clouds hold high phantomy, but they are not examples of disorderity, dysfunctionality, or a distorted conformity to the cosmical system and structure; it is simply a reflection of our own inability to perceive cosmical progeny in their true forms.

[1:28:72] It is therefore concluded that phantomy cannot be considered a measure of cosmicality, and therefore too, cannot be a measure of chaosity.

[1:28:73] The dyadicity of phantomy is conveyed by the intrinsic need for the realisation of perception and its measurement and comparison to reality; these two elements of perception and reality form phantomy, and therefore, form its principles.

[1:28:74] This opens up a larger point about the strict dyadicity surrounding the understanding of anything; this is manifested in the two part concept that there can either be a perception of something, or the reality of something; a middleground here is simply a distortion of either of these two dyadic points.

[1:28:75] The entirety of the purpose of phantomy relates to the extrinsic nature of perception; its extrinsicity points to the unnecessary and derisory role of perception in the contemplation of truth in The Cosmos.

[1:28:76] Whether phantomy holds a great measure of focality or not, therein exists only a matter of opinion and perception; the importance of the measure of phantomy is held highly in philosophical stances such as those found within phantomism, but equally, due to phantomy being based upon perception, in other viewpoints, it is considered unimportant in the overall contemplation of The Cosmos.

[1:28:77] The futurity of the phantomy is clearly conveyed in the Phantomic Cosmology and understands the future according to the eventual abstract construction of The True Cosmos through the revelation of all the existing phantomics.

[1:28:78] A futurity in which The Cosmos is perceived only according to its most real of formations is the ultimate ambition of phantomy and the Phantomic Cosmology.

[1:28:79] The motivation of the study and adherence to phantomism relates to the dissipative actions of categorising perception in order to purify them according to fact, in order to reveal truth; the discovery of this truth is steadfastly held in phantomism.

[1:28:80] The achievement of such truths greatly assigns with the ideas of progressivity, for in revealing truth, we absorb the intended perceptions of The Cosmos and its progeny and only in this achievement of truth shall we progress in our knowledge, understanding, and acceptance of The Cosmos.

[1:28:81] Perception is held as a false sense of reality; whether this is regressive for the human mind, or not is a matter of further discourse, but the principle remains that the construction of an idealised version of The Cosmos embraces a greater experience of and interaction with wonderment.

[1:28:82] The perception of something and its reality are synchronous in that they exist at the same time, just in different realms; perception and reality are two sides of the same paradigm; the former is that of the abstract and the latter is that of the physicality.

[1:28:83] Neither is superior in power and influence for they both hold their fortitudes, and although reality is the truth, it is not always a force of progression to know the truth of something, or some situation.

[1:28:84] Just as the abundancy and frequency of the phantoms largely reside in the shadows, so does their vastity and the extent of their influence over the entirety of The Cosmos.

[1:28:85] However, the principle remains that the greater explorations we make, the greater knowledge we shall possess and so, the greatest understandings we shall hold of the vastity, abundancy, and frequency of the phantom entities and phenomena in The Cosmos.

[1:28:86] Further so, the greater studied this discipline is by the phantomists, the more shall be revealed of the truths of The Cosmos; in truth, we found Pure Knowledge, not Perceived Knowledge, the latter of which is always inferior to the former.

[1:28:87] As we have previously established, there occurs in The Cosmos the largest of eruptions, collisions, and explosions in both creation and destruction, but now must turn own thoughts to that which remains after such fulminations have occurred; these are aptly entitled the residuals.

[1:28:88] The measure and the derivation of meaning and categorisation from such residuals is a newfound instrument of study henceforth entitled residuality.

[1:28:89] The first and foremost characteristic of residual entities is their vastity; they may be small or large in scale in comparison to the entity from which they originated; they may

be cosmically or chaotically influenced depending upon their locomotion, naturity, and orderity.

[1:28:90] From locomotion, we can derive cosmicality, or chaosity; after the catastrophic occurrences of eruptions, cosmic explosions, and widespread collisions, it is logic to understand that the residual entities would scatter into space without direction, or control.

[1:28:91] During this time, the residuals are considered highly chaotically influenced for they hold no orderity due to the proximity of their residuality having just occurred.

[1:28:92] However, the grand force of gravity shall inevitably take hold and take back control of the residuals by reforming their gravitational attraction and assigning it to either the entity from which the residual came, or some new entity that the residual happened to have neared during its seemingly directionless course.

[1:28:93] From this point, gravity shall mould a newfound orderity for the residual and whatever form the residual shall take, it shall, from then on, until the next cosmic cataclysm, align in orderity with the entity that may now be called its centerior.

[1:28:94] And so, it can be inferred, that the locomotion of the residuals is chaotic to begin with, but inevitably turns towards cosmicality thereafter by the grand force of gravity in all its mysteriosity.

[1:28:95] Both the naturity and orderity of residual entities works largely in the same way, for their naturity only turns cosmical once they hold a proper course of direction and once it is proven that they are in the orbit of a larger entity, and not just hastening through space throughout control, direction, or purpose.

[1:28:96] The influence of gravity causes both the orderity and the naturity, in that chronology, to shift away from that of chaosity and towards that of cosmicality; the time in which this occurs is an outstanding factor for it may take millions of years for gravity to secure its grasp, or it may take a much shorter time.

[1:28:97] But until gravity does fulfil its purpose, and does control such chaosities, the residual elements of a cosmic cataclysm shall remain a threat to any cosmical system they proximate.

[1:28:98] Until then, any of the residuals could strike a fatal blow to any other cosmical entity, such as that of The Earth, and thus form a greater disorderity of such an entity that could ripple out to cause disorderity for the entire system.

[1:28:99] Therefore, it is only until this threat is extinguished by means of gravitational control that the residual can be considered cosmical, but until then, its chaosity is too high to be treated as otherwise.

[1:28:100] We have spoken of the vastity of the residuals, but it is their abundancy on a scale of millions and billions, and their relatively compact frequency, especially after impact, that constructs an overall understanding of their vastity.

[1:28:101] The compositivity of residuals is found in their own very naturity and purposivity; although they themselves are not formed by many parts, it is the residuals that form the whole; they are the physical manifestations that demonstrate the composite structure of The Cosmos and all its progeny.

[1:28:102] Residuals hold great levels of criticality for their very existence as the parts of wholes is essential to the structure of The Cosmos and all its progeny, and therefore, without residuals, The Cosmos would not be as it is.

[1:28:103] Another interpretation of the criticality of residuals is their demonstrable ability to cause destruction and disorderity in the cosmical system, thus causing their criticality to remain at heights at which asteroids and meteors in disorderity are also present.

[1:28:104] The study of residuals according to their dynamicity is another instrument affording greater understanding of residuals and residuality.

[1:28:105] From the moment of the cosmic cataclysm of their creation, the residuals are in constant and violent and uncontrollable dynamic states wherein their motionalities, functionalities, naturities, and orderities are in continuous question.

[1:28:106] For this reason, the dynamicity of residuals during their most uncontrolled states, is most high and is often a sign an even greater chaosity.

[1:28:107] Dynamicity does not always constitute chaosity, however, and this should always be remembered, but in the case of the residuals, there exists a certain dynamicity that is difficult to quantify by means of any other entity in The Cosmos.

[1:28:108] The residuals attribute their formity from the collisions, eruptions, and explosions of cosmical and natural phenomena; they are the physical manifestations of the concept of destruction and creation.

[1:28:109] Their entire formity is based upon the destruction of another entity and it is this formity that is found to be unique and perhaps the most cosmical of all formities.

[1:28:110] The residuals hold great potential in their functionality for if when under the influence of The Chaos, they still hold the function of destruction in the inevitability of creation and this is something that shall forever stay as their functionality even after their cosmicalisation.

[1:28:111] Despite their connection to chaosity and their threat to the cosmical system, the residuals are, in fact, intrinsic to the structure of The Cosmos and its progeny.

[1:28:112] Throughout the study of cosmogony, we clearly understand that the largest and most violent of explosions, eruptions, and collisions have destroyed many entities, but in their wake, have created even greater cosmicity in the form of grander entities.

[1:28:113] By this notion, we understand that the residuals of such cataclysms are the building blocks of the progeny of The Cosmos and it is this understanding which leads our Residual Principle and supports the concept of the Creations of Destruction.

[1:28:114] The Residual Principle holds that the residuals of The Cosmos are necessary in all their aspects for both the destructions they originate from and the creations that they will form thereafter; they, themselves, the manifestations of the oxymoronic principle of the Creations of Destruction, and thus secures their high level of intrinsicity in the structure of the progenies of The Cosmos.

[1:28:115] If we are to comprehend the Great Mystery, we should continue to consider all its aspects; this involves the study of subjects that we may not have fully prepared ourselves to learn, or that we had not initially that we would learn of, but we must if we are to become a fulfilled learner.

[1:28:116] The purposivity of the residuals should be clear to us by the notions aforementioned, but if not, let us say here and now that their purposivity lies in the creation of progeny from the ashes of destruction.

[1:28:117] The residuals are the survivors and they shall rebuild by the power of the grand force of gravity; they hold the most important purposivity, for without the residuals, without the survivors, the structures of The Cosmos would not exist as they do.

[1:28:118] Everything that exists is residual of that which existed before it, and it is by this principle that we shall understand and contemplate residuals and the instrument of study of residuality.

[1:28:119] Another instrument of study that is deeply intertwined with the nature of residuals is that of reciprocity; the residual elements of a cataclysm are the physical manifestations of reciprocation.

[1:28:120] A destruction occurred and in turn, reciprocatively, a creation formed thereafter as a direct consequence; the residuals are what form this new creation, and they are what define the essence of what it means to measure reciprocity and enact reciprocation in a cosmical context.

[1:28:121] The residual elements in The Cosmos also demonstrate a sense of synchronicity; in that when they are created, they are so at the same time as millions and billions of other residuals, and when they come together again by the grand force of gravity to form a new

cosmical entity, they are so at the same time as all the other residuals that they are in close proximity with.

[1:28:122] A residual cannot form a whole without the synchrony of other residuals in the same way that a cosmic cataclysm should be questioned of its own genuinity if only a single residual is created; it is not in the naturity of residuals to act, create, or destruct alone, and so, they rely upon their synchrony with other residuals to conduct their functionality, their purposivity, and to fulfil their naturity.

[1:28:123] The most common of residual causes is that of planetary collisions, supernovae explosions, giant volcanic eruptions, and any other violent, yet natural phenomena, that causes smaller fragments to be dispersed into space.

[1:28:124] As we begin to end our discourse on the wide-ranging philosophical discipline of Sporadics, we must discuss the purpose of its entitlement as it is; sporadics derives, of course, from the word, sporadic, meaning to occur in irregularity, and thus, is closely associated with chaosity, disorderity, and a naturity of unknownness.

[1:28:125] More specifically, the state that such entities of sporadics hold is henceforth known as sporadisy and in Cosmic Philosophy, is the main quality of all that is categorised as part of The Chaos; a distinct unknownness about some part of its function, features, naturity, or purpose.

[1:28:126] In sporadisy, we witness and understand The Chaos at its most core of forms; we see it in the context of its most common factor; that of irregularity, abnormality, and in the new instrument of study, concility, the measure of the unknownness of something.

[1:28:127] The oppositism of sporadisy and The Chaos is cosmicality and The Cosmos, and it is only by the proper understanding and perception of The Cosmos, wherein we may form a paradigm of normality and from this, we can compare to derive sporadisy in any entity, occurrence, or phenomena.

[1:28:128] By this notion, we understand the imperativity of sporadisy in the application of these comparisons in order to derive philosophical concepts, meanings, and stances of opinion in the nature of sporadics and what it means to be part of The Chaos.

[1:28:129] If we are to derive sporadisy in entities, events, and phenomena, then we must first define that which is following the cosmic conformity, orderity, and naturity.

[1:28:130] If we are to define that which is abnormal, we must first know that which is normal; the normality must come before the abnormality for unless we wish to not differentiate the two from one another.

[1:28:131] As one of the main aspects of The Chaos, sporadisy is central to the study of The Chaos and what it means for an entity to be chaotically influenced, or for some occurrence to be deemed as part of The Chaos.

[1:28:132] Sporadisy exists in all things, not just that of a cosmical context; we can derive sporadisy in many aspects of our lives; sporadisy in behaviour, in language, in mentality, and sporadisy in philosophical study, defined as an irregular occurrence with greater meaning.

[1:28:133] Sporadisy defies the current logic, but we must always remember that the greatest weakness of logic is that it is bound by our current minds and our current knowledges; sporadisy exists beyond this, and perhaps derives Future Logic, and Future Knowledge.

Time in The Cosmos & The Universe (Epochology)

[1:29:1] The discipline of philosophical study herein and henceforth entitled as Epochology deals with all aspects of time relating to The Cosmos and The Universe.

[1:29:2] There are two primary branches of Epochology of the Astronist Tradition, and these are Cosmic Epochology, the study of time in relation to The Cosmos, and Universal Epochology, the study of time in relation to The Universe.

[1:29:3] There is also a third branch of Epochology that studies time in relation to divinity, and The Divine; this is henceforth known as Divine Epochology, but is lesser studied and less encompassed than the first two branches mentioned.

[1:29:4] It is the role of the epochologists to study each of these branches and to derive meaning, measure, conceptualisation, knowledge, understanding, and a philosophical paradigm in which we can better comprehend time in relation to these large encompasses.

[1:29:5] The triadic encompassis of The Cosmos, The Universe, and The Divine are the overarching concepts that shape the conformation of the study of Epochology.

[1:29:6] Cosmic Epochology involves the measurement, meaning, and concepts of time according to The Cosmos; from our current scientific understanding, The Cosmos began approximately fourteen billions years, but this number means nothing to us for we cannot comprehend it.

[1:29:7] Joseph Stalin once said that one death is a tragedy, and a million is just a statistic; this quote stands true in a cosmical context; fourteen billions years is so large that it becomes its own triviality, though two thousand years is held so highly because it is still a long time in relation to human life expectancy, but it is also just the amount of time that we can comfortably comprehend without it becoming trivialised.

[1:29:8] It is up to us as humanity to widen our minds to be able to not only attempt to comprehend such timescales, but moreso, to appreciate and accept such timescales for the gravity they possess.

[1:29:9] Let us put fourteen billion years into contextualisation relating to ourselves by breaking it down; fourteen billions years ago The Cosmos began via The Big Bang, The Milky Way formed one billion years after that; four and a half billion years ago The Earth formed and three point eight billion years ago, the evolutionary journey of life began on The Earth.

[1:29:10] Two hundred and thirty million years ago, the first dinosaurs are thought to have emerged and they were made extinct around sixty five million years ago; the first humans

walked The Earth around two and a half million years ago and two hundred and fifty thousand years ago, the first modern humans developed from their ancestors.

[1:29:11] Marking the Era of Civilisation, the first human civilisation was established around five thousand years ago and today, the peoples of the world look back and wish not to understand all of this complexity, unquity, and grandity, by not be able to contemplate such timescales for what they are and our place within such timescales.

[1:29:12] In the Astronist Tradition, Epochology is not only the study and philosophical contemplation of the perception, reality, and existence of time, but also a celebration of time and its centrality to all we know and all that is existent.

[1:29:13] We, as humans, perceive what is henceforth known as Anthropic Time; the form of time centred on humanity and human perceptions of time; and then there is what is henceforth known as Cosmic Time; the time centred on The Cosmos and taken purely from a cosmical perspective.

[1:29:14] Cosmic Time is superior to Anthropic Time, but it is Anthropic Time that we as humans are eternally bound to; we can begin to imagine Cosmic Time in its context, but we shall never truly know, or understand it.

[1:29:15] The key difference between the two is that Anthropic Time is a construction of the human mind, and Cosmic Time is a natural progeny of The Cosmos.

[1:29:16] Anthropic Time is defined by our construction of clocks, and calendars, but is also transcendent of these and relates more to our mindset; a general world mindset in which all things are considered under a lens of human existence, human understanding, and human constructions of time.

[1:29:17] Everything we perceive in The Cosmos, the orbitality of the planets, the rotality of stars, the motionality of all celestials, and the time it has taken for them to reach their scales is all based upon our own anthropic perception of time.

[1:29:18] It could be said that all anthropic perceptions of time are in fact false for they are only true to our own circumstances, and are thus, not true or applicative in any larger cosmical or universal context.

[1:29:19] For the purposes of practicality, establishment of Anthropic Time has been the only way to construct our civilisations as we have and it has been the only way in which our perception of the world, reality, existence, and The Cosmos has currently been able to develop.

[1:29:20] It is important for us from herein to appreciate both forms of time with both holding grand purposities for our overall understanding and usage of time.

[1:29:21] There are another two forms of time which are henceforth known as Universal Time and Divine Time; these contemplate time according to The Universe and The Divine respectively.

[1:29:22] The true reality of time is found only in Cosmic Time, for this supersedes that of Anthropic Time for Anthropic Time is a human construction and despite the beliefs of some of us, human sovereignty and authority does not extend beyond our own constructions on The Earth, and so shall never extend to encompass over the entirety of The Cosmos.

[1:29:23] This is an example of what is henceforth known as a Logical Supersession in Astronist Philosophy which defines itself as being the idea that if one's knowledge, authority, and comprehension does not extend over one entity, then it is logical that one's knowledge, authority, and comprehension is not going to supersede over that of a larger entity in both scale and complexity.

[1:29:24] Further so, it remains logical to notionise that time itself is a construct of humanity and even Cosmic Time is a construct of the human mind to want to organise The Cosmos; to The Cosmos, time does not exist by the same name or structure.

[1:29:25] By this notion, we question the very existence of time and its meaning to both ourselves as progeny of progeny of The Cosmos and to The Cosmos directly.

[1:29:26] Nevertheless, time remains the most important construct of humanity and one that shall never fade in its relevancy to all that we do; to us as we are, time's existence is eternal; to exist without time is to exist in a knowledge vacuum for all the knowledge held has been captured by the paradigm of time that we have established.

[1:29:27] Herein, we end our introductory on the discipline of Epochology and questions raised about the most fundamental realities, existences, and perceptions of time, but these shall forever transcend throughout all our epochological studies.

[1:29:28] We begin with the concept of pretemporality; the enaction of the notion that when we look at space and all the celestials, we are looking back in time.

[1:29:29] This concept is best exemplified by the fact that it takes eight minutes for the light of The Sun to reach The Earth so when we look up at The Sun it is as it was eight minutes earlier; although this may mean very little in the case of The Sun itself for we cannot see any difference between the light of The Sun, the concept begins to take effect in the instance that The Sun were to disappear.

[1:29:30] If The Sun was to disappear then we would not realise for eight minutes until after it disappeared when manifests this concept perfectly and draws attention to its importance if The Sun does no longer exist, then neither shall we.

[1:29:31] The concept of a Pretemporal Cosmology understands The Cosmos according to a physical non-anthropocentric perception; essentially, The Cosmos we as humans observe is The Cosmos that exists to us, but holds that this is not The Cosmos that exists to The Cosmos itself.

[1:29:32] A Pretemporal Cosmology is entirely based upon an anthropocentric perception for the Pretemporal Cosmos is The Cosmos we see from our perspective here on The Earth; puristic views would hold that this is the most narrow in perception of all the cosmologies of Astronist Philosophy due to its total reliance on the observances of humanity, not the knowledge of humanity.

[1:29:33] Pretemporality, as an instrument of study, measures the extent of the difference between that which is henceforth known as The Observed Cosmos, and that which is henceforth known as The Literal Cosmos.

[1:29:34] The philosophical stance of Pretemporalism relates to the concept that the Pretemporal Cosmos is the only Cosmos that we can ever hope to observe, and therefore, to gain a greater and truer understanding of The Cosmos, we must imagine and wonderment it rather than observe it.

[1:29:35] This leads us on to the henceforth entitled Pretemporalist Tradition, which is a praxis of Cosmic Philosophy and wider Astronist Philosophy relates to a distinct focus on imagination, wonderment, and theoretical enknowledgement rather than an observation of The Cosmos in order to enhance one's understanding of it.

[1:29:36] This stands in direct opposition to the Observatist Tradition which places a higher focus and importance on the observation of The Cosmos in order to derive philosophical concepts and meaning, rather than that of imagination, wonderment, and theoretical enknowledgement.

[1:29:37] The Pretemporal State is the condition in which a celestial or cosmical entity is in when it is observed as opposed to its Literal State which is the condition it is in, in reality.

Creation Theory

[1:30:1] Epochology also deals with the study of the various cosmic creation theories of the Astronist Tradition, Astronist Philosophy, and Cosmic Philosophy and herein they shall be henceforth entitled and introduced, described, and discussed.

[1:30:2] Autocreationism is the concept that The Cosmos or The Universe created themselves rather than some higher Divine entity; autocreation provides The Cosmos or The Universe with Divine ability to create themselves.

[1:30:3] Autocreational thought can be found inferred in many other insentensations in the Omnidoxy and is the strongest non-Divine creational theory in Astronist Philosophy.

[1:30:4] Autocreationism most often derives an Endless Cosmos theory, or Rebirth Cosmos theory, relating to the idea that The Cosmos, or The Universe autocreate without control of its own creation and so, it endlessly recreates itself after its collapse.

[1:30:5] The theory of autocreation redefines cosmology, theology, and philosophy, and by introducing a self-creating paradigm in which The Cosmos, and The Universe hold no overarching creator.

[1:30:6] Yet, by this notion of autocreation, a non-directional, and non-destinical cosmology is formed; by Divine creation, there exists a sense of destiny, and direction in The Cosmos with a distinct understanding that there exists meaning, purpose, and course in The Cosmos in The Universe.

[1:30:7] Autocreation is a type of cosmology and cosmogony that well aligns with our current understanding of the beginning and the end of The Cosmos.

[1:30:8] Autocreationism's understanding of The Universe is much more obscure than that of The Cosmos; if The Cosmos is autocreated, then where does this leave The Universe in the Astronic Cosmos-Universe Paradigm?

[1:30:9] If multiple cosmoses existed, then they are autocreating all the time in the entirety of The Universe; if autocreationism is applied to The Cosmos, then The Universe must also fall in this autocreative understanding and therefore, The Universe also autocreates.

[1:30:10] The next of the cosmical and universal creation theories is that which is henceforth known as Bicreationism; bicreation is the idea that two distinct entities were equally instrumental in the formation of The Cosmos, or The Universe.

[1:30:11] This concept branches off into many different avenues of thought ranging from dualism (the belief in two Divine creators of The Cosmos and The Universe), multiple non-divine creators of The Cosmos in The Universe such as the concept of

Cosmouniversalism, the concept involving The Cosmos and The Universe as the bcreators of one another equally.

[1:30:12] From bcreationism, many new forms of cosmology and universality emerge to eventually found brand new thought schools, philosophical positions, and cosmological branches that shall inevitably change the way in which we understand and contemplate The Cosmos in The Universe and the relationship between the two distinct entity as outlined by Astronist Philosophy.

[1:30:13] Bcreational Thought contemplates cosmology always in accordance with a two-part creation; two separate and distinct entities must either come together to form the whole, or they must both create the whole by equal means; bcreationism is distinct from dualism as bcreationism does not maintain that existence is predicated upon two entities, just that the creation of existence was.

[1:30:14] It must be said herein that universal and cosmic creational theories, in the context of Astronist philosophical discipline and contemplation, should be studied in isolation from current faith traditions for the concept of The Universe and The Cosmos as separate entities is a newfound concept in and of itself unique to the Astronist Tradition.

[1:30:15] If we are to explore the many different possibilities of the creation of The Cosmos and The Universe and the exploration of their general interactions and symbioticity in such levels requiring a great amount of intellectual and philosophical contemplation, then we must remove our current and past theologies and faiths regarding cosmology and cosmogony.

[1:30:16] By not doing this, we narrow our minds too quickly to the huge variety of philosophical theories and concepts regarding The Cosmos and The Universe and the nature of their creations and evolutions.

[1:30:17] To bcreate is to create one system of existence from the equal measure factor of two distinct entities, which are most commonly The Cosmos and The Universe.

[1:30:18] Bcreationism generally departs from traditional Astronist Cosmology because it equalises The Cosmos and The Universe as playing equal parts in the creation of existence, whereas in the traditional Astronist Cosmology, The Universe is generally considered to be superior to The Cosmos for The Cosmos exists within The Universe and so The Universe holds supremacy over The Cosmos.

[1:30:19] The concept of cocreation relates any cosmological or universal structure that is created by the means of two different entities, but not by equal measure, and so, it is made distinct from bcreation.

[1:30:20] Cocreationism can be the creation of The Cosmos from a two-part collaboration between The Universe and The Divine, or between The Universe and The Cosmos by incorporating some autocreational concepts.

[1:30:21] Cocreational concepts are largely umbrella concepts that don't exactly form their own cosmology, but are part of the structure of others with cocreationism being the only definitive philosophy of a cocreational origin.

[1:30:22] To cocreate is to bring into existence, by means of two separate entities, either by coming together to form a whole, or by using their functions to create a whole from their dyadicity, but this dyadicity is never equal; in cocreation, there always exists a larger, or superseding entity.

[1:30:23] In cocreationism, the philosophy of cocreation, a cosmological order is form wherein two non-equal entities are considered creators of existence; in most cases, this falls to both The Universe and The Divine due to the ultimate naturity of The Universe being largely undetermined and unfixed.

[1:30:24] Although more ambiguous than other creational theories, cocreationism may hold greater logicity when perceived from an Astronist cosmological perspective; due to the unknown naturity of The Universe, a greater emphasis is placed upon the intercorrelations and integrations between The Universe and The Divine.

[1:30:25] The concept of anticreation and its philosophical associate, anticreationism, revolve around the idea that there was no definite creation of either The Cosmos, The Universe, or The Divine, and leads onto principles holding that these entities have always existed, just not in ways that we can comprehend.

[1:30:26] Anticreational Thought blames the lack of comprehension and knowledge and indivinity of the human mind for we are not yet able to comprehend existences beyond that of our own and those of a cosmical naturity.

[1:30:27] Anticreationism gives a Divine feature to The Cosmos and The Universe by suggesting their existences are eternal in one form, or another; here, we see a uniqueness that either raises The Cosmos and The Universe to a higher level, or lowers that of The Divine.

[1:30:28] Anticreationism does wholly accept The Big Bang as a scientific theory, but suggests that it was not the ultimate creation of either The Cosmos, The Universe, or The Divine on any level of circumstance, and instead, puts forward an idea wherein the Ultimate Creation shall never be truly known to us in our current mindset.

[1:30:29] Another creational theory is that of countercreation which holds that during the creation of either The Cosmos, or The Universe, some external forces or entities were pushed against in order for the creation to occur.

[1:30:30] Principally, in countercreation, for a creation to occur, an pre-existing entity must be forced against, or some pre-existing space must have been there for the creation to become existent into.

[1:30:31] The most primary example of countercreational thought is found in the concept that for The Big Bang to have occurred and for The Cosmos to expand, there must first have existed some space into which The Cosmos expanded.

[1:30:32] To countercreate is a method of creation in which some pre-existing entity, or space must be create into or created against in order for the creation to occur.

[1:30:33] Countercreationism raises larger questions about the naturity of The Divine, The Precosmos, the naturity of The Universe, and that which is known as The Precosmic Existence Principle, the principle by which existence in some form occurred before that of The Cosmic Existence, the existence we know and reside within.

[1:30:34] The next branch of Creation Theory is that which is known as Exocreationism; the concept holding that The Cosmos and The Universe must have both been created from some externality, from some entity, or force outside the boundaries of both The Cosmos and The Universe.

[1:30:35] Exocreation is perhaps the most commonly held creational theory as it falls in alignment with theological ideas about how some Divine entity, or deity created The Cosmos and The Universe, from some place outside known existence and reality.

[1:30:36] One of the main causality dilemmas is produced by notions of exocreationism as one asks, if The Divine did create The Cosmos and The Universe, then what did create The Divine?

[1:30:37] This leads us on to questioning the naturity of The Divine, the creation of The Divine, and helps us understanding more clearly what it means to be of divinity, and largely, the answer to the causality dilemma is either that The Divine always existed, or that it autocreated.

[1:30:38] If so, in our abstract thoughtpath, we then return to notions of exocreationism for if The Divine was to always exist, or if The Divine was to autocrete itself, then what space, or field did The Divine always exist within, or autocreated within?

[1:30:39] Furtherso, this leads us onto notions about the fundamental existence of The Divine; in order for The Divine to exist, did there have to exist some space beforehand? Does existence need a plane to occur?

[1:30:40] After discussions about the Initial Creation, Exocreational Thought stands logically truly for The Cosmos exists within The Universe, and all the cosmical progeny exists within The Cosmos which all follows a thoughtpath of exocreationality.

[1:30:41] To exocreate is to create from without, rather than from within, and neither by some autocreational means.

[1:30:42] The next of the creational theories is that of Hypercreationism; the overarching concept holding that both The Cosmos and The Universe were created by Divine means from above were they now physically exist.

[1:30:43] Whether being created from above, or from below, does not constitute goodness or evility in Astronist Philosophy, but instead derives meaning of overseeingness and underpinningness depending on whether one is studying hypercreational, or hypocreational theories.

[1:30:44] Hypercreation tends to fall in alignment with mainstream faith concepts of cosmology, especially with regard to a deity overlooking their progeny.

[1:30:45] Hypercreational Thought is typically exocreational by its naturity; holding that some external force, or god created both The Cosmos and The Universe from an external plane of existence, and oversees the entirety of their creation from a plane above it.

[1:30:46] Simply, to hypercreate, is to both create from above, and oversee one's create from above it.

[1:30:47] Hypercreationism does have consequential effects on its overall cosmology; in terms of logicality, for one to oversee, one cannot be in between and intertwined with the occurrences within that which one oversees.

[1:30:48] Therefore, in a hypercreational cosmology, it is generally considered that there exists no intercession or interaction between The Divine and its universal and cosmical progeny; Hypercreationism places greater emphasis upon free will and the overseeing, yet non-intercessional naturity of The Divine.

[1:30:49] We now come to discuss the Twin Theory of hypercreation, known as hypocreation; this demonstrates the oppositism the theory preceding it, in that it forms a cosmology wherein The Divine, or the creating force of The Cosmos and The Universe exists physically below them both.

[1:30:50] Unlike hypercreational theories, Hypocreational Thought is more logically connected to the ideas of intercession, predestination, and a general increase of interaction between The Divine and its universal and cosmical progenies.

[1:30:51] In Astronist Philosophy, above does not constitute moral goodness, and neither does beneath constitute moral evility; instead, especially when speaking of a Divine entity, physical position has a greater emphasis on meaning relative to the interaction of that entity and its creator.

[1:30:52] Hypocreational Thought is paired with the concept of underpinning which, in Astronist Philosophy, relates to the idea of some Divine creator being both intrinsic, intertwined, and intercorrelated with the entities of its creation.

[1:30:53] This is exemplified in statements relating to seeing divinity in celestial entities, in nature, and in the orderity of The Cosmos; there exists an partially distinct, yet indistinct interconnection within The Cosmos that is formed by the underpinning naturity of The Divine in a Hypocreational Cosmology.

[1:30:54] To hypocreate is to create from below and subsequently underpinning and intertwine oneself as the creator to that which one has created; by this notion, hypocreation is closely connected to the ideas of pantheism.

[1:30:55] The next of the creational theories is that which is henceforth known as anocreationism; the concept by which the creation of The Cosmos and The Universe occurred by infinite chance, that the inevitability of their creation always existed, and in an infinite time paradigm, it was inevitable that their creation would occur and it did.

[1:30:56] Although initially this creational theory may come across as inane, its logical premise is strong than first thought.

[1:30:57] The notion that The Cosmos and The Universe could have been created by chance does hold logicity; from the principle that there must exist something first before something may exist, there must have existed an Infinity Paradigm in which some Divine entity, or so oppositely, nothing but eternality existed.

[1:30:58] In this Infinity Paradigm of time, space, and matter, the means of existence would reside, and so, given an infinite amount of time, space, and matter, it is logical to notion that at some inevitable point, the most perfect combination of time, space, and matter would occur, which is what began The Cosmos and The Universe.

[1:30:59] In Divine terms, The Divine entity that created The Cosmos and The Universe may have not intended such to hold any purposity; given the Infinity Paradigm in which this creationality resides, The Divine would have an infinite amount of time, space, and matter for The Cosmos and The Universe to have created.

[1:30:60] Infinite Chance is the probability of something occurring if an infinite amount of space, time, and matter is available for it to occur; by this notion, we find anocreationism.

[1:30:61] To anocreate is to create by measure of infinite means; if one has an infinite amount of time, space, and matter to do something, it is only an inevitability that it shall happen.

[1:30:62] In the Infinity Paradigm, time, space, and matter, the means by which everything is created, are no constraint; therefore, it is logical to notionise that there was no set time, place, or purpose that The Cosmos and The Universe were to come into creation.

[1:30:63] However, directly from these notions, we begin to go down nihilistic paths of nonpurposity, but so equally could nonpurposity be true as is its counterpart of purposivity.

[1:30:64] The principle of Divine End relates to the idea bound by the logic that if some Divine entity created The Cosmos and The Universe, then it is logical that such a Divine entity would so equally be able to end The Cosmos and The Universe.

[1:30:65] This brings about ideas of presumption; presuming that The Divine will be the initiator of the end of The Cosmos and The Universe, and not The Cosmos and The Universe being the initiators of their own end.

[1:30:66] This concept, and more, relating to the ultimations of The Cosmos and The Universe shall be latterdiscoursed in The Apogenesis.

[1:30:67] Another creation theory is that which is known as Intercreationism; the idea by which space, time, and matter are placed highest in the cosmological structure and whereby space, time, and matter replace notions of The Cosmos, The Universe, and The Divine.

[1:30:68] Instead, it is held that the eternal interactions between space, time, and matter as the cosmical elements of existence are the sole creators of that which we understand to be The Cosmos in The Universe.

[1:30:69] By this cosmology, The Cosmos and The Universe are considered as entities bound by space, time, and matter, which is a logical notion in and of itself, but also, places space, time, and matter upon a pedestal whereby they are the creators of existence and reality.

[1:30:70] Intercreational Thought is generally non-theistic by its naturity and by traditional concepts of god, but it is not irrational to perceive space, time, and matter as playing the role of The Divine in this particular cosmology, which would make this still a Theistic Cosmology, and a Cosmological Trinity at that.

[1:30:71] To intercreate is to create by means of a multitude of separate entities; in this case, three entities exist; time, space, and matter, and they form the reality in which we, the stars, the galaxies, and The Cosmos reside.

[1:30:72] The Universe, however, is a different matter; its reality may well be disproportionate, distorted, or completely differentiated from our own reality, and so, this unknownness generally isolates The Universe from being included in an Intercreational Cosmology.

[1:30:73] Instead, it is simply held that time, space, and matter are still the fundamental creators of The Universe, by the way in which they created The Universe, and the results of such a creation are unknown to us in our current cosmical states, and are beyond our own reality of existence within The Cosmos.

[1:30:74] Intercreationism redefines the cosmological paradigm, and encourages us to think of creational theories in terms of time, space, and matter, and these alone without divinical intercessions.

[1:30:75] We may well infer intercreational thoughts in many other cosmologies and concepts, but it is intercreationism that forms the newfound paradigm and cosmological structure by which time, space, and matter are considered the centralities and all else are considered to be abstraction of what is henceforth known as The Cosmological Trinity.

[1:30:76] We now turn our thoughts to another concept of Creation Theory, that which is known as Intracreation, and its philosophical branch of Intracreationism; this concept encompasses the idea that both The Cosmos and The Universe were created from within, not without.

[1:30:77] To expand upon this, The Universe is considered an eternal plane and all existences, and realities were created within The Universe and expanded out in the form of The Cosmos.

[1:30:78] To intracreate is to create from with inside the creator itself; by this notion of cosmological structure, The Universe is considered to be an all-encompassing entity of eternity within which The Cosmos and all other cosmoses reside.

[1:30:79] In this, the role of The Universe and the role of The Divine interestingly merged together with The Universe become the eternity, divinity, and all-creating entity that The Divine is traditionally considered to be.

[1:30:80] Intracreational Thought and Cosmology involves The Universe as the creator within which all creation occurs, and The Cosmos is considered to be the expanding entity that extends outwardly as the manifestation of creation, but is ultimately bound by The Universe as the eternal plane.

[1:30:81] Monocreationism is more an opposition to other creational theories and cosmologies rather than a unique cosmology of its own; monocreation holds that The Cosmos and The Universe are ultimately created by one being, force, entity, or deity.

[1:30:82] Furthererso, monocreation upholds that the most fundamental naturity of The Cosmos and The Universe is their ultimate oneness, founded upon the idea of The Cosmos being created from one point, and describes The Cosmos and The Universe as one for The

Cosmos resides within The Universe, and although The Universe is infinitely vast, it is still one when thought of as an entity of itself.

[1:30:83] Monocreationism opposes all other concepts that stipulate or infer a multitudinal cosmology, and understands that all else other than singularity, or oneness, is an embellishment and therefore maintains the principle that everything in existence can be derived back to oneness in some form.

[1:30:84] To monocrete is to perceive The Cosmos, The Universe, and the entirety of reality and existence as subjects and progeny on oneness; that all things originate back to oneness.

[1:30:85] This, like many other of the concepts and cosmologies raised in this discoursed, is a largely logical, especially in a cosmical context because all that we know to exist originated from some type of oneness.

[1:30:86] Life on The Earth originated from one cell formation; The Cosmos originated from one singular point of The Big Bang; the black holes hold singularities at their centralities; all the physiologies and biologies of life can be derived back to a oneness; a distinct singleness; a definite moneness.

[1:30:87] In notions of Monocreational Thought, we collate aspects of monotheism, and a principle of Monoultimation; a principle holding that all things of existence must originate from some singularity, or oneness.

[1:30:88] The largest obstacle against monocreationist ideas is that they themselves are ultimately bound by our own cosmical reality and existence.

[1:30:89] In other dimensions, on other planes, and in other cosmoses, dualism may be the origination of all things, and all the monocreationist thought still persists, we cannot know the naturity of the realities and existence of these other cosmoses and beyond our own cosmos and in The Universe itself, and so, this places a great restriction on how far monocreationist thought can persist logically and realistically.

[1:30:90] Nevertheless, monocreation and its philosophical branch, monocreationism, strives on in being concepts of great importance throughout cosmological and theological discourses, and are held centrally in Creation Theory.

[1:30:91] The next of the creational theories speaks of the true oppositism of monocreation, and that manifests itself in the idea of multicreation, and its philosophical branch, multicreationism.

[1:30:92] The principal stipulation of multicreationism is that there exists a multitude of creations and a multitude of originations, never just one creation and origination.

[1:30:93] Multicreationism understands that there are multiple cosmoses, that exist outside our own, that which is referred to in Astronist Philosophy and Cosmology as The Cosmos, and understands that all these different cosmoses reside within The Universe.

[1:30:94] Therefore, the idea of multicreation is widely spoken of during discourses throughout the Omnidoxy, and it is countlessly inferred as an important part of the overall Astronist Cosmology.

[1:30:95] By Multicreational Thought, we derive that existence depends upon a multitude of factors and a multitude of creations to realise; by similar notions, a Multicreational Cosmology may devise that The Cosmos, The Universe, and The Divine were created separately of each other, either autocreationaly, or by some other means.

[1:30:96] Due to the nature of Multicreationist Thought, there ironically exists a multitude of concepts within the creational theory, and its concepts largely transcend multicreationism itself and can therefore be found in many other aspects of Astronist Cosmology and Cosmic Philosophy.

[1:30:97] Due to the multiple functions found in The Cosmos, the multitude of cosmoses considered to be in The Universe, and the multitude of possibilities about the creations, and destructions of The Cosmos and The Universe, and the many theories surrounding the naturity of the creator of all things, Multicreationist views point toward a multitude of creations, originations, and finalities for all things of existence.

[1:30:98] It is an easy mistake to make to classify multicreational notions as all-encompassing ones, but this is a matter of terminological difference, and herein defined is omncreationism.

[1:30:99] Omncreationism is the belief orientation of the concept of omncreation and perhaps the most difficult to imagine; the all-encompassing, all-time, all-space, and all-matter creations that span across an infinity of possibility, time, space, matter, and circumstance.

[1:30:100] Therefore, omncreation is an extension of multicreation with the only difference being that multicreation speaks of a multitude of creations, and omncreation speaks of an infinite amount of creations.

[1:30:101] Omncreational Thought contemplates ideas of infinite creation by all means; they incorporate all realities, all existences, all possibilities, and all creations in a paradigm of infinite time, space, and matter, thus invoking anocreational ideas of Infinite Chance.

[1:30:102] To omncreate is to perceive creation by infinite measures and terms, and finally, suggests that there is no beginning or end to creation; instead, creation is eternal; it has always occurred and it always shall for eternity on an infinite plane of time, space, and matter.

[1:30:103] The final concept of Creation Theory of the Astronist Tradition in The Grand Centrality is henceforth known as pericreation, and its philosophical branch, henceforth known as pericreationism.

[1:30:104] Principally, pericreation is another very common cosmological structural concept that can be found in many other parts of Astronist Philosophy and wider Cosmic Philosophy, and holds that first something to exist, it must exist within something else; this supports the traditional Astronist Cosmology of that which is known as The Cosmos being created and existent within The Universe encompassing it in all ways.

[1:30:105] Pericreationism holds that there must be a perimeter for a creation to be created within, but this concept inevitably leads to the Perimeter Paradox; the infinite amount of perimeters created by the principle that a creation must exist within a perimeter for it to be created.

[1:30:106] There exist many paradoxes within philosophy, and Astronist Philosophy is no exception to this fact, and so, therefore, the subject, tradition, and attempt of the resolution of philosophical paradoxes shall be henceforth introduced and entitled as Paradoxy, and defines itself as a newfound discipline and a major branch of Astronist philosophical contemplation, and a person conducting such philosophical studies is known as a paradoxer, or a resolver.

[1:30:107] Perhaps the easiest resolution of the Perimeter Paradox is the incorporation of The Divine as the ultimator, and therefore, no perimeter is needed to encompass The Divine; there always exists multiple resolutions to paradoxes; never just one, and this stands as the most fundamental principle of paradoxy.

[1:30:108] To pericreate is to create by means of perimeter; a pre-existing plane within which creations reside.

Latter Epochology

[1:31:1] The discourse of Latter Epochology addresses additional theories of time in The Cosmos and The Universe as part of the entirety of the philosophical study of epochology.

[1:31:2] The first of such branches is henceforth known and entitled as Periology; this is the philosophical study and contemplation of the distinctive time periods found in the history of The Cosmos.

[1:31:3] Periologists derive a philosophical cosmological structure and meaning from the periods founded by the science of Physical Cosmology, in order to draw upon larger concepts of overall cosmic orderity, naturity, functionality, and the application of all other instruments of study.

[1:31:4] Although periological contemplations of cosmic time periods are based upon the science of physical cosmology, there are different terms applied to each epoch in the Astronist philosophical tradition.

[1:31:5] The first of all cosmical epochs is known, in the Astronist Tradition, as the Inception Epoch, also known as the Planck Epoch in mainstream Physical Cosmology, and this is generally held, in both philosophical and scientific terms, to be the event of The Big Bang.

[1:31:6] On time scales so small that no current physical theories have managed to contemplate them, this is held as The Creation Moment in Astronist Cosmology, and is the point in time, space, and matter wherein all The Cosmos was as One, in its own singularity.

[1:31:7] In the Astronist Cosmology, it is suggested that this point of Oneness held two distinct features that The Cosmos itself does not; pure divinity and infinity.

[1:31:8] Pure Divinity is specified as such because The Cosmos is certainly directly Divine as omnimentioned throughout Astronist Philosophy, but Pure Divinity means being The Divine itself, or being interceded by The Divine itself, if one is of such faith to believe in divinical entities.

[1:31:9] Infinity is mentioned due to the incessancy, in Astronist Philosophy, of considering The Cosmos as The Finite, and The Universe as The Infinite; however, in this very moment, at the Inception Epoch, The Cosmos shared this quality for it was infinitely dense, and infinitely minute.

[1:31:10] The Inflation Epoch begins thereafter and marks the expansion of The Cosmos; strictly, the Inflation Epoch is still in continuance today and shall be so until The Great Collapse.

[1:31:11] Inflationary processes have been in occurrence ever since the Inflation Epoch, and shall continue to be so as they form the most fundamental parts of the nature of The Cosmos, as well as forming the orderities, functionalities, and motionalities found within The Cosmos.

[1:31:12] The next of the cosmic periods is that of the Nanonic Epoch, which covers both the Quark and Photon Epochs in mainstream physical cosmology, is the period in the cosmic evolution wherein gravitation, electromagnetism, and both types of interaction had taken their currently perceived forms.

[1:31:13] However, due to the temperature of The Cosmos, it remained too hot to allow quarks to combine to create hadrons; this cosmic period is so called due to only the fundamental forces and the elementary particles forming across The Cosmos during this time.

[1:31:14] During the first three hundred and eighty thousand years of cosmic evolution, gravity and electromagnetism were only just beginning their functionalities, and their orderities.

[1:31:15] Next began, what is known in mainstream physical cosmology, as the Dark Ages of cosmic evolution, and in the Astronist Tradition, is known as Tenebrian Epoch, or the Tenebrous Epoch.

[1:31:16] During this cosmic period of about one-hundred and fifty million years, The Cosmos held no large scale structures due to the length of time they needed to form, and so, this epoch is characterised by its distinct lack of progeny, and light.

[1:31:17] However, it is an amateur's mistake to suggest that no cosmical workings were occurring during this period; in fact, many of the earliest formations took place here and so, we can derive greater meaning and philosophical understanding of the nature and orderity of The Cosmos and its progeny by studying this period.

[1:31:18] From the study of this period, we may also derive greater philosophical meaning and understanding of cosmic darkness and what future epochs of darkness in The Cosmos may bring and may consequence.

[1:31:19] During this period also, there was a great cooling down of The Cosmos after the extremity of the temperatures from The Big Bang and the Inflation Epoch thereafter.

[1:31:20] Of the following cosmic period, we discuss a epoch of rapid structural formation in The Cosmos, including stellar evolution, galactic formations, galactic evolutions, and galactical cluster and supercluster developments.

[1:31:21] In the Astronist Tradition, this cosmic period is considered to be of the highest cosmicality and is henceforth known as the Wonderment Epoch due to its intrinsicity to how The Cosmos functions and appears today as we look at it from our small world.

[1:31:22] This is the period in which the galactic disks formed, The Solar System in which The Earth resides formed, and in which the first traces of life on The Earth emerged; this is epoch onto which many of our wonderment of The Cosmos are project and a time during which many of our wonderments of The Cosmos occurred.

[1:31:23] The final member of The Five Epochs is known as the Futurity Epoch; this is the cosmic period relating to the time beyond the Present Epoch and, in Astronist Philosophy, involves The Humanic Exploration of The Cosmos, The Maturity of Progeny, and The Ultimatum of The Cosmos and The Universe.

[1:31:24] The future is metaphorically bright for the humanic exploration of The Cosmos, but not physically bright for it is predicted that stellar formation shall begin to slow down and eventually cease.

[1:31:25] There also exists various ultimatologies for the fate of The Cosmos, and The Universe as two separate entities in the Astronist Tradition; these include concepts from Black Hole Cosmology, Divine Ultimatum, and Finality Theory.

[1:31:26] There are the elements of our existence and The Earth's existence that resided from their beginnings; these are henceforth introduced as initialities; this is no different for The Cosmos, and the elements in existence from the beginning of that are henceforth known as primordials, or primordialities.

[1:31:27] The state of primordiality is to be in existence at the beginning of some occurrence, or some entity's lifespan, and the philosophical study and contemplation of such elements is henceforth entitled as Primordiology.

[1:31:28] Primordiological study encompasses the entire contemplation of primordial celestials in relation to time, and their existence as having an impact upon the overall orderity, functionality, and naturity of themselves, and The Cosmos entirely, as well as incorporating all other relevant instruments of study.

[1:31:29] Primordiality is a newfound instrument of study in and of itself that should be applied when referring to the existence of progeny, or general existence, during the early epochs of The Cosmos, and the extent to which a particular celestial can trace their existence back to the earlier progenies and elements of the early epochs.

[1:31:30] The Primordials are those progeny of The Cosmos that existed in the earliest of epochs and usually take the form of gravity, electromagnetism, the oldest of stars and galaxies, and the gases, dusts, and filaments that formed the Metagalactic Superstructure.

[1:31:31] The philosophical stance of the primordials and primordially is henceforth known as primordialism; in this, the belief is held that the primordial entities of The Cosmos are the most fundamental to cosmical existence and that all other progenies are dependent upon these primordial progenies.

[1:31:32] Furthermore, it is also held in primordialism that it is a logical notion that the primordials shall play an instrumental role in the events leading up to the ultimatum and finality of The Cosmos due to the central roles they played in the evolution of The Cosmos for it to become what it has.

[1:31:33] Primordialist Philosophy plays a focus and a centrality on the primordial entities of The Cosmos, advocates for the discovery of further primordials, and supports greater understanding of primordially and its wider philosophical application as an instrument of study in its own right.

[1:31:34] It is the principal task of the primordialogists to understand, from a purely philosophical perspective, the primordial entities of The Cosmos through the application of the instruments of study in order to derive meaning and greater knowledge and understanding of these concepts.

[1:31:35] The most principal of all primordials is gravity; it is the most fundamental force of The Cosmos that has functionality in all aspects of cosmicality, and is an element of The Cosmos that has existed since the Nanonic Epoch and is expected to do so until the finality of The Cosmos.

[1:31:36] In essence, gravity is The Cosmos and The Cosmos is gravity; without gravity, The Cosmos would simply not be as it is and so, the primordially of gravity is the highest out of all other progeny due to its intrinsicity in all periods of cosmic existence.

[1:31:37] Speaking of the primordials more generally now, we must know how to identify them if we are to philosophically study and derive meaning from them, and so the first two instruments of study that we can apply are abundance and frequency.

[1:31:38] It is logical to notionise that if something is in existence at the beginning and it is so fundamental that it exists so early on, then its influence, whether directly, or indirectly, shall be felt throughout the entirety of existence; by this notion, we have described what it means to be primordial.

[1:31:39] To be primordial is not only to exist at the beginning, but to play a fundamental role throughout existence; we find this exemplified by both gravity and electromagnetism in that they both began their existence in the Nanonic Epoch, and their functionality and influence, whether directly, or indirectly, is still intrinsic to the existence of The Cosmos in the Present Epoch.

[1:31:40] By this very notion, we understand what it means to hold primordiality; it is a matter of existing from the earliest stages of The Cosmos, being intrinsic throughout its existence, and stay in existence until the end of The Cosmos.

[1:31:41] Both the abundancy and frequency of some primordials such as gravity, the filaments, and the cosmic gases demonstrates their primordiality; gravity is in all places of The Cosmos, the metagalactic filaments are so large they make our one-hundred thousand light year wide galaxy an infinitesimal speck and were one of the first cosmical structures.

[1:31:42] Finally, the cosmic gases were instrumental, as ordered by the forces of gravitation, in the formation of the stars, the nebulas, the galaxies, and the quasars of The Cosmos in The Universe.

[1:31:43] All the primordials demonstrate such frequencies during their earlier existences, especially during their clusteration periods, such as when the oldest of stars formed and their proximities were so densely compacted, that their frequency was therefore mosthigh.

[1:31:44] The centricity of each and every primordial must be clear now; their existence throughout the periods of The Cosmos to the Present Epoch and beyond; their high abundancy and frequency; their presence throughout many of the formational structures of The Cosmos.

[1:31:45] After the contemplation of these characteristics of the primordials, we understand that their centricity to The Cosmos and its appearance, functionality, purposivity, naturity, and orderity is paramount and that they exist as, not the centricity to us, but as centricities to The Cosmos in almost every way.

[1:31:46] The vastity of the primordial is another instrument of study that should be applied to primordiological study; there has not ever been just one member of primordiality for there has always existed a wide-ranging field of members.

[1:31:47] They all appropriate themselves upon different appearances, functionalities, orderities, naturities, motionalities, and by all other aspects and measures, with the one unifying quality between them all being their primordiality; their existence in the early epochs, their intrinsicity to the formations of the earliest of celestials, and their existence throughout the epochs of The Cosmos.

[1:31:48] These are the uniting factors of primordiality and they can be found and applied in many of the earliest of celestials, fundamental forces, and the cosmic gases.

[1:31:49] This diversity we see in the primordials is their most cosmical of attributes for we see a grand diversity in The Cosmos and so, it is logical to notion the grand diversity and vastity of the celestials and forces so intrinsic to the structure of The Cosmos and its most ancient of progeny.

[1:31:50] It is also important to remember the compositivity of the primordialials; they only rarely act alone; during their own formations and the formations they participated in, there was a multitude of elements involved in both of these processes.

[1:31:51] The composite nature of the primordialials reflects the composite nature of The Cosmos; it is again logical to notion that those progeny of The Cosmos that have existed for the latest, are intrinsic to the cosmical order, and shall exist until the finality of The Cosmos, will reflect in themselves the attributes of The Cosmos itself.

[1:31:52] Dynamicity is also found in large aspects through the primordialials; since their very creations, they have been beacons of constant change, activity, and progression; both in relation to themselves and in relation to The Cosmos.

[1:31:53] The primordialials have engineered change throughout The Cosmos; they have always been at the forefront of the commencement of new epochs; they have changed the appearance, the order, and the functionality of The Cosmos; they have been the pioneers of cosmical change and they forever shall fulfil this role.

[1:31:54] The dynamicity of the primordialials is again made evident in the extent of their activity; all that is primordial has played an instrumental role in the evolution, the development, and the maturity of all in The Cosmos.

[1:31:55] The interactions between the primordialials and The Cosmos and owing to their creative natures, has made The Cosmos and all its progeny that which they are and that which the peoples wonderment over.

[1:31:56] It is to the divinely infused functionalities of the primordialials and their intrinsicity in the overall history of The Cosmos that we owe our venerations, adorations, and wonderments to.

[1:31:57] It is the results of the fundamental dynamicity of the primordialials that we wonderment though we may not know this when we peer up to the night sky, or imagine The Cosmos in our minds.

[1:31:58] Finally, it is the dynamicity of the primordialials that demonstrates progression in The Cosmos and its evolutionary history.

[1:31:59] It is the primordialials being the oldest celestials, the fundamental forces, the metagalactic filaments, and the ancient cosmic gases and dusts that have formed, structured, and helped expand The Cosmos as we know it.

[1:31:60] They have progressed The Cosmos towards its own greater maturity and of the progeny within it; they have initiated the formations, developments, and evolutions of all that is within The Cosmos.

[1:31:61] If we understand progression to be physical expansion then the primordials have been intrinsic to this; if we understand it to be maturity development the primordials have been intrinsic in this way when in relation to the celestials; and finally, if we understand mental progression in relation to ourselves, it is the primordials and their descendants that have, are, and shall continue to progress us as a united humanity towards greater advanced state of mindset and worldview.

[1:31:62] Therefore, it is clear that the dynamicity of the primordials is central to primordiological study and leads to a better understanding of primordiality as it stands that dynamicity is intrinsic to primordiality.

[1:31:63] We must now apply the instrument of study of focality to the primordials, and in this, we may take ample inspiration from that of the instrument of centricity; if the importance of the primordials has not yet been emphasised, then the application of focality shall clarify.

[1:31:64] If focality is a measure of importance, it must therefore be understood that the primordials of The Cosmos hold the most importance in the overall cosmic evolution for they existed in the earliest of times and they shall exist in the latest.

[1:31:65] Not only this, but the primordials have been intrinsic to all the major formations and occurrences since they came into existence; this give them ultimate focality in the structures, functions, orderities, and places them as the focalities of the entire naturity of The Cosmos and all its progeny.

[1:31:66] By these notions, we can certainly infer that the primordials are the ultimate focalities of The Cosmos and its progeny, and from the application of this instrument of study, we reinforce the overall centricity of the primordials.

[1:31:67] The instrument of study of formity is another applicative that is integral to the formations of the progeny of The Cosmos; the fundamental forces, the cosmic gases and dusts, and the metagalactic filaments were essential for the formations to occur.

[1:31:68] It is insightful to notice the sequency of formation; the fact that formations are created from previous formations demonstrates this intrinsic sequency and we define the primordials as the initial formations in this sequence.

[1:31:69] We must now turn our attentions to the application of the instrument of study of fundamentality; as derived from our study of the focality and intrinsicity of primordials, we can derive great fundamentality from them, both in relation to the cosmical system, and in relation to the overall evolution and development of The Cosmos.

[1:31:70] If fundamentality is defined as the measure of the extent of one's core interaction with something, then we can derive greater fundamentality of the primordials when we confirm their initiality, their proximity to all progeny, and their formative functionalities to

the majority of the systems of The Cosmos we know and wonderment over today and beyond today.

[1:31:71] Essentially, the categorisation of a cosmical progeny as a primordial is the collection of the most fundamental elements and progeny of The Cosmos into a single group.

[1:31:72] The functionality of the primordials can often be forgotten in the shadow of their focality, intrinsicity, and fundamentality, but in fact, these three instruments are the necessary precursors for which we can understand the functionalities of the primordials.

[1:31:73] The primordials were the first progenies of The Cosmos to hold functionality and they are the progenitors of cosmical function and system that pioneered the path for all other progenies to follow.

[1:31:74] Go forth, both the young and not so young, to study the wonders of primordiology, gain a strong philosophical grounding in a unique circumstance of The Cosmos, and become the greatest of primordialogists; primordiological discipline is the study of the most intrinsic of progenies and elements of The Cosmos and it is no small challenge to overcome.

[1:31:75] The philosophical discipline of study introduced herein and henceforth known as Quantumology deals with the study of the earliest epochal stages of The Cosmos as well as with the overall naturity by which The Cosmos has expanded and how this interacts with The Universe as a distinct entity from The Cosmos itself.

[1:31:76] Quantumological study includes both the Inflation Epoch, and the Nanonic Epoch, for they qualify as the earliest epochs of The Cosmos, and the epochs in which much of the most fundamental formations occurred and during which that which is known as The Cosmic Reality formed and developed to become how we know it to be today.

[1:31:77] If we are to understand The Cosmos as it is today and The Cosmos as it shall be in time's futurity, then we must look to its past and we must study its most initial moments for in studying these parts of The Cosmos, we understand from where it can, and from this, we may derive to where it shall go, and how it shall end.

[1:31:78] We must show the children of the world as our solemn duty in our knowledge that The Cosmos holds the answers to our questions, that these studies of a purely philosophical grounding, are the most important of all philosophical subjects because their main functionality and purposivity is to produce ideas and to ignite discussions along this premise.

[1:31:79] If we do not talk about The Cosmos and All that may well exist beyond The Earth, and this is what I see in today's current world, then how are we to explore The

Cosmos, enknowledge ourselves of its wonderments, and ultimately, understand its most important components.

[1:31:80] The purposivity of beginning is to set the course for the middle and the end; the naturity of beginning is to hold no assurity that the current course shall continue, however, its other naturity is to set a precedence for what should happen if its purposivity is to be fulfilled; whether these are met is a question of the functionality of the formations created and their abilities to create new formations that can achieve such goals.

[1:31:81] It is the case for many narratives that the beginning is often reflected in the end by some means, and in a cosmical context, this is even more so true for The Cosmos began infinitely small, and although it is now so vastly large, it shall end as it began, according to some finality theories, whose ideas are logical when based upon the Inception Epoch of The Cosmos.

[1:31:82] Go forth budding quantumologists and study such natures of beginning and end in relation to The Cosmos, use your philosophical mind, methods, and instruments to construct concept relating to the earliest epochs, and explores how these earliest epochs have compounded the naturity, orderity, and fundamentalities of The Cosmos we wonderment, love, and wish to know and understand better, and more.

[1:31:83] The Philosophical Universe is a concept as part of epochology, but also relates to the entirety of the concept of The Universe in the Astronist Cosmology and Philosophy, and refers to The Universe by means of a lens of pure philosophical study; a universe in which any ideas are relevant and contributory, and may be possible in some reality.

[1:31:84] This term also relates to the depiction of The Universe as a distinct entity from The Cosmos in Astronist Art and in other forms of visual artistic expression, and typically involves a mystical aura.

[1:31:85] The Philosophical Cosmos is based upon the same concept, but instead involves The Cosmos as a distinct entity from The Universe within which it resides, and again, relates to the purely philosophical study of The Cosmos, holds a mystical aura around it, and is uniquely expressed in visual arts of an Astronist style.

[1:31:86] An important branch of epochology is that which is herein introduced and henceforth known as Seasonology; the philosophical study, in Astronist and Cosmic Philosophy, of the definitive seasons of The Cosmos and its progeny, the naturity of time periods in The Cosmos, and their variously derived inferences as applied to by philosophical instruments.

[1:31:87] The study of seasonality in The Cosmos is as vast and abundant as there exists planets in The Cosmos for the seasons by which we live are important in understanding natural structures, orderities, and functionalities, but there are seasons outside spring, summer, autumn, and winter that we must expand our minds to.

[1:31:88] The philosophical study of Seasonology merits its own instrument of study in the form of seasonality which measures the extent, diversity, and general nature of the seasons of a particular entity, and the seasonologists may infer of these findings that which they derive.

[1:31:89] Seasonological study must begin with the planet on which we reside now, The Earth, in order to derive clarity of the study itself, and it is always easier for the people to begin with home, the place they know and understand.

[1:31:90] The Earth's seasons are so diverse and vaster than we tend to realise; depending on where we stand on the planet, the season may be so very different from a different location, but like time itself, seasonality is not prescriptive of our Present Epoch, and instead, we can understand The Earth according to its own vast seasonalities.

[1:31:91] By this, we mean to understand The Earth in such a way that see its changing appearance, structure, and topography as manifestations of seasonality, as well as the diversity of the topographies of The Earth both in the Present Epoch, but also in the Past Epochs of The Earth's history.

[1:31:92] Entirely bound by time, season and seasonality are reflections of change over time, and their measurement derive by location, circumstance, and consequence, but most ultimately, it is time that constructs and controls seasonality.

[1:31:93] We can therefore understand seasonality according to The Three Precipices of Time; the past, the present, and the future, and by this philosophical applicational structure, we can study The Earth's seasonality in relation to The Earth's past, present, and future epochs.

[1:31:94] Futurity is therefore one of the central components of seasonological study for it is easily understood that the seasons of The Earth, and as lattermentioned, the seasons of The Cosmos, have always occurred since the inceptions of the progenies, and therefore, by issuing logicity, we perceive that the seasons shall continue into futurity.

[1:31:95] The age of something is another dictation of seasonality for if something has existed longer, then its history of seasonality, its development of seasons, and its futurity of season shall be more matured than something that has not existed for as long.

[1:31:96] The ability of us to explore and determine the forecasts for seasonality is based upon current and past trends of season so the greatest so the longer history of season, the richer the forecasts of season will be.

[1:31:97] We must also see the diversity in seasonality across different worlds; the seasons of The Earth are on large scales of time, with the previous ice age of The Earth occur a couple of million years ago.

[1:31:98] The Human Age of The Earth has comfortably slotted in with a distinct lack of volatility in The Earth's seasons; if humans had tried to establish their civilisations during the last ice age, our expansion throughout The Earth would not have been as widespread.

[1:31:99] Although we may not always remember and acknowledge it, our whole existence is dependent upon the fact that The Earth has undergone a lull in seasonal activity for the last million or so years.

[1:31:100] This lower level of volatility has allowed us to build our civilisations, evolve into sentient beings, spread throughout the world, and generally, become what we are.

[1:31:101] From this notion, we can easily derive that sentience and civilisation are heavily dependent upon season.

[1:31:102] Returning to the aforementioned point, The Earth has large stretches of global seasonal change; some have interpreted this as Divine intercession for the benefit of humanity, while others have derived this pattern by The Earth's position in The Solar System, and its general evolutionary structure.

[1:31:103] However, we must accept the potential diversity of seasonality, and therefore, on others worlds, the extensive seasonal periods experienced on The Earth, may not be so prevalent elsewhere.

[1:31:104] On other worlds, the seasons could change like our days turn to nights; we must accept this rapidly adaptive and altering environment if we are to understand the other worlds of The Cosmos.

[1:31:105] It is the inevitability of cosmicality that the other worlds of The Cosmos will not be as The Earth is; in some ways, similarities will be shared, but in others, the differences will be alarming to our comfortable lives here on The Earth and our narrow minds of monoplanetism.

[1:31:106] A season is simply collective periods of change in whichever context we may find them, whether this be meteorologically related, mentally related, cosmically related, or by whichever means exists.

[1:31:107] One may ask, why are the seasons so necessary to existence?

[1:31:108] It is well-established that it is in the inherent naturity of all existent entities to change, and change is all that seasonality is, but seasonality is just an organised and categorised version of change into a collective period.

[1:31:109] If something doesn't change, it becomes higher and higher in extrinsicity as its functionality, and purposivity are gradually moved away from intrinsicity due to the introduction of newfound functionalities and purposivities to take its place.

[1:31:110] Like all things of existence, the young become old, and so, the old must redefine itself to become new once again for it is not only the naturity of the human mind to value change, but it is the naturity of The Cosmos to do so too.

[1:31:111] To stay intrinsic to the system, the entity must be adaptive to the change of environment and the change of orderity, functionality, motionality, and all other instruments of study relating to either appearance, relevance, structure, or function.

[1:31:112] One may logically notionise that seasonality is based upon need and is therefore executed for the purposes of fluctuance; an intrinsic naturity found in all entities of existence to change in their structure, pattern, consciousness, and ability.

[1:31:113] We can therefore infer that seasons and time periods are essential to existence because they relate to cosmicity in a way that nothing else does; they demonstrate motion in the very being of entities; they are the apparatus of time applied to the structure of The Cosmos.

[1:31:114] Essentially, that is the entirety of what seasonality is; it is the reflection and manifestation of time and time's passing through the progenies of The Cosmos and their ageing processes, their meteorological climates, their evolutions, and their topographies.

[1:31:115] Now we must move on to discuss the seasons of The Cosmos and although at one's initial perception, there may not exist seasons in The Cosmos, they are as prevalent as they are on The Earth.

[1:31:116] It is important to notice that the structure of existence is built upon seasonality; all existent entities are never linear; they are change in their appearance, functionality, purposivity, and their orderity.

[1:31:117] The first of the seasons of The Cosmos can be found in the formation of galaxies; their seasonality rests in the different stages of their formation; the Compaction Season, the Clusteration Season, the Orderity Season, the Dispersion Season, and the Devolvment Season.

[1:31:118] The Compaction Season relates to the earliest part of the galaxy's formation and relates to the time that the gases, dusts, chemicalities, and the early stellar formations are compacted into a dense space as the earliest filaments of the galaxy begin to form.

[1:31:119] The Clusteration Season relates to the time period in which the earliest of stars clustered together during their primitive developments and existed in the nebulaic star factories.

[1:31:120] The Orderity Season relates to the time period in which the developed stars began to form their own systems and started to orbit around the oblivionic centrality of the galaxy; during this season, the first planets formed by the involvement of the force of gravity.

[1:31:121] The Dispersion Season relates to the time period during which both the star systems of the galaxy disperse to form the galactic disc, and the galaxy itself dispersing from other galaxies in its close proximity.

[1:31:122] The Devolvment Season relates to the time period during which the galaxy begins to gradually degenerate from the lack of formational gas reserves; eventually, each and every star of the galaxy will fall into degradation, which will eventually lead to the collapse of the galaxy.

[1:31:123] These are to be henceforth referred to collectively as Formational Seasons as their seasonality is directly derived from the formation of the entity they relate to.

[1:31:124] There are the Planetary Seasons, the Solar Seasons, and Quasarial, and Pulsarial Seasons, and the Oblivionic Seasons; these all constitute that which is known as seasonality in their own unique and finite ways, but each of them generally follow the standard seasonal stages as aforementioned.

[1:31:125] Therefore, we can infer that seasonality, although its xenesises remain unique, its fundamental stages hold a shared similarity between the different progenies of The Cosmos, and this constructs the most fundamental naturity of seasons and seasonality.

[1:31:126] Not only can these seasonal periods be applied to cosmical progeny, but they can also be applied to The Cosmos as a well-ordered whole.

[1:31:127] We see these seasonal periods throughout the different stages of The Cosmos; we see its Compaction, Clusteration, and Orderity seasons, and then we can wonderment of the Dispersion and Devolvment seasons that are yet to come.

[1:31:128] These are not considered epochs in this context, however, because they relates to The Cosmos as one single entity, and the epochs instead relate to The Cosmos when taking into account the entities collectively that exist within it, rather than them singularly, which again comes into the jurisdiction of seasonality.

[1:31:129] From these notions, we can infer that there are intrinsic, inherent, and cosmoswide seasonality stages that are found in all things cosmical and can be inferred to be integral to cosmical structure and orderity.

[1:31:130] Such inferences demonstrate the centrality of seasonology to Cosmic Philosophy and in supporting the wider Astronist philosophical tradition; from this, we can also

understand that seasonology, and its shared instrument of study, seasonality, are in need of much greater development, especially across future times and among multiple peoples.

[1:31:131] From this, we infer an even larger discussion about the true nature of The Grand Centrality itself; The Grand Centrality is ultimately a founding text, and therefore, as aforementioned, is not all-encompassing.

[1:31:132] Expounded in The Grand Centrality, there are countless amounts of foundational ideas and is therefore, a book by which other people will add upon, and this idea is therefore closely related to the lattermentioned Adornment Principle and process of supplementation.

[1:31:133] The Grand Centrality is a book upon which other books will reside and shall be written upon; the subjects, the concepts, and the disciplines of philosophical study are herein founded and the ideas of the future shall also be founded upon these subjects.

[1:31:134] The purposivity and central nature of The Grand Centrality is its foundationality; it is written to found subjects, concepts, and discipline of philosophical contemplation, and it is eternally encouraging of the development of these subjects and concepts for their greater implementation and usage in the world and beyond.

[1:31:135] From this, we understand the nature of The Grand Centrality to be non-dogmatic, motional, and foundational; it, and I, forever appreciate the minds of the future and their improved perceivance, knowledge, and ability to formulate new additions to the ideas and topics founded within The Grand Centrality.

[1:31:136] Seasons and epochs are closely related in Astronist and Cosmic Philosophy, with their main distinction lying in their differences in timescales and subject; epochs are generally on the timescale of hundreds of millions and billions of years, whereas seasons tend to be shorter, although seasons tend to be directed towards a particular cosmical entity.

[1:31:137] Just as we humans change throughout our lives, so does The Earth, so do the stars, so do the galaxies, and so do the most surprising of entities, such as the black holes of The Cosmos, they too, hold seasonality and it is the duty of the seasonologists to derive such seasonality and examine its meanings and inferences.

[1:31:138] We often speak of time in a cosmic setting in grand scales of distance and longevity, but there does exist transience in The Cosmos; there also exists the shortest of timescales in The Cosmos just as much as the longest of timescales.

[1:31:139] The philosophical study of transience and transient existence is herein introduced and shall be henceforth known as transientology; this study also has its own instrument of study, henceforth known as transientality.

[1:31:140] It is reflective of the structure of existence and reality that The Big Bang, the inception of The Cosmos, occurred so infinitely quickly and that the development, evolution, and maturity of The Cosmos thereafter has taken billions of years to occur.

[1:31:141] From this, we can infer that The Big Bang is the greatest and most interesting exemplar of the transience of existence; by this notion, the ephemeral constitutes the emanscent; length continues on from shortness.

[1:31:142] Transientialism and Transiential Thought, from these and other similar notions, hold that emanscence is the concentration of activity in time, and therefore, such instances stand as superior over their ephemeral oppositisms.

[1:31:143] Transientality is the application of the philosophical contemplation of shortness in time to the events, and entities of The Cosmos and leads to wider discussions about the concentrations, compactions, and distortions of time in The Cosmos, and attempts to define certain inferences in order to make philosophical conclusions that hold even greater impacts upon theological, cosmical, and universal concepts.

[1:31:144] Transience is evident throughout The Cosmos; often, it is the most destructive of events that are the greatest in transience; the impact of an asteroid onto a planet, the collision of worlds, the supernovae and hypernovae of The Cosmos.

[1:31:145] Transience can also be linked to ourselves as humans; we often think of ourselves as a long-existing entity as a whole, but it remains true that perspective is often the most distortive of things.

[1:31:146] Humanity has been in existence for a long time, but only from our own perspective, but not from the perspective of The Cosmos.

[1:31:147] Humans, as we know ourselves, have existed for around two hundred thousand years, and if we compare this to The Earth which has existed for four and a half billion years, and The Milky Way nearly as old as The Cosmos itself, at thirteen and a half billion years.

[1:31:148] Therefore, when we make a comparison, the length of the existence of humanity has a blink of an eye compared to these grandities, and so, this would technically categorise our own existence as transiential.

[1:31:149] The downfall of time when used in a philosophical applicative sense is that it is often distorted by the perception of the individual applying it; their knowledge, logic, and understanding forms a limitation to which time has to conform because to apply time in any other way would be outside of our current mental capacity to do so.

[1:31:150] By the study of transience of time in The Cosmos, our most ultimate conclusion is time's intrinsic vastity and diversity in both its manifestations and in the consequences of such manifestations.

[1:31:151] If we are to study the largest of timescales of The Cosmos, then it is both logical and prudent to study the shortest; perhaps it is in the smallest of things that we find the largest of answers.

[1:31:152] Transientology, like all other Astronist philosophical discipline and studies, upholds its centralmost goal to be the accumulation of two types of knowledge; one's own personal knowledge, known as Individual Knowledge, and humanity's knowledge as a whole, known as Entire Knowledge.

[1:31:153] And so now, the greatest minds of the young and the old go forth and use your talents to get yourself where you wish to be, and during this process, make your contribution to where you believe and know humanity should be in order to fulfil its destiny.

The Adornment Principle

[1:32:1] Between discourses, I must explain herein to set a course henceforth about why the original version of the Omnidoxy is, and must always remain without ornamentation.

[1:32:2] It seems illogical that the Astronist artistic style pairs itself so closely with the principles of a strong ornamental culture and vision, and then for the central book of Astronist Philosophy to be largely without ornamentation at all.

[1:32:3] The concept dealing with this is herein and henceforth known as The Adornment Principle; the idea that the Omnidoxy in its earliest of versions is a canvas both mentally and visually upon which others shall inevitably place their ideas, creations, and artistic flair.

[1:32:4] The original versions of the Omnidoxy shall remain unornamented to distinguish them from the beauteous books that shall follow them.

[1:32:5] The Omnidoxy shall remain a book of canvas upon which ideas can be derived from, actions can be made upon, philosophies built upon, and now, pieces of art, that shall be made by one's inspiration for the words of this text and therefore, beauteous covers shall be henceforth made to environ these words.

[1:32:6] The Adornment Principle opens up another dimension of interpretation for the Omnidoxy, as it is therefore understood to be a book of abstract and mental interpretation and founding, and can now be a book of visual and physical interaction and creativity.

[1:32:7] The Adornment Principle holds the best of intentions for it reflects all that the Astronist Culture and Philosophy is; an encouragement of strong, distinct, and meaningful ideas, creations, and arts, and this is upheld by The Adornment Principle of allowing the peoples of The Earth and beyond to cover these words they way in which they wish to.

[1:32:8] Think of this as an intermission of clarity; making certain that all know of the importance of ornamentation in Astronist Culture, but also making certain that all know of the principal ideas beyond the unornamentedness of the Omnidoxy in its original form.

[1:32:9] This should now encourage all the creative minds of the world and the worlds beyond our own to go forth and create their own covers of the Omnidoxy; those which have shown the greatest of skill to complete shall be officially recognised by the Astronist Institution as Official Covers of the Omnidoxy.

The Apogenesis (Ultimatology)

[1:33:1] We begin with a newfound word most of whom will not have ever seen before; apogenesis; simply, the oppositism to genesis; the end of things in all ways; their ultimatum; the state at which one reaches one's existential periphery.

[1:33:2] Beyond the apogenesis, nothing exists, for apogeny is not just simply death; it is the finality of something's existence; for some, the apogenesis may be death; for others, death is simply a gateway to further existences.

[1:33:3] However, the apogenesis is that which is also known as the Absolute End; beyond one's apogenesis, they are no longer in physical, spiritual, cosmical, universal, or divinical existence.

[1:33:4] Therefore, it is sufficive that this discourse be entitled with this notion of Absolute End because this discourse is going to discuss a range of questions, positions, theories, subject areas, and concepts about ultimatum in general and its inherent naturities and ultimatum with regards to specific entities from a purely philosophical perspective and inspired by the current discoveries of science.

[1:33:5] The philosophical discipline of study relating to the ultimatum of entities and The Cosmos and The Universe as whole and distinct entities is herein introduced and henceforth known as Ultimatology.

[1:33:6] Those whom study ultimatology shall be henceforth known as ultimatologists, and it should be no secret that these grand minds shall be taking upon on a task of great philosophical profundity for they pose concepts and questions about the most pressing, incomprehensible, undeniable, and also by some notions, terrifying part of existence; its end.

[1:33:7] The end of existence, whether discussed in terms of the humanic small-mindedness of death, or whether in terms of the Absolute End, the apogenesis, is perhaps the topic that our minds and conscioues are least willing to attempt to comprehend and discuss.

[1:33:8] The psychology of this unwillingness can be left to be discussed by those whom make such questions their profession, but still, it is inevitably left to those whom think of, not only the future, but the end, and not only the end of humanity, but the end of existence itself; it is up to these grand minds to raise the awareness of such philosophical questions and to make its discussion one at the forefront subjects of philosophical debate, in both the Astronist Tradition, but also part of wider philosophical discourse.

[1:33:9] Therefore, there should be no need of further clarity on the importance and centrality of ultimatology in Astronist Philosophy; to all the ultimatologists alive today, and to all those whom I shall sadly never meet to grace and enhance my own thoughts on the subjects, I herein bestow the duty of forever enhancing and championing the subject for the grandity you and I know that lays within it.

[1:33:10] I also encourage you, the budding ultimatologists, and all the persons of philosophical discipline, to take pride in the philosophical subject you have chosen to apply your mind, body, and soul to for it remains true, that in deep philosophical study, all three parts of ourselves are wholly required.

[1:33:11] As all the prominent philosophical discipline of the Astronist Tradition are endowed your own associative instrument of study, ultimatology shall do so too; this shall return in the form of ultimaty, as a derivation of the concept of ultimation.

[1:33:12] Ultimaty can be applied to all areas of ultimatological study and all its derivational topics, as well as that of all concepts, theories, and positions relating to that which is known as endtime, the Absolute End, and also is closely related to ideas of the future, and the instrument of study of futurity.

[1:33:13] The fundamental purposivity of ultimaty is to delve deep within the concepts surrounding endtime, and the pull out their most intrinsic parts in order to expose their true natures.

[1:33:14] As all other instruments of study, ultimaty is crucial to proper philosophical applicational study and it is made clear herein that philosophical study cannot be genuinely made without the application of at least one instrument of study during the process of one's study.

[1:33:15] The essence of ultimation is finality, yes, but it is also inevitability; it is inevitable that all things that exist must also end, and so, inevitability is the naturity of ultimation; another naturity of which is extremity, for it remains the constitution of ultimation to be the very end of existence; the most extreme of extremes.

[1:33:16] All things that exist have their own unique ultimations; all forms of life have their own unique endings; all planets, stars, and galaxies; all things cosmical have an ultimation.

[1:33:17] Universal Ultimation is a more difficult notion to conclusively pinpoint; in the Astronist Tradition, it is understood that The Universe is infinite by its naturity and by our own knowledgeable extent.

[1:33:18] Due to this, it would seem The Universe has no ultimation due to its infinity; this notion proximates The Universe and The Divine even closely to one another as they had been previously.

[1:33:19] These two distinct entities almost become as one when spoken of in ultimatory terms; there only exists a thin distinction between the two in this contextualisation.

[1:33:20] The Universe and The Divine are therefore bound to one another's own ultimations for they are both considered infinite.

[1:33:21] For those without theistic faith, the most prominent of notions regarding ultimation would be The Universe being the only entity in existence without an ultimation for, in this case, there is no beyond The Universe and there is no ultimation of The Universe because The Universe is ultimation itself.

[1:33:22] If The Universe autocreated, then it itself is the ultimation of existence; if an entity is the ultimation of existence itself, then this is why there is no ultimatory circumstances surrounding The Universe.

[1:33:23] The notion of the cycle of death and rebirth could be proposed to stand against the ideas of ultimation, but one of greater philosophical knowledge understands that ultimation goes beyond this cycle.

[1:33:24] Again, the death in this cycle is not the ultimation; it is the gateway into which a newfound existence is formed; by this notion, death and rebirth as found in some faiths is no different from death and the afterlife found in other faiths.

[1:33:25] It is true that ultimation does not relate to death, as aforementioned, but the end of existence itself; unless the cycle holds eternality by some Divine circumstance, then it will have an inevitable ultimation; in some time, it will end as all things must.

[1:33:26] The concept and instrument known as eternality may be considered to be another obstacle to the ideas of ultimation, but again, this constitutes no obstacle to such ultimatory concepts.

[1:33:27] To be eternal is to be ultimate; if one is in an eternal state then one is in their ultimate state for ultimation constitutes an end and if a state is the final state of an entity, then this is their ultimation for they shall no longer ever exist in any other way.

[1:33:28] We now turn to the first and arguably the most unknowable of the branches of ultimatology, that which is henceforth known as vacuology; the philosophical discipline of the Ultimatory Diegesis wherein black holes consume The Cosmos, and is also closely connected to Black Hole Cosmology.

[1:33:29] From what we know currently of black holes, their functionality consists of their gravitational pull being so large that entire stars, and star systems are sucked into their orbit and are ripped apart by the oblivion's gravitational intensity.

[1:33:30] Vacuological study deals with the finality theory wherein black holes become so large in both their scale and intensity, that the entirety of The Cosmos turns into a void wherein only black holes and very few other celestial entities exist.

[1:33:31] Therefore, it is in the vocational interests of vacuologists to study the possibility of this theory materialising, the philosophical inferences of such a theory, and the naturity, dynamicity, orderity, purposivity of The Cosmos in this case.

[1:33:32] In fact, all the instruments of study can be applied to this theory of finality and shall be so herein by accordance with Astronist Orthodoxy; the traditional applications of such instruments in a vacuological context.

[1:33:33] First, we must address abundancy; although black holes are more abundant in The Cosmos than we would first think, the comparison to the abundance of black holes in a vacuological context is so much larger that the entirety of The Cosmos is dominated by them.

[1:33:34] From abundancy, we can infer dominancy and scope, but from the instrument of study of frequency, we can infer intensity; in the vacuological cosmology, the frequency of black holes is as high as the frequency of the planets and stars in The Cosmos today.

[1:33:35] We see great bipolarity in the vacuological cosmology for The Cosmos over which we wonderment, adore, and laud today, is a cosmos filled and built by the most beauteous of celestial entities; beauteous in every aspect of their being; by their colour, their function, their orderity, and their structure amongst other characteristics.

[1:33:36] So, to imagine and theorise a cosmos in which only invisible oblivions exists in a void of light, there seems no greater bipolarity than this; bipolarity in appearance, functionality, naturity, purposivity, and bipolarity in all other ways that it may possibly be applied.

[1:33:37] Perhaps that is why vacuological study is often so depressive and terrifying; to theorise and think deeply by philosophical means is to unveil darkneses and truths that our fragile minds often cannot take.

[1:33:38] There have been many tragedies of humanity; some caused by the natural processes of The Earth on which we reside, and others caused by ourselves, and the most inhumane of humanity.

[1:33:39] There have been these tragedies, but perhaps the most ultimate of tragedies is that all that exists now in its most grand and wondermental beauty shall, in a vacuological cosmology, be gone forever from existence.

[1:33:40] To attempt to both comprehend such a fate for The Cosmos is perhaps the harshest of all truths, but as philosophers, we must face truth, for it is truth that which we

seek; the uncoverment of truth is for that which we fight and it is towards that which we strive.

[1:33:41] It is often only when we enter the harshness of the world around us and that the worlds beyond, that we realise there exists a distinct atmosphere of mercilessness, unforgivingness, and an innocent cruelty about The Cosmos and all its progeny and the subsequent natures that exist within and upon them.

[1:33:42] By this notion, the fates relating to a comfortable, warm, and merciful finality seem not to correspond to the natures from which they are therefore to stem.

[1:33:43] As a philosopher, it is our duty to doubt and question the finalities that speak of comfort, eternal peace, and happiness.

[1:33:44] The question remains; why would The Divine have created such a merciless nature of The Earth, of which its nature can be considered pleasant when in comparison to the natures of the other worlds of The Earth, if The Divine itself is the oppositism to this?

[1:33:45] We shall not let this philosophical discourse distort itself into one of theological debate, but the questions surrounding such intercessions remain and shall become forevermore so prominent to consider as vacuological study, and wider philosophical study, gains greater grounds and means for expansion and entrenchment.

[1:33:46] No matter one's theological beliefs, there exists a distinct mercilessness to The Cosmos and all its progeny from our perspective as humans, and so, it is therefore logical to notionise that the vacuological cosmology is simply the ultimatum of this mercilessness in its most potent, and eternal form.

[1:33:47] Returning to bipolarity, which is what we see in many entities of The Cosmos, and so, it seems logical and rationality to suggest that the most ultimate stage of The Cosmos should be the most extreme polarity from that which we came and was, and this suggestion of concept is fulfilled by the vacuological cosmology.

[1:33:48] In a vacuological cosmology, not only is the centricity taken into question, but also all other aspects of instrumental studies of philosophical application.

[1:33:49] And therefore, in a cosmos of black holes, wherein does the centricity reside? If The Cosmos results in an invisible oblivionic void, then how are we to derive the centricity if there is no light to orbit around the black holes?

[1:33:50] Perhaps the centricity of the Black Hole Cosmology would be a hypermassive black hole around which all other black holes orbit.

[1:33:51] The Cosmos that we know and wonderment upon today is a cosmos structured upon centralities; there are centralities of centralities, and therefore, centrality is most focal in The Cosmos, but in the vacuological cosmology, centrality may not be so focal.

[1:33:52] Due to light being intrinsic to centrality, there exists no functionality for centralities in an oblivionic cosmos.

[1:33:53] The vacuological cosmology is vastly reduced in compositeness compared to its currently existing counterpart.

[1:33:54] Although this future cosmos is more greatly unknown, its overall simplification is clear to any student of it.

[1:33:55] There exists composite parts to the vacuological cosmos and due to the complexity and abundance of such composite parts is vastly reduced, their intrinsicity and focality is greatly escalated.

[1:33:56] From this notion, we derive both the proportionality and the disproportionality found in many of the instruments of study of Astronist Philosophy; an example of which is when the intrinsicity of an entity rises and its extrinsicity falls as a direct reciprocatory consequence.

[1:33:57] These kinds of notions are further discussed in the lattermentioned discourse of Instrument Theory which deals with the exploration of the instruments of study in all their aspects and by all their natures, functionalities, and applications.

[1:33:58] The cosmicality of The Vacuological Cosmos must also be taken into consideration when studying its depths for we know The Cosmos as it is now to be a place of awe, order, structure, beauty, grandeur, and purposiveness, but wherein do these factors exist in the vacuological cosmology?

[1:33:59] For this, the idea of cosmicality may need to be redefined to become the idea that the normality is the essence of cosmicality and if the ultimate fate of The Cosmos is to be dominated by black holes, then the normality exists therein and thus, the cosmicality is rebalanced once again.

[1:33:60] Criticality is the next of the instruments of study to be discussed within vacuology, and although one may first assume the criticality of such a scenario to be the highest of all scenarios, then one would be mistaken.

[1:33:61] Criticality is a measure of the potential for an entity to cause disaster, but in the existence of the vacuological cosmology, all disaster has already occurred for The Vacuological Cosmos to be reached; in the wake of such demonstrable disasters, a distinct calmness is all that remains.

[1:33:62] And therefore, the worst of the criticalities has passed; perhaps this is the greatest demonstrator of the naturity of the vacuological cosmology; an eerie void of darkness, and soundlessness, and all the while with the knowledge of the disasters of the storm passed and knowing that the dominators of The New Cosmos are those which orchestrated the storm.

[1:33:63] Dynamicity is an instrument of study that becomes vastly distorted by the vacuological theorem.

[1:33:64] Dynamicity, as aforeapplied, focuses on the change, activity, and progression of celestial entities, or of The Cosmos as a whole.

[1:33:65] In the vacuological cosmology, there exists perhaps the greatest leap in change in The Cosmos from its current existence today, however, the actual change occurring whilst the vacuological cosmos reigns, would be logically very little.

[1:33:66] The Vacuological Cosmos would be a void of lightlessness, and due to black holes being invisible because of this lightlessness, we would see very little change in The Cosmos once the vacuological cosmology reigned supreme.

[1:33:67] Therefore, the main activity in occurrence in this oblivionic scenario of finality would be the growth in scale of the black holes, which would continuously consume and distort space and each other.

[1:33:68] By this notion, the greatest amount of change in The Cosmos other than the growth in the sizes of the black holes would be the eventual collapse of The Cosmos.

[1:33:69] In this ultimatory theorem, very little progression from a human perspective would be achieved due to the dominance of black holes in The Cosmos; at this point, all that could possibly be progressive would be the collapse of The Cosmos from within, which links to a lattermentioned concept within Finality Theory.

[1:33:70] One of the most interesting applications of instrument in the vacuological cosmology is that of intrinsicity and extrinsicity.

[1:33:71] Under the vacuological dominancy, the intrinsicity of black holes would become so high, that nothing else could ever hope to match it, which establishes an omen for conceptions we have of black holes in The Current Cosmos.

[1:33:72] The most intrinsic entities in The Current Cosmos are the stars, the galaxies, the planets, and the other cosmical celestials, but there always exists throughout Cosmic Philosophy, the lingering of black holes in their chaotic states; their naturities, purposities, orderities, and functionalities.

[1:33:73] In the vacuological cosmology, these elements of black holes are perhaps revealed; does it remain that black holes hold the purpose of consuming the celestials of The Cosmos in The Cosmos's eventual degeneration and collapse.

[1:33:74] It is most interesting, and perhaps even logical, to hold that the existence of black holes in The Current Cosmos demonstrate the rips in The Cosmos, like those in a piece of paper when each end is pulled.

[1:33:75] This points towards the purposivity of the black holes; perhaps they are the most cosmical of the cosmicals; whether we welcome their existences and this proposed purposivity, or not, it will happen that is the course of The Cosmos.

[1:33:76] By this notion, we realise the current extrinsicity of black holes coupled with their lingering intrinsicity, and in the vacuological cosmology, the intrinsicity of black holes reigns dominant while the intrinsicity of all the other celestials fades into non-existence.

[1:33:77] Perhaps the struggle between intrinsicity and extrinsicity is the greatest and ultimatmost concept within The Cosmos; the constant contention between oppositism; this is not an illogical concept, for we see its evidences in many other parts of The Cosmos.

[1:33:78] The struggle between protons and electrons; between lightness and darkness; between goodness and evility in the human world; and between the celestials of The Cosmos.

[1:33:79] This leads us to wonder whether there exists an even larger struggle of intrinsicity and extrinsicity beyond our comprehension; one that takes place between The Cosmos and other cosmoses, or a Universal Struggle, or a Divine Struggle; if so, what is the ultimation of these struggles?

[1:33:80] One action that we must complete in the study of the vacuological cosmology theory is to remove ourselves from the equation for no matter how much knowledge we grasp, or how much power we gain, if the vacuological cosmology is part of The Cosmic Course, then we will be powerless to stop it.

[1:33:81] We shall fight to the end for that is the intrinsic will of humanity, but during studies such as these, we are forced to remove our own existences from the equation, knowing that during these future times, we will no longer exist, and if we do, our existence would be so different from our existences in present time that we cannot say that it would be our version of existence at all.

[1:33:82] No matter how prevalent the black holes of the vacuological cosmology become, their intrinsic naturity shall forever remain the same; they shall still hold finity.

[1:33:83] As long as the black holes still exist within The Cosmos, they cannot be understood to be anything other than being finite for they existence within a paradigm of finity, within which nothing can be infinite.

[1:33:84] The only contention against this concept is the possible functionality of black holes being portals to different dimensions, or planes of reality, or different cosmoses.

[1:33:85] The discoverment of this functionality would render black holes to hold infinity, which would consequently alter even our most basic understandings of black holes, but until that time of discovery, black holes exist as all the other celestials exist, that is being bound by finity.

[1:33:86] It is no surprise to us that the instruments of study of focality, fundamentality, primarity, and vastity when applied to black holes in the finality theorem of The Vacuological Cosmos are at their most high of levels.

[1:33:87] In focality, we measure overall importance of the entity; in fundamentality, we measure the necessity of the entity to the structure of the paradigm in which it exists; in primarity, we measure the principal naturity of the entity; and in vastity, we measure the overall scale and scope of an entity.

[1:33:88] By these four instruments, black holes in the vacuological cosmology attain the most ultimate states in each of them within the finite bounds of The Cosmos itself; in focality, they attain ultimate importance; in fundamentality, they attain ultimate necessity to the structure of The Cosmos; in primarity, they attain a distinct principal naturity within The Cosmos; and in vastity, they attain ultimate scale and scope within The Cosmos by their high level of abundancy, frequency, and dominancy.

[1:33:89] There is a plethora of concepts and inferences to be made when discussing and applying the instrument of futurity to black holes in the vacuological cosmology.

[1:33:90] In essence, such a vacuological scenario forces us to question the very purposity, existence, and naturity of The Cosmos itself in its most fundamental form.

[1:33:91] We know it is the inevitability of The Cosmos, as part of The Cosmic Course, to collapse, or to end, as all existence must, but if the vacuological cosmology is true, why were the celestials and all the other cosmicals created in the first instance?

[1:33:92] If the inevitable finality state of The Cosmos is to be consumed, dominated, and eventually collapsed by a cosmos of black holes, then there leaves very little room for any contemplations about a higher existence, or a greater purposity to human, and more widely, celestial existence.

[1:33:93] If it is the inevitability that darkness shall triumph over light in The Cosmos, then where does this leave existential purposity.

[1:33:94] One could argue that once the black holes of the vacuological cosmology collapsed The Cosmos, The Cosmos would restart and a big bang like scenario would reoccur, thus rendering less despondence, but neither providing us with any greater purposivity.

[1:33:95] We must also take into consideration our own futurities in vacuological studies; where shall our futurity end? What shall be our own finality in this cosmology? How shall that finality occur?

[1:33:96] Ultimately, if the vacuological cosmology is the true cosmical course, then our most solemn action is to accept this inevitability as the will of The Cosmos and its decided destiny.

[1:33:97] With the philosophical application of futurity in this scenario, we explore the inferences that arise from the vacuological cosmology and the subsequent consequences on all elements involved, as well as the consequences on ourselves.

[1:33:98] One of the lowest levels of instrument in the proposed scenario of the vacuological cosmology is that of the instrument of study of imperativity; this cosmology, if it were to materialise, is not to come into fruition for an incomprehensible period of time, therefore its urgency is largely squandered, but this neither reduces its importance in its philosophical study, nor in its actual occurrence.

[1:33:99] The inversivity of the vacuological cosmology cannot be understated during this discourse for all that exists now in The Cosmos shall be the oppositism to all that exists in The Vacuological Cosmos.

[1:33:100] All aspects of inversivity; position, direction, order, and effect are all overturned in their current capacities for the vacuological cosmology to exist as it is theorised.

[1:33:101] Perhaps the instrument of study that shall stay largely the same will be that of orbitality for it is one of the primary functionalities of current black holes that they are either the centrality of the orbit, or that they are a product of the orbit.

[1:33:102] With our current infinitesimal knowledge on such ideas, it is logical to assume that this functionality of black holes will not change even if their abundancy, frequency, and dominancy in The Cosmos changes dramatically from what it is today.

[1:33:103] If they have centralities, then their centrality shall depend upon the size they have achieved, and if a black hole is not the largest or most intense of a group, then it is logical to assume that it shall either be consumed by the larger black hole, or it shall begin to orbit around its larger oblivionic sibling.

[1:33:104] Throughout The Grand Centrality, and in wider Astronist Philosophy, the naturity of black holes is largely considered to be unknown, and so is part of The Chaos.

[1:33:105] By the vacuological cosmology, the chaosity of The Cosmos reigns supreme and calls into question the true naturity of black holes; if chaosity is the measure of the extent of The Chaos within The Cosmos, then the vacuological cosmology would be the ultimate manifestation of chaosity.

[1:33:106] At what point do the chaosities turn into cosmicalities?

[1:33:107] If chaosity and cosmicality are bound by the perception and knowledge of humanity, then are they hopelessly restricted?

[1:33:108] The Chaos becomes as one with The Cosmos when our knowledge of The Chaos becomes as equal as our knowledge of The Cosmos, or it may be normality that reigns; chaosity is perhaps based upon a lack of normality, but The Chaos becomes the new cosmical orderity and system, then that is when The Chaos becomes as one with The Cosmos in Astronist Cosmology.

[1:33:109] Whether cosmical or chaotic, a certain orderity is abided by in the functionalities of celestials, and black holes, although the naturity of their orderity is largely unknown, are still bound to an orderity for they must in order to exist within The Cosmos.

[1:33:110] Black Hole Orderity is the kind of orderity prevalent in The Vacuological Cosmos; it is an orderity wherein black holes dictate orbitality, rotality, functionality, and motionality.

[1:33:111] Finally, in our instrumental contemplation about the vacuological cosmology, we must turn our attentions towards that of rationality; the measure of the extent to which reason and logic are infused with a particular cosmological structure, event, theorem, or celestial entity.

[1:33:112] In Philosophical Cosmology, we must base our conjectures upon reason and logic in some way in order to stay true to the essence of Astronist Philosophy and Cosmic Philosophy.

[1:33:113] In vacuology, the proposed cosmology and ultimatory scenario is based upon logic because it does not gain its basis from any non-proven entity; we know black holes exist, we know their functionality, we know their potential, and this finality theorem is the manifestation of this potentiality.

[1:33:114] The stages by which the vacuological cosmology exists are derived by the most logical of steps from what we currently know about the fundamentality and the naturity of the functionalities of black holes.

[1:33:115] Of course, this theorem remains predictional, but I do not write of this theorem as one of science, but as one of philosophy; this is where many peoples may fall into mistakenness.

[1:33:116] Philosophy is essentially ideas and is strictly abstract; science is the proving and the application of these ideas in the physical world through empirical experience and observation.

[1:33:117] The essence of Cosmic Philosophy as part of wider Astronist Philosophy, is to be largely founded and inspired by current discoveries in science, but too, must still retain its philosophical roots by its theoretical and abstract characteristics.

[1:33:118] It is the duty of Cosmic Philosophy, as part of wider Astronist Philosophy, to go beyond current scientific discoveries and knowledge in order to explore the concepts, the occurrences, the scenarios, and the states of futurity that we do not currently have scientific knowledge of.

[1:33:119] Philosophy and science hold a great deal of dyadicity and work symbiotically; from philosophy comes the ideas, and from science comes the proof of the validity of such ideas, but we must also think of value in this equation for it derives a great amount of importance here.

[1:33:120] Even if an idea isn't valid, that does not mean it isn't valuable; there have been main ideas of the past that have been proven incorrect, but have still held value throughout their existence, and some of these ideas still exist today.

[1:33:121] Value can be derived and measured according to the following four main components; necessity, utility, monity, and emotionality, and just because an idea may not be correct, that does not make it illogical for there may have been many logical ideas that have been disproved.

[1:33:122] The proving, or disproving of an idea is more closely connected to its actuality rather than its value; some ideas hold greater meaning and purposivity than just their manifestations in the physical world.

[1:33:123] The metaphorical aspects of some ideas and the interpretations of these thereafter are the most common valuation to be derived from ideas after that of the idea's actuality.

[1:33:124] As philosophers, the ideas we form are the ideas by which worlds work and by which the peoples of such worlds conduct their lives; whether such ideas are formed in actuality or metaphoricality, this function and purpose provides a value that cannot be equaled and establishes a responsibility that must be understood and adhered to by all professional philosophers.

[1:33:125] Cosmic Philosophy uses the traditional philosophical tools of rationality, logic, and reality, but also incorporates the newfound instruments of study from the Astronist Tradition, which are all infused with a basis in rationality, logic, and reality.

[1:33:126] We cannot say that we know something will happen until it has actually happened and we have witnessed it, or have proven its occurrence; by this notion, the vacuological cosmology is simply one of many predictions relating to the ultimatum of The Cosmos.

[1:33:127] The vacuological ultimatum could be said to be one of the most rational of the ultimatum scenarios due to the lack of divinical, spiritual, and non-scientific components to its surmation.

[1:33:128] All we have are the minds of the cosmologists and the imaginations of the wondermenters; do you see now by this single notion, the huge imperativity of encouraging the Astronist Culture of astronomy, philosophy, and cosmocentricity?

[1:33:129] We must spread this mindset and worldview to all peoples so that they can have the freedom to choose to contribute to philosophies regarding The Cosmos and all that is beyond The Earth, and all that relates to General Philosophy.

[1:33:130] The epoch that the vacuological cosmology relates to is herein introduced and shall be henceforth known as the Oblivionic Era, or the Oblivionic Epoch.

[1:33:131] There are two traditional ways to perceive the vacuological cosmology; the first is most often deemed a mistake in vacuological perception, but nevertheless, holds the concept that in the vacuological context, black holes are destructive of The Cosmos.

[1:33:132] The second traditional way of perceiving the vacuological cosmology is that the black holes become The Cosmos itself; due to their intrinsicity to its existence, they are The Cosmos, rather than its destructors.

[1:33:133] These perceptions should be explored by vacuologists, and the interpretation and introduction of newfound perceivences should also be encouraged to develop by the students of vacuology, as herein clarified.

[1:33:134] In an infinite time paradigm, the possibility of an event will occur as long as it has a higher probability than zero, and so, by this notion, quantum fluctuations in an Absolute Void could spark the inception of a new cosmos.

[1:33:135] This leaves us with an Eternal Existence scenario by which, given an infinite amount of time, an infinite amount of cosmoses could be created, with their space, time, and matter configurations being totally different from our own.

[1:33:136] This is also known as Eternal Cosmology; a cosmology that presumes time's infiniteness and the probability of an event occurring to be higher than zero; by this ultimate notion, time, space, matter, and existence are eternal and both The Cosmos and The Universe in which The Cosmos resides are also eternal.

[1:33:137] When we study in ultimatological terms, we must address the concept of the degeneration of The Cosmos; the gradual deterioration of the physical characteristics of The Cosmos that we adore, laud, and most often wonderment upon.

[1:33:138] Very few ends happen quickly in The Cosmos, even if they seem to; take supernovae as the exemplar of this; there is process millions of years long that leads up to the actual supernovae itself, but it is this process that we are discussing herein, and it is this overall process that is called degeneracy.

[1:33:139] The Cosmos, also known as The Grand World in Astronist philosophical orthodoxy, is structured upon processes and you may notice of processes that their naturity is to inevitably and gradually deteriorate for their level of momentum can only be sustained for finite amount of time for they exist within The Cosmos, and so their momentum is finite.

[1:33:140] We see this degenerative process taking place in the stars; The Sun is burning up its resources everso gradually now, and shall eventually become totally degenerated.

[1:33:141] It can therefore be said that the moment an entity is created is the very same moment that its degenerative journey begins; from the moment we are born, we then begin to go old, with the inevitability of our death; from the moment of a starbirth, the very same moment that star begins to utilise its resources with the inevitability of the exhaustion of such resources.

[1:33:142] By this notion, degeneracy and the rate of degeneracy is solely based upon resource; the extent of and the depth of resources and the speed at which they deplete.

[1:33:143] Degenerational processes can be considered to be the penultimation rather than the ultimatum itself, but they can be found in all entities and scenarios just before the occurrence of the finality.

[1:33:144] We now move our thoughts on towards another branch of ultimatology, and it is the philosophical discipline of study herein introduced and henceforth known as totology.

[1:33:145] Totology involves the philosophical contemplation of something in its total state, or its most ultimate state, in whichever way this may be interpreted by the studier.

[1:33:146] The instrument of study of totality is the cosociate philosophical instrument for the study of totology, and relates to the study of the effects of being in a state of totalness, or ultimateness on the entity, or more generally, discusses the extent to which an entity has reached their totality and how far they yet have to go before achieving it, if they have not yet done so.

[1:33:147] In totological study, the totologist must describe, define, and derive meaning from varying states of totality and although totology is largely studied in a cosmic sense, it may also be studied in both an ethical, moral, and psychological sense, owing to various interpretations about states of totality in these different paradigms.

[1:33:148] To be in a state of totality is to exist in a state of extremity; a Totality State is a point at which one reaches an existence beyond which they do not exist, and so, by this notion, a Totality State is an ultimatum in and of itself.

[1:33:149] If one is in a state of totality, one can exist no further beyond such means; totality from the human mind's perspective is a very personal concept with imperative consequences for each individual and holds as much variation as there exists minds to think it.

[1:33:150] For some, the age at which we live to is our totality for such people believe there is no beyond this existence; for others, a greater existence is hoped and expected and typically comes in the form of some Creator-Creation meeting and from which one's spirit shall exist forever; this would be classed as a Totality State by its definition.

[1:33:151] By whichever totality you believe you shall ultimately attain, there exists inevitability of totality nonetheless, and it is this inevitability that teaches us about the naturity of wider ultimatum; its incessancy, its certainty, and its most important role in who we are and whom we are to become.

[1:33:152] Our beliefs of ultimatum largely dictate our theological orientations, our philosophical ideations, and our general worldviews; by this notion, ultimatum plays a huge role in Psychological Philosophy, the branch of Astronist Philosophy dealing with the interactions between the human mind and philosophical contemplation.

[1:33:153] Totality can be derived in terms of morality; being of the highest morality that oneself can be; from this, we can derive concepts of moral correctness, moral order, and moral decency, which must all be established and encultured if a civilisation is to only function, but carve out a distinct identity for itself.

[1:33:154] If we know the moral totality that we are tasked with reaching, then we can work throughout our lives to be the best we can be in accordance with the jurisprudences of the civilisation in which we are citizen, but if we do not know the moral totality, then how are we to aspire ourselves and those whom are yet to be born to achieve such moral order and decencies?

[1:33:155] This notion affects the human mind by both psychological and philosophical means for if we know or believe we know our own totalities, then that will inevitably affect the way in which we live, what we do, what we achieve, and how we treat others.

[1:33:156] Thought about totality is something that can be taught and even enforced, but ultimately, it is down to the individual's consciousness and their natural orientation towards ideas that shall lead to their truest views about their own ultimatum, and their own Totality State.

[1:33:157] Not only can humans and cosmical entities become totalities, but inanimate entities as well; a government or nation can be, a philosophy can be, a house, a family, a building, a culture; all these things, and all else that exists can be its own totality in its own unique way, and this kind of totality is known as Inanimate Totality; the totality of things that are neither living, yet neither are they celestial.

[1:33:158] These such totalities are often merited by vision; they are formed by the ambitions of the individuals that founded them, or the individuals, or groups that came along afterwards and helped to build them; this is more commonly known outside of Astronist Philosophy as an Idealism, or an Idealistic State.

[1:33:159] In that which is known as Divinical Studies, or Theological Studies as part of Astronist Philosophy, a state of totality is most often ascribed to that which is appellated as The Divine.

[1:33:160] We must now begin to come to an end of our overview of the grand philosophical discipline of totology by focusing on the naturity of the totalities of the two distinct entities that we know as The Cosmos and The Universe.

[1:33:161] The totality of The Cosmos can be interpreted in a number of different ways, a few of which shall be discussed herein, and all of which can be considered orthodoxal viewpoint about the totality of The Cosmos.

[1:33:162] The first totality of which would relate to the point at which The Cosmos is the largest it can possibly become in a physical sense before its own collapse.

[1:33:163] Since the Inception Epoch, The Cosmos has been expanding and it shall continue to do so until the fabric of spacetime collapse and it ceases to exist as we know it now; it is at the penultimate moment just before it collapse, that The Cosmos will be at its largest physically, and it is at this point that we find an interpretation of a totality.

[1:33:164] A totality in the sense that The Cosmos is the largest it could ever be at that point; it holds within it more space and entities than it ever will be able to; it is as vast as it ever will be at that moment, and this is why a totality is derived here; this type of totality is henceforth known as Expansive Totality.

[1:33:165] The second totality to be derived of The Cosmos focuses on grandity, and holds that The Cosmos has already reached its totality and is experiencing it now in the Current Epoch.

[1:33:166] This is argued because many of the celestials and cosmical entities of The Cosmos are in their most mature of stages in their existences in the Current Epoch; essentially, this type of totality which is henceforth known as Grand Totality relates totality to cosmical entity maturity, beauty, and structure.

[1:33:167] Grand Totality opposes Expansive Totality in the fact that when The Cosmos reaches its most expansive point, the celestials and cosmical entities within it will have all but collapse and degenerated.

[1:33:168] Ultimately, Grand Totality is the totality of contents and places greater emphasis upon the celestial entities of The Cosmos themselves to derive totality rather than deriving totality from The Cosmos itself as its own distinct entity.

[1:33:169] This draws upon a larger question of whether totality correlates to either size, or maturity, and quality; take an example of this relating to ourselves; is our totality when we are the fittest, the most agile, and the most productive, or is our totality the moment just before we perish; perhaps we can conclude that there are multiple totalities in equal existence simultaneously.

[1:33:170] Eternal Totality is the next of the totalities of The Cosmos to be discussed, and relates to the concept that The Cosmos is in and has always been in and shall always be in a state of totality for whatever its current state, is whatever its Totality State is.

[1:33:171] The totality henceforth known as the Detotality relates to the idea that The Cosmos has never been in and shall never reach its own Totality State due to the fact that its potential totality is dictated by The Universe and The Universe, by its own naturity, is infinite, and so, even though The Cosmos is finite by its own naturity, the potential for its totality is infinite, and therefore, can never be truly known to be reached.

[1:33:172] Agnostic Totality is another totality of The Cosmos that relates the true totality of The Cosmos to The Divine, and so, the human mind cannot know, predict, or even imagine the truest totality of The Cosmos because the totality of The Cosmos is The Divine; this also henceforth known as the Unknowable Totality.

[1:33:173] Whichever cosmic totality one believes is achievable, or not, the importance of totological study in this area cannot be disputed for by learning greater avenues of knowledge of the totalities of The Cosmos, gives us greater understanding of the wider naturity of The Cosmos and about its ultimation.

[1:33:174] The study of the totalities of The Universe is more burdensome due to the naturity of The Universe being infinite from the basis of Astronist Cosmology and from our narrowsome perceptions here on The Earth.

[1:33:175] Ultimately, the aforementioned concept of the Eternal Totality is the best descriptor of Universal Totality because Eternal Totality relates to the concept that The Universe is in, has always been in, and shall always be in a state of totality due to its infinite naturity.

[1:33:176] We could also relate Agnostic Totality to become a Universal Totality in that because The Universe is considered infinite by Astronist Cosmology, there is no way ever knowing its truest form of totality; there is no conception that we drawn upon that would envisage The Universe in its totality, and so, all we can say is that we will remain agnostic of The Universe's totality.

[1:33:177] Divinical Totality relates to all totological study directed towards that entity which is known as The Divine in Astronist Philosophy, which is related to the creator of existence in whichever faith one believes, or relates to the entity that created existence that is not a deity if one is non-theistic in one's thoughtpath.

[1:33:178] Divinical Totality, from the orthodoxical perspective within Astronist Philosophy, relates to that which is totality itself; The Divine is the Totality State; The Divine is the creator of all things, and so, by this, The Divine is totality.

[1:33:179] For non-divinical thinkers, we can relate to Divinical Totality to that which we know already exists, such as The Universe and its Universal Totalities; it remains imperative that Astronist Philosophy serves all theological orientations.

[1:33:180] The concepts of rebirth, regeneration, and rejuvenation have been in the minds of man since the beginning of philosophical and theological thought, and in Creation Theory, we discussed the possibility of the continuous death and rebirth of The Cosmos in The Universe, and of this death and rebirth process in relation to The Universe.

[1:33:181] In totology, these concepts are encompassed by the concept herein introduced and henceforth known as regenesis; if genesis is origination, then regenesis is the reorigination of an entity; its return to the origination point of its genesis.

[1:33:182] If totality is the extent of an entity's existence, then genesis is a form of this totality because in the moment of an entity's origination is the moment in which the totality of that entity can be seen in a microcosmic way.

[1:33:183] Regenesis relates to the way by which can entity returns to its origination, and this may be seen as one totality returning back to another totality; this return from the Expansive Totality, or the Grand Totality, to the genesis is known as the regenesis, and the

type of totality is known as Originational Totality; the totality at the origination point; the totality at the genesis of an entity.

[1:33:184] Regenesis relates to the cosmical version of death and rebirth; that is, the return of The Cosmos to the size and naturity of The Big Bang following its collapse; this, in turn, forms its own Regenesis Cosmology whereby an eternal cycle occurs of cosmic death and cosmic rebirth.

[1:33:185] Essentially, regenesis is a return to the genesis that did previously occur; from this notion, we can derive a certain naturity of The Cosmos; a naturity by which a return to that which once occurred is prevalent in the cosmical system and orderity; this regenesis can be understood in terms of a return in size and scale, naturity and orderity, or a return by means of appearance, structure, and purposivity.

[1:33:186] Regenesis is a return to the point of origination, not just a previous point in the existence of the entity; it is a return to the original existence of the entity.

[1:33:187] Degenesis, the final concept within what is henceforth known as Genesis Theory, holds the concept that there is never a return to the genesis, and acts as the oppositism to the regenesis.

[1:33:188] Degenesis holds that when the totality of a cosmical entity is reached, they transform into a completely new entity, or else they cease to exist at all.

[1:33:189] Degenesis constitutes itself upon a linear narrative, instead of a circular narrative like the death and rebirth cosmology of regenesis.

[1:33:190] Let us now move onto the study of the various different theories and concepts surrounding finality, the instrument of study relating to the end of The Cosmos, and this discipline is a branch of ultimatology that is henceforth known as Finality Theory.

[1:33:191] The first of the concepts of Finality Theory is henceforth known as autofinality; this relates to the idea that the ultimation of The Cosmos will be triggered by The Cosmos itself, and not some higher authority power, such as The Universe, or The Divine.

[1:33:192] Autofinalism does not deny the existence of The Universe, or The Divine, but simply holds that they do not intercede in the initiation of the finality of The Cosmos.

[1:33:193] The next concept of Finality Theory relates to the idea that the elements and processes that form the finality are more prominent than the actual finality itself; this concept is henceforth known as antefinality, with its philosophical branch known as antefinalism, and this is also known as prefinal, with its philosophical branch known as prefinalism.

[1:33:194] It is held in this theory that the processes and elements that form the finality can tell us more about the naturity of The Cosmos and its finality than the finality itself can; this idea of placing a greater emphasis on the occurrences before the event is henceforth known as predemonition.

[1:33:195] Predemonitional theories are logical in their basis because the elements and processes that form the final entity and occurrence are often demonstrative of naturity.

[1:33:196] The end product, whether that be the entity, or some occurrence, like a finality, are not always demonstrative of their naturities as they are in their physical forms; this is why predemonitional thought is helpful to philosophical study because it allows us to analyse the elements and processes that form the entity, or the occurrence that we intend to study.

[1:33:197] The next of the finality theories is henceforth known as circumfinality; this relates to the idea that the elements and entities in a cosmical system are more integral to the finality than the actual finality and the predemonitional elements of the finality themselves.

[1:33:198] The philosophical position associated with this concept is henceforth known as circumfinalism and relates to the term henceforth known as circumdemonition; the belief in the greater importance of surrounding entities to an event rather than the event itself and the direct elements that form the event.

[1:33:199] Predemonition and circumdemonition are part of the wider concept of demonition; the philosophical construct relating to the study of events and the creation of entities in The Cosmos and the extent to which certain elements had an effect on these events and entities, depending upon the position, the naturity, and the functionalities of the elements surrounding relates to the extent to which they had an effect on the event and entity.

[1:33:200] Demonitional thought allow us to construct a system for our philosophical understanding of why events and entities come into existence, and how different elements effect this by establishing different philosophical positions on how each element differs in its importance to the entity and the occurrence.

[1:33:201] Cofinality is the next of the theories of finality holding the idea that finality occurs only with the cooperation between two or more elements; as well as this, it relates to the idea that finality is not singular, but multi-dimensional in its naturity.

[1:33:202] Cofinalism, which is the philosophical branch of cofinality, holds that mutual cooperation between different elements of a cosmical system is what causes the finality to occur as it in the order that it does.

[1:33:203] Cofinal thought is exemplified by the finality stages of stars; it is due to the running out of resources of hydrogen fuel that the stars begin to expand to red giants, and it is the mixture of chemicalities therein that force supernovas and hypernovas to occur.

[1:33:204] If we look at cosmical finalities microscopically, we can find cofinality in many of the penultimate finality processes in The Cosmos, and is it not often said that in the smallest of things, we find the largest of truths; just because such entities are microscopic, does not proportionally diminish their level of importance according to their size.

[1:33:205] Often, it is also said within Astronist Philosophy, that the smallest of things hold the greatest of importance; perhaps this is an analogy that we can taken upon in much of our philosophical study.

[1:33:206] It is the quality of a good philosopher to never overlook the smallest of things; thoroughness when appropriate is the philosopher's greatest of tools for one's overlooking of a concept, or the element of an concept could be the difference between their philosophical mastery, and their fading into the background amid the noise of the world.

[1:33:207] Essentially, it is up to the philosophers of the world to spot the smallest of problems, identify them, study them, contemplate them, and devise thought systems with the aim of solving them; from this, we can derive that it is the sole duty of a philosopher to turn their minds, as their own in-house telescopes, towards the smallest parts of our worlds.

[1:33:208] Enfinality is the next theorem of finality and relates to the principle that there must be a trigger, or a causality in order for a finality to occur, and it is this trigger, or causality that is the most important part of the entire ultimation.

[1:33:209] This principle is underpinned by its philosophical stance henceforth known as Enfinalism, and rejects the idea that any type of finality is self-occurring, or self-creating, and insists that its occurrence, or creation is forged by some causation factor, whether that be another cosmical entity, some universal force, or a divine power.

[1:33:210] Epifinality is part of Finality Theory and serves as the direct oppositism to enfinality, meaning that it finds the Finality Moment itself to be the most important part rather than any supposed trigger, causality, or another other predemonitional, or circumdemonitional influences.

[1:33:211] The philosophical stance associated with the concept of epifinality is henceforth known as epifinalism, and remains an important part of the overall study of Finality Theory.

[1:33:212] The concept of extrafinality can most often be identified within ideas of regenesis and actually holds the belief that there is never a true finality of anything

cosmical, and believes in the concept of recreation, the death and subsequent rebirth of cosmical entities and eventually The Cosmos as a whole.

[1:33:213] Extrafinalism holds the belief that the entity beyond the finality of the celestial is superior in every way to its predecessor, and places the most emphasis on the entity beyond the finality that the celestial shall transform into after regeneration has occurred.

[1:33:214] Herein, it must be solemnly clarified, that the cycle of death and rebirth is discussed here purely in scientific and philosophical measure of cosmical entities in order to stay in accordance with the principles of prosubstantiation.

[1:33:215] Forefinalism is the philosophical stance associated with the concept of forefinality, holding that the entirety of the occurrences that directly interact with an entity determine its ultimate finality.

[1:33:216] This takes the concept of predemonition and widens it to the entirety of all things that ever interacted with an entity, or were involved some occurrence to mean that these all hold equal relevance in the position, nature, and status of an entity, or an occurrence's finality.

[1:33:217] Infinalism is the philosophical stance revolving around the concept of infinality; this holds that a true finality is not going to happen, but that it is impossible, because of the structure of The Cosmos and its dependence upon and positioning within The Universe, which is a largely unknown and infinite entity, and therefore, a true finality cannot ever be sure to possible to occur.

[1:33:218] Interfinality is the next theorem of ultimatum as part of Finality Theory and relates to the idea that it is the naturity of the ultimatum of celestials to be dependent upon other ultimations to occur; an exemplar of which is the finality of The Earth, which is dependent upon The Sun in every possible ultimatum scenario.

[1:33:219] Macrofinality and its associated philosophical stance, henceforth known as macrofinalism, relates to the idea that ultimations in The Cosmos must be perceived by studiers in macrocosmic consequences, environments, and circumstances, rather than in an isolatory perceivance as is held by the concept of microfinality, whose philosophical stance is henceforth known as microfinalism.

[1:33:220] The next of the finality theories is herein introduced and henceforth known as monofinality, with its philosophical stance encompassed as monofinalism.

[1:33:221] This concept involves the idea that ultimatum, or finality, in The Cosmos, and of The Cosmos is essentially singular, without any influence from other finalities, and is therefore the direct oppositism to the concept of interfinality.

[1:33:222] Nonfinality is part of Finality Theory and holds ideas similar to that of infinality, but expands upon such ideas slightly in that nonfinalism holds that finalities in The Cosmos, or The Universe are not necessary to the structure, naturity, and orderity of these two distinct entities.

[1:33:223] Nonfinality doesn't give any importance in philosophical contemplation to ultimatory scenarios in the overall naturity and structure of The Cosmos, and neither does it give any importance to finalities of The Universe.

[1:33:224] Omnifinality, and its philosophical associative stance henceforth known as omnifinalism, which is largely in oppositism to other aforementioned concepts of Finality Theory, holds that all cosmical and universal entities are bound to ultimation, and that only a divinical being is non-ultimatory.

[1:33:225] Postfinality is a finality theorem relating to the idea that everything that occurs beyond the finality is most intrinsic to the actual finality itself, and stands in direct oppositism to the concepts expounded by forefinalism.

[1:33:226] Refinality, and its associated philosophical stance henceforth known as refinalism, relates to the idea that finalities of celestials in The Cosmos are not ultimations, but instead, consists of an ending continuation of finalities, and is closely related with the ideas expounded in regenesis.

[1:33:227] Superfinality, and its associated philosophical stance henceforth known as superfinalism, emphasises the concept of The Divine, or some higher deity, when studying and contemplating ultimation.

[1:33:228] Essentially, superfinalism holds that The Divine is the ultimator and presides over all finalities in both The Cosmos and The Universe, and therefore supports a concept of direct intercession between The Divine and The Cosmos and The Universe.

[1:33:229] While many other ultimatory concepts within Finality Theory do not depend upon divinical solutions, superfinality embraces such solutions and expounds that all ultimatory scenarios are directly and purposefully orchestrated by some higher and divine power.

[1:33:230] Thermofinality is a concept of Finality Theory relating to the idea that the finality and ultimation of either a celestial in The Cosmos, or of The Cosmos itself, is wholly dependent upon temperature, and defines a correlation between heat and ultimation.

[1:33:231] Therefore, thermofinalism, the philosophical stance associated with thermofinality, positions and emphasises temperature, and especially heat, as the primary measure of the nature of a finality, and grants temperature as the main causality of ultimation.

[1:33:232] Transfinality, as the second to last concepts of Finality Theory discussed in The Grand Centrality, involves the idea that the naturity of finality and ultimation is to be intrinsically interconnected with other finalities, whether this is correlated by their simultaneous occurrence, their appearancial resemblance, or by the similarity in their causations.

[1:33:233] Transfinalism establishes an ultimation wherein a certain meaning is identified according to these three correlations, and too, establishes a cosmology of finality in which measurements can be used to derive the naturity of a finality and the intrinsicities of its occurrence.

[1:33:234] As the last concept of Finality Theory to be outlined in The Grand Centrality, trifinality is the idea relating to a finality construct wherein all types of ultimation can be found to be dependent upon three distinct elements; most typically attributed as time, resource, and proximity.

[1:33:235] This triad of attributes forms that which is henceforth known as trifinalism, the philosophical stance associated with trifinality and trifinal thought.

[1:33:236] Trifinalism establishes a cosmology of finality wherein time, resource, and proximity dominate the derivation of meaning, and in the totologist's quest to discover truth of finality, they can turn to this such cosmology of finality, or any of the others, they can press upon these theories their own natural orientations, and from there, they develop a philosophical stance that is unique to them, but is also shared with the rest of the peoples of this world and beyond.

[1:33:237] We witness reversion in many forms throughout The Cosmos, and it is most often connected, especially in Astronist philosophical terms, as a type of, and close associate of ultimation, which is why we speak of reversional thought within ultimatology.

[1:33:238] The derivation of ultimatology relating to reversional thought and dealing with the philosophical study of reversion in The Cosmos is herein introduced and henceforth known as reversology.

[1:33:239] Reversological study involves concepts relating to reversal processes in The Cosmos, and establishes time as its primary measure, such as the reversal of The Cosmos back to its original state, or the reversal of The Universe back to its original state.

[1:33:240] Reversological study all encompasses ideas of reversion wherein an entity doesn't revert back to their original state, but to a former, or lesser state than it had been; this is how we can distinguish reversional processes and concepts, from reversal processes and concepts.

[1:33:241] An exemplar of a reversional process that is predicted to occur in The Cosmos is that of The Earth's reversion back to a lifeless and volcanic planet during The Sun's Red Giant Phase, wherein The Sun will grow so large that it consumes the entirety of The Earth, but before it reaches The Earth, all life will be obliterated.

[1:33:242] During the early stages of The Earth's structural development, it resembled a lifeless, volcanic, and uninhabited planet, and by this prediction, we see the reversional process in effect.

[1:33:243] If we study reversologically, we find a key naturity of many entities and elements within The Cosmos; their inherent ability, and also, their inherent necessity to return to a previous state; to revert back to that which has already occurred.

[1:33:244] By this reversological cycle, we derive a Reversal Cosmology wherein reversion and reversal dominate existence, and wherein the inevitability stands that all that existence shall one day return to its former existence, or a version of its former existence, in the effect of establishing an eternal cycle of creation, abention, and reversion.

[1:33:245] It is in the interests of the reversologists of present times and times of futurity to stand reversional and reversal processes occurring within The Cosmos; to develop newfound philosophies regarding the inferences of these processes.

[1:33:246] There have been many inferences throughout The Grand Centrality that The Cosmos itself shall revert to a form state, and we see this thoughtpath revealed in many of the concepts within Creation Theory

[1:33:247] If this were to be true, and The Cosmos is destined to revert back to its former self, this tells us more than we could ever have hoped for about its truest and most ultimate naturity; a naturity whereby all cosmical existence is fixated upon its point of origination and inception, to which it is eternally and universally bound.

[1:33:248] It is up to the reversologists to also contemplate wherein the entities of the Astronist Cosmology known as The Universe and The Divine fit into this Reversal Cosmology; from the Reversal Cosmology, there are still many theistic and non-theistic views relating to how this cosmology could actual occur and become as we perceive it; by some universal underpinning, or by some divinical oversight; these remain questions of reversology that the greatest of philosophical minds are set to tackle.

The Concentricity of The Cosmos (Concentritology)

[1:34:1] There are many uncertainties about The Cosmos, its progeny, and its overall naturity, but there also exists many certainties in the orderities, motionalities, functionalities, and structures of The Cosmos and those entities which exist within it.

[1:34:2] One of these certainties, which has been observed in The Cosmos, and subsequently depicted in many of the artpieces of The Cosmos throughout the centuries of art history, is that of concentricity.

[1:34:3] Concentricity denotes a pattern whereby circular shapes are portrayed within circular shapes, and it is this shape and structure that forms the orbitalities of the planets in a cosmical system.

[1:34:4] In our home system, The Earth, Mercury, Venus, and Mars all have orbital periods and proximities closer to The Sun than Jupiter, Saturn, Uranus, and Neptune, and so they have the former four planets form circular orbitalities that fit within the latter four planets, which have larger circular orbitalities.

[1:34:5] This understanding of orbitality forms the concentricity of the cosmical system, and this is a structure and shape that can be found throughout the vast amount of systems in The Cosmos.

[1:34:6] This cosmicality of concentricity is clear due to its intrinsic place within all areas of each cosmical system and the cosmical orderity as a whole.

[1:34:7] Concentritological study derives centrality of concentricity in the cosmical system and orderity, and takes the view that concentricity is both inherent and intrinsic to the overall structure, functionality, and naturity of The Cosmos.

[1:34:8] Due to the fact that the pattern of concentricity can be found in a majority of cosmical scenarios and circumstances, it is derived that concentricity is the ultimate cosmical construct and it is to the interest of concentritologists to study this conclusion, as well as study the nature of concentric pattern and structure in The Cosmos.

[1:34:9] As one of the most initial sparks of my fascination with The Cosmos and its progeny, concentricity is perhaps the greatest and most obvious identifier that there exists an intrinsic structure, meaning, purposivity, and naturity to The Cosmos.

[1:34:10] This relates to the concept of that which is henceforth known as The Animate Cosmos which forms the underpinning of the entirety of Cosmic Philosophy from an Astronist perspective; the worldview that The Cosmos is active in its existence,

meaningful in its functions, purposeful in its occurrences, and overall, holds some consciousness.

[1:34:11] Not the type of consciousness that we hold and consider to be that which makes us sentient; another type of consciousness that can be found in all things of nature; a distinct sense of function, purpose, and dynamicity that perhaps we shall never be fully comprehending of.

[1:34:12] This concept is manifested in the concept of The Animate Cosmos; a cosmos that is alive in all the actions it takes and of which such actions hold purpose, and meaning.

[1:34:13] The oppositism to The Animate Cosmos concept is henceforth known as The Inanimate Cosmos; a worldview wherein one believes The Cosmos, its progeny, and their subsequent actions, and occurrences do not hold purpose, meaning, or direction.

[1:34:14] People who believe in The Inanimate Cosmos are henceforth known as inanimators and those of us who believe in The Animate Cosmos are henceforth known as animators.

[1:34:15] The Inanimate Cosmos refuses to see the consciousness of The Cosmos; the inherent and intrinsic patterns presented by the progeny of The Cosmos; the purpose and meaning derived from the functionalities, motionalities, and dynamicities of all the cosmical progeny.

[1:34:16] However, ultimately, it is their failure to see the grandity, vastity, and divinity of The Cosmos and that its very core naturity, although is related to ours, for we originate from it, its naturity is greater in every way; by scale, by comprehend, by complexity, and by mysteriosity.

[1:34:17] We have therefore established that by the concept of The Animate Cosmos being central to all Astronist interpretations of The Cosmos, and Cosmic Philosophy, and concentricity itself being central to Astronist Cosmology, we fundamentally derive that there exists distinct certainty about The Cosmos; its unknown, its vastness, its complexity, but ultimately, its awareness of itself and the destiny must fulfil.

[1:34:18] An important derivation within concentricity and concentritological philosophy is that of coration; coration is the view within concentritology that the core of the concentric share is the most important and binds the entirety of the concentric structure together.

[1:34:19] From this view of the core of a cosmical system, corality is also developed as its own newfound instrument of study that considers the naturity, purposivity, importance, and meaning of the cores of cosmical systems.

[1:34:20] Coration defines the core of the cosmical system as the stars to be the shining beacon of cosmicality; the most potent form of cosmicality; the obvious essence of expressed in The Cosmos of cosmicality.

[1:34:21] The core of the cosmical system is considered, in coration, to be that which forms the most fundamental part of the cosmical system as a whole and believes that the whole of the concentric structure is dependent upon the core in order for it to function as it does.

[1:34:22] Corative thought is based upon logical notions holding that the most important part of the cosmical system is that which exists at its centre, for the centre is the most important part of all things; it is the one place that all the other areas converge upon and for which they share a commonality with one another.

[1:34:23] One of the central duties of the concentritologists is to explore the naturity of concentricity, and as the most basic introduction to the naturity of such, we can universally derive that the naturity of concentricity is held in diversity, as a derivation of vastity.

[1:34:24] All the concentricities of each and every cosmical system hold a distinct interconnection with each of the other concentricities of The Cosmos, but too, they hold a certain uniqueness that forms the basis of what they are.

[1:34:25] Whether by size, or shape, or scale, or complexity, each and every concentricity holds a unique combination of these four elements of concentricity, and too so equally, these four elements are also shared by all the concentricities.

[1:34:26] By this notion, a paradox is formed whereby the very elements that make a concept unique, are the very same elements that form its connection with all other concepts with which it shares such elements.

Instrument Theory (Instrumentation)

[1:35:1] In order to contemplate a concept philosophically, the instruments of study are both central, and necessary because they derive three components of study: measure, meaning, and conceptual construct.

[1:35:2] As philosophers of study, we must utilise the instruments of study to enhance that which we enknowledge ourselves of; we must use the instruments to compliment our thoughts, and apply the concepts we create to the reality of that which we contemplate.

[1:35:3] The use of the instruments of study allow us, as philosophers, thinkers of thought, to perceive, understand, construct, and dissect complex ideas that have many interpretative aspects and many applicative aspects.

[1:35:4] Essentially, Instrument Theory is the contemplations of these instruments of study and how one believes they should be applied in relation to the ways by which they are said to be applied according to the Astronist Tradition.

[1:35:5] Abundancy is an instrument of study that measures the quantity of something, and its counterpart instrument, frequency, is the measure of the proximities between these quantified entities.

[1:35:6] Binariness is an instrument of study that contemplates two components, especially so in a cosmical context, and derives meaning according to this structure and applies this meaning to other instruments, such as orderity, motionality, and dynamicity.

[1:35:7] Bipolarity is an instrument of study that contemplates two components, but specifically in context of these two components holding two oppositism to one another; these extremities are subsequently studied and inferences are derived from these according to other instruments, again, such as orderity, motionality, naturity, and dynamicity.

[1:35:8] Calendarity is an instrument of study that measures time according to human perception, and is primarily based upon location, established culture, and organised philosophy from which the perception is originated; it is this perception that is philosophically contemplated.

[1:35:9] Centricity is an instrument of study encompassing many different contexts, but largely consolidates itself according to some central component; whether this be an abstract, physical, futural, cosmical, or predictional centricity.

[1:35:10] Chaosity is an instrument of study dealing with all contemplations of the entity known as The Chaos in Astronist Cosmology, but also, concepts surrounding chaotic

functionalities, orderities, and naturities in general, in both cosmical and non-cosmical senses.

[1:35:11] Composity is an instrument of study contemplating entities that are made up of several parts, or elements, and so are not just dyadic, triadic, or quadical; an exemplar of this in Astronist Cosmology is the entity defined as The Cosmos.

[1:35:12] Concentricity is an instrument of study focusing on the prevalence of the concentric pattern and structure in The Cosmos, and its reflection upon other instruments, such as orderity, naturity, and motionality, amongst others.

[1:35:13] Corality is an instrument of study that considers the naturity, purposity, importance, and meaning of the cores of cosmical systems, and has a tendency to measure the importance of the core with other parts of a typical cosmical system.

[1:35:14] Cosmicality is an instrument of study measuring the extent to which an entity, or some event is in alignment with that which is deemed as the cosmical orderity, or the cosmical system.

[1:35:15] Criticality is a two-part instrument of study; its first part measures the potentiality of some entity, or event to be disastrous, typically in threatening the cosmical orderity, and also invokes a sense of immediacy; its second part relates to the reception given by the public towards a philosophical contemplation, or statement.

[1:35:16] Dyadicity is an instrument of study measuring the relationship between two elements of some entity, or event, and in this measure of the interaction, differs from the instrument of binarity.

[1:35:17] Dynamicity is a wide-ranging instrument of study measuring three main components of an entity, or an event; its affects on the change, the activity, and the progress made in The Cosmos and of the cosmical progeny.

[1:35:18] Eternality is an instrument of study measuring the extent to which something may exist forever, and contemplates the nature of foreverness and being in eternal existence, and the subsequencies of such.

[1:35:19] Extrinsicity is an instrument of study measuring the extent to which an element is not essential to the structure or the fundamentality of something and of which its comparter, the instrument of intrinsicity, measures the necessity of something's structure and fundamentality, and are both typically used in an abstract sense.

[1:35:20] Finity is an instrument of study contemplating entities according to their finite naturities, such as that of The Cosmos, and acts as the direct oppositism to the instrument of study of infinity, which contemplates entities according to their infinite naturities, such as that of The Universe, and The Divine.

[1:35:21] Focality is an instrument of study measuring the overall importance of something by taking into account all its many aspects, and makes a conclusive and balanced judgement of this according to all aspects contemplated.

[1:35:22] Formity is an instrument of study that philosophically contemplates the ways by which an entity forms, especially one in a cosmical context, and incorporates the instruments of orderity, naturity, and motionality into its conclusions and inferences.

[1:35:23] Fundamentality is an instrument of study contemplating the extent to which something is necessary to the functionality of something, and is most typically used in physical sense.

[1:35:24] Functionality is an instrument of study contemplating the basic and the complex systems of something in order to fulfil an intended purpose, and may be used in both abstract and physical contexts.

[1:35:25] Fusionality is an instrument of study that philosophically contemplates the joining together of two previously distinct entities in order to create oneness, and the subsequent consequences of this in both abstract and cosmic physical senses.

[1:35:26] Futurity is an overarching instrument of study covering the entirety of philosophical contemplations of the future, of time that is yet to come, in all its many applications, contexts, and senses.

[1:35:27] Graduality is an instrument of study relating to the existence of an entity, or the duration of an event, in relation to time, but specifically, the progression of this slowly, or by lengthy degrees, and its comparter is the instrument of immediacy, which studies the urgency and instancy of these such degrees.

[1:35:28] Imperativity is an instrument of study that measures importance, but differs from the instruments of focality and intrinsicity, by focusing on the measurement of importance in relation to the immediacy of that which is being contemplated.

[1:35:29] Imnemnity is an instrument of study measuring the extent to which a philosophical concept falls in alignment with current scientific and empirical knowledge, or the extent to which it does not, which forms the comparter of imnemnity, known as disimnemnity.

[1:35:30] Inversity is an instrument of study contemplating and measuring the effects of oppositism, especially so in a cosmical context, and relates this according to position, direction, orderity, and consequence.

[1:35:31] Lunarity is an instrument of study focusing on the philosophical contemplation of moons, their inferences in the cosmical system, and their overall importances in the wider cosmical orderity.

[1:35:32] Matrixity is an instrument of study contemplating a strict adherence to the cosmical orderity, so as not to allow any chaotical influences to pervade into the cosmical system, and is based upon the idea of The Matrix.

[1:35:33] Medianity is an instrument of study measuring the inferences and concepts relating to being positioned in the middle of some wider space, or as the central part of an ordered series.

[1:35:34] Motionality is an instrument of study relating to physical movement of cosmical entities and the inferences derived from these movements in relation to naturity, functionality, and orderity, and this instrument of study may also be used in other more abstract ways, such as motionality as a comparable to progression.

[1:35:35] Motivity is an instrument of study contemplating motivation in relation to action, and is more typically found in discourses on ethics and morality, rather than on cosmical discourses.

[1:35:36] Mysteriority is an instrument of study focusing on the air of mystery found in some cosmical entities, and in other more abstract concepts; a general unknowingness of something, that is made distinct from that of chaosity.

[1:35:37] Naturity is an instrument of study contemplates the most basic and inherent features, characteristics, and qualities of something that make it a distinct entity, and is the most fundamental instrument of philosophical study alongside orderity.

[1:35:38] Orbitality is an instrument of study dealing with the philosophical contemplation of the physical orbits of celestial entities and the subsequent meanings and inferences derived from these motionalitys.

[1:35:39] Orderity is the most fundamental instruments of study alongside that of the instrument of naturity, and deals with the intrinsic structure, pattern, and uniformity of the ways by which celestials, as distinct and individual entities, and by which The Cosmos as a whole are arranged, and functioned in alignment with the cosmical system.

[1:35:40] Orthogonality is an instrument of study contemplating the philosophical meanings and inferences derived from the shape of right angles.

[1:35:41] Planetarity is an instrument of study focusing on the philosophical contemplation of planets, their inferences in the cosmical system, and the ways by which they help form, arrange, and structure the cosmical system, and the extent of their specific importance in this purpose.

[1:35:42] Primarity is an instrument of study measuring importance, but is most typically used to emphasise one entity's importance over another, rather than individual importance, as is focused by intrinsicity and focality.

[1:35:43] Progressivity is an instrument of study that measures the extent to which an entity physically progresses by motion, or the extent to which some entity, or concept enacts progression, and also contemplates and attempt to determine the nature of what progression is in different sets of criteria.

[1:35:44] Proportionality and Disproportionality are major comparter instruments of study that measure the extent to which a concept, or instrument of study reacts when there is an increase, or decrease in another related concept, or instrument; proportionality is deemed when two or more concepts do correspond, meaning they increase, or decrease together, and disproportionality is deemed when two concepts, or instrument do not correspond, whereby one increases when the other decreases.

[1:35:45] Purposity is an instrument of study involving the general philosophical contemplation of purpose in relation to some entity, an event, or an abstract concept; the purpose is attempted to be identified, defined, and measured according to functionality, naturity, and orderity.

[1:35:46] Rationality is an instrument of study that measures the extent to which a concept is formed by a series of logical steps, or a conclusion that is formed based on justified reason.

[1:35:47] Reciprocity is an instrument of study relating to the structure and system of the celestials in The Cosmos to respond to function with a corresponding function, and contemplates inferences derived from reciprocative actions.

[1:35:48] Regressivity is an instrument of study that is the comparter of the instrument of progressivity, and involves the measure of the extent to which an entity, or some abstract concept causes greater distance from a specified goal, and contemplates the nature of regression.

[1:35:49] Rotality is an instrument of study that largely relates to the rotational motionalities of celestial entities in The Cosmos, and is therefore primarily used in Cosmic Philosophy, and contemplates the inferences from such rotations in relation to the wider cosmical orderity and system.

[1:35:50] Sensicality is an instrument of study related to that of rationality, and contemplates the idea of common sense in philosophical contexts; a series of decisions or conclusions that can be made from sound judgements, sensicality is a supporter of logic, and is most often used in more practical and applicational circumstances.

[1:35:51] Solarity is an instrument of study involving the philosophical contemplation of stars in their physical existences and works to derive greater meaning from their natural functionalities.

[1:35:52] Symbiocity is an instrument of study that measures the extent of the mutual interactions between two or more different entities, whether these be cosmical, or non-cosmical, and derives philosophical inferences and conclusions from this symbiotic relationship.

[1:35:53] Synchronocity is an instrument of study that contemplates inferences about two or more entities, or occurrences that happen at the same time as each other, or conduct their functions at the same time as one another, and draws philosophical conclusions therein.

[1:35:54] Vastity is an instrument of study that contemplates abundancy in its most extreme terms, but not only equates this with quantity, but also, complexity; therefore, many entities can be considered to hold high vastity, but also, one single entity, due to its complexity, can also be considered to hold a high level of vastity.

[1:35:55] The instruments of study are the building blocks of Astronism, and fundamentally form the newfound Philosophical Method, also known as the Contemplative Method.

[1:35:56] Two of the most important ideas within Instrument Theory are that of Proportionality and Disproportionality; because instruments of study are interconnected and some stand as oppositisms to each other, if the amount, measure, or intensity of one instrument goes up then depending upon the correspond instrument, it would either go up as well, or decrease as a result.

[1:35:57] Proportionality is when two or more instruments share the same trajectory, so much so that when one of them increases, they all increase; disproportionality represents an imbalance between instruments of study and relates to two or more instruments that do not share the same trajectory, so much so that when one of these increases, the others decrease; this disproportionality and distrajectory is most commonly caused by oppositism.

[1:35:58] The concepts of proportionality and disproportionality form the closest boundary between that which is henceforth known as Locutional Astronism, and that which is henceforth known as Numerical Astronism, of which the most principal of disciplines of study is Equational Philosophy will is latterdiscoursed in The Duodoxy about The Logical Cosmos.

[1:35:59] The concepts of proportionality and disproportionality construct ideas that are very close to requiring numerical inserts in order for them to be both comprehended and utilise to their full potentiality; therefore, it is not irrational to suggest that the concepts of

proportionality and disproportionality are the necessary precursors for the introduction and development of Numerical Astronism, and they are themselves instruments of study in their own right, as aforementioned in this discourse.

[1:35:60] This instrument of study status for the two concepts allows them to be used in many diverse ways and in contexts of philosophical study not even yet considered, or conceived to be understood.

The Ambiguation Principle

[1:36:1] I write the Omnidoxy with the intension of its accessibility to all peoples of this world, and to all peoples of all worlds beyond that on which we now reside.

[1:36:2] The diversity of the peoples of this world is vast and this is to logical multiply when we consider all the peoples of the all the world beyond The Earth; this type of extensive diversity is perhaps truly and wholly incomprehensible to our minds.

[1:36:3] For this reason, the Omnidoxy must remain accessible to all peoples in the way of the mind; in the way of interpretation; for the diversity of minds, a document must be written with diversity of word and a distinct openness to interpretation; by this notion, The Ambiguation Principle is herein formed.

[1:36:4] Although the words of the Omnidoxy form the Astronist Tradition of philosophical thought, the concepts, the theories, and the conclusions detailed herein are still open to the interpretation of the individual reader.

[1:36:5] It would be against the heart of philosophy to encapsulate thought within the boundary of the words of this document; in essence, we must remain true to what it means to be a philosopher; it means to question, to doubt, to explore, to imagine, and to strive to know more.

[1:36:6] A literalist and orthodox interpretation of the words of the Omnidoxy is favoured by The Astronist Institution as its own official interpretation, but this is not placed upon the peoples of worlds like a decree of belief.

[1:36:7] Instead, the peoples of all the worlds are encouraged to regard The Grand Centrality in the way by which they interpret it with the official interpretation being their solemn guide to understanding the philosophy.

[1:36:8] The Ambiguation Principle is hereby founded upon the following statement:

[1:36:9] In order to reascend the philosophical culture, Astronism must be that which the people want; a philosophical system into which they can place their own ideas and base their own natural orientations upon; hence, the peoples of all the worlds are encouraged to interpret the words of the Omnidoxy in their own personal and unique ways, while simultaneously and equally understanding that the Astronist traditional interpretation stands as a universal guide for philosophical thought and practice.

[1:36:10] The ambiguity of the Omnidoxy is most important, but nonetheless is it complex; the Omnidoxy and its preserver of its philosophy, The Institution of The Philosophy of Astronism, must mark the perfect balance between protecting and enhancing that which

the Astronist Tradition is based upon by orthodoxy, but also aligning with the nature of philosophy, which means cherishing the diversity and freedom of thought.

The Edge of The Cosmos (Perimetrics)

[1:37:1] Throughout the Astronist Cosmology, a distinction has always been made between that which is known as The Cosmos and that which is known as The Universe.

[1:37:2] Herein introduced is the philosophical discipline of study henceforth known as Perimetrics; this discipline of study deals with the nature of this relationship between The Cosmos and The Universe, specifically the point of their contact; the boundary whereby The Universe begins and The Cosmos ends.

[1:37:3] Perimetrists are interested in studying that which exists at the edges of The Cosmos, and that which exists beyond the edge, the nature of the edge of The Cosmos, and that which may be inferred from such concepts about the naturity of The Universe and The Cosmos as two distinct, yet interacting and eternally intertwined entities.

[1:37:4] Perimetrical thought considers the perimeter of The Cosmos, its furthest edge, to be the most important part of The Cosmos, and the element of The Cosmos that holds the most truth about the naturity of The Cosmos, and holds that there exists the most knowledge about The Cosmos and The Universe when its edge is philosophical studied.

[1:37:5] Due to the unknownness of this element according to our current knowledges, the perimetrists have a large philosophical endeavour before them for they are to use mostly their imaginations coupled with logical and rational judgements in this discipline.

[1:37:6] We know so little about the edge of The Cosmos from our current scientific knowledge and so, perimetrists must depend upon their imaginative cognitions and their logical insights in order to develop ideas and theories about the perimeters of The Cosmos.

[1:37:7] Before we conduct instrumental study about the edge of The Cosmos, we must discuss three different concepts that relate to the discipline of perimetrics; these are the Universal Horizon, Incomprehensibility of Scale, Eternal Expansion, and Peripherance.

[1:37:8] The concept of the Universal Horizon holds that the perimeter of The Cosmos is forever eternal and that to attempt to find it is an admirable mission, but one of fruitlessness for it is believed that the edge of The Cosmos is so close to The Universe the edge itself holds the same naturity as The Universe, and as a result, is infinite.

[1:37:9] The concept of the Universal Horizon is closely associated with the concept of Eternal Expansion; the idea that The Cosmos is in continual and eternal expansion, and this would therefore logically mean that its edge could never be reached.

[1:37:10] Equally so, it is a logical notion to suggest that that which exists within The Cosmos cannot ever see, be, know, or understand that which exists without The Cosmos; by this notion, we understand that from our humanic perception, we shall never see, be, know, or understand neither the edge, nor that which exists beyond The Cosmos.

[1:37:11] The greatest uniqueness of horizons is that we never reach them; this is the same for the Universal Horizon theory, and from this notion, we understand it to be logically founded; not from some humanic conclusion, but from a conclusion made by the functions of nature, of which these are the greatest types of logical conclusions, because it is with functionalities of nature that we cannot argue that which is fact.

[1:37:12] That which is natural is that which is fact; any contention to nature is a fabrication of humanity's distortive doing.

[1:37:13] The concept of Incomprehensibility of Scale relates to the idea that there is no edge to The Cosmos that can either be comprehended by us as humans, or that there is no edge to The Cosmos at all because of its incomprehensible scale; a scale that is considered infinite by this notion.

[1:37:14] The shape of The Cosmos dictates its perimeter, just as the corners of a square dictates its size; from this notion of logic, perimetrists must study the nature of the shape of The Cosmos in order to understand its edge.

[1:37:15] The questions that come to the perimetrist's mind are numerous and largely inconclusive at their initial point.

[1:37:16] Is the perimeter of The Cosmos the same in all direction? Is the edge of The Cosmos a boundary line that can be crossed? Does the perimeter of The Cosmos have an angle? Is it controlled by The Cosmos, or The Universe, or should the Astronist Cosmology establish The Perimeter as its own distinct cosmological entity just as The Cosmos and The Universe have been established in the Astronist Cosmology.

[1:37:17] Isn't it most often at the edge of things that we learn most about them? By this notion, we can relate to life; the closest we get to the end, the greater understanding we hold of its mysteries.

[1:37:18] When one applies the instrument of study of abundancy to perimetrical thought, one is left with a host of ideas a direct result.

[1:37:19] We presume that there exists just one perimeter of The Cosmos, but in accepting that we know very little about the edge of The Cosmos, we too, open up the possibility for all ideas to be possible; therefore, there may be a multitude of perimeters to The Cosmos, and depending upon the true naturity of the perimeters, they may be infinite in their abundancy.

[1:37:20] Assuming we could do so, if we were to travel to the edge of The Cosmos and were to meet it, how would we know when we had passed beyond it into The Universe?

[1:37:21] According to traditional Astronist Thought on the matter, we would never be able to do this as we ourselves now, for that which exists and is bound to the naturity of The Cosmos cannot leave the reality it has formed.

[1:37:22] If we were to speculate on the matter beyond these standard thoughts, we could find the point to be when the reality we know now and have always known, has changed in its entirety.

[1:37:23] The multitude of perimeters idea is not illogical by its very foundation for there are many progeny and elements of The Cosmos that have once been thought to be singular, but have later been found to be just one part of a multitude of the same progeny, or element.

[1:37:24] With abundancy, we must always discuss frequency as its counterpart instrument, and with this notion that there may exist a multitude of perimeters, or edges to The Cosmos, we are automatically lead to ideas of the frequency of these perimetric multitudes.

[1:37:25] How far apart from one another do these multiple of perimeters lie? Do they hold proximity to each other? Or do they hold greater distance between each other?

[1:37:26] If we contemplate abundancy, then it is inevitable that we would find a great importance in contemplating frequency for it is frequency that remains an inevitable question of the naturity of the abundancy contemplated.

[1:37:27] From a contemplation and logical conclusion about abundancy, comes contemplations about frequency, and from contemplations of frequency, comes contemplations about the functionalities of that which is the subject of discourse.

[1:37:28] Although we do not know the true functionality of the perimeter of The Cosmos, of which we can only speculate, if we propose that there exists an unknown multitude of perimeters, we find ourselves discussing their frequencies, which is a form of categorisation.

[1:37:29] By this notion of categorisation, concepts surrounding functionality begin to seep into our thoughts; if there a multitude of perimeters, if there are multiple edges to The Cosmos, then what functionalities do each of these edges hold, and from this, we begin to contemplate purposivity, fundamentality, and orderity, as is lattermentioned within this discourse as we explore each of the instruments of study and we apply their contexts to the subject under discourse.

[1:37:30] By these previous three applications of instruments, we see how their applications and contemplations are interconnected; how they feed and bounce off one another; how contemplations involving one instrument can so easily lead to contemplations involving other instruments; in this, we see the importance of instrumental study in advanced philosophical contemplation.

[1:37:31] As an alternative to concepts aforementioned in this discourse about the perimeter of The Cosmos, abundancy simply measures the quantities of the subject; the quantity of this subject, therefore, could very easily be singular.

[1:37:32] Of course, by this notion, wider concepts regarding frequency are obstructed, but this stance opens up wider concepts in other areas, such as those relating to the instruments of naturity, focality, and centricity.

[1:37:33] Perhaps it is by this single notion that the greatest part about the study and contemplation of philosophy is revealed; the ability for a stance to create obstacles, dubiety, and rejection towards a concept whilst simultaneously opening up a whole new meadow of fruitful concepts that, if we had not contemplated an opposite stance, we would have been ignorant to their fruits.

[1:37:34] The instrument of study of binarity is perhaps one instrument that we would think does not apply to perimetrical concepts, but the opposite remains true, for if one contemplates any philosophical subject deeply and widely enough, it is inevitable that they shall find some way of applying an instrument of study to the subject being contemplated.

[1:37:35] We can derive binarity in a perimetrical context through the idea of splitting the edge of The Cosmos into two distinct abstract parts; the first being the side of the edge still within The Cosmos, and the second being the side of the edge that is beyond The Cosmos.

[1:37:36] This division between the two sides is not to contemplate any type of superiority, nor is it to pin either abstract side against one another; instead, from this, we see the two components of the perimeter that form that which is cosmical and that which is beyond cosmicality.

[1:37:37] If it is ultimately singularity that is found of perimeter, then it is binarity that we derive when contemplating the two sides of the perimeter.

[1:37:38] It is logical to notion that if a perimeter does exist, then there must be always something within its perimetric boundary, and always something beyond its perimetric boundary, and from this logical notion, we derive binarity; a paradigm of two components.

[1:37:39] The next instrument of study to grasp our thoughts is that of bipolarity; we can derive bipolarity in the context of the edge of The Cosmos because by its very nature, function, and purpose, the edge of The Cosmos is an extremity itself.

[1:37:40] The opposite extremity would of course be the centrality of The Cosmos, of which we do not know the exact spot, but we know it must be somewhere within The Cosmos.

[1:37:41] In perimetrics, we study one of these two poles of extremity; that which is furthest away from all things in all directions; the most extreme of extremes that can ever exist in The Cosmos, apart from its direct oppositism in the centre of all centralities, of course.

[1:37:42] Is it not true that we often see the truest side of a subject when its two extremities are revealed to us?

[1:37:43] From extremities, we can learn a great deal about the naturity of the subject; with regards to ourselves, by the extremities of the human mind; from peace to violence, from joy to despair, and from to love to hate; the most extreme convictions of humanity form the clearest of apertures about whom we really are.

[1:37:44] The application of the instrument of bipolarity is essential to a greater understanding of one side of the edge of The Cosmos, and beyond the edge to the other side, the side of The Universe.

[1:37:45] One of my greatest fascinations about the structure of Astronist Cosmology is that in all the vastness and complexity and wonderment of The Cosmos, there still exists The Universe beyond it; if The Cosmos is so incomprehensible in all aspects, then what of The Universe?

[1:37:46] By what measure can we describe The Universe? The answer is by none, because its reality is not as our own is, and it would be irrational to attempt to measure that which we have nothing to compare the subject of the measurement to.

[1:37:47] Everything holds the ability to surprise and The Cosmos and The Universe are certainly not exceptions to this conclusion; just when our ignorant minds think The Cosmos could not be anymore vast, complex, and wondermentful, The Universe beyond The Cosmos is revealed, and by the introduction of The Universe, we must accept that we will be eternally stupefied.

[1:37:48] The instrument of study of centricity is perhaps introduced here with some confusion for studiers; how can the perimeters of The Cosmos be applied to centricity?

[1:37:49] We are able to derive centricity in the perimeter of The Cosmos if we imagine that the perimeter exists amongst other perimeters; if the perimeter is a perimeter that can be found in all cosmoses of The Universe, then perceiving such cosmoses in such a wide

canvas, and from such a distance, makes their perimeters look as though they are their centralities.

[1:37:50] In order to understand this, think of a dot; you begin to look at it close up and you can see all that exists within its circularity, but as you distance yourself from it, as you gradually move further and further away from it, that which exists within it becomes so tiny that the perimeters of the dot become all that you can see; that which is the opposite of the centrality becomes the centrality when viewed from a different perspective.

[1:37:51] This draws upon larger questions and queries about the nature of perception, but the principle stands true when we think about The Cosmos in The Universe.

[1:37:52] The further and further away we go whilst still keeping our eyes fixated on The Cosmos, the smaller and smaller its insides become, and the more enclosing its perimeters become, until they are all you see; until they are the centrality themselves; until they are the centricity of the subject.

[1:37:53] When we think about and apply the instrument of centricity to perimetrics, we must think beyond our own perceptions and consider new perceivences that perhaps we shall never see ourselves, but we know that from some perspective, that perceivence could be true; this conceptual empathy is the sign of a great philosopher, especially a philosopher holding a strong understanding of what perception really is.

[1:37:54] The instrument of study of composity can also be applied to a perimetrical concept by means of the abundancy; if something is abundant of parts, then it is a multitude, and it is therefore made up of several different component parts.

[1:37:55] If the perimeter of The Cosmos is not just one barrier, or boundary, or reality then, it must be composite of different parts and due to one of the naturities of The Cosmos being that it is certainly composite, then it is not illogical suggest that the perimeter of such a beacon of composity, would be composite by its own naturity.

[1:37:56] But in all this discourse about what the edge of The Cosmos is, or could be, what role does concentricity play in perimetrical concepts?

[1:37:57] We have discoursed many times about the concentricity of all the planetary systems of The Cosmos, but by the introduction of perimetrical concepts, we are driven by logic to derive that there exists a concentricity over the entirety of the cosmical superstructure, and the perimeter, the edge of which forms the outermost part of the concentric shape of The Cosmos.

[1:37:58] From an Astronist perspective, the perimeter of The Cosmos holds the greatest amount of cosmicality and herein, I shall explain why.

[1:37:59] The naturity of The Cosmos is finiteness, order, limitation, and boxed reality and existence, and the instrument of study known as cosmicality is the measurement of this meaning of cosmicness; to compares and contrasts different subjects according to the role they play in the functioning of this cosmical system, and philosophical conclusions are drawn upon by such findings.

[1:37:60] The perimeter of The Cosmos is the centralmost symbol of cosmicality; it is the most perfect reflection of what it means to be cosmical as it forms the boundary of The Cosmos, it encapsulates the orderity have grown to know and wonderment upon.

[1:37:61] The perimeter both actualises and symbolises the naturity of The Cosmos; it forms the finity, the orderity, and the cosmical existence that we know, adore, and wonderment upon.

[1:37:62] All that we see is The Cosmos, and all that we know is within The Cosmos, and so too, is all that we may understand; the perimeter of The Cosmos encompasses of all this; it encircles the entirety of existence; it is the barrier that keeps all of cosmical existence within its orderity.

[1:37:63] By this notion, we could go as far to say that the orderity, the naturity, and the fundamentality of The Cosmos is prescribed by and dependent upon the perimeter of The Cosmos; this conceptualisation is therefore henceforth known as the Perimetrical Cosmology; a cosmology wherein the perimeter reigns as the ultimate entity upon which the cosmical system depends.

[1:37:64] When applying the instrument of criticality to perimetric concepts, we measure the extent to which the perimeter of The Cosmos holds a potentiality for threatening the orderity of The Cosmos.

[1:37:65] With the intrinsic part that the cosmical perimeter plays in the orderity of The Cosmos, as aforeaffirmed, one would think that the criticality level would be low, but in fact, the opposite is true.

[1:37:66] We all know that with great power comes an even greater responsibility, and there is no exception for the perimeter of The Cosmos; its intrinsicity to the cosmical orderity is in fact the very part of it that makes the perimeter more dangerous to the collapse of the cosmical system as we know it.

[1:37:67] The Cosmos is in constant accelerating expansion, and has been since its inception, and as predicted in some ultimations, this expansion will, in some future time, become so widespread that the cosmical fabric will collapse.

[1:37:68] Whether one blames the perimeter of The Cosmos for this or not, it would be illogical to notionise that the perimeter of The Cosmos would play no part in the ultimatum of The Cosmos, especially so in this type of finality scenario.

[1:37:69] Due to this concept, the criticality of the edge of The Cosmos is an important instrument to apply during this study.

[1:37:70] The dyadicity of the cosmical perimeter is applied in order to relate to the perceivance of the perimeter as being formed by two parts; the two extremity poles of its diameter; one expanding in one direction, and the other expanding in the opposite direction.

[1:37:71] This is what fundamentally formed the eventual perimeter for if there does not exist these two poles of extremity, there cannot exist a perimeter; of course, we can form such logical notions upon the logical we understand, but the true shape, nature, and pattern of the perimeter is unknown to our current understandings, and is perhaps likely to conflict with our current logics.

[1:37:72] The next of the instruments of study to apply and consider in a perimetrical context is that of dynamicity; change, activity, and progression are measured in this instrument, and we see these many abundancies in relation to the perimeter of The Cosmos.

[1:37:73] By the dynamic of change, it is understood that the expansion of the perimeter of The Cosmos has been the one element of The Cosmos that has pushed all change that has occurred since the Inception Epoch.

[1:37:74] All that has happened through change has done so because the perimeter has been expanded enough to make it happen; without the expansion of the perimeter, it is logical to notionise that the changes we have since in The Cosmos would not have happened on any scale as close to that which they have occurred.

[1:37:75] This notioned principle stands true when contemplating both the activity and progressional aspects of dynamicity as well.

[1:37:76] All that has occurred in The Cosmos has done so by the confines of the cosmical orderity, and it is held in a Perimetric Cosmology, that this orderity is dependent upon and in alignment with the functionalities and naturities of the cosmical perimeter.

[1:37:77] Therefore, we can derive that the activities and progressions that have occurred within The Cosmos and shall continue to occur until the cosmic collapse, are dependent upon the status of the cosmical perimeter; by this notion, both activity and progression are controlled by the perimeter of The Cosmos, as the ultimate contemplator of that which occurs within The Cosmos.

[1:37:78] Whether perceived through the lens of a Perimetric Cosmology, or by some neutral thoughtpath, it is not illogical to notionise the centricity of the edge of The Cosmos

to the changes, activities, and progressions in occurrence throughout The Cosmos, which in turn, form the overall dynamics of The Cosmos.

[1:37:79] Although the perimeter of The Cosmos is the beacon of cosmicity, and is therefore finite by this notion, there is another stance which takes the perimeter of The Cosmos to hold much greater levels of eternity, as the next instrument of study that we shall herein contemplate.

[1:37:80] When we contemplate a continual autocreational cosmology; a cosmology whereby The Cosmos recreates itself on a never-ending basis, we understand that the perimeter of The Cosmos in this regard, would form a pattern of infinitesimal size, to the most expansive size that is physically possible, to collapse, and then to shrink to the infinitesimal size, only to expand again into a new cosmos.

[1:37:81] By this notion, the perimeter becomes eternal in its naturity and also by this notion, we truly understand the intrinsic place that the perimeter of The Cosmos holds as a staple feature of The Cosmos.

[1:37:82] If we can simplify The Cosmos down into its most essential parts; the inception point, the spacetime, the matter, and the perimeter are all that remain, which demonstrates the focality of the perimeter of The Cosmos in any type of cosmology.

[1:37:83] By this notion, we can also contemplate the potential divinical infusement that the edge of The Cosmos holds; whenever anything may possibly hold some eternal and infinite value, then it is shown to have some divinical basis of construct.

[1:37:84] Whether by Divine command, by some unknown universal orderity, or simply by its own cosmical naturity alone, the potential for the eternity of the perimeter of The Cosmos is herein argued in three main aspects; by its naturity, by its reach of expansion, and by its distinct divinical qualities.

[1:37:85] Extrinsicity is applied to perimetric concepts, mainly in the form of the Extrinsic Perimeter; the stance holding that the edge of The Cosmos holds no essentiality to the functionalities, or the orderities of The Cosmos, and neither to its overall naturity.

[1:37:86] Often this stance is supported by the ideas of incentricity; that which is not physical central, is not intrinsic to the overall structure, and with the edge of The Cosmos being the exact oppositism to the cosmical centre, it is therefore notionised that the perimeter holds very little to no essentiality in the cosmical system.

[1:37:87] The instrument of study of finity is applied to perimetrical ideas in the belief that the perimeter of The Cosmos is ultimately finite by its own intrinsic naturity; the perimeter is that which bounds existence within The Cosmos to a certain limited space.

[1:37:88] When applied to the instrument of finity, the edge of The Cosmos is largely considered to exist within and as a part of The Cosmos; this would automatically consider the cosmical edge to be finite by its own cosmical naturity.

[1:37:89] The space, the existence beyond the cosmical perimeter may be infinite, but the perimeter itself is finite; furthererso, the perimeter of The Cosmos is the ultimate symbol of finiteness; it itself is the guardian of finity for it holds together The Cosmos, and allows its progeny to only exist in a limited amount of space.

[1:37:90] If the instrument of focality is the measurement of a cosmical's importance overall, then we can derive that the perimeter of The Cosmos holds high focality for it is one of the main components of the cosmical system and by all its aspects, it can be deemed as essential to this system.

[1:37:91] Focality takes into account all aspects of something before it makes a measurement of that entity's overall importance, and by all measures, the perimeter of The Cosmos holds at least some importance due to its primary functionality of marking the boundary between The Cosmos and The Universe in the Astronist Cosmology.

[1:37:92] The formation of the edge of The Cosmos must have occurred at the Inception Epoch because for something cosmical to exist, it must exist within the perimeter of The Cosmos; in the first microsecond of The Big Bang, the perimeter of The Cosmos was compacted together; the most extreme poles of the perimeter were as close together as they could ever be.

[1:37:93] From that moment on, the perimeter has been expanding and within the wake of this expansion, the progeny of The Cosmos has formed; by this notion, the formation of the perimeter has ignited the formations of the progenies of The Cosmos as we know and wonderment them.

[1:37:94] By this essence, the formity of the perimeter is perhaps as high as any other formational element due to the intrinsic role the perimeter has played in the formative cycles of the majority of the progeny within The Cosmos.

[1:37:95] Just as the perimeter lies at the heart of formity in The Cosmos, it too holds a strong fundamentality that cannot be overlooked, even by those whom wish not to raise the perimeter as playing an essential part to The Cosmos; it cannot be denied and then logically supported that the perimeter of The Cosmos does not hold at least some fundamentality to the overall structure of The Cosmos.

[1:37:96] Applying the instrument of functionality to the edge of The Cosmos results in the development of many concepts; the key one of which is the concept of the perimeter's multi-faceted functionality.

[1:37:97] From the perimeter's primary functionality as marking the boundary between The Cosmos and The Universe, other functionalities have followed as a result; the formational functionality of the progeny of The Cosmos, the creative functionality of space within The Cosmos, and the dictative functionality of the all-encompassment of cosmical existence from all that is universal beyond.

[1:37:98] The instrument of study of futurity stands intrinsic to any discourse relating to the perimeter of The Cosmos for the expansion of the perimeter is demonstrates the future itself; that which The Cosmos expands into is the futurity that we wish to seek and study.

[1:37:99] There have been many theories of finality that relate to the cosmical perimeter, and although these ultimations do vary dramatically between orientations, they do share one commonality between them.

[1:37:100] That the perimeter of The Cosmos shall play an instrumental role in the end times of The Cosmos; that the cosmical perimeter shall in some future epoch expand to a point at which it either collapses, or it continues to expand thereafter, which would reveal its own eternity.

[1:37:101] The future of the perimeter is the future of The Cosmos in its entirety for the perimeter bounds the orderity, the naturity, and the functionalities of all the progenies of The Cosmos, and to some extent, The Cosmos itself.

[1:37:102] Demonstrated and praised within the Astronist philosophical tradition are the many concepts relating to perimetrical futurity and due to the central role of the cosmical edge, it seems not illogical to prioritise its application against many of the instrument of study, and its relevant role within different Astronist cosmologies.

[1:37:103] The level of imperativity in relation to the cosmical perimeter is in fact very low; shall the finality of the perimeter effect humanity? Shall it impact The Cosmos with any immediacy? All current scientific knowledge tells us no.

[1:37:104] Even when we think about this notion in both philosophical, rational, and logical terms, we arrive at similar conclusions; the immediate importance of the perimeter is not found to be true in relation to its potential effects on the cosmical system.

[1:37:105] This seemingly non-imperative status of the cosmical perimeter does not translate to the immediacy of our contemplation and study of it, nor does its central position in all Astronist cosmologies falter as a result.

[1:37:106] It may be said that the most important parts occur at the end, and this would ring true with regards to the cosmical perimeter; its effects shall not be felt until the end of The Cosmos, but those effects are what shall change existence forever, and determine whether The Cosmos returns in another form, or whether it never returns again for eternity.

[1:37:107] The instrument of innemny in a perimetrical context is largely unrestricted for there is so little that we can scientifically prove about the edge of The Cosmos that our philosophical study of such an entity can be widely contemplated without much need for scientific alignment.

[1:37:108] Of course, as our knowledges and understandings grow stronger about the perimetrical element of The Cosmos, then the greater the innemny will become as a result; by this notion, however, we should not consider innemny as a form of narrowing philosophical contemplation, but simply a sharpener of the knowledge we possess to conduct our philosophical studies of subjects.

[1:37:109] The intrinsicity of the edge of The Cosmos is an overarching instrument in this context, for the perimetrical intrinsicity has been demonstrated in many of the instruments aforementioned and lattermentioned in this discourse.

[1:37:110] Inversity is another instrument of study that can be identified throughout perimetrical naturity; if inversity is the measurement of opposites in position and direction then the outward expansion of the cosmical perimeter is the ultimate physical manifestation of inversity for the opposite poles of the perimeter are the inverse of each other.

[1:37:111] We can derive a strong sense of medianity from all perimetrical concepts because it is the most fundamental position and naturity of the cosmical perimeter to exist between the entities known as The Cosmos and The Universe in the Astronist Cosmology.

[1:37:112] Here, we see one of the greatest manifestations of medianity in all of Cosmic Philosophy and perhaps this particular manifestation of medianity is the first of its kind and the most ultimate all other examples of cosmical medianity.

[1:37:113] Regarding the application of motionality to the cosmical perimeter, there are two main contemplations; that of Constant Motionality, and Accelerating Motionality.

[1:37:114] The first of the two relates to the stance holding that the perimeter of The Cosmos is expanding, has expanded, and shall continue to expand at the same speed.

[1:37:115] The second of the two relates to the stance holding that the motionality of the perimeter of The Cosmos is expanding at a continuously accelerating rate; the innemnic view generally favours that of Accelerating Motionality, but like many of the other scientific knowledges and theories relating to The Cosmos, they too are always susceptible to newfound knowledges and proven theories.

[1:37:116] Perhaps the most contemplative part of perimetratics is the application of the instrument of study of mysteriosity to the perimeter of The Cosmos.

[1:37:117] From our narrow perceivence here as humans on one planet, the greatest aspect of the perimeter of The Cosmos is in fact the extent to which its whole naturity is shrouded in mystery, and the fact that all that we think we know of the way by which The Cosmos has expanded, shall so easily be foiled by the cosmical reality.

[1:37:118] This perimetrical mysteriosity is which many of us shall wonderment upon, adore, and laud the edge of The Cosmos for, and it is for this reason that the application of this instrument must be made and is thus, very important to the overall philosophical contemplation of the cosmical perimeter.

[1:37:119] The instruments of naturity and orderity shall be considered together in this regard because even after all the concepts branching from perimetricks, these two instruments still lay in ambiguity.

[1:37:120] Perhaps it does not hold any logicality to attempt to categorise the perimeter to be part of either The Cosmos, or The Chaos; by all accounts, its functions and general derived narrative relates to a certain cosmicality, but due to its separation from all other types of cosmical progeny, therein demonstrates an autonomy of the perimeter.

[1:37:121] From an orthodoxical view, however, the perimeter should always be considered to be part of The Cosmos, but it is the beauty of philosophical contemplation to allow those who wish to do so to raise questions and form concepts that counter this view of the perimeter.

[1:37:122] Perhaps future philosophers of this discipline will determine that the perimeter belongs in neither The Cosmos, nor The Chaos; it could be logically argued that the perimeter is an element that exists beyond both the cosmical and chaotic paradigms; all things that exist must exist within something, and so, therefore, they must exist within a perimeter, and therefore, a perimeter must be formed if existence is to occur.

[1:37:123] By this notion, a universal and divinical naturity of the perimeter is formed which transcends both the cosmical and chaotic paradigms entirely, and demonstrates the lengths to which a contemplator could reach in the study of perimetricks.

[1:37:124] For a much smaller instrumental contemplation, we often think of the cosmical perimeter as being circular in shape, but there is nothing to stop the most ambitious of contemplators from considering the perimeter to be orthogonal, or to be formed by some other shape.

[1:37:125] Often, the greatest beauty of philosophy is demonstrated in the most bizarre of concepts; it is these bizzarrities that we as philosophers contemplate for all concepts are initially perceived to be unusual.

[1:37:126] The importance of the perimeter of The Cosmos has been inferred throughout many other contemplations of instrument and conceptualisations within this perimetrical

discourse, and so, needn't be repeated, but it is instead the perimeter's primarity over other progeny of The Cosmos that must be clarified to all studiers.

[1:37:127] Primarity exists about the cosmical perimeter in the most simplistic of sense via its encompassment of all other progeny within The Cosmos; there is no illogicality in the notion that without a formed perimeter, the cosmical orderity, system, and reality as we wonderment them would not exist as they do.

[1:37:128] It would be illogical, however, to notionise that such progeny existent within The Cosmos, covering a relatively space within The Cosmos compared to the cosmical entirety, would hold greater importance of that which is so vast and expansive that all that does exist, in a cosmical reality, exists within it; this being the perimeter of The Cosmos.

[1:37:129] We have contemplated a couple of times within this instrumentation of the perimeter of The Cosmos that it is the ultimate manifestation of some instruments; the same can be said of the instrument of progressivity.

[1:37:130] Progressivity is structured upon the idea of a gradual series of changes with the goal of reaching a higher, superior, or a greater advanced state.

[1:37:131] With this in mind, let us contemplate that the cosmical perimeter is the essence of cosmical progression for all that has changed has done so by the grace of the cosmical perimeter within which it exists.

[1:37:132] Since the Inception Epoch, the perimeter of The Cosmos has continued to expand into new plains of existence, and if this isn't the ultimate manifestation of progression, then nothing is.

[1:37:133] Since the beginning, the perimeter of The Cosmos has expanded towards even greater states of existence with every second of its own existence.

[1:37:134] A gradual series of change is manifested in the expansion of the cosmical perimeter, and with every instance of wider expansion, a higher, superior, and greater advanced state is reached.

[1:37:135] A relentless expansion that holds no mercy for the progeny and the occurrences it creates in its wake; ultimate progression is perhaps closest to resembling some form of divinity.

[1:37:136] If the purposivity of the perimeter of The Cosmos has not yet been clarified to the studier, then one must begin to contemplate on their own ability to read within the meanings of the insentensations to derive inferences.

[1:37:137] The cosmical perimeter holds the fundamentality to cosmical existence and reality; its primary purposivity is to underpin and host all that cosmically exists; it fences the cosmical system, provides it with structure, and secures it in place.

[1:37:138] It could perhaps be logically inferred that the perimeter of The Cosmos is that which keeps The Cosmos as it is; whether the perimeter of The Cosmos reigns over The Cosmos, or The Cosmos reigns over its perimeter, the difference is subtle, but the inference is vast.

[1:37:139] So, we have inferred the purposivity of the edge of The Cosmos, but we must also contemplate this furtherso; when we take thought about the perimetrical purposivity, we take thought about the purposivity of existence in its entirety.

[1:37:140] This can be derived because the cosmical perimeter encompasses the entirety of cosmical existence; it can, therefore, be logically denoted that when we make a deduction about perimetrical purposivity, we deduce about the purposivity of existence.

[1:37:141] The next of the instruments of study to contemplate and apply to perimetrical concepts is that of reciprocity; the reciprocal nature of the cosmical perimeter is clearly demonstrated by its expanding function corresponded by creations occurring within it.

[1:37:142] Reciprocity can be derived in many of the cosmical progeny, as one of the primary characteristics of functionality, and with regards to the perimeter of The Cosmos, there is no exception for the cosmical edge is perhaps the large reciprocal force in the entirety of cosmical existence.

[1:37:143] Although the progressivity has been championed within this instrumentation of the cosmical perimeter, that which is so very progressive must also share the potential to be regressive, and it is by this principle, that we apply regressivity to the cosmical perimeter.

[1:37:144] The compartship between the instruments of regressivity and progressivity can be easily contrasted when related to the cosmical perimeter.

[1:37:145] If progression is the advancement towards a perceived greater and superior state, then regression, as its direct oppositism, is the advancement towards a perceived lesser and inferior state.

[1:37:146] From the traditional viewpoint of the cosmical perimeter, the progression of the perimeter is paramount in its existence, but as the perimeter nears the point of collapse, we can contemplate that regression will gradually overtake the progression, thus causing the inevitable collapse.

[1:37:147] In a physical sense, the regression of the perimeter can be derived by the concept that the perimeter of The Cosmos shall experience the diminishment of its existence by shrinking into a lesser state as The Cosmos collapses alongside it.

[1:37:148] By this notion, we contemplate the most ultimate form of regression; the regression of The Cosmos itself; again, we see that perimetrical concepts draw upon the most ultimate exemplars of an instrument and its effects.

[1:37:149] The main point to make about regressivity is that hope is not lost for the return of progression, and this is especially so in the case of the cosmical perimeter.

[1:37:150] Just as the perimeter of The Cosmos is in some future time predicted to regress into a lesser state than its current self, so too, is the possibility for its reemergence, especially so by means of a recreated cosmology; a cosmology whereby progressivity and regressivity form the basis of existence; it is their battle in the form of cosmical expansion and cosmical diminishment that dictates being, reality, and knowledge.

[1:37:151] As the influence of the perimeter of The Cosmos is prevalent throughout all cosmical existence, the symbiotic naturity of the cosmical perimeter is also derived to be prevalent.

[1:37:152] The edge of The Cosmos holds a symbiotic relationship with the space that exists within it; the mutually beneficial relationship exists in that for the space to exist, the perimeter must encompass it, and for the perimeter to exist, the space must exist within it.

[1:37:153] This symbiotic relationship is in occurrence throughout the naturity of The Cosmos and not without this symbioticism could the perimeter exist as we perceive it and understand it to.

[1:37:154] The symbiosis of the cosmical perimeter is of comparable importance to the functionality and orderity of it, and is considered to be part of the fundamentality of the cosmical perimeter.

[1:37:155] The perimeter must cooperate in function with the space within the perimeter and the existence beyond the perimeter; for the existential entirety of the perimeter, it must craft and balance the relationship with which it may function.

[1:37:156] We can easily derive synchronicity with regards to the expanding perimeter of The Cosmos which occurs in continuation at the same time that the cosmical progeny are being created within it.

[1:37:157] All that has occurred within The Cosmos is happening in synchronous with the expansion of the cosmical perimeter because everything that has ever occurred has done soon at the same time as the perimetrical expansion; by this notion, the synchronicity of the edge of The Cosmos is perhaps the highest it possibly could be.

[1:37:158] Also, the measurement of the vastness of the cosmical perimeter constitutes a great level of vastity, perhaps the greatest of a cosmical basis, only penultimate to The Cosmos itself.

[1:37:159] The vastity of the perimeter holds direct correspondence towards the extent to which it has expanded; also, the potential of the vastity of the perimeter is in direct correspondence to can expand with the amount of space there is available for it to expand into, the extent of time with which it has to expand before the end of The Cosmos, and the extent of matter that there shall exist to infill The Cosmos.

[1:37:160] In the Perimetrical Cosmology, and during any level and context of any perimetrical discourse, the conceptualisation of Perimetrical Collapse runs throughout in strength by its continual inference in the contemplation of Perimetrics.

[1:37:161] The Perimetrical Collapse relates to the process of diminishment, specifically directed towards the edge of The Cosmos as a separate consideration from the progeny within the perimeter and from The Cosmos itself.

[1:37:162] Built upon logicality, the concept whereby The Cosmos will, in some time of futurity, eventually cease to exist as we understand it, is central to the Perimetrical Collapse; in fact, it is the trigger of the Perimetrical Collapse.

[1:37:163] Although, by this notion, we face a paradox; what shall come be the trigger, the Progenitorial Collapse, or the Perimetrical Collapse?

[1:37:164] It is the ultimate inevitability of the cosmical perimeter to collapse, and by this notion, we understand that it is in fact the intrinsic naturity of cosmical edge to collapse; one could say it is in the destiny of the cosmical perimeter to collapse for its destiny is corresponded to that of The Cosmos itself.

[1:37:165] It can therefore be concluded that in the Perimetrical Cosmology, the role of the concept of Perimetrical Collapse is central and foremost, and it may be considered that the Perimetrical Cosmology cannot be complete with its ultimatory stage; the Perimetrical Collapse.

[1:37:166] The potential divinity of the cosmical perimeter has been inferred to throughout our contemplations on this subject, and by the conceptualisation of the Divine Perimeter idea, an official stance is developed that underpins and collects such perimetrical divinical concepts.

[1:37:167] The final concept of the philosophical branch of study of Perimetrics is known as Peripherance; this is similar to the term, circumference, but instead relates to the enclosing boundary of the cosmical perimeter, which may or may not be circular by shape.

[1:37:168] The peripherential concept provides no shape to the edge of The Cosmos, but instead, considers it to be a shape of uniqueness; a shape that is not emulated in any other element of The Cosmos.

[1:37:169] The concept of peripherance is important to wider Perimetrical Cosmology as it provides a characteristic of the functionality of the perimeter, but too, retains the ambivalence surrounding this entire subject.

[1:37:170] Perimetrics is a subject wherein scientific understanding is scarce, and so, philosophical contemplation prevails, but logicity, and rationality are largely undermined by the immense incomprehensibility and the inconclusiveness of perimetrical concepts.

[1:37:171] Peripherance is essential because it is a summation of the naturity, the functionality, the orderity, the motionality, and all other aspects of the cosmical perimeter; peripherance demonstrates the cosmical perimeter by its entirety, from all aspects, and encompasses all that can be known about these different aspects of the cosmical perimeter.

[1:37:172] Ultimately, perimetrists use both peripherance and all the other conceptualisations and instrumentations contemplated in this discourse to study and understand Perimetrics.

The Firmaments of The Cosmos

(Firmamentology)

[1:38:1] In Astronist Cosmology and Cosmic Philosophy, firmaments are the cosmical elements that do not consist of a physical form in the same way as a planet, a star, or an asteroid does; instead, firmaments are streams of insubstantiality; the most prominent exemplars of which are lightness and darkness.

[1:38:2] As distinct from the category known as filaments, which relates to the largest structures in The Cosmos, firmaments can be found in all parts of The Cosmos as part of solid physical progeny, and often play a large role in the functionality of these progeny.

[1:38:3] Firmaments are some of the most wondermentful progeny within The Cosmos and it is their ethereal natures that distinguishes them from all other cosmical progeny, and it is for this reason that they are also adored and venerated.

[1:38:4] The firmaments of The Cosmos hold a certain physical divinity that seems to infuse in all the other cosmical progeny with which they interact.

[1:38:5] Philosophical contemplations relating to the cosmical firmaments are organised and studied within the discipline of firmamentology, and it is the firmamentologists who designate themselves to specialise in the philosophical contemplation of the cosmical filaments.

[1:38:6] The most prominent of the cosmical firmaments is that of lightness; light is one of two Supercosmical Elements, the other being darkness.

[1:38:7] These two elements hold places of strong focality for the basis of existence, the vastness and complexity of which can only be explained in a composite paradigm wherein each of the most important parts of existence can explain one segment of it.

[1:38:8] The stimulus of sight, temperature, and sound, light is the fundamental component of cosmical existence for without light, The Cosmos would not exist for there would be no perception, no temperature, and neither would there be any firmamental structure for it is light that has been the most basic constituent in the formation of the galaxies, the stars, and the superclusters of The Cosmos.

[1:38:9] With lightness, we see The Cosmos, and so, as a direct reflection, with lightness, we also enknowledge ourselves of The Cosmos.

[1:38:10] With lightness and darkness, we often equate them to goodness and evility respectively, but this is a basic philosophical error.

[1:38:11] Whether light holds any truly divinical associations as the history of faiths and symbolisms would have us believe, or whether the Astronist approach of antequation, or non-association, is adopted is a matter of theological, rational, logical, and symbological debate.

[1:38:12] Can an accurate description of the naturity of light be adequately appropriated by the words of insentensation? Due to its vastness, this is very much doubted, though this stance does not dampen our efforts to try and formulate some appropriation.

[1:38:13] The naturity of light is a direct reflection of the naturity of ourselves, of The Cosmos, and of existence itself; light is the stimulus for all cosmical existence and darkness, its antimentor, its oppositism, is a type of stimuli that acts as the antithesis to light and it is upon light that darkness depends.

[1:38:14] Whether by means of sight, sound, or temperature, all that is analysed by study in association with light can be derived from some cosmical origination; by this essence, lightness is cosmicness.

[1:38:15] All in all, the naturity of light transcends the two entities of Astronist Cosmology known as The Cosmos and The Chaos; light can neither be categorised in either of these divisions, nor can it subjugated into a single functionality, orderity, or motionality.

[1:38:16] The orderity of light is a vastness as light itself; there can be the most heralded of cosmical entities that emanate the brightest of lights, and so equally, there can be the most chaotic of entities that emanate even the brightest of lights still.

[1:38:17] By association, light, specifically in the Astronist Cosmology, is pivoted towards being the most basic form of existence and darkness, as its necessary antimentor, is present whenever lightness is present.

[1:38:18] For there to be lightness, there must always be darkness; this is the most fundamental naturity of the two Supercosmical Elements.

[1:38:19] In this context, we use the term supercosmical to relate to that which exists within The Cosmos, but in simultaneity, also is neither considered to be wholly part of The Cosmos, or wholly part of The Chaos.

[1:38:20] Lightness pervades all aspects of cosmic philosophical study, and so too, does darkness, and with their existences intertwined, so are their naturities and orderities, and all other aspects of their being in an antimentorial way.

[1:38:21] The extremities of lightness and darkness are exemplified in The Cosmos and it is prudent during firmamentological study, to contemplate these two extremities.

[1:38:22] The cosmical extremity of lightness being the largest of quasars, and the cosmical extremity of darkness being the core of a black hole.

[1:38:23] If we imagine these two most extreme of entities side by side, we see the greatest exemplification of the naturity of lightness and darkness because we witness both their oppositism, as well as their striking simultaneity by the functionality and the fundamentality that they both serve.

[1:38:24] The focality of lightness and darkness in cosmical existence is undisputed, but when we widen the scope and speak on universal terms, this undisputed status some transforms into one of ambiguity, like many topics do when viewed upon by means of universality.

[1:38:25] Just because the cosmical reality and existence is wholly dependent upon these two elements of lightness and darkness, does by no means correlate to their importance beyond The Cosmos, in the universal reality and existence.

[1:38:26] Nobody can ever know for certainty of what the universal reality is, or whether it even exists beyond The Cosmos, the obstacle in logical thought cannot be denied, that just becomes one entity is essential in one paradigm, does not mean it shall in another paradigm.

[1:38:27] The divinical naturity of both lightness and darkness is another facet of deep philosophical contemplation, contention, and of even greater importance to engage in discourse concerning that such topic.

[1:38:28] By the notions of The Ten Cosmical Elements, the elements of lightness and darkness are eternally separated from the element of the Divine; by this notion, both lightness and darkness are not associated with divinity; alternatively, perhaps divinity is the synthesis of these two antitheses; in philosophy, it is also imperative to any civilised discourse to propose the range of alternatives, even to the most accepted and engrained of concepts.

[1:38:29] As the antimentor of lightness, darkness is the eternal oppositism to the lightness, and although they are forever intertwined by each of their very existences, they are also forever separated by their own existences; this is henceforth known as The Lightness-Darkness Paradox.

[1:38:30] In the cosmical system, we cannot deny that the majority of the characteristics of The Cosmos is infilled with darkness; by this notion, darkness is even more part of the physical cosmos than lightness is.

[1:38:31] From our perspective as humans, we are just as dependent upon darkness as we are upon lightness, but for two totally opposite reasons, but oppositism does not constitute any less focality for either side.

[1:38:32] It is the philosophical and disciplinal duty of the firmamentologists of the Astronist philosophical tradition to tackle these two intertwined entities and their subsequent concepts, and a challenge for even the greatest and widest and most imaginative of minds, they are and shall forever be.

[1:38:33] The next topic within firmamentology is that of luminosity, which is one of the lesser known instruments of study that is only applied in an exiguous amount of circumstances.

[1:38:34] The state of being luminous is widely regarded in Astronist Cosmology to be an entity's main driver of wonderment for the imaginations of those whom view it.

[1:38:35] One may ask, what is the difference between lightness and luminousness? The answer is quite simple; lightness is an of element that is majorative in some celestials, such as that of a star, and luminosity is the actual rays of light projected by that entity.

[1:38:36] The light projected from The Sun, as it travels through the recesses of The Cosmos to reach our faces as we close our eyes and look up at that which our entirety depends upon; feel the warmth, feel the absolute radiance, and see the immense luminosity that is projected by this most wondermentful of celestials.

[1:38:37] Luminosity is the measure of the extent to which a celestial's physical structure is dominated by projected light, and attempts to derive inferences from greater or lesser amounts of luminosity in comparison to different celestial entities.

[1:38:38] By traditional means, the greater the luminosity the greater the celestial's cosmicality for light is the driver of the majority of cosmical processes, and so, the greater its role of focality, primarity, and imperativity in the wider cosmical system.

[1:38:39] By this notion, we can derive that luminousness corresponds to cosmicality positively, as distinct from lightness, as we aforeaffirmed that lightness transcends these two paradigms of The Cosmos and The Chaos.

[1:38:40] This does not mean to say that all progeny of The Chaos are without luminosity, and neither are all the progeny of The Cosmos with luminosity, but only that luminosity is more widely regarded to be associated with cosmicality.

[1:38:41] From the luminous elements of entities, we see, and perceive, and understand the world and The Cosmos all that exists within it; as distinct from lightness itself, luminous is its main observable product, and a progeny in and of itself.

[1:38:42] Luminosity has excited since the beginning of The Cosmos, since the Inception Epoch, and it is to no one's dispute that the quality of luminousness has played a focal

part in the narrative of The Cosmos, and from a logical standpoint, shall continue to do so for the extent of the cosmical narrative.

[1:38:43] Luminousness is the essence of being, and is delineated by its associated instrument of study known as luminosity, which is applied to luminousness in whichever context it is contemplated in.

[1:38:44] In Astronist Philosophy, we consider flux in abstract terms, as departed from its traditional definition in physics, to relate to the ability, or inability of a firmament, whether that be lightness, darkness, or luminousness, to be applied to two different entities and still produce a similar functionality, orderity, motionality, or by some other instrument of study.

[1:38:45] An example of this would be the contemplation of the flux of lightness and of darkness with regards to a star; these two firmaments can both be realistically applied to a star so it is not a Null Flux, but they also produce oppositistic instrumentations, and therefore, results in an Oppositist Flux, rather than a Homogenous Flux.

[1:38:46] The Homogenous Flux is the application of two different firmaments that produces a similar instrumentation effect, and an Oppositist Flux is the application of two different firmaments that produces opposing instrumentation effects.

[1:38:47] The study of flux is both important and useful in all types of firmamentological contemplations because it allows us to contrast two different firmaments by whichever instrumentation we so choose, and from this, we can infer greater distinctions between each of the firmaments which are often harder to contemplate due to their greater level of ambiguity and abstractness.

[1:38:48] Now we turn our attentions to one of the most wondermented and mystological firmaments and that is the firmament of stardust.

[1:38:49] Often magically portrayed in Astronist Art and Symbology, stardust plays an important role in these and other related Astronist fields, and even though in Astronist Philosophy and Cosmology, the mystological and symbological influences are still very much apparent, a greater emphasis is placed upon the cosmological meaning for this term, and its actual purposities and functionalities in The Cosmos.

[1:38:50] We are all but the stuff of stardust; this poeticism has been widely promulgated throughout modern dialogue, and holds a basis from actual scientific study, for which we shall, by the Astronist Tradition, create a philosophical basis for.

[1:38:51] As products formed from the heaviest of elements created by stars, stardusts are the remnants of stellar existence, and are disseminated throughout the deepest reaches of The Cosmos towards the formation of new stars, planets, and systems by the grand force of gravity.

[1:38:52] When we look at ourselves, and the world on which we dependent, and the star system in which our world resides, we can derive their formations back to the stardust scatterances throughout The Cosmos as a result of the most violent of supernovae and hypernovae in past cosmical times.

[1:38:53] It is perhaps difficult for our logical minds to both believe and comprehend that the smallest remnants of these most distant of cosmical occurrences would result in the formation of new stars and orbiting worlds which would give rise to natures, peoples, and civilisations with thousands of years of history.

[1:38:54] Or perhaps it is not such an illogical notion, for it remains true of many things in the cosmical reality that the smallest of things create the largest of results, and perhaps it is the firmament of stardust that is the manifestation of this very observation.

[1:38:55] There are three orientations to take when contemplating that which shall be henceforth known as Stardust Cosmology, as part of wider firmamentology, and they are as follows.

[1:38:56] The first is to take the stance of Divine intercession; this view suggests that the entirety of the directions and journeys of stardusts through The Cosmos are controlled and destined by some higher power, known adenominationally in Astronist Philosophy, as The Divine.

[1:38:57] The second is to take the stance of coincidence; this view suggests that the course of stardust's creation of stars, planets, and systems is pure coincidence is not part of any wider narrative, or construct.

[1:38:58] The third is to take the stance of a cosmical emphasis; this does not dispel theological notions of the first suggestion, but simply funnels towards a greater autonomy for The Cosmos and its systems and orderities, and those may either take an atheistic stance to this, or a theistic one while still retaining cosmical emphasis.

[1:38:59] Whichever orientation one takes, the focality of stardust in the Stardust Cosmology continues to hold strong, and by the notions of stardust's creative abilities and tendencies, we reveal an intrinsic firmament in The Cosmos as a whole, and demonstrates to all cosmic philosophers that stardust should be taken into consideration in all types of Astronist cosmologies.

[1:38:60] As a firmamental product of luminosity, the galactic halo is a galaxy's luminous extension into the space beyond the galactic disc and is a pivotal kopol upon which we can wonderment.

[1:38:61] By this notion, we witness a beauteous exemplar of cosmical luminosity in one of its grandest and vastest of forms, and by this, we can begin to measure luminosity in a metagalactic context.

[1:38:62] Galactic haloes can be categorised into two types of firmamentological study and these are henceforth known as the Inner Halo and the Outer Halo, and it is often either of these galactic haloes that demonstrate the oldest of stars in a galactic formation, often ordered into globular clusters.

[1:38:63] Phenomena is term often designated in Astronist Philosophy, and typically holds three distinctive definitions.

[1:38:64] The first of which relates to the object of one's perception, as distinct from kopol; the object of one's wonderment, adoration, or laudation.

[1:38:65] The second of which relates to the progeny of The Cosmos collectively, especially asimilar to nature in this regard, and especially relates to anything of non-human origin.

[1:38:66] The third of which relates to anything that is beyond current traditional philosophical contemplation and understanding.

[1:38:67] Therefore, by the evidence of these three definitions, phenomena is an important term within Astronist Philosophy, and it is the collective cosmical phenomena that we wonderment, adore, and laud.

[1:38:68] It is the progenial phenomena that we do majoratively study and contemplate in Cosmic Philosophy, and so by this entitlement, we provide phenomena its important terminological position within wider Astronist Philosophy, especially so as a describer of firmamental progeny.

[1:38:69] Although temperature is not officially considered to be an instrument of study, it plays an immensely important role in the entirety of philosophical cosmological contemplation, and has been aforementioned and shall be lattermentioned throughout the Omnidoxy as a driver of many progenial occurrences, formations, and consequences in The Cosmos.

[1:38:70] The philosophical study and contemplation of temperature in Astronist Philosophy is considered to be part of firmamentology, as temperature certainly holds firmamental tendencies and characteristics.

[1:38:71] To that end, we must first contemplate the two extremities of cosmical temperature in order to contemplate temperature in its widest entirety before specifying our study, and it is Absolute Zero and Absolute Calefact that relate to the coldest and the hottest cosmical temperatures respectively.

[1:38:72] What can we derive from temperature in philosophical and cosmological terms? Temperature is both a driver of functionality, but it is also a product of functionality; it is a consequence of occurrence, but is also a driver of such occurrence in creating consequence.

[1:38:73] Ultimately, temperature is a paradoxical element of the cosmical system that is applied in opposing ways in different circumstances, and to add a further dimension, the spectrum it holds between cold and heat dictates the nature of the consequences, the functionalities, and the orderities it causes.

[1:38:74] For a moment, let us contemplate temperature beyond The Cosmos, for it is cosmical temperature that we have up to now studied, and in order for us to draw an even larger picture of the naturity of temperature, we must contemplate it in all of its aspects, which means that we must contemplate its possibilities by both universal and divinical means.

[1:38:75] Temperature is not just a progeny of The Cosmos, as it did not form after the many millions of years of the cosmical development; temperature is instead a curious constant of The Cosmos and has been a characteristic of existence since the very moment of the Inception Epoch.

[1:38:76] Whether the presence of temperature existed prior to the Inception Epoch is the contemplation of Universal Temperature, and suggests that beyond the perimeter of The Cosmos, temperature plays an instrumental role as it does within The Cosmos, but perhaps by a different set of spectrums and realities for cosmoses.

[1:38:77] It would be logical to suggest that something that is so inextricably tied to existence would exist beyond a defined reality such as The Cosmos, but oppositistically, it would also logical to suggest that temperature is only a feature of cosmical existence, and so, in universal and divinical realms, there is no such element of temperature afforded.

[1:38:78] The latter of the two suggestions is greater supported by the notion of temperature's intrinsic impermanency by its own spectrum; there is only certain temperatures that can be possibly reached in The Cosmos on both ends of extremity.

[1:38:79] This demonstrates temperature's ultimate restriction and as a result, demonstrates its cosmicality for all things that are cosmical are ultimately limited by the bounds of The Cosmos itself.

[1:38:80] Alternatively, this does not mean to say that temperature is bound to these limitations in all realities and existences beyond The Cosmos.

[1:38:81] Like many other elements of discussion within Astronist Philosophy, whether an entity is cold, or hot than any of its counterparts does not constitute any greater chaosity, or cosmicality at either end of the spectrum.

[1:38:82] Instead, we can measure that when temperature spikes do occur in The Cosmos, such as during a supernova occurrence, the greater their cosmicality and their chaosity in simultaneous unison, and so therefore, temperature does not correspond to cosmicality, or chaosity.

[1:38:83] However, during a filamentologist's philosophical contemplations of temperature, they may find patterns of temperature relating to greater chaosity, or greater cosmicality, and by this measure, a correspondence would be derived.

[1:38:84] We shall now conduct a full instrumentation of temperature in The Cosmos in order to establish the foundations of the philosophical concepts and contemplations of temperature in a cosmological context, and as demonstrated by the many promissions throughout the Omnidoxy, the conduction of instrumentation is essential for deeper philosophical knowledge of a particular subject.

[1:38:85] The instrument of abundancy is exemplified in its most extreme form when applied to temperature for it is temperature that is existent in every point of existence in The Cosmos, and at each point of existence, henceforth known as cosiculs, the temperature is unlike any other cosicul in The Cosmos.

[1:38:86] A three-dimensional abundancy can be seen when we apply abundancy to temperature because we see the amount of temperature points, then the amount of points on the spectrum of temperature, and then we see their dissemination through each cosicul of The Cosmos.

[1:38:87] As the second instrument of study of this particular instrumentation, binarity is most clearly derived by two sets of perceivences; either hot and cold, or above zero and below zero.

[1:38:88] By this notion, we derive that the fundamental structure of temperature is commanded by these binary parts that are both intertwined and dependent upon each other for their existences.

[1:38:89] Bipolarity is greatly seen in the study of temperature by philosophical means through the two most iconic of cosmological extremities, those of cold and heat.

[1:38:90] The former of which associates itself with inactivity according to basic scientific circumstances, and with the latter associating to activity of the molecular structures of entities.

[1:38:91] There is no greater bipolarity than these when it comes to the study of temperature, and without these two extremities, it stands true that the fundamentality of temperature, which also links to its purposivity, would not exist.

[1:38:92] Throughout our discussion on temperature, we have supported the notion of its centrality in the fundamental structures of The Cosmos, due to the combination of its abundance, its focality, its fundamentality, and its functionality, the culmination is its centrality as a direct result.

[1:38:93] From every stage in the formation and narrative of a star, to the emergence of life and sentience on worlds, and from the largest structures to those on molecular levels, temperature plays a consistent role in all the progeny and the cosmical phenomena in The Cosmos, and by this very notion, its status as a filament is solidified.

[1:38:94] As aforementioned, temperature is bound to two extremities, thus making it limited on both ends of its existential spectrum, and this notion alone raises its cosmicality, but it is temperature's central role in the functionalities and the fundamentalities of The Cosmos that demonstrates its cosmicality.

[1:38:95] Temperature is a factor in all cosmical processes and occurrences, and often dictates both the circumstances and the consequences of a particular process or occurrence, and by this notion, by this central role that temperature plays in the proper functioning of the cosmical system, we derive its immense cosmicality.

[1:38:96] The criticality of temperature is demonstrated by an either gradual, or a quick-successional rise in the temperature of an entity which often causes explosive and violent consequences, such as that of a supernovae, or hypernovae.

[1:38:97] The rise or lowering in temperature is correspondent to the level of criticality; it is only a neutral, or constant temperature that diminishes the criticality level, as both immense coldness and immense heat are both considered drivers of criticality, even though the way by which they are critical is different from each other.

[1:38:98] Dyadicity can also be derived when applying it to temperature because we see both extremities of the temperature spectrum interacting of entities throughout their existences, and although these interacting oppositisms do so interact erratically and do so cause violent explosions of greater kinds than any that could possibly be produced by humanity.

[1:38:99] However, they are nevertheless interacting, and it is these that we call Opposit Dyadic Pairs; dyadic entities that hold opposing functionalities that are still forced into interaction with one another.

[1:38:100] If the instrument of dynamicity is the measure of change, activity, and progression according to the subject, then temperature is the very manifestation of dynamicity.

[1:38:101] In all aspects of change, both internally of itself, and externally of all the progenial processes and formations in The Cosmos, temperature plays an instrumental role.

[1:38:102] As aforementioned, the rising or lowering of temperature is in direct correspond to the increase or decrease in activity, and this is scientifically founded.

[1:38:103] All major events that have occurred in The Cosmos have done so through intense levels of heat, or intense levels of coldness, thus solidifying temperature's ability to command cosmical activity, or inactivity.

[1:38:104] Finally, progression, which is more abstract than the previous two components of the instrument, but even by this component, the role of temperature can be applied and is easily demonstrated.

[1:38:105] Easily demonstrated when studying the entirety of the cosmical narrative, we can infer that temperature has played an instrumental part in every aspect of major importance in the cosmical narrative.

[1:38:106] We can first see this in the Inception Epoch, then in the formation of the metagalaxy, the stars, the planets, and the star systems, and by predictational means, we can logically infer that temperature shall play another focal role in the degradation of The Cosmos towards the end of its narrative, by the deformation of stars, the dwindling of galaxies, and the destruction of plants; temperature is a constant factor effecting each of these parts of the cosmical narrative.

[1:38:107] By the multitude of inferences about temperature's constant role in the cosmical narrative, it would perhaps be logical to notionise that temperature is a factor that extends beyond The Cosmos, and is naturally eternal due to its enduring impact on all things, without exception.

[1:38:108] The debate about temperature's eternality will continue to rage on as a major topic of philosophical contemplation, as shall temperature's universality and divinity, but these types of disputes and debates demonstrate the main purposivity of the Omnidoxy itself, and the wider Astronist philosophical tradition.

[1:38:109] It is the purposivity of the Omnidoxy and wider Astronist Philosophy to spark such debates amongst all peoples; not in aid of any violent outbreak, but simply and innocently to introduce and nurture a new philosophical era wherein doubt, question, knowledge, thought, and imagination are the keystones of human academics and education.

[1:38:110] We can derive the finity in two parts; firstly, that temperature holds only two possibly extremities in its cosmical form, thus demonstrating a limitation to which it must

align as is the definition of finity, and secondly, one's belief in temperature's non-existence beyond The Cosmos.

[1:38:111] The second notion of the two demonstrates temperature to be a solely cosmical characteristic, which also plays into other concepts such as multiversal, and omniversal theories, which in themselves, draws upon even larger debates about divine intercession, as well as theological existence.

[1:38:112] If the focality of temperature has not yet been demonstrated by the words of this discourse up to this present insentensation, then one has not yet managed to grasp the intertwined and interconnected nature of Astronism.

[1:38:113] All discussions of Cosmic Philosophy occur within a paradigm of thought that is structured of a series of instruments, elements, and events; it is not only logical that these three would interact and overlap, it is also inevitable.

[1:38:114] Any discussion or philosophical investigation according to Astronist means occurs upon the basis that the discussion or investigation itself is more prominent than the results they achieve.

[1:38:115] To understand this better, we must contemplate the difference between questions and answers; questions are never be right, nor wrong, but it is the prerogative of answers to either be right, or wrong.

[1:38:116] Questions are always the precursors to answers; for answers to be given, questions must first be posed; however, it is the ultimate nature of answer to be motional; to be moulded by the context of the current time in terms of knowledge, experience, and logical development.

[1:38:117] We can never truly trust or know that which is henceforth the Answer Absolute; this is why the Astronist approach to philosophy, and wider academicism, is not to emphasise the proposal of answers, but instead, is to emphasise the proposal of questions and the possible logical answers to those questions according to scientific knowledge, logic, reason, and imagination, all underpinned with the acceptance that the proposed answers will inevitably change as the context of their being changes.

[1:38:118] The loyalty of answer and the loyalty of question are incomparable for it is only the latter that we can wholly trust not to change in the face of new contexts, only to develop, grow more complex, and deepen by the knowledge, vision, and understanding gain by the development of the civilisation that poses them.

[1:38:119] Forgive the digression about the nature of questions and answers, but the belief in the focality of temperature of the Astronist Tradition should be evident by the instrumentations applied to all other aspects of cosmological philosophical discussion during this particular instrumentation discourse.

[1:38:120] We see temperature clearly again in the formity of most cosmical progeny, and in the formity of The Cosmos itself for only the most ignorant of us could notionise that the Inception Epoch of without any temperature; a monoperature, without any temperature fluctuations, and thus, no influence from temperature by any means.

[1:38:121] By the formation of stars and galaxies, clusters and asteroids, and by the immense destructive creations of planets, quasars, and pulsars, each of these wondrous formities held intense and extreme temperatures at the peaks of their creations.

[1:38:122] The continuity of temperature's role in the functions, structures, and orders of The Cosmos is a merit to temperature's overall fundamentality to the entirety of cosmical existence, and how much more fundamental can one get than that?

[1:38:123] The functionality of temperature is measured and totally dependent upon where on the spectrum the subject resides, and according to this position on the spectrum, the functionality of temperature can change dramatically.

[1:38:124] Perhaps this is the greatest uniqueness of temperature; that it has the ability to release opposing abilities upon its own doings, as in that temperature can both heat up and melt, and it can also cool down, then it can freeze, and afterwards it can thaw.

[1:38:125] Each of these processes are oppositisms that come from the same source along the spectrum and thus, determines both the uniqueness and the vast functionalities of temperature, and further strengthens aforementioned notions of temperature's focality, fundamentality, and strengthens lattermentioned notions of temperature's imperativity, and naturity.

[1:38:126] The futurity of temperature is closely intertwined with the futurity of The Cosmos for temperature has played an interconnected role with the course of the narrative of The Cosmos thus far, so it would be illogical to notion otherwise about temperature's role in the future of The Cosmos.

[1:38:127] Imperativity is the next instrument of study that we shall consider during this instrumentation, and if imperativity is the measure of importance according to immediacy then temperature also fulfils this instrument completely.

[1:38:128] If the temperature of a subject is at either extremity, then its imperativity increases and intensifies more and more, and with many of the cosmical progeny being positioned at either end of these two temperature extremities, the imperativity of temperature is therefore very high when applied to certain cosmical progeny.

[1:38:129] We must also take into account fluctuation in cosmical temperature for the different progenies of The Cosmos; there are times when the temperatures of stars increase immensely, and decrease, and then continue on at a steady rate of temperature.

[1:38:130] As is with many other cosmical concepts, processes, and elements, and with wider Astronist philosophical study, the greater scientific knowledge we possess, the deeper, the more earnest, and the more complex our philosophical contemplations shall be, which falls in alignment with the principles of innemny.

[1:38:131] Innemny measures the extent to which a concept falls in alignment with current scientific and empirical knowledge, and although we do know so much about temperature and its naturities and functionalities in The Cosmos from a scientific perspective, a deeper philosophical debate about its role in existence has never been considered until this discourse.

[1:38:132] Innemny essentially measures the extent of our current scientific achievements in a particular area, and allows our philosophical and imaginative mental instincts to go beyond the current empirical knowledge to forge new thoughts in ways never before studied by scientific minds.

[1:38:133] This is how the Astronist Tradition perceives the relationship between philosophy and science; they are inseparable and essentially, one and the same by their very core natures.

[1:38:134] It is the way by which they are chronologically ordered that we see their true distinctions; philosophy has, is, and shall always be the precursor to science, and we see this statement in truth by all histories of the civilisations of this world.

[1:38:135] Philosophy is the idea and science is the application, experimentation, and investigation of the proposed idea; their limitations are also equally existent.

[1:38:136] Philosophy is bound by only one's minds ability to imagine the greater of ideas, but philosophy also does not deal in proof, just logic, rationality, and sensicality.

[1:38:137] Science is firstly bound by the width of the initial idea, and is further confined by proof, empiricism, and current knowledge in order to determine fact, but fact may so change, as we have witnessed throughout our own histories for fact is purely based on the extent of the knowledge with which we determine fact which is the ultimate confinement of fact.

[1:38:138] The instrument of intrinsicity measures the essentiality of a temperature in this case, and by the aforementioned and lattermentioned statements of this instrumentation, we have already established the foundations for the intrinsicity of temperature in The Cosmos, but herein we must explore it specifically.

[1:38:139] For the formations of the stars, temperature has been essential for it has gauged the extent of the star's rays, the intensity of the star's formation, and shall command the extent of the supernovaic explosions of the star during it's death.

[1:38:140] We could go on with endless exemplars of temperature's essentiality, but this notion alone, we have demonstrated temperature's widespread intrinsicity throughout all cosmical processes, and their most inherent functionalities, and narratives.

[1:38:141] It is the core nature of the spectrum of temperature to hold a medium point, and so, we can derive medianity in accordance to temperature by this notion.

[1:38:142] In terms of temperature, the medianity is always zero and this shall always remain so because of the naturity of the spectrum of temperature, and so, with medianity being an important part to the entirety of temperature.

[1:38:143] The main purposivity of temperature is to be an instrumental factor about the ways by which a progenial entity is consequentially resulted through the processes and environment that it creates.

[1:38:144] Without temperature, the processes and formational structures of entities would not have occurred as they have in The Cosmos, and this reinforces the importance of the purposivity of temperature, and this is something that requires greater contemplation from firmamentologists, as it links to wider purposivities of all other cosmical filaments.

[1:38:145] The instrument of study of solarity relates to the processes of stars, and by this notion, temperature is one of the most fundamental and influential factors effecting these processes, as well as the functionalities of stars, as aforementioned during this instrumentation.

[1:38:146] The next firmament of study during this discourse is that of the Accretion Disc; a rotating cosmical structure in orbital motionalty around a central cosmical entity, especially so around black holes, stars, and quasars.

[1:38:147] The two forces of gravity and friction suspend the accretion disc, and friction is causality of the orbiting materials to spiral inward directing themselves towards the central cosmical entity.

[1:38:148] The accretion disc is a cosmical phenomena that we cannot see with our naked eyes from the worlds on which we inhabit, so virtual constructs of accretion discs to show people how they function, and what their purposivities and naturities are becomes really important, and supports the notionisation of the widespread construction of planetariums worldwide.

[1:38:149] The entirety of the accretion disc is dictated by the central body, which draws upon the importance of centricity in the whole cosmical entity of accretion discs, and by knowing that the accretion discs are both rotational, are orbital, and are spirally motioned, the instruments of rotality, orbitality, and motionalty are all defined.

[1:38:150] Accretion discs hold even more importance with regards to their presences around black holes because without accretion discs, we would have no way of observing black holes for it is the firmamental luminosity of the accretion disc that makes distinct the areas around the black hole from the black hole itself.

[1:38:151] By this notion, accretion discs fulfil a purposivity and functionality wherein they act as visional amplifiers for our greater understanding of the most mysterious and complex structures in The Cosmos, which in turn draws upon wider purposivities and functionalities for firmaments in general; they fulfil the role of creating clarity for perceiver about cosmical phenomena.

[1:38:152] Known as the caldrons of The Cosmos, the accretion discs are the perfect exemplars of gravitational influence amongst cosmical entities, and by their own very naturity, they are the greatest manifestations of cosmicality for they are the mechanisers of motion, rotation, and orbitation in The Cosmos, and they radiate this via their luminosity.

[1:38:153] Majoratively circular by their overall shape and following a concentric structure, accretion discs are perhaps the greatest supports of concentricity theories about the overall cosmical system, orderity, and structure for they too, follow the concentric structural formation that many other progeny in The Cosmos also follow.

[1:38:154] By their influence from gravity and friction, their shedding of clarity on the most unknown cosmical progeny, and by their fixated orderities, strong sensical functionalities and purposivities, accretion discs are beacons of what it means to be cosmical, and by this notion alone, they deserve our greatest efforts of both wonderment, adoration, and laudation, as majorly important filaments in The Cosmos.

[1:38:155] The next two firmaments of our attention are considered to be minor when placed in contrast with other firmaments, are that of the Parhelic Circle, and the Anthelion.

[1:38:156] The former of which is a type of optical phenomena resembling a giant halo appearing as a horizontal line on the same altitude as The Sun, and perhaps sometimes associated with a lunar presence.

[1:38:157] The parhelic circle either appears in which is henceforth known as Entire Parhelia, or Broken Parhelia; the former describes the instance wherein the parhelic circle is completed, and the latter describes the instance wherein the parhelic circle is segregated.

[1:38:158] To see the true beauteousness of an Entire Parhelia would turn any non-wondermenter into the world's greatest by its overwhelming and all-overcoming radiance, and a rare, yet distinct sense and appearance of cosmical divinity.

[1:38:159] Seeing the completion of the parhelic circle derives much greater inferences than initially discerned for a great many wonderments lie within Entire Parhelia; that of

completion, fulfilment, attainment of purposivity, the highest beauty and radiance, and a distinct sense of perfection.

[1:38:160] A wonderful gift The Sun has provided is that of the parhelic circle, and it is one that we must look towards for a greater understanding of proximate resemblance, and an important filament indeed.

[1:38:161] The latter of which, known as the anthelion, is a type of optical phenomena that is part of the parhelic circle on the opposite side to the sun resembling a faint white halo, and is, itself an important filament to mention due to it being a cluster of luminosity, arguably holds greater focality than the rest of the parhelic circle.

[1:38:162] Both of these firmaments should be duly wondered upon because of their brilliance, their rarity, and their radiant beauty, though adoration, or laudation of such is not majoratively practiced due to their relative insignificance when related to wider cosmical system, orderity, and structure, but are still important notions of wonderment in the Astronist Tradition as part of firmamentology.

[1:38:163] In Astronist Philosophy and wider Astronist Culture, the term Celestial Arm refers to two vastly different associations; the first meaning of which is relevant within firmamentology and refers to the luminous glow emitted from the arms of a spiral galaxy.

[1:38:164] This describes a filament that exists upon a galactic scale, and although it is only the product of the stars of the galaxy, and not by its own origination, though does not make it any less worthy of our wonderment.

[1:38:165] In Astronist Philosophy, the belief in the grandity of The Cosmos is held in strength, and due to this, notions of sentient life are permitted; if one agrees, and derives that there are others whom are looking up in the hope finding life, then it is the luminous Celestial Arms of the galaxies that they shall see first which places greater importance on this particular filament.

[1:38:166] The second meaning of which isn't directly related to firmamentology, although considering the phrase's appearance within this discourse, it seems prudent to address its secondary association which relates to people's expression of wonderment, adoration, or laudation of any cosmicals through the form of tattooing themselves.

[1:38:167] Whichever way one wishes to express their wonderment and adoration of The Cosmos is their own personal freedom that should always be afforded to all peoples globally and beyond, and this is something that all Astronist philosophies and organisations promote and work towards.

[1:38:168] Although the phrase Celestial Arm relates to just one type of tattoo, the practice of Celestial tattooing holds many different forms across the body and relates to tattooing

procedures undergone in the creation of a cosmical symbol, background, or image on one's skin.

[1:38:169] Celestial Tattooing can express any cosmical or chaotic entity in The Cosmos, and may incorporate many other mythological, mystological, and humanic subjects into its expression.

[1:38:170] Celestial Tattooing, also known as Cosmical Tattooing, can be found throughout all Astronist cultures, traditions, and mediums across types of peoples, and is therefore, supported by Astronic philosophies and cultures, but it is only celestial tattooing that is encouraged and expressed in Astronic arts.

[1:38:171] Tattoos across the face are not encouraged by Astronist cultures, even if they are depicting cosmical entities, because this causes fear, disattachment, and a wider general extremism.

[1:38:172] Nevertheless, all Celestial Tattooing is considered an important outlet of expression of one's cosmical laudation, though many other non-permanent expressions of laudation are also existent.

[1:38:173] One of the most important and highly wondermented, adored, and venerated filaments in the Astronist Tradition is an aurora; all we need do is imagine the night sky filled with giant green contours darting across thousands of miles with The Cosmos as the backdrop from the perspective of those looking up at the auroral display from The Earth's surface.

[1:38:174] It is herein confirmed that the filament of auroras are given special recognition and importance within Astronist and Cosmic Philosophy, as part of filamentology, for their unquity, beauteousness, and their unmistakable grandity.

[1:38:175] As a product of The Sun's flares penetrating The Earth's atmosphere, auroras are considered to be some of The Cosmos's and The Earth's greatest interactions, and further strengthens a sense of solar and planetary symbiosis.

[1:38:176] The importance of the wonderment of auroras in the Astronist philosophical tradition is accordingly demonstrated in wider Astronist Culture through art, literature, and music, so much so that the auroras are intended to become the most proximate Earth-related symbols of Astronist and Cosmic Philosophy.

[1:38:177] With the inspiration for the Astronist Starlight Festivals partly arising from the beauty of auroras, and their affirmed place in varied levels of devotion within the Astronist Tradition, one can make no mistake in deriving that both aurora borealis, and aurora australis are beacons and cornerstones of Astronist philosophical contemplation, with the larger and overarching context of The Cosmos holding omnipresence in the background.

[1:38:178] In Astronist Philosophy, halation is the next filament of our attention within our discourse on firmamentology, and in this context, it relates to the blurred appearances in photographs and observation due to the spreading of light beyond its proper boundaries.

[1:38:179] Halational notions are often most associated with those of a divinical naturity rather than a cosmical one, especially so in Astronist Art, however, in orthodoxical philosophical views, halations hold little wider importance or inference beyond their physical and visual occurrences.

[1:38:180] Halation must not be confused with luminosity, for the two are very similar to untrained minds, but the former is a photographic and observational phenomena, while the latter is much greater, as it is an actual extension of lightness itself.

[1:38:181] Halation is considered a minor filament, and although it all are open to wonderment it, very little emphasis is placed upon its specific firmamentality within the Astronist philosophical tradition, while in the Astronist Arts, its role is much larger and more prevalent.

[1:38:182] The physical star to which we are proximate and that we have entitled as The Sun is itself not a filament, but the flares, the rays, and the beams of heat and light emitted from it are filaments by their very core natures.

[1:38:183] This develops the filament that is henceforth known as helia which includes all the emittances of The Sun, or any other star, as distinct from the physical structure of the star itself.

[1:38:184] Heliacal study and wonderment can be considered both a branch of solarological philosophical study and wonderment, but more so as part of filamentological philosophical study and wonderment.

[1:38:185] The stars of The Cosmos are the commonmost and the greatest of all cosmical progeny to wonderment upon, and the inferences surrounding heliacal studies are widespread, with the most important being both the symbiosis of solar and planetary progeny, as well as the impacts that the natural emissions of stars have across their entire system.

[1:38:186] The collective firmaments of helia also form their own minor instrument of study within the orthodoxical Astronist Tradition, which is henceforth known as heliacality.

[1:38:187] Heliacality measures and contemplates the extent of the impacts of the emittances of stars onto the planetary entities that orbit them, as well as the impacts of the emittances on other non-planetary entities within the star system.

[1:38:188] The firmaments of helia are considered to be highly important within the Astronist Tradition due to their intrinsicity for other filamental forms such as that of auroras, and parhelic circles.

[1:38:189] Without heliacal firmaments, all the optical and physical phenomena that originate from The Sun and that we wonderment from the surface of The Earth would simply not exist for it is these heliacal firmaments that form the connection between The Sun and the planets that rotate and orbit around its centrality.

[1:38:190] For this reason, the instrument of study of heliacality is henceforth developed as a minor instrument for the purposes of developing the philosophical contemplations of heliation further so beyond the current means of this single founding text.

[1:38:191] In Astronist Philosophy, the term illuminance holds a slightly different definition from its counterpart definition in mainstream physics, and is instead defined as the specific type of illumination observed from immensely grand distances.

[1:38:192] A famous exemplar of that which we now term as an illuminance was the supernova observed in 1054 by Chinese astronomers which eventually formed that which we now all know today as the Crab Nebula.

[1:38:193] These types of luminosities are rare, and they come mainly in the form of supernovae, hypernovae, quasars, and other immensely bright celestial objects that are observable from a planetary surface.

[1:38:194] It is said herein that one who witnesses a true illuminance shall never wish to cast their visions away from the stars for even a second until death do them part from The Cosmos.

[1:38:195] Illuminancy is therefore an important concept within Astronist and Cosmic Philosophy because it describes the most immense and grandest of luminosities within The Cosmos, and relates these distantmost of events to our lives by their observances from here on The Earth, or from any other civilised world.

[1:38:196] We must draw these connections between the most distant of cosmical events because if we do not, we are in danger of losing that which is most important, and are in danger of missing the grandest and wondermentful of all cosmical phenomena, which further reinforces the importance of illuminancial contemplations.

[1:38:197] In all, we designate illuminance as a major cosmical firmament that is considered as such within the Astronist Tradition due to the philosophical contemplations and traditions that it has therein founded by its own origination.

[1:38:198] The next of the firmaments, and the third to last in this discourse on filamentology, is that which is known as the firmament of noctilucence; this relates to the

nebulaic clouds that surround a central star that are subsequently illuminated by the luminosity of the star within the clouds.

[1:38:199] In *Astronist and Cosmic Philosophy*, noctilucence holds a different meaning from its mainstream definition which relates to clouds in the upper atmosphere.

[1:38:200] The filament of noctilucence is the manifestation of the power and the integral naturity of luminosity to want to shine through all that entraps it, and not only does this make for a brilliance of colour, luminousness, and shape, it also demonstrates the importance of nebulaic clouds and their philosophical functionality of resembling the confinement of vision.

[1:38:201] Although clouds, or any other blurrer of vision is looked upon with negativity within the *Astronist Tradition*, nebulaic clouds are an exception for they are viewed in a majoratively positive sense.

[1:38:202] The nebulaic clouds surround the central star as though they are protecting it from the harshnesses of space and *The Chaos*; they hold the central star in a cocoon-like sphere to preserve the pureness, the direct divinity, and the grandity held within.

[1:38:203] By this notion, noctilucence draws upon a wider concept of cosmical protection; the certain instances in *The Cosmos* whereby one progeny naturally protects, or is inferred to protect another.

[1:38:204] Noctilucence also relates to the natural arrangement of nebulaic clouds around different cosmical progenies and to form that which is henceforth known as a *Noctilucent Accompicence*; a perfect and complete spherical nebulaic cloud around the central entity.

[1:38:205] *Accompicent* formations are those which can be considered as complete, perfect, or achieving the highest level of fulfilment that they possibly can do by their own natural abilities and functionalities.

[1:38:206] *Accompicence* can be found in all formations within *The Cosmos* because although the naturity of cosmical entities is essentially limitation, perfection within such limitations is still readily achievable.

[1:38:207] The concept of *accompicence* therefore holds an important place within *Cosmic Philosophy* for it describes cosmical perfection and the fulfilment of an entity's purposivity, naturity, and functionality.

[1:38:208] The second to last filament of our attentions within this discourse is that of *occultation*; rather a firmamental process than a filament in and of itself, *occultation* relates to the motionality whereby a celestial entity conceals a smaller celestial from view by passing behind, or distorts the luminosity from view by a celestial passing in front of the larger entity.

[1:38:209] From this notion, the firmamental process of occultation, by whichever means that it happens, is a distortive occurrence that contorts the luminosity of an entity from its normal shape, form, or intensity.

[1:38:210] Occultation is the commonmost originator of firmamental phenomena and is therefore demonstrated to be an important contributor to firmamentological study.

[1:38:211] In this context, occultators are henceforth known as the larger of the two entities involved, an example of which would be a star, and the occultatees are henceforth known as the smaller of the entities involved, an example of which would be a moon passing in front of such star.

[1:38:212] Occultational concepts group together the interpositions of cosmical progeny and are intrinsic to firmamentology.

[1:38:213] The last of the firmaments addressed in this discourse is that which is known as oscillation; cosmical progenies conducting movements back and forth at a regular rhythm.

[1:38:214] Oscillatory occurrences in The Cosmos would be considered to hold chaotic inferences, if it were not for their regularity and their clear physical necessary for certain structures, such as stars.

[1:38:215] Due to this, oscillation is considered to be a cosmical phenomena that is a minor firmament when compared to that of the other firmaments within firmamentology.

[1:38:216] It is the fundamentality of oscillation for movement to occur between two set points which demonstrates its cosmicality, as well as formulates its strong sense of restriction as its very core naturity is determined between two set points.

[1:38:217] Oscillation is also considered to be the consequence of some great fulmination which demonstrates the idea that for oscillation to occur, there must first have occurred some immense fulminatory event as the oscillatory precursor.

[1:38:218] To conclude this discourse, we have herein outlined the most fundamental aspects of firmamentological contemplation and study with the instrumentation of certain firmaments, and the introduction of others.

[1:38:219] It must be herein reminded to all that the Omnidoxy is principally a founding book that does not encompass the entirety of Astronist and Cosmic Philosophy for such philosophical traditions are formed over time from the words of many great minds and from the events of reality.

[1:38:220] To write herein and proclaim the Omnidoxy as holding the absolute word in all Astronist and Cosmic Philosophical matters, and to proclaim that the Omnidoxy

encompasses all that shall ever be within the Astronist philosophical tradition is to fabricate a narrative whereby one single text holds the final say on all matters which opposes the very core nature of philosophy itself.

[1:38:221] The term 'Founding Text' is therefore the perfect two-word synopsis for the purpose, function, reality, and intention of the Omnidoxy which is to act as the originator and the establisher of a newfound philosophy and thought tradition to which countless others shall add to, develop, improve, and make their own across the future of humanity.

[1:38:222] The Omnidoxy shall not change in its words, or its principles, but the words of others to which they attribute to those of the Omnidoxy are those which shall carve out the history of this philosophy and its traditions, as founded by the Omnidoxy.

[1:38:223] The firmaments shall herein and forevermore be the superlunary and ethereal wisps of The Cosmos that hold some indescribable sense of divinity, and it is for this reason that we must both study firmamentology, as well as wonderment upon all the cosmical filaments.

The Future of The Expanding Cosmos (Omnology)

[1:39:1] From finality and ultimatology, we derive inferences, and became mused with contemplations surrounding the end times of The Cosmos, but it is in the philosophical discipline of Omnology that we contemplate ideas under the presumption that The Cosmos is expanding, and the eventualities and consequences of this, for it is in Omnology that one contemplates The Future of the Expanding Cosmos, as derived by the title of this discourse.

[1:39:2] Omnological study involves the entirety of all concepts, orientations, and thoughtpaths that relate to ideas of futurity in the continued expansion of The Cosmos, with the ultimate goal of deriving the most rational, logical, and innemic conclusions about the consequences of cosmical expansion.

[1:39:3] Even though omnological study is very much centred on futurity, in order to understand it by its entire context, we must contemplate the expansion of The Cosmos from The Big Bang to the present day, and of course, beyond, if we wish to conduct deeper omnological contemplations.

[1:39:4] It is to the philosophical interest of omnologists to contemplate such deeper aspects of cosmical expansion, especially so by placing the consequences of the expansion at the forefront of all philosophical enquiries, and is the omnological approach to all topics within its discipline.

[1:39:5] The Cosmos began during the Inception Epoch as is understood in epochological terms, but in mainstream scientific understanding, it is termed as The Big Bang; from this moment on, the expansion of The Cosmos has been at the forefront of all creation; an expansion that has taken place in all directions, and holds countless complexities to the consequences and the structures it has produced throughout its existence.

[1:39:6] For something to expand, it must begin at some origination point; a location wherein the first instances of expansion takes place, and the location from which all expansion has culminated from and continues to create space into which it expands.

[1:39:7] As defined by the physical laws of existence, that which expands also dilutes as a consequence and we see this in the development of The Cosmos; at its beginning, at the Inception Epoch, The Cosmos was concentrated in the smallest point physically possible, and since then, its existence has expanded, and as a direct result, the space within it exists has also expanded, which causes its concentration to dilute the greater that it expands.

[1:39:8] By this notion, we can derive how each element is correspondent in consequence to certain other elements, and by the occurrence of certain events, such as the correspondences and proportionalities between expansion, concentration, and dilution.

[1:39:9] The concept of Cosmic Dilution leads us onto our first contemplation about the futurity of The Expanding Cosmos, which is henceforth known as The Separatory Cosmos; a State of Cosmos wherein the expansion has occurred for so long that all the galaxies within The Cosmos are separated from one another, so much so that they cannot observe other galaxies.

[1:39:10] This is a state wherein the expansion of The Cosmos has gone so far that the visions of those living within it are darkened to the point at which only their own galaxy is the greatest extent to which they can forever hope to know, see, and understand The Cosmos.

[1:39:11] By this notion of ideas, The Cosmos suddenly becomes a very lonely existence, and derives a race against time to explore our galaxy, and eventually travel intergalactically before this cosmic inevitability occurs, and we lose our cosmic visions beyond The Milky Way forever.

[1:39:12] And by this, the cruel reality of The Cosmos is revealed, but also simultaneously, its truest divinity; The Cosmos is not concerned with our own individual yearns for it to do what we wish for no matter the destruction, and no matter the human heartbreak caused, The Cosmos shall continue upon its course, with its neither morality, or nor immorality.

[1:39:13] By the laws of concentration and dilution, the future of The Cosmos is only logical going to end in the instance of The Separatory Cosmos, for any other consequence would be illogical; the further The Cosmos expands, the entities within it are only trajected to distance from one another.

[1:39:14] Now, we must introduce the philosophical school within the Astronist Tradition of Cosmic Philosophy that is henceforth known as Accelerationism; this school of cosmic philosophical thought holds the belief that The Cosmos not only expanding, but is, in actuality, accelerating.

[1:39:15] By this notion, we not only understand that The Cosmos is expanding towards The Separatory Cosmos, but is accelerating towards this inevitable fate.

[1:39:16] This tells us more about the nature of The Cosmos just as much as the nature of The Universe; we understand, by logic, that if The Cosmos is expanding, then the space for The Cosmos to expand in must also be expanding at an accelerating rate, and The Universe in which The Cosmos expands, must also be infinitely expansive enough to withhold all the expansion of The Cosmos that resides within it.

[1:39:17] By this notion, we understand that which is known as the Chain of Acceleration; the idea that for one thing to accelerate, so must the other elements around that entity

accelerate accordingly; this causes a series of accelerations, and a chain reaction that ends only with the end of the cosmical reality.

[1:39:18] The accelerationist school of thought stands in direct oppositism to consistentism; the belief that The Cosmos is expanding at a constant rate, and to decelerationism; the belief that The Cosmos is slowing down in the rate of its expansion.

[1:39:19] If The Cosmos is indeed accelerating then does that constitute a notion wherein The Cosmos shall one day inevitably collapse, when it has reached the extent of its own acceleration, whereby it can no longer accelerate at all.

[1:39:20] Another avenue of understanding could be directed towards the idea that The Cosmos will not collapse by its own acceleration, but instead, will continue on in its accelerated expansion for an infinite amount of space, time, and matter.

[1:39:21] In decelerationist thought, it is held that The Cosmos, from the moment of its inception, has already begun to slow down, and shall expand only to a certain point, and when at this point, it shall therein collapse because of its own stoppage.

[1:39:22] In consistentist thought, it is held that The Cosmos is expanding at a constant rate, and shall not ever be effected by any variation in its rate of expansion, and is more closely linked to the concept which is known as The Infinite Cosmos than any other school of thought or cosmology mentioned herein.

[1:39:23] This is The Cosmos in an infinite state in all aspects; infinite expansion, infinite space, time, and matter; by this notion, the lines distinctly drawn by the Astronist Tradition are blurred between that which is known as The Cosmos, and that which is known as The Universe.

[1:39:24] By whichever reality The Cosmos is destined to end, there importance for us in the present time that we make a point to discuss such issues so that we are able to stay in alignment with the foundations of the Astronist philosophical tradition, with the principal tenet being the galvanisation of the mass discussion of The Cosmos and its many possibilities.

[1:39:25] In this text, we speak not of absolutes in relation to The Cosmos, for this is no dogma; instead, we speak of the many brilliant possibilities of The Cosmos, and many indeed there are.

[1:39:26] From my personal perspective, I much prefer the world at night, when there is only oneself and the stars present, with no other distractions; at this time, one is able to see The Cosmos without the noises of the world we have created, as distinguished from the natural world that we have since inhabited and populated with our civilisations.

[1:39:27] I am but one mind, and although I have been given a mind brilliant so as to create this Founding Work, and all that exists within it, I am but one mind, and a human mind at that, and so, unlike The Universe, my mind does have a capacity; it is not infinite; I require of the peoples that shall succeed me that they build upon the foundations that I have laid herein, and all who take on such a vocation, please always keep with you the spirit that I share now at the time of this writing.

[1:39:28] Next, I introduce herein the philosophical discipline of study known as Adiabatics as part of Omnology, and the Astronist Tradition of Cosmic Philosophy; Adiabatics is the contemplation of heat in The Cosmos, specifically in relation to how it has been effected by the continuous expansion of The Cosmos since its Inception Epoch.

[1:39:29] Just like it is the nature of that which is to expand is to dilute, so too does heat in the exact same procedure; during the Inception Epoch, the inconceivable levels of heat in The Cosmos were entirely compacted into a relatively tiny space, and from that moment onwards, since the rapid expansion of The Cosmos, that heat has also diluted out, and is only concentrated in phenomena such as the stars, planets, and other celestials.

[1:39:30] Other than these relatively spread out concentrations of heat, the background temperature of The Cosmos demands that it is freezing beyond any measure here on The Earth.

[1:39:31] Adiabaticists are tasked with contemplating the future of heat in The Cosmos, and with so many different avenues of possibility, these individuals have much to contemplate upon their assumption to the role.

[1:39:32] Heat in The Cosmos is perhaps the greatest example of cosmical extremity and bipolarity; in a cosmos of space that is so cold that it remains, on average, only four degrees higher than Absolute Zero, and to then come across the stars, the supernovae, nebulae, and the most distant quasars, whose temperatures are simply startling to any contemplator.

[1:39:33] By these notions, we are able to understand the nature of heat in The Expanding Cosmos as being bipolar and a subject of extremity, but now we must contemplate different scenarios that are currently in circulation about the role of heat, and its future in The Expanding Cosmos.

[1:39:34] Firstly, cyclicist thought in relation to The Cosmos, which contemplate all things in relation that from which they originate as a means to determine where which they shall go, hold that The Cosmos shall return to its original form like during the Inception Epoch, which would involve the reconcentration of heat into a size and dimension of space so relatively minuscule once again.

[1:39:35] However, the issue remains that during the Inception Epoch, there existed the space for the heat, matter, and chemicalities to explode out into, but if The Cosmos is

retracting in size and dimension, then where shall this concentrated heat go; perhaps The Big Bang will reoccur so as to form another cosmos.

[1:39:36] Essentially, we cannot leave the conversation at the fact that the heat will be reconcentrated; we must look at the consequences of this, and the consequences that concentrating such a huge amount of heat, matter, and other chemicalities into such a small, dense point is the recipe for an almighty explosion; one that shall either birth that which is known in the Astronist Tradition as The New Cosmos, or shall force all that is left of the cosmical reality to cease to exist by the force of such absolute concentration.

[1:39:37] Alternatively, if The Cosmos continues upon its trajectured course of expansion infinitely, then the heat from the initial Inception Epoch, shall continue to become more and more scarce as space, time, and matter expand.

[1:39:38] All the heat that exists now in The Cosmos originated from the Inception Epoch; it is only this heat that keeps the furnaces of The Cosmos functioning as they do today, and it is only this heat that has caused our existence here on The Earth.

[1:39:39] Adiabatics explores heat in The Cosmos generally, but in an omnological context, puts this study in the context of The Expanding Cosmos, and contemplates and attempts to understand the possibilities for heat in The Cosmos in this scenario.

[1:39:40] The aspect of disconsolation with regards to the reality of The Expanding Cosmos is the inevitability of the galaxies of The Cosmos departing so vastly from one another, that we shall never be so graced as to see the beauties beyond The Milky Way; how shall we witness the metagalaxy? How shall we study the superclusters if this is the fate of The Cosmos?

[1:39:41] If The Cosmos is accelerating in its expansion, then it is only by logic, that we accelerate our own expansions in every way we can; in the expansion of our worldviews, our knowledges, our civilisations, our populations, and by the pure exploration of The Cosmos.

[1:39:42] If the voids of The Cosmos are only destined to become larger by the expansion of space, then so are the spaces between each and every cosmical phenomena, and so much further must we travel in order to reach each celestial; this is the current and future reality of The Cosmos and its expansion.

[1:39:43] With this expansion of The Cosmos comes the dilution of heat, as aforeaffirmed, but so too shall the concentrated points of heat, the main example of which are stars, they shall expand like all stars must into a red giant, and as The Cosmos continues along its trajectory, these shall only grow in their populations as an inevitability of the evolution of stars.

[1:39:44] Another aspect of adiabatics in relation to The Expanding Cosmos is that of the inevitability of temperature indifference as the cause to the collapse of The Cosmos for all cosmical reality and function is based upon certain entities being hotter internally, than the external surroundings.

[1:39:45] In this scenario, which is known in the Astronist omnological tradition as Degree Indifference, all temperatures in The Cosmos will become the same; just a fraction of a degree above Absolute Zero; by this notion, there shall be no further reactions or interactions in The Cosmos again because everything will experience that which is henceforth known as Ultimate Homogenisation.

[1:39:46] This constitute one future of The Cosmos if The Cosmos continues to expand, and by this Big Freeze Diegesis, The Cosmos becomes synchronously and synonymously cold, dead, and empty of any type of reaction, and interaction; this is known in the Astronist omnological tradition as The Dead Cosmos.

[1:39:47] The next of the scenarios pertaining to the consequences of the future of The Expanding Cosmos is that which constitutes that all that exists within The Cosmos is, innemically, all that shall form the consequences of its own gradual end.

[1:39:48] This concept is known as the Substance Principle in the Astronist omnological tradition, and was founded by the combined works of two of the greatest and mostly revered minds, Einstein and Hubble, and it holds that the greater the amount of matter there is in The Cosmos, the greater amount of gravity, and the greater the amount of gravity, the stronger the pull becomes on all cosmical phenomena, which eventually begins to slow down the expansion trajectory and leads all matter returning to its origination point; The Contracting Cosmos is thus the result of this scenario.

[1:39:49] The accelerationist school of thought herein takes the lead by the suggest of a newfound scenario of cosmical expansion and the future of The Cosmos therefore, and constitutes that there exists dark energy, which is forcing this acceleration.

[1:39:50] The existence of dark energy stands in total oppositism to the previous theory of The Contracting Cosmos being dependent upon that which exists within it, and due to our innemic knowledge of dark energy still being in its infancy, and the lack of philosophical contemplation on the topic to think of new ideas, the actual future of The Accelerating Cosmos is largely unknown in the current time of this writing.

[1:39:51] There exists an unusual property of dark energy being that even with the expansion of The Cosmos, the density of dark energy remains constant, so as The Cosmos expands, a consistent amount of dark energy is created to infill the new space created by the expansion of The Cosmos.

[1:39:52] The potential possibilities of dark energy are endless as omnologists of the future shall contemplate the effect to The Expanding Cosmos if dark energy's density were

suddenly to become less constant with the cosmical expansion, or if its density were to increase as The Cosmos expands; such differences in the properties of dark energy have vastly different consequences for the cosmical reality.

[1:39:53] The increase of the density of dark energy as the expanding rate of The Cosmos continues to accelerate will eventually cause the density of dark energy to become greater than a particular entity, and whenever this were to occur, that entity would become ripped apart from the inside out; this scenario of the future of The Expanding Cosmos is henceforth known in the Astronist omnological tradition as The Doomsday Cosmos, and is known in the scientific mainstream as The Big Rip.

[1:39:54] By this scenario, the entirety of plants, stars, and galaxies would be torn apart, and even the smallest of all atoms would implode, thus destructing the very fundamental structures of the cosmical reality; The Doomsday Cosmos shall, I am sure, be a most brilliant subject of artistic interpretation for Astronist and Cosmic art pieces to be created; go forth all artists and paint, draw, and imagine what this most horrendous, but also most terribly brilliant of spectacle could possibly look like.

[1:39:55] Perhaps in these most final of moments of The Cosmos, whether we ever are graced enough to witness them in their realities are not, it shall be almighty, absolute, and ultimate in every way we could possibly imagine; in any case, the concept, or instance of reflecting upon The Cosmos and seeing any cosmical phenomena in its entirety, whether at its beginning, middle, or end, is henceforth known in the Astronist Tradition as The Grand Manifestment, or The Panoptic Cosmos, and this is illustrated at the very end of The Grand Centrality in The Dodecadox, as part of Prerology.

[1:39:56] The only derivation of certainty that we can make about the future of The Expanding Cosmos, in all of omnology, is that we majoratively know very little about the expansion of The Cosmos and its consequences, especially so with the introduction of dark energy and its enshrouded role in such circumstances.

[1:39:57] The subjects of cryonics and pyronics are also considered as part of the philosophical discipline of omnology as they pertain to heat in The Cosmos as part of adiabatics; cryonics relates to the process of deep-freezing, and pyronics relates to the process of heating, especially to a normal temperature after the cryonic process has occurred.

[1:39:58] Curiously, the ethics of these two procedures, especially that of cryonics in the interest of cryopreservation of organic matter in space, and in long distances, especially in relation to the technique of freezing human bodies to travel long spacial distances so that they do not age during this lengthy period of time.

[1:39:59] Even though the ethics of these two procedures are considered to be officially part of omnology due to their subject, their ethical natures are more closely associated with

contology, and as such, the ethics of cryonics and pyronics cross into both of these branches of Astronist Philosophy.

[1:39:60] Those whom stand in the way of the Humanic Exploration of The Cosmos; those whom oppose the spacial development and expansion of humanity's civilisations in The Cosmos; those whom downgrade, ignore, and implore others to ignore the immensity, centrality, and beauty of The Cosmos; each of these people say that the Humanic Exploration of The Cosmos is unrealistic, and impractical.

[1:39:61] Cryonics is one of the most important technique of procedure that we will need to develop to its most efficient extent if we are to explore even the closest star systems of The Cosmos in relevant time; cryonics is the only practical way for us to explore The Cosmos without ageing so much in the process of this that we no longer recognise the person who have become since beginning our cosmic travel.

[1:39:62] It is for this most realistic and practical reason, and it is for this most fundamentally intrinsic of factors in relation to the Humanic Exploration of The Cosmos, that the Astronist Tradition wholly advocates, and supports the advancement of both cryonic and pyronic procedures in the context of space exploration.

[1:39:63] If we are to explore The Cosmos in mass terms, which is the ultimate ambition and vision of the Astronist philosophical tradition, then we must understand that these two procedures are integral to the achievement of long-distance space travel; this is a reality of The Cosmos, but it is a reality that, if we start to develop, improve, and advance now, we can make the most efficient, comfortable, and safe version of these procedures that do not impede upon the traveller's journey.

[1:39:64] The People's Constitutional Company of Jesse Millette should herein and henceforth be instructed to be determined in its efforts in the establishment of subsidiaries and organisations that support the development, improvement, and future advancement of the cryonics procedure.

[1:39:65] The procedures of cryonics and pyronics can be considered as part of the Astronist Sciences, as the main focus of scientific discovery and the subjects of experiment by Astronist cryonic organisations.

[1:39:66] I shall now conduct an entire instrumentation on the subject of omnology and The Expanding Cosmos in general in order to create a foundation for further philosophical contemplations about this major subject within the Astronist Tradition.

[1:39:67] Abundancy is fundamentally congerent to The Expanding Cosmos as with the expansion of anything, it is only logic to notion that it shall become larger, and all that exists within it, and as part of it shall, also become more populated.

[1:39:68] The trillions of galaxies of The Cosmos have only be able to come so populated because of the expansion of The Cosmos, for if The Cosmos had not expanded in such a vast way, then the cosmical phenomena within it, would also have restricted to the abundances it can reach.

[1:39:69] However, The Cosmos hasn't stopped expanding, and due to this, its capacity of space, time, and matter has continuously expanded as a direct result, and with this, so have the abundancies of the cosmical phenomena within The Cosmos.

[1:39:70] In the constantly, or even the infinitely expanding cosmoses aforementioned in this discourse, the abundancies of The Cosmos itself, and all within The Cosmos shall continue to grow, and it is only by logical thought that in The Contracting Cosmos, the abundancies of The Cosmos and all within shall decrease accordingly; thereby, we understand the extent of the proportionality and the symbioticity between the rate of cosmic expansion, and the extent of the abundancies of The Cosmos, and the cosmical phenomena.

[1:39:71] It must also be mentioned that the abundancy of The Cosmos and the cosmical phenomena it are different abundancies, although they are closely intertwined; their difference comes in that cosmical phenomena abundancy relates to a single celestial, or at most, a group, but the abundancy of The Cosmos relates to the entirety of The Cosmos, and all the celestials, space, time, and matter within it, thus forming The Cosmos itself.

[1:39:72] Finally, we incorporate the instrument of study of frequency into this discuss on abundancy, and we understand that in this context, frequency and abundancy are proportionate to one another, but with opposite effects.

[1:39:73] The most expansive The Cosmos becomes, the more abundant it becomes, and too do the celestial and cosmical phenomena themselves become, but too, so do their frequencies become less due to the larger amounts of space within which they reside.

[1:39:74] By this notion, we understand the monotonicity, as herein newfound instrument of study, between frequency and abundancy in The Expanding Cosmos, thus causing a negative correlation between the two instruments and their applicative consequences.

[1:39:75] We can also derive a great deal of bipolarity from contemplating the continued expansion of The Cosmos; firstly, bipolarity in a physical sense; the continuing physical separation between one end of The Cosmos to the other.

[1:39:76] We also witness ever-increasing bipolarity between each of the celestials and cosmic phenomena within The Expanding Cosmos, as part of physical bipolarity.

[1:39:77] Still as part of physical bipolarity, the elements and celestials of The Expanding Cosmos are trajectured away from the origination point; as the expansion of The Cosmos continues, the periphery of The Cosmos continues to become more and more bipolar.

[1:39:78] The Expanding Cosmos is trajected towards two extremes of bipolarity; the first is an extremity in size, and the second is an extremity in conjunction with both time, space, and matter, for in the expansion of The Cosmos, these three elements of the cosmical reality are all heading towards greater extremes as The Cosmos expands.

[1:39:79] Centricity is both integral to understanding The Expanding Cosmos and its future in a metaphorical sense, but in a physical and cosmical sense, centricity sees little relevance due to the ever expanding cosmos lacking a definite centre.

[1:39:80] Centricity can be derived in a metaphorical sense by the fact that The Expanding Cosmos is central to component of understanding the nature of The Cosmos itself in actuality; without an understanding of how, why, and where The Expanding Cosmos is expanding, we cannot hope to formulate any deeper understanding of the nature of The Cosmos.

[1:39:81] However, in a physical sense, the centricity of The Expanding Cosmos is often not the element that we focus our attentions and contemplations upon the most due the periphery of The Cosmos being the most frequently contemplated element in omnology.

[1:39:82] We can derive that composity in The Expanding Cosmos perhaps most out of many of the other aspects of The Cosmos discussed within Cosmic Philosophy, as within the context of The Expanding Cosmos, we understand that there exists countless series of separate, composite, and interconnected parts that form The Cosmos we know and wonderment upon.

[1:39:83] It is the composity of The Cosmos itself that forces its own expansion; the gravity, the dark energy, and the nature of its periphery; all of these composite, yet interconnected elements form its own expansion, and so, the compositeness of The Cosmos remains integral to form The Expanding Cosmos.

[1:39:84] Concentricity and the concentric structure and pattern remains in relation to specific celestials, star systems, and galaxy; however, due to the expansion of The Cosmos, any concentric patterns that ever may have once existed, no longer in our current knowledges and perspective of The Cosmos, and have been lost in The Cosmos's expansion; whether The Cosmic Entirety, as made distinct from the concept of The Panoptic Cosmos, does have any real pattern, or shape is still up for innemic proof, and philosophical contemplation.

[1:39:85] The Expanding Cosmos is perhaps one of the most ultimate manifestations of cosmicality, and to apply the instrument of cosmicality to The Expanding Cosmos, is to apply cosmicality to itself, for The Expanding Cosmos is the most powersome, superior, and overriding exemplar of cosmic existence that there is.

[1:39:86] As lattermentioned during the application of the instrument of study of orderity, there exists no more superior authority on what constitutes cosmicality, and what constitutes orderity.

[1:39:87] That remains the most curious part about orderity, cosmicality, and even all other applications of instruments; they remain applied from our own perspective, by the extent of our own knowledges, but in The Cosmos, all that is cosmical is ordered, and all that is within The Cosmos can be described as fulfilling the requirements of cosmicality.

[1:39:88] The Expanding Cosmos is no different; in fact, it is argued herein that it is the greatest manifestations of both cosmical orderity, and cosmicality for if cosmicality is a measure of the extent to which something conforms to the laws and systems of The Cosmos, The Expanding Cosmos is the most perfect exemplar of this.

[1:39:89] From a cosmic perspective, this remains true as The Expanding Cosmos is essentially The Cosmos, with the distinctions between these two entities largely blurred when placed parallel to one another.

[1:39:90] However, from an anthropic perspective, the fact that we know so little about The Expanding Cosmos; why, when, what, where, and all the other possible questions, and we know so little of that which is possibly its most vehement of drivers, dark energy, then we understand The Expanding Cosmos, by the extent of our current knowledge, perspective, and coherence, that it may be categorised as a subject of mysteriousity, disorderity, and unknownness, and thus, its cosmicality is weakened as a result.

[1:39:91] Despite this anthropic view, the cosmic perspective is maintained, in the Astronist Tradition, as the most superior of perspective, and yet the hardest to comprehend for any human being as it is always difficult to place one's view into the perspective of something so inanimate.

[1:39:92] Nevertheless, the cosmic perspective remains higher and truer than that of our own, and because of this orientation of the Astronist philosophical tradition, The Expanding Cosmos is maintained and considered as the greatest, highest, and purest manifestation of cosmicality, for it remains the force of The Cosmos itself; it is henceforth known as The Cosmic Soul in the Astronist Tradition.

[1:39:93] Criticality in its cosmical context can be considered to play an integral role in any contemplation about The Expanding Cosmos, by the concept that The Expanding Cosmos is upon a trajectory that this heading towards a critical point, and when at this such particular point, the collapse of The Cosmos shall occur, or some other cosmically changing event.

[1:39:94] By this notion, we understand that criticality is at the centre of cosmical occurrences, and that all cosmical occurrences are conducted along a series of gradually

building and intensifying circumstances that eventually reach the critical point, and is exemplified by The Expanding Cosmos, but it is not restricted to only this exemplification.

[1:39:95] Dyadicity is greatly manifested when applied to The Expanding Cosmos; there exists two elements of function to The Expanding Cosmos, the first of which resides in the rate at which the expansion occurs, and the second of which resides in the size at which the expansion results in.

[1:39:96] Also revealed by a short instrumentation of dyadicity, the elements of result to The Expanding Cosmos; the first of these is the extent of the cosmical phenomena produced by the cosmical expansion, and the second of these is the extent of space produced by the cosmical expansion.

[1:39:97] These different identified dyadicities form the symbiotic nature of The Expanding Cosmos, and constitutes that there are different types of dyadicities that each form a separate, yet interconnected whole that is The Expanding Cosmos.

[1:39:98] In essential, whether it be in regards to the relationship between The Cosmos and The Universe, or the space created and the space beyond the cosmical periphery into which cosmical space is formed into, or some other duo of the cosmical reality, dyadicity forms the intrinsic basis for all cosmical interactions.

[1:39:99] In essence, this identification of relationships between one entity to another is the basis of instrument theory; that is what can be defined as academic and the philosophical contemplative process of instrumentation.

[1:39:100] We can also derive a great amount of dynamicity from an instrumentation of The Expanding Cosmos, and this is split into three different categorisations that make up the instrument of dynamicity; these are change, activity, and progression.

[1:39:101] We derive change by the functionalities of The Expanding Cosmos in that The Expanding Cosmos is in constant change, and has been since the Inception Epoch; whether it be identified in the expansion of The Cosmos's periphery, or in the change of the abundancy, frequency, and naturity of the cosmical phenomena.

[1:39:102] By the component of activity, we derive continual activity, again, ever since the Inception Epoch, and we see this in every single interaction of The Cosmos, whether this be in occurrence at the molecular level, the metaphorical level, or the cosmical and physical level.

[1:39:103] And finally, by the component of progression, we see this perfectly and entirely manifested by the very existence and functionalities of The Expanding Cosmos; in The Expanding Cosmos, there exists constant and unrelenting progression; progression in size, progression in abundancy, and progression from the origination point that was the Inception Epoch, or The Big Bang, as known in non-philosophical terms.

[1:39:104] The eternity of The Expanding Cosmos is an element wherein there exists still a great deal of philosophical contemplation and discussion to be had.

[1:39:105] Whether The Expanding Cosmos shall expand eternally or not, which also commands its own infinite naturity, the possibility of this remains, still, and not without proper philosophical contemplation can we conduct any discussion of the eternity of The Expanding Cosmos, as it may be completely, or partially overlooked.

[1:39:106] If the eternity of The Expanding Cosmos is true, or even if it is not we still must discuss it if we are to uphold the authenticity of our own philosophical tradition, then this demands that there shall be no end to that which begin, which does, by this single notion, defy the principles of logic, wherein that which begins must also end.

[1:39:107] To this end, the eternity of The Expanding Cosmos signifies eternal space, eternal time, and eternal matter and phenomena; this is an interesting aspect of eternity herein identified; its intrinsic ability to pervade the entirety of all components involved; if The Cosmos is infinite and eternal, then the entirety of it must also be eternal, not just some part of it; this structures that which is henceforth known as The Eternity Principle in the Astronist philosophical tradition.

[1:39:108] By any notion of eternity in The Cosmos, this poses a fundamental issue towards the Astronist Cosmology, which maintains that The Cosmos is finite and separate from The Universe, which is infinite.

[1:39:109] From this principle, in the proclamation that The Expanding Cosmos is eternal, one blurs the distinction between that which is known as The Cosmos and that which is known as The Universe, though despite this contention, it must always be contemplated if we are to stay within the principles of philosophy; the contemplation of all concepts, even those that may not align with our current knowledges, or current orientations of our own thoughts and beliefs.

[1:39:110] In direct contrast to the previous application of instrument, we now explore that of finity, so as to understand contrastations between the two instruments of eternity and finity.

[1:39:111] If The Expanding Cosmos is finite, then this aligns with the principle that all that have a begin, must also have an end, but also, it proves the existence of the point of criticality; that there is a point at which The Expanding Cosmos shall no longer expand, and shall be forced to collapse.

[1:39:112] The finity of The Expanding Cosmos also aligns with the general Astronist Cosmology, wherein The Cosmos is considered finite, and The Universe infinite, in direct contrastation with the eternity concept proposed previously.

[1:39:113] Finitude of The Expanding Cosmos is both more logical by its very nature, and more widely accepted due to its alignment with the laws of the cosmical reality.

[1:39:114] One aspect of this that may be misunderstood is that just because The Expanding Cosmos is considered finite, and that it shall expand to a point at which only its collapse is viable, this does not pertain to the idea that this capacity by any means the fault of the existence beyond The Cosmos in The Universe, for The Universe always remains infinite in the Astronist Cosmology; the plain upon which The Universe sits cannot ever reach its capacity.

[1:39:115] Also, this concept of finitude directed towards The Expanding Cosmos does not pertain to any notion that The Cosmos can't have an eternally reoccurring existence; simply just that The Cosmos, by its very core nature, cannot be itself an infinite entity; but instead, must hold its occurrence by intervals.

[1:39:116] Focality is the contemplation of the overall importance of the subject in question, and there exists no more important part of The Cosmos than the very fact of its own expansion; without this such expansion, there would exist no cosmical reality as we understand it now; there would exist no epochs, no phenomena, no space, time, or matter.

[1:39:117] If not for The Expanding Cosmos, The Cosmos itself would not be; the removal of the subject from the equation to witness the result is the greatest way of identifying and coming to a balanced conclusion about the focality of the subject.

[1:39:118] And if the expansion aspect of The Cosmos was taken away from it, there would exist no cosmos, which therefore describes the ultimate focality of The Expanding Cosmos to the entirety of The Cosmos's existence.

[1:39:119] Whether The Expanding Cosmos has any even overreaching impacts upon The Universe is another matter of focality entirely; due to the fact that The Expanding Cosmos is expanding into The Universe, there must be some effect, but due to The Universe being understood and considered as infinite, the extent of this effect is forever incapacitated due to the fact that it cannot ever fill The Universe, no matter what size it becomes.

[1:39:120] By this single exemplar, we understand that the focality of something really depends upon the context and that which it is compared to, and exists within; as we have seen with a short contemplation about the focality of The Expanding Cosmos; it is of intrinsic and ultimate focality in relation to the context of The Cosmos itself, but in the context of The Universe, its focality is considered infinitely minute due to the infinite capacity and nature of The Universe itself.

[1:39:121] There persists no greater fundamentality than The Expanding Cosmos, as from the previously instrumentation about this same subject's focality, it exists at the core of The Cosmos, as the very centrality of the cosmical reality; herein, it must be said that there exists no greater fundamentality to The Cosmos than the very fact of its own expansion.

[1:39:122] Functionality is that which measures the operative effects and natures of activity of a particular entity; with relation to The Expanding Cosmos, the primary function is expansion as is obvious, and due to this functionality, expansion sends forth greater abundancy of cosmical phenomenas of all kinds.

[1:39:123] It is the expression of this functionality in the continuity of expansion that we understand the operative naturity of The Expanding Cosmos; its intrinsicity as a continually operative entity.

[1:39:124] The effects of such are the manifestations of the cosmical existence; the importance of functionality is to fulfil the purposivity of the entity in subject; the essence of which is the creation of the cosmical reality as we know, perceive, and wonderment upon it; not without The Expanding Cosmos could we possibly exist in the reality we do.

[1:39:125] By this notion, The Expanding Cosmos is in continual function in order to fulfil this purposivity so as to keep in the procession of creation; without The Expanding Cosmos, such cosmical creations could not exist, and so, this is why The Expanding Cosmos must continue to expand forevermore, until of course, as established in concepts aforeaffirmed in this discourse about omnology, The Cosmos is expected to one day collapse for the forces of its own manifest.

[1:39:126] The futurity of The Expanding Cosmos has been aforeaffirmed and lattermentioned within this entire discourse about omnology, with this being the foremost focus of omnological contemplations.

[1:39:127] We see the graduality of The Expanding Cosmos in the immense amount of time it has taken for The Cosmos to expand to the size it has today, even at the rapid speed of its growth; by this notion, we can begin to understand that even the fastest of speeds imaginable are gradual with an infinite amount of space to fill.

[1:39:128] This graduality of The Expanding Cosmos transcend beyond this and has become infused all progeny of The Cosmos; the formation of galaxies, the development of stars, and the journey of lifeforms; each of these, and all other processes, happen in gradual steps, and by understanding this notion, we understand a key part of the naturity of The Expanding Cosmos; its intrinsic graduality.

[1:39:129] From contemplating the graduality of The Expanding Cosmos, we turn our attentions to contemplating the aspects of its immediacy; the prominentmost example of which being the Inception Epoch itself which commands the ultimate immediacy through its irreversibility, the inconceivable rate of its expansion, and the instantaneous creation of space, matter, time, and phenomena in The Early Cosmos.

[1:39:130] Although graduality has overtaken immediacy in the development of The Expanding Cosmos, it is a logic penchant to notionise that The Expanding Cosmos, as it

began, will also end with an all-effecting immediacy; an irreversible, inconceivably fast, and instantaneously destructive end, which does play into notions of an immediate finality, and thus, is not supported by certain theories of cosmical finality.

[1:39:131] The measure of imperativity stands in accordance with the extent of the immediacy founded, and with relation to The Expanding Cosmos, the imperativity derived is somewhat incontented for it exists without consistency just as The Expanding Cosmos shuttles between graduality and immediacy.

[1:39:132] As the measure of the innemny focuses upon the reflection of philosophical concepts to that of scientific knowledge, the extent of the innemny with regards to The Expanding Cosmos is largely obscured due to the relative unknownness and the nature of futurity itself.

[1:39:133] That which we know of The Future Cosmos is that which we hold knowledge of now in our present time, whichever present time that may be for at the time of this writing, the present time is different from that of the time at which you conduct your own reading of this text.

[1:39:134] The extent of the innemny is dependent upon that which we know for certain, or has been proven by experiment, and due to the nature of the topic of The Expanding Cosmos, its innemnic state holds very little weight due to our knowledge of it being so poor, and our experimentations of it being non-existent.

[1:39:135] The intrinsicity of The Expanding Cosmos to the structure of The Cosmos abounds beyond our very ability to perceive the extent of something's importance to something else, because The Expanding Cosmos is, in essence, The Cosmos itself, and there gains no greater intrinsicity than this.

[1:39:136] As its title suggests, the application of the instrument of study of logicity shall measure the extent of the logic to The Expanding Cosmos, and by such an application, there is derived, a great deal of logicity.

[1:39:137] It is only logical that The Cosmos should expand in order to physically fit within it all that does exist in forms of the cosmical progeny, and it is also only logical to notionise that The Expanding Cosmos shall, in some time of futurity, collapse for the very naturity of cosmicality is itself finite, and so, it holds some capacity to the extent of its own expansion.

[1:39:138] However, that which we do not know is the extent of the influence The Universe has over The Expanding Cosmos; is it in fact The Universe that is expanding and not The Cosmos? Is it The Universe that is controlling The Expanding Cosmos?

[1:39:139] The Universe is the unknown variable in this formula, and by this, we must accept that we do not understand the physical, or logic construction of The Universe, and therefore, we are limited in our measure of its logicity.

[1:39:140] However, the overarching principle remains that anything cosmical which The Expanding Cosmos is itself, must have an end if it had a beginning, and because the Inception Epoch occurred, then there will be an ultimatum for The Expanding Cosmos as a notion based upon pure logicity.

[1:39:141] When one applies the instrument of study of matrixity to the subject of The Expanding Cosmos, one must understand that The Expanding Cosmos transcends The Matrix of the cosmical orderity, for it encompasses all that exists within The Cosmos; both cosmical and chaotic progenies and phenomena.

[1:39:142] If strictly applied, The Expanding Cosmos defies the instrument of matrixity, which measures the extent of the chaotical influences of the entity in subject, and attempts to eradicate all such chaosities in order to restore the cosmical orderity.

[1:39:143] However, it is impossible to remove chaotical influences from The Expanding Cosmos as they form an intrinsic part of the naturity and existence of The Cosmos, and although such influences may not fall in line with principles of cosmical orderity, the cosmical orderity, is not a concept of ultimatum, and can be transcended, as we have witnessed herein now with the application of the instrument of matrixity to The Expanding Cosmos, and its inability to be entirely applied.

[1:39:144] The Expanding Cosmos is the greatest manifestation of the instrument of study of motionality in The Cosmos for the expansion of The Cosmos is that which has caused all other motionalities of The Cosmos to occur as they have.

[1:39:145] Without The Expanding Cosmos, we would not have motionality as we know it to exist, and how intrinsic it is now to the proper functionality of The Cosmos itself, in its entirety.

[1:39:146] The motionality of The Expanding Cosmos, its rate and naturity, and the essence of its own purposivity, is incomprehensible by its own scale in relation to any other cosmical phenomena; The Expanding Cosmos is the greatest phenomena of the cosmical reality, and should be of the highest wonderment for any cosmic philosopher.

[1:39:147] Mysteriosity is perhaps highest found when in relation to The Expanding Cosmos, for there exists so little that we certainly know about The Expanding Cosmos, thus creating a level of mysteriosity that shall never diminish, for there are aspects of The Expanding Cosmos that we shall never be able to know, or truly understand and comprehend in certainty.

[1:39:148] If the naturity of something describes its innermost, intrinsicmost character, then the naturity of The Expanding Cosmos is formulated by three distinct characteristics; continuously accelerating expansion, immense ambiguity, and an incomprehensibility from the perspective of all that exists within it.

[1:39:149] These three pillars of the naturity of The Expanding Cosmos form how we understand, with the first of the three comprising of The Expanding Cosmos's physicality, the second comprising of its abstract side and its conceptuality, and the third comprising of our ability, or inability to properly perceive it, though the study of the naturity of The Expanding Cosmos is still greatly encouraged for the incomprehensible is the most intriguing aspect to any philosopher to try and understand, as is the purpose to the establishment of the philosophical discipline of omnology.

[1:39:150] The Expanding Cosmos, in all its mosthigh wonderment and laudity, is the progenitor of all the cosmical orderity, as well as the disorderity in disproportionate measures to one another as disorderity is largely outpopulated by the phenomenas of orderity in The Cosmos.

[1:39:151] The Expanding Cosmos has formed what the orderity and disorderity of the cosmical reality is in present time, but also in all times and epochs of The Cosmos, for The Expanding Cosmos commands the orderity and disorderity to become what it has.

[1:39:152] Without The Expanding Cosmos, we assume that there would be not orderity, or disorderity, and that for the cosmical reality, which is formed by orderity and disorderity, to exist, there must be an expansion to The Cosmos; this is known as the Essential Expansion principle.

[1:39:153] Primarity measures the importance of The Expanding Cosmos over other aspects and concepts of The Cosmos, such as the cosmical orderity, the cosmical progeny, as well as the structures, and functionalities of The Cosmos.

[1:39:154] When discussing primarity, it is best underlined herein and now that all that exists within The Cosmos exists so within The Expanding Cosmos, and therefore, all that exists in this way, must play to the laws of that which they exist within; therefore, The Expanding Cosmos holds the most supreme primarity over all other cosmical entities and concepts, as all that exists within, and in relation to The Cosmos, is bound by the space, time, matter, and laws of The Expanding Cosmos.

[1:39:155] Therefore, the primarity of The Expanding Cosmos is the primarity of The Cosmos, and there exists no higher, more superior primarity than that of The Expanding Cosmos, except of course, for all that exists beyond The Cosmos and its expansion; namely, The Universe, and all that is Divine.

[1:39:156] Now, we direct our attentions towards the purposivity of The Expanding Cosmos, and such a proposition extends itself towards matters of theology, ultimatum, finality, as well as existence.

[1:39:157] That which is known as the Functional Purposivity of The Expanding Cosmos is to create the space, the time, the matter, and all the means for creation to take place, and the plain for it to exist upon.

[1:39:158] That which is known as the Ethereal Purposivity of The Expanding Cosmos pertains to theological possibilities of the expansion of The Cosmos including it as part of a Divine Plan, part of a wider spiritual plain of existence, one of many spiritual existence, or alternatively, not part of any Divine Plan from the atheistic perspective, which presents issues of purposivity when the godly gap is not infilled.

[1:39:159] The determination of the purposivity of The Expanding Cosmos would automatically determine one's understanding of our own, and every other cosmical progeny's purposivity for we are a minute part of the entire purposivity of The Expanding Cosmos, thus finding the answer to the purposivity of The Expanding Cosmos would be finding an answer to all cosmicality and the reality, and existence we live within and always will live within.

[1:39:160] We must appropriate all instrumentations, and any other philosophical contemplation, with a certain degree of rationality for without such, but to apply rationality itself, as its own instrument of study, to The Expanding Cosmos develops into a discourse about the rationality of the actual concept of The Expanding Cosmos.

[1:39:161] With the little inneminity we hold regarding The Expanding Cosmos, we can confirm, through empiricity, that it is expanding, though its acceleration is more obscured, and with anything that expands, certain consequences appear.

[1:39:162] The main consequence of which is manifested as the dilution of the potency of that which exists within the space that is expanded, as is exemplified with the distancing of the cosmical progeny from one another.

[1:39:163] The reason for the The Expanding Cosmos to exist is inextricably linked to questions regarding its purposivity; the only rational answer that any human mind can offer to this is that The Expanding Cosmos has expanded and is continuing to expand in order for the cosmical orderity to exist, and in order for the cosmical progenies to form.

[1:39:164] We can derive a great deal of reciprocity from The Expanding Cosmos by looking towards its past, and from this, we witness that the expansion of The Cosmos itself was a reciprocal of the Inception Epoch; it came into existence in return for the immensity of the Inception Epoch, and incomprehensible burst of energy, light, and chemicality that it did genesisise.

[1:39:165] The consequences of this reciprocal, whether it was caused by a concept known as The Prior Cosmos, or whether it emerged by some other means, its consequences have existed forevermore and ever since and we see that reciprocity has played an integral part in the structure of the entire cosmical reality, presumably because of the reciprocal nature between the Inception Epoch, and The Expanding Cosmos thereafter.

[1:39:166] By such means as this, the reciprocity of The Cosmos is discovered in all aspects of reality; from the symbiotic relationships between all physical entities, to the exchanges made between lifeform to another, whether they be sentient, or not; in the naturity of everything, there exists a slim descendant of the original reciprocity of existence, found to have occurred between the Inception Epoch and The Expanding Cosmos as a subsequence.

[1:39:167] Symbioticity, as aforementioned in the previous instrumentation of reciprocity, is a version of reciprocity specific to the living organisms, lifeforms, and sentient beings, and the interactions they share between each other, rather than those of cosmical entities.

[1:39:168] However, as aforementioned during the instrumentation on reciprocity, the influence of that which is henceforth known as the Initial Reciprocal between The Expanding Cosmos and the Inception Epoch is held to have caused the reciprocity in all existent entities of The Cosmos, then symbioticity itself has been caused by The Expanding Cosmos, thus causing its symbioticity to be the highest any entity could ever reach.

[1:39:169] Even more interestingly, this allows us to comprehend the influence, scale, and immensity of the Initial Reciprocal as well as the general immensities of Inception Epoch and The Expanding Cosmos by applying them to concepts and objects that we can relate to as humans.

[1:39:170] We all see the reciprocals taking place between sentient and non-sentient lifeforms today in both a molecular and a visual and physical level; to understand that all of these symbiotic and reciprocal relationships and interactions originated from the Initial Reciprocal between The Expanding Cosmos and Inception Epoch is demonstrative of their pervading naturities throughout the cosmical reality.

[1:39:171] Furtherso, this explains a daunting and inescapable reality that both the Inception Epoch and The Expanding Cosmos are the ultimations of cosmical existence, and from them, all else can be derived as originated from.

[1:39:172] Now we arrive at one of the most intrigue instruments to apply to The Expanding Cosmos, and that is the instrument of synchronicity; all that The Expanding Cosmos is, entails of a synchronous procession of creations that are all perfectly formed, functioned, and destructed in complete simultaneity with one another to produce that which is known as the cosmical reality, the cosmical orderity, and is also known in the Astronist Tradition as the cosmical harmony.

[1:39:173] Towards The Expanding Cosmos itself rather the progeny that exist within it, there exists perfect synchronicity by the expansion of the cosmical periphery, and this expansion is in constant occurrence whilst all manner of creations are in occurrence within the periphery itself; can there be any greater or more superior exemplar of perfect synchronicity than this? I think not, for if there were, it would have to exist outside of The Cosmos itself, upon some universal, or Divine plain of existence.

[1:39:174] The application of totality to The Expanding Cosmos presents an interesting paradox in return for it is the naturity of The Expanding Cosmos to always expand until other factors of physical law and reality demand it to stop and collapse, and due to this naturity, there currently exists no totality to The Expanding Cosmos because it is in that which is herein described and henceforth known as being in a state of Continuance of Totality.

[1:39:175] This is whereby the entity in question never reaches its totality because its totality is always either decreasing, increasing, is fluctuating, or is just simply unknown due to its answers being hinged upon universal means which are irretrievable by our minds at the present time of knowledge and comprehension during this writing herein.

[1:39:176] Therefore, a paradox is formed which states that for the totality of The Cosmos, as The Expanding Cosmos, to be known, we must first reach the point in time, space, matter, and scale of expansion that the physical laws of The Expanding Cosmos command its collapse and degradation to a smaller, lesser, or imploded state, and it is only at this very moment, that we shall know the extent of the totality of The Cosmos and its expansive functionality, but until then, it shall remain in the Continuance of Totality, in a state henceforth known as limbance, or limbancy.

[1:39:177] We have spoken of The Expanding Cosmos being the ultimatum of all the existent entities within The Cosmos throughout this omnological discourse, but now has come the time to apply the instrument of study of ultimaty to The Expanding Cosmos, and when done so, a peculiarity is derived.

[1:39:178] Yes, The Expanding Cosmos is the ultimatum of the current state of The Cosmos, but within the next instance of further cosmical expansion, The Expanding Cosmos that had been previously designated as the ultimatum is no longer so which relates back to concepts of limbancy of The Expanding Cosmos; its intrinsic nature of deny itself by its own expansion.

[1:39:179] By this notion of peculiarity, though not quite a full paradox, the ultimaty of The Expanding Cosmos is in a similar state of limbance as when the instrument of study of totality is applied; furtherso, we witness that the instruments, towards whichever subject they are applied, are interconnected with one another

[1:39:180] It should spark no disparity between cosmic philosophers that The Expanding Cosmos is the absolute essence of vastity and the exemplary physical manifestation of

what it means to be vast in every sense of the instrument; in scale, in age, in purpose, in nature, in function, in structure, and in all other possible ways that an entity can hold vastity.

[1:39:181] The Expanding Cosmos has created the vastity for which it is now the perfect and ultimatemoost manifestation of, and by all cosmical measure, The Expanding Cosmos is the total extent of the vastness of anything within The Cosmos.

[1:39:182] Now, such vastities must be expressed in context of The Universe, and even the greatest of vastities that is The Expanding Cosmos cannot compare to the infinite vastity of The Universe itself, without even factoring in The Divine, which is transcendent of vastity, for its scale, and physicality are both immeasurable, and transcend capacity to constitute vastity.

[1:39:183] In essence, vastity is constituted according to The Expanding Cosmos in relation to the scale of the cosmical expansion, the time within which this expansion has occurred, and the speed at which this expansion is in occurrence.

[1:39:184] To make some concluding statements about the omnological discipline within Astronist Philosophy, it remains a steadfastly central branch of Astronism, but also, a discipline that is largely in its infancy, and by its very nature, totally futurological and majoratively undetermined.

[1:39:185] Philosophical contemplations about The Expanding Cosmos, as well as its nature, future, purpose, and as all the most relevant instruments of study applied to this subject earlier in this discourse, revealed is the immense scope, and complexity of this philosophical discipline.

[1:39:186] Omnologists old, young, and all in-between go forth and contemplate such issues as the nature of The Expanding Cosmos, what this means for The Universe, what this means for reality, existence, and being, and what this means for humanity, as it is always important to relate most of our findings of a cosmic nature back to our anthropic interests and all other sentient existences.

The Geometry of The Cosmos (Kosmetrics)

[1:40:1] Less commonly spelt as cosmetrics, it is a major branch of study within Astronism that is first outlined herein through this discourse, and deals with the shape, patterns, and other visually and physically ascribed structures of The Cosmos and its progeny.

[1:40:2] In the Astronist Tradition, kosmetricists attempt to contemplate all aspects of positioning, shape, pattern, and contours of The Cosmos, as well as the cosmical progeny themselves, and it is the penchant and ambition of all kosmetricists to come to conclusions about such physicalities and their consequences through impacting upon other progenies, and The Cosmos itself.

[1:40:3] The most prominent of aspect to the shapes and positions of The Cosmos is that which is known as Planetary Suspension; this entails the fact that planets in the cosmical plain, are positioned in such a way, in the vastness of space, as if they are hanging; that which they physically are, due to the wonderment of gravity.

[1:40:4] But it is this notion that the planets are suspended that forms the basis of our knowledge of their naturities; they entire dependence upon gravity; with gravity, the planets are cocooned in the cosmical plain, which itself suggests a plethora of ideas about the naturity of the cosmical reality.

[1:40:5] If gravity were to disappear suddenly, to where would the planets fall, or collapse upon? If the planets are suspend in the cosmical plain, then what plains do exist above and below the one within which we reside? What level of immensity and power is required of gravity in order for it to be able to hold and control planets as it does so perfectly and divinely?

[1:40:6] Indeed, such a beautiful notion it is, to envisage the planets in this particular way; by this, we see their alignment with the cosmical orderity, and most importantly, revealed and clearly demonstrated is their place in the Cosmic Hierarchy, certainly as progenial entities within The Cosmos, instructed by their superiors.

[1:40:7] Having established that all that does exist within The Cosmos, exists so upon a cosmical plain, a notion of poignancy arises and demands to understand the shape of this plain; essentially, the shape of The Cosmos.

[1:40:8] The prominent approach to this question in the Astronist philosophical tradition is that of sphericism.

[1:40:9] As aforementioned in this discourse, the beauteous planets and their alignment with the cosmical orderity is added to by their beauty, abundancy, and consistency which

drives the notion that spheres, the shape of all planets, are a divine shape, and this is henceforth believed in all Astronist Traditions.

[1:40:10] Due to this reason, the approach to the question of the shape of The Cosmos is that it resembles a spherical shape; a three-dimensional sphere bound by the coordinations of depth, breadth, and height, and a sphere that has been in accelerative expansion since the Inception Epoch.

[1:40:11] It is this sphere that of three-dimensions that constructs the entirety of the cosmical reality, and it is by this same principle that the sphere upon which humanity resides exists in terms of its own microcosms of depth, breadth, and height; by this notion, all the countless planets within The Cosmos are all microcosms of The Cosmos itself and its own shape; this is known as the Microcosmic Planetism.

[1:40:12] Those of astuteness amongst us will most likely have already turned their attentions to the shape of The Universe, as a separated entity from The Cosmos according to the Astronist Tradition of Cosmic Philosophy.

[1:40:13] The Astronist approach to the shape of The Universe is similar to that of The Cosmos and its reality, yet it is both hyperised and infinitised so as to introduce the shape of The Universe as a hypersphere.

[1:40:14] Still a sphere by its core naturity, The Universal Hypersphere, also known as an infinisphere, is made up of an infinite amount of dimensions due to the considered infinity of The Universe in the Astronist Tradition.

[1:40:15] This also aligns with the considered naturity of The Cosmos in the Astronist Tradition as a plain of limitation and bounded existence, as is demonstrated through its existence, only by the allowance of three dimensions.

[1:40:16] The sphere and hypersphere concepts of the shape of The Cosmos and The Universe respectively do align with overall perceived naturities of these two entities, but there is one remain constant; the spheric basis for these shapes, and understanding and perceiving this, allows us to understand not only The Cosmos, but The Universe too.

[1:40:17] Dimensions and possibilities abound infinitely in The Universe by its existence as an infinisphere, and although the possibilities in The Cosmos do abound relative to our own perceptions here upon The Earth, the three dimensional reality remains the same, as structured by time, space, and matter.

[1:40:18] Proposed are the possibilities for inter-dimensional and multi-dimensional avenues of space travel, and although the Astronist Tradition does not deny and in fact, wholly supports these possibilities of venturement, they still remain possibilities according to the traditional philosophical approach; these are considered distortions of dimensions, rather than dimensions in their own right.

[1:40:19] This is how we can best understand the difference between that which is a possibility and that which is a dimension in this context; as aforementioned, the possibilities of The Cosmos abound, though its dimensions remain in triform; distortion, manipulation, and the considered stipulation of the cosmical dimensions are all possibilities, though not dimensions in and of themselves.

[1:40:20] The ability to venture back in time does not constitute a new dimension, for the heights, depths, and breadths of the cosmical reality remain, and neither does this apply to any ability or inventive technology that allows travel to distanced areas of space in drastically shorter times; this is considered a manipulation of the cosmical reality, rather than a new cosmical dimension in and of itself for although the dimensions have been distorted, they still remain in essence once the journey has ended.

[1:40:21] Now that the shape of The Cosmos and The Universe, and their constituent dimensions and possibilities have been explained, clarified, and classified, we can begin to contemplate that which The Cosmos is majoratively constituted by, and it is indeed a confounding entity of the cosmical reality, and one that is most often overlooked due to its invisibility.

[1:40:22] Firstly, we must begin with the most basic of notions, as exhumed by the question: what is space?

[1:40:23] Space in The Cosmos resembles the dimensions of height, breadth, and depth of existence; it forms the physical reality that we exist within; that which we know in mainstream terms as outer space, is simply a continuum of these constituents of height, breadth, and depth.

[1:40:24] Space is often mistakenly described as a vacuum, yet there perhaps exists more in space than on any terrestrial world; all the particles, lightstreams, energies, the flowing stardusts, and asteroids, and the hurtling comets and meteors; to say space is a vacuum is the same as saying our lives are without complexity and abundance of occurrences and changes.

[1:40:25] Or at least, the only time that it is correct to say that space is a vacuum is when all energies, chemicalities, and cosmical phenomena are taken out of the equation.

[1:40:26] Space is a physical manifestation in and of itself, just as the planets, the stars, and the galaxies are, although it is perhaps not perceived as such due to its invisibility, it is maintained that the dimension of area is a physical manifestation as it is depth, height, and breadth, which are qualities that are infused in all cosmical realities and entities, with space being the principal bearer and progenitor of these qualities.

[1:40:27] Often, in discussion of cosmical reality in Astronist Philosophy, The Cosmos is described as a plain of existence; space, due to its expansive tendencies, has become

manifested so as to form this plain of existence and the cosmical reality itself; this can be understood as the purposivity of space.

[1:40:28] Although philosophically, the entity of The Cosmos and space itself are distinguished as different entities, with the latter existing with the former, space is the principal element of The Cosmos as it forms as a place that all that exists within The Cosmos resides without exception, and by this notion, contributes to our understand of the shape of The Cosmos, which is why a discussion of what space is, must be discussed as part of the discipline of Kosmetrics.

[1:40:29] Contemplating what space is, inextricably calls upon the question of what space is made of; principally, it is made of the dimensions of height, depth, and breadth in terms of its structural reality, but in this endeavour of contemplation, we enter into discussions of the naturity of dark energy and dark matter, which both form an overwhelming majority of the elements of space, and therefore The Cosmos itself.

[1:40:30] The principle of Nonconjunction arises by the notion that we know that which constitutes space for in such a relatively short time ago, we knew not of the existences of dark matter and dark energy.

[1:40:31] Nonconjunction insists that we cannot truly and entirely say that we fully understand, and completely hold knowledge of something; in this context, we cannot truthfully say that we hold complete and entire knowledge of what space is, and that which it is constituted by.

[1:40:32] Aforementioned was the distinction made between The Cosmos and space, but now we explore their relationship according to the Astronist philosophical tradition.

[1:40:33] Principally, space exists within The Cosmos; space is the area of dimension constituted by height, depth, and breadth that forms the cosmical reality, as well as all cosmical phenomena, and its existence began at the Inception Epoch, and has existed in an accelerating state of expansion ever since.

[1:40:34] Space is therefore constituted by The Cosmos as all that exists within The Cosmos, as part of the cosmical reality, is constituted by The Cosmos, even though space itself is the principal element in the development of the cosmical reality.

[1:40:35] It is fair to say that The Cosmos could not exist as it does without space itself for, as aforeaffirmed, space is the main element of the constitution of the cosmical reality, and no such essential part to any mechanism can be remove without the mechanism's collapse, and this is no different in the context of the relationship between The Cosmos and space.

[1:40:36] And so, the essentialism of space to The Cosmos defines their subsequent relationship between one another, and defines that although space is certainly the principal component of The Cosmos, it does not constitute The Cosmos itself, and instead,

exists within the periphery of The Cosmos, for the end of space marks the periphery of The Cosmos.

[1:40:37] Therefore, to conclude on this, in the Astronist Tradition, a definite distinction is made between that which is known as The Cosmos and that which is known as space, as is the most famous distinction made between The Cosmos and The Universe in the Astronist philosophical tradition.

[1:40:38] And now we arrive at one of the most interesting of the conceptals of Cosmic Philosophy, and this is herein described and henceforth known as the Cosmic Web.

[1:40:39] First conceptualised in Astronist Mystology, by its own traditions, the idea of the Cosmic Web essentially holds that The Cosmos is an interconnected and complex system of elements and cosmical phenomena.

[1:40:40] The Cosmic Web is most often depicted in Astronist Art by the connection of all stars in the night sky, and considers constellations as forming constituent parts of the Cosmic Web.

[1:40:41] The Cosmic Web is considered as part of Kosmetrics because it is a major conceptualisation of a cosmical pattern, and although it is entirely fictional and metaphorical, the principle stands that the patterns of The Cosmos are the greatest of manifestations, even if they are metaphorical and conceptual.

[1:40:42] As a major subject for wondermentation, the Cosmic Web is a prominent example of kosmetrical conceptual understanding, and although the physical connections between each cosmical phenomena are fictional and conceptual, they are true inanimately.

[1:40:43] The Cosmos is interconnected, and it is a complex system of different elements that form The Cosmos itself, and although they are not always physically connected as the Cosmic Web is depicted in art, they shall forever be connected in principle by the system they form.

[1:40:44] Finally, the patterns and shapes depicted of the Cosmic Web are infinite and such great drivers of wonderment that the concept of the Cosmic Web should always hold prominence as a starting point for kosmetric study.

[1:40:45] The innemnic view of the shape of The Cosmos is largely congregating around the idea of the Flat Universe; a cosmos in which zero curvature is proclaimed, and so directly opposes the generally accepted spherical structure and shape of The Cosmos in the Astronist Tradition.

[1:40:46] However, in the spirit of philosophical contemplation, Astronist Philosophy also appreciates the proposal of the Flat Universe, which is known as The Flat Cosmos in the Astronist Tradition.

[1:40:47] The Flat Cosmos constitutes a flat geometry and opens up questions regarding the finity of The Cosmos, as well as causing questions about the proper implementation of the cosmical dimensions into this theory, especially that of height and width.

[1:40:48] Essentially, we see here a contention displayed between logic which, according to the Astronist Tradition, sides with the school of sphericism, whilst innemny and empirical knowledge sides with that of The Flat Cosmos.

[1:40:49] Whichever theory is later proven correct, that does not ultimately matter, for it is the principal discussion of such concepts that is most important lesson to be learned, not only from this particular discourse, but all others lattermentioned and aforementioned within The Grand Centrality.

[1:40:50] Discussion naturally breeds ideas which consequentially leads to the discoverment of further theories and concepts, which can later be experimented and proven to fact, or disprove to become simple philosophisations; this is the engine that requires the fuel of discussion to begin and to continue its function.

[1:40:51] And also, again, the flatness of The Cosmos must also be applied to the ideas of nonconjunction, as aforementioned about the constitutions of space; as we lead all these discussions with the constant boundary of our own human knowledge and understanding, we must ultimately accept that a huge wide-reaching idea such as this, could never be truly and entirely certain, for there shall always arise concepts of cosmical shape and structure that both the philosophers and the scientists have not yet ever considered, thus highlighting the essentiality of discussion and continual contemplation.

[1:40:52] The small discipline of philosophical study known as isotropics mainly converges on the idea that The Cosmos itself is the same when perceived from any amount of different directions, with its oppositistic discipline being that of anisotropics, relating to all celestials that are not the same when perceived from different directions and angles.

[1:40:53] These two small branches of cosmical and philosophical contemplation are important to kosmetrics because they ignite a discussion of perspectives of shape, pattern, and structure to cosmical phenomena and entities, as well as The Cosmos in its own entirety, which is considered in Astronist Philosophy as Isotropic Perfection for it exists in total similarity from whichever direction it is mentioned, or perceived.

[1:40:54] Examples of anisotropies of The Cosmos are much more frequently observed than their isotropic counterparts, with the easily understood example of which being an asteroid, which is perfectly anisotropic because from whichever angle it is either measured or perceived, it is dissimilar due the protuberances of the topography of its surface, and unevenness of its general shape and structure.

[1:40:55] Neither quality is superior to the other, as they exist in a state of equality, with there also existing Isotropic Perfection, as well as Anisotropic Perfection at both ends of the spectrum.

[1:40:56] This discussion ignites two further debates; the first of which relates to questions of similarity and dissimilarity of cosmical entities within The Cosmos, and the second of which relates to contemplations of perfection within The Cosmos about its progeny, but also of the cosmical progeny themselves.

[1:40:57] The Cosmos is a vast Web of interconnected cosmical phenomena that are held together by the wondermentful force of gravity, and due to the vastity and complexity of The Cosmos and the abundancy of the progeny that exist within it, an even greater level of similarity and dissimilarity can be derived.

[1:40:58] Discussing each and every one of these similarities and dissimilarities within this discourse would constitute the size of The Grand Centrality itself, however, to introduce this discussion, which is the essential principal purpose and goal of The Grand Centrality, we shall herein uptake a discussion about the prominentmost similarities and their counterpart dissimilarities.

[1:40:59] Firstly, although it may be argued that similarity and dissimilarity should be considered instruments of study as they can be used to apply concepts, the broadness of their application, and their general insubstantiality in terms of derivitions, typically does not constitute them as instruments of study, but this shouldn't discourage us in our usage of them as tools of comparison between two or more different entities, whether this be done abstractly, or physically.

[1:40:60] The perfect exemplar of an interconnected similarity and dissimilarity is held in the worlds of The Cosmos for they all shall the similarity in their categorisations as planets, but their unquities form their dissimilarities between each other.

[1:40:61] The terrestrial worlds and the gaseous worlds share very few commonalities in their structures, topographies, and sizes, with perhaps the only similarity being their originations.

[1:40:62] By this notion, we understand that similarity and dissimilarity in a cosmical context can be classified according to a plethora of criteria, with the most prominent of which being structure, origination, size, topography, habitability, mass, colour, speed, and orderity.

[1:40:63] The similarities and dissimilarities between cosmical entities must always stay within the discipline of kosmetrics, even if the context and subject of the similarity investigation relates not to the shape of The Cosmos; this is because similarity and dissimilarity arose from contemplations about cosmical patterns, shapes, and directions,

which makes any discussion of either similarity, or dissimilarity, a kosmetrical discussion in Cosmic Philosophy, according to the Astronist Tradition.

[1:40:64] One of the greatest examples for kosmetrical contemplation in relation to the shape and pattern of cosmical phenomena are those of the elliptical galaxies; their ellipsoidal shape is a relative of spheres, and which further relates to the centrality of sphericism in Astronist approaches and contemplations of cosmical shape and structure.

[1:40:65] Ellipticals are also intriguing for philosophical contemplation due to the brightness of the profiles, and the almost featurelessness of their appearances, which demonstrates an immense amount of clusteration in occurrence during the formation of these galaxies, and again displays the importance of positioning in terms of abundancy and frequency and its impact upon shape, and overall appearance.

[1:40:66] Stemming from contemplations about elliptical galaxies, the application of ellipsoidality is herein and henceforth development as an interesting exemplary for cosmical shape, especially in relation to its spherical cousins, so as to support the ideas of sphericism.

[1:40:67] Wherever we observe and discover ellipsoidal shapes in The Cosmos, we must certainly apply ellipsoidality, for these shapes are somewhat rare, in our current observations, and greatly support ideas about the spherical theme of The Cosmos in the Astronist philosophical tradition.

[1:40:68] There herein and henceforth exists a small discipline within kosmetrics known as elliptics, in which ellipticists contemplate the appearances of ellipses and elliptical shapes in The Cosmos, which may either be applied to the instrument of ellipticality, or to ellipsoidality.

[1:40:69] A shape in The Cosmos that most are familiar with is that of the spiral; with its associated instrument of study being henceforth known as spirality, this family of patterns is contemplatively one of the most important in the Astronist Tradition after that of the spherical family.

[1:40:70] The spiral structure of many of the galaxies demonstrates the abundancy and frequency of spiral shapes in The Cosmos, and we can apply the instrument of spirality to compare the distinctions between different spiral shapes in terms of their appearance, structure, and functionality.

[1:40:71] Spiral galaxies are structured by their disk, arms, and bulges, also known as central bars, with the galactic halo also being another feature of spiral galaxies; these characteristics form the overall topology and topography.

[1:40:72] The most important aspect of galactic spirals is their arrangement and their organised procession in a circular motionalilty around the galactic core, in that which is henceforth known as a parade style.

[1:40:73] Galactical spirals are a great subject to wonderment, and are highly lauded within the Astronist Tradition for they command structure, are demonstrative of the cosmical orderity, and is the signature pattern and shape of The Milky Way galaxy in which we reside, and is therefore a prominent example of cosmical shape that relates to our own civilisational existence.

[1:40:74] In spirality, we derive that the oldest of stars exist at the galactic core and by this notion, we understand that during a galaxy formation, an expansion occurs in order to form the spiral structure, for at the initiality of the galactic formation, the spiral shape has not yet been given sufficient enough time to develop.

[1:40:75] If it is the conviction of a particular kosmetricist, then they are able to conduct their own instrumentation in accordance with the Astronist Tradition in relation to spirality, and due to the subject of spiral shapes in The Cosmos constituted as a topic of such richness, and depth of field, there is a continual aboundment of investigations and philosophical contemplations to be had.

[1:40:76] Though not an official instrument of study itself, modality is a key component in kosmetrical study and contemplation for it measures the differences in the ways in which cosmical entities and phenomena function; the most prominent example of which could be one's contemplation of the parade style of galactic rotation, especially found in spiral galactical structures.

[1:40:77] Modality contemplates the different procedures of cosmical structures and phenomena, and contemplates why different entities have different functionalities associated with them.

[1:40:78] Modality encompasses concentricity, motionalilty, orbitality, and rotality as functions of cosmical procedure, and considers the ways in which cosmical entities operate by categorising such operatives into these four instrumentations, and although modality itself is not considered an instrument of study, it is formed by these four instruments combined.

[1:40:79] By this notion, modality remains a significant aspect of the discipline of kosmetrics for if we are to understand the shapes and patterns of The Cosmos, then it is essential that we also understand the procedures that have formed these shapes and patterns, and that continue to accompany them.

[1:40:80] In our contemplations of the shape of The Cosmos, we often consider the most beauteous and those phenomenas with a most rich appearance such as the planets, the star

systems, and the galaxies, however, we can also turn our attentions to the voids of The Cosmos for inspiration in cosmical shape.

[1:40:81] At this moment, it would only be logical for one to doubt such a notion, that voids can help us understand cosmical shape, and structure, but in fact, out of all cosmical phenomena and characteristics, voids are the most abundant, and the largest of all cosmical features.

[1:40:82] Although one may not initially think so, voids have indeed structured The Cosmos, and are still doing so for it is the cosmical chasms that they create that take millions of years for light to travel across that form the overwhelming majority of the cosmical plain, with the brightest and most iconic examples of cosmical phenomena constituting only a small proportion of the overall cosmical plain of reality.

[1:40:83] Although voids cannot be measured, they can certainly be imagined by the most gifted kosmetrists among us and it is the impossibly jagged void periphery which varies according to when a void reaches a cosmical phenomena such as a galaxy, or star system, that demonstrates the voidal shape.

[1:40:84] The main concept to be considered in a kosmetristical approach to voids is the concept of voidence, or voidency; this relates to the idea that voids not only have played a significant role in the structuring of The Cosmos, but in fact, are the most important phenomenas to the existence of The Cosmos.

[1:40:85] The level of a void's voidency is measured by its size, its positioning in relation to the surrounding cosmical phenomena, as well as its age, for it is voids that remain some of the oldest phenomena within The Cosmos.

[1:40:86] Voidence, and kosmetristical voidal study and contemplation also attempts to understand why certain areas of The Cosmos are more prone to voids than others, which divulges one of the most important questions of kosmetrics: why are there immense clusterations in The Cosmos are of stars and galaxies alike, and then why are there unimaginably deep voids bigger than entire galaxies?

[1:40:87] This may be very simply answered by the force of gravity pulling cosmical phenomoni together in certain waves of cosmical convulsion, but when contemplated philosophically, a greater purposivity is derived, one that understands these clusterations and dissipations to either be divinely assembled, or organised in this way for a greater universal purposivity, or to support some purposivity that we do not currently understand, which further relates to the purposivity and true naturity of the cosmical orderity.

[1:40:88] If we do contemplate kosmetristically, and we do so voidally in addition, then we come to conclusions of voidal purposivity, voidal identity, and voidal functionality.

[1:40:89] Another facet of kosmetric contemplation is that of superposition; in cosmic philosophical terms, this relates to an observational phenomenon whereby one cosmic entity is positioned in front of another from the perspective of the observer.

[1:40:90] This results in the distortion of shape and the true intensity, brightness, and curvatures of cosmical entities; this may also relate to the fact of an entity existing above another entity from a particular observation perspective.

[1:40:91] The main treasure of contemplation to be derived from superposition is the distortion of shape by the positioning of other entities; does this derive a sense of disorderity, or does this merely suggest only the inadequacy of our Earthly observations?

[1:40:92] Nevertheless, cosmical entities that are superposed upon each other sit within the discipline of kosmetrics and its many contemplations in relation to cosmical shape, and pattern.

[1:40:93] As should have become clear by the discussion undertaken within this discourse, there are many different types of shapes, and the annularities are some of the most important, especially to planetary structures.

[1:40:94] The annulars of The Cosmos are most commonly demonstrated as the planetary rings that surround planetary systems, the most famous of which are those of the Classical Planets of Saturn and Uranus.

[1:40:95] Annularity is the application, and comparison between different annulars of The Cosmos, in whichever form they exist, and is the principal method of understanding and defining annular from annular, and each's purposivity, naturity, and functionality.

[1:40:96] Due to planetary rings forming from passing asteroids and comets which are considered as part of The Chaos in the Astronist Tradition, annularities in this context are known as orderators, also known as cosmicators, for they bring a chaotic entities into orderity and cosmicality.

[1:40:97] The asteroids and comets that once roamed The Cosmos directionlessly, become part of a system of rotation around a planet, and begin to follow the same parade style as aforementioned in relation to the star systems around a spiral galaxy.

[1:40:98] The annulars of The Cosmos are demonstrations of cosmical orderity; they are beacons of cosmical orderity that assist in converting chaotic entities to cosmical entities, and entities of disorderity to entities of orderity.

[1:40:99] Accompanied with annular contemplations is the concept relating to the ansae; this is the full diameter of a set of planetary rings, and symbolises entirety, perfection, and completeness in the Astronist philosophical tradition, as well as describing the fullness of something through the investigation and measurement of its two most distant points.

[1:40:100] The annularities, in whichever form they do exist, should be highly wondermented and adored upon because it is herein and henceforth ascribed that the Astronist Tradition holds up annulars, especially those around planets, as progenies of cosmical magnificence, cosmical orderity, and demonstrations of planetary development, as well as pioneers of conversionism; entities that bring chaotic entities into an ordered and organised system, or procession.

[1:40:101] Kosmetrics is a major branch of Astronist Philosophy, especially so within Cosmic Philosophy, and this is further demonstrated by the fact that kosmetrics deals not only with the positions and shapes and patterns of cosmical entities, but also, with the different points of celestials.

[1:40:102] The first example of this subdiscipline is with the antapex; this is the lowest point on a celestial entity in relation to the dimension of height; the point of The Earth, for example, would be the south pole, but in fact, the atmosphere over the south pole is actually lower than the south pole itself on the surface of The Earth.

[1:40:103] Therefore, in cosmical terms, the antapex of The Earth is the point when outer space is considered to be begin which is generally considered to be at the Kármán Line, at the end of the mesosphere and the beginning of the thermosphere.

[1:40:104] It is at this point that the antapex is considered in cosmical terms, and in terms of technicality; more generally, antapexal contemplations within kosmetrics generally focuses upon the southernmost poles and points of entities in whichever capacity, size, or structure they do take.

[1:40:105] In the Astronist philosophical tradition, one may have noticed the unusual absence of the word, magnitude, from Astronist cosmic philosophical discussions and discourses; this is because in the Astronist Tradition, magnitude is only used within the discipline of kosmetrics, hence why it has been largely absent from usage up until this point.

[1:40:106] Magnitude, in a cosmic philosophical context, is majoratively similar to its scientific equivalent, but is officially defined herein as the combined measurement of the size and brightness of a celestial, or cosmical entity.

[1:40:107] Magnitude can be utilised as an instrument for the comparison of entities in relation to size and brightness, and is a key establisher of contemplations for kosmetrical discourse and discussion because without an investigation of magnitude, one may not be able to compare the size and brightnesses of celestials in a combined notion.

[1:40:108] The scientific study of astrometry focuses on the positions, motions, shapings, and magnitudes of stars, and is philosophical equivalent is herein defined and henceforth

known as astrometrics, as a branch of kosmetrics, which deals specifically with the contemplations of stars in a kosmetrical context.

[1:40:109] Planetometrics, also known as planetometry, is the planetary equivalent of astrometry within the discipline of kosmetrics, and contemplates the positions, motions, shapings, and magnitudes of planets in a similar fashion to astrometrics.

[1:40:110] These, along with galaxometry, also known as galaxometrics, which deals with the contemplation of galaxies in the same way, are known as the Three Sister Subjects of Kosmetrics, due to their similar structure, and how studiers are often able to overlap these three subjects and study them in simultaneity.

[1:40:111] The astrometrists, planetometrists, and galaxometrists are all considered prominent philosophers within the discipline of kosmetrics, and the subsequent philosophical branches that they do study hold as much depth and breadth as many other larger disciplines.

[1:40:112] Astrophysics, in a philosophical context, is considered a branch of kosmetrics, and forms the bridge between scientific astrophysics, and philosophical astrophysics, as it is the penchant of all kosmetrists to strengthen the bridge between the scientific and philosophical worlds.

[1:40:113] The philosophical branch of astrophysics, as a derivation of the discipline of kosmetrics, deals with the philosophical aspects of the laws and theories of physics, as well as the physical natures of stars, through a tradition of imagination, wondermentation, and physical observation.

[1:40:114] We must all know the truth of the fate of The Earth for it is the right of every human to know the eventuality of the world upon which they reside, despite such a destiny being steeped in catastrophe.

[1:40:115] Due to the procedures of stars and the way by which their ends are initiated, they begin to inflate, and the star to which we are situated closest is no exception to the rule for it shall too inflate, and The Earth we adore now shall be no more.

[1:40:116] The beautiful buildings of The Earth, the magnificent rainforests, deserts, tundras, and grasslands of the planet, and even our giant, complex cities shall all become engulfed, as shall the entire planet, into The Tumeified Sun, as part of the official process known as The Great Tumefaction in the Astronist philosophical tradition.

[1:40:117] From this process, The Earth shall be no more and shall become immersed in totality of The Sun's nuclear fusionality and is prophesied to be the eventual finality of The Earth, and of humanity, if the prophecy of the human exploration of The Cosmos is not fulfilled.

[1:40:118] This process of tumefaction enacted by The Sun is not uncommon for it is a natural occurrence for every other star of The Cosmos, but also relates to the wider process of philosophical contemplation known as augmentation in the Astronist Tradition.

[1:40:119] Augmentation is the distortion of a celestial entity through a rapid increase in its size, the main aforementioned exemplar of which being the tumefaction of stars, but augmentational contemplation remain an important concept within kosmetrics due to size increase occurring throughout The Cosmos and many different cosmical processes.

[1:40:120] Augmentation demonstrates a natural cosmical process and provides evidence for how celestial shapes can change to reconstruct and reorientate a cosmical procedure and system; the change of the naturity of the celestial entity's shape due to its increase is evidence for how shape is directly impactful on the cosmical system and orderity, as well as the naturities and existences of the impacted celestials.

[1:40:121] Another shape that is highly adored and lauded upon in the Astronist Tradition is the proposed biconcave structure, or appearance of a galaxy; how a galaxy, through the increase in height of its galactic annulars made of stardust and gas rising above the galactic core itself creating a concave shape above and below the galactic core, thus creating a biconcave galactic shape.

[1:40:122] Oppositely, the biconvex structure and shape resembles two outward bulges both above and below, which is a shape most commonly reflected at the galactic core, and demonstrates an oppositism, which are commonly arrived at during kosmetrical contemplations of shape.

[1:40:123] This is constituted by the idea that in the context of shape, there always exists an opposite to the shape considered; whether this be the oppositisms of flat and inflated, and square and circular, or some other shape-related oppositism.

[1:40:124] The biconvex structure is often a result of clusteration; this demonstrates its own contemplative consequences; the main of which being the concept of expansion for the biconvex structure is a result of come kind of expansion, or some strong clusterational effect, as is seen at the core of galaxies.

[1:40:125] These two shapes are known in the Astronist Tradition as Sister Shapes due to their related and oppositistic status between each other; biconvex and biconcave structures are demonstrations of oppositism in cosmical entities, and not without such oppositism present in The Cosmos would there exist the cosmical orderity and reality as we know it.

[1:40:126] Not all shapes within the discipline of kosmetrics are in physical existence; instead, some are inanimate and for the purpose of measurement and contemplative investigation; the most prominent example of this is that which is known as a colure.

[1:40:127] Colural contemplations are focused on how colure circles are used on different planets, and celestial structures, and the differences in dimension and measurement for different cosmical entities.

[1:40:128] Colurity is the general application of the results derived from colural lines and what these drawn circles tell us about the naturity of the entity in question, and how the differences in measured colures change the orderity, functionality, and general cosmicality of the entity in subject.

[1:40:129] Also studied and contemplated within kosmetrics are the topographical features of the cosmical entities, especially in relation to any particular shape found upon celestial entities.

[1:40:130] An example of this is a dorsum; this is a ridge on a planetary, or lunar surface; dorsums are categorised as surface shapes within kosmetrics and are considered alongside other planetary shape formations including rimas, rilles, and catenas.

[1:40:131] Each of these four types of surface shapes form the subjects of wondermentation, scientific study, and investigation for it is these shapes that give planetary and lunar entities their distinctive characteristics; these are always be contemplated when combined together.

[1:40:132] The instrument of study of orbitality and the wider philosophical discipline of orbitology contemplate orbits, their naturities, functionalities, and different characteristics in their entirety, however, kosmetrics also deals with the contemplation of orbitalities in a very specific and uniquely kosmetric way.

[1:40:133] There herein and henceforth exists a discipline of philosophical contemplation known as eccentrics, which deals with the shapes that orbits create upon their completion, of which there are many to contemplate for each planet has a unique orbit in and of itself, yet we classify these orbits in three major groups; concentric, ovalic, and inconcentric.

[1:40:134] Concentricity is one of the most highly wondermented, adored, and lauded aspects of the cosmical system and orderity, and is often rigorously contemplated within the Astronist Tradition.

[1:40:135] Furtherso, it is heavily linked to kosmetric contemplations within eccentrics and offers arguably the most ideal and perfect shape of a circle without any elongations, or tiltations, and although this is most often not the case in reality, for observational, educational, and philosophical purposes, it is the version of planetary orbits that is most often depicted and wondermented.

[1:40:136] It is important to make the distinction between the concentric orbit of one planet, and the concentricity of the entire star system, which are defined as two differing concepts.

[1:40:137] The ovalic shape of a planetary orbit is perhaps the most common in reality, and as its name suggests, is made distinct by the oval shape that it forms with an apogee, and aphelion also being featured in this type of orbital shape.

[1:40:138] The final shape of a planetary orbit is that of the inconcentric which is characterised by the increased angle of the planet in relation to the star itself and its fellow planets, and may also be described as having an inclined orbitality.

[1:40:139] It is important to note that when contemplating such a shape of orbitality in geometric models of star systems, the inconcentric shape is best seen from a sideways perspective, and the most prominent example of an inconcentric orbitality is that of the Classical Planet of Pluto.

[1:40:140] Within the study of eccentrics, as a branch of kosmetrics, and as an associated derivation of orbitology, there also exists satellite orbits, or lunar orbits which focus on the different orbits around planets themselves, which are also split into three classifications; equatorial, inclined, and polar, and each of these can be contemplated in combination, or in separation from each other.

[1:40:141] The idea and application of eccentricity relates to the combined shape that all the planets of a star system create rather than the orbitality of a single planet, and is usually concentric, especially when depicted from above.

[1:40:142] Additionally, an eccentric orbitality is any orbital shape that does not align with one of the three major classifications herein identified, which are concentric, ovalic, and inconcentric; any deviation from any of these three categories is considered an eccentric orbitality, and is therefore not categorised into any of the major branches.

[1:40:143] Eccentrists hold the philosophical discussion of the shape of orbits at the centre of their philosophical and academic investigations; they attempt to derive meaning and consequence from the different structures, shapes, and patterns of orbitalities, and intend to apply their derivitions to other theories, as well as in conducting full-scale instrumentations upon the various different shapes, structures, and patterns of both stellar, planetary, and lunar orbitalities.

[1:40:144] There exists equators of all physical entities within The Cosmos, and so, as philosophers of shape, pattern, and positionings, kosmetrists must study equators as a result, thus establishing herein the philosophical discipline of equatology, as studied by equatologists.

[1:40:145] Equatology is essential the philosophy of that which is equatorial; that which is situated on, linked with, or approximate to the equator of an entity, whether this be a moon, planet, star, or galaxy.

[1:40:146] Within this niche discipline, there also exists contemplations about the equator of The Cosmos itself, for it is only logical to suggest that, under a spherical cosmos structure, there exists an equator to The Cosmos just as there exists an equator of all other spherical entities, such as planets, moons, and stars.

[1:40:147] The existence or non-existence of this cosmical equator is of debated significance within equatology, and when any subject is contemplated equatologically, there must always be a reference to the effects of the positioning of the equator on the occurrences on the planet, or moon below it, as well as that which has caused the initial positioning of the equator in subject.

[1:40:148] Equatological contemplations are always conducted inanimately due to the imaginary nature of the equatorial line itself, but not only do equatologists have a philosophical application of their work, but also a physical one as they are tasked with defining the equator and the meridian of planets, stars, moons, and other spherical objects as derived by the most recently received datas.

[1:40:149] By this notion, we understand that the task of equatologists is multi-disciplinary as it originates in philosophy, but also branches out into geometrics, science, and mainstream astronomy.

[1:40:150] Throughout the entirety of the Astronist philosophical tradition, an emphasis is placed upon the idea of centrality in all its contexts and aspects, as is evidenced by the title of this work, as The Grand Centrality.

[1:40:151] In the Astronist Tradition of philosophy, there exists a pedestal upon which the idea of centrality is perched, and it is this idea of centrality that is full of such brilliance and is wondermented, adored, and lauded upon in this very light.

[1:40:152] However, within the discipline of kosmetrics, we contemplate that which is herein and henceforth known as the anticentre, or the anticentrality, which is not to be confused with an incentrality.

[1:40:153] The anticentrality focuses all contemplates on that which exists opposite to the centre in some way, whether it be a simple point, some cosmical entity, or this may also relate in an abstract sense, as in, a particular concept is opposite to that which is considered central and most important to the subject in question.

[1:40:154] In cosmical physical terms, the anticentre is generally considered to be the outermost point of a star system, or galaxy, in opposition to the star, or galactic core at the centre, and may also relate to the apogee of a planetary, or lunar orbitality.

[1:40:155] The meaning and inferences of an anticentrality are drastically different whether it is contemplated inanimately or physically; inanimately, the anticentrality is inferred to mean a distinct oppositism to a widely held, or accepted belief, or theory, whereas in a

physical sense, the anticentrality is inferred to purely mean a physical opposition to that which is located at the centre, and typically holds less further inferences than its inanimate counterpart.

[1:40:156] Anticentralities are important to contemplate within kosmetrics as they form a positioning contrary to that which is considered the most relevant, the most true, or the most inspiring, yet this does not mean that anticentralities are any less worthy of our discovery and enknowledgement than anything closer to the centrality, or the centrality itself.

[1:40:157] Essentially, the abstract version of the meaning holds much greater philosophical consequences than the physical version of the meaning, yet both versions are inextricable to kosmetrical contemplations for each of them hold their places in the topics they address.

[1:40:158] It should, by now, be understood that kosmetrics is a discipline of cosmic philosophy dealing with cosmical shape, positioning, and pattern; one of the prominentmost exemplars to contemplate in this way are galaxies for they hold a rich abundance of shapes, points, positions, and related features.

[1:40:159] These are listed as follows and are herein described by their cosmic philosophy definitions.

[1:40:160] Galactic Diameter: an inanimate line used for measurement and investigation that spans from one edge of the galaxy in subject to the other, and intersects the corepoint along its route.

[1:40:161] Galactic Radius: another inanimate line used for both measurement and investigation which spans from one edgepoint of a galaxy to the galactic corepoint.

[1:40:162] In the Astronist Tradition of Cosmic Philosophy, the Galactic Equator and the Galactic Plane are different, though in mainstream cosmology, they are used interchangeably to mean the same line of measurement.

[1:40:163] Galactic Equator: the inanimate line best comprehended from a bird's-eye view model of a galaxy which acts similar to the Galactic Diameter, but is strictly horizontal and occurs from one edgepoint, intersects the corepoint, and ends at the directly opposite edgepoint.

[1:40:164] Galactic Plane: a physical feature of a galaxy which intersects and pervades the galactic disk horizontally and splits star systems between those in existence above and below the Galactic Plane.

[1:40:165] Galactic Nucleus; another name similar to the Galactic Core, the Galactic Nucleus is the exact corepoint which the diameter, radius, equator, and plane must all

intersect; to differentiate, the Galactic Core refers to a region at the centre of the galaxy, while the Galactic Nucleus refers to an exact centrepoint, or corepoint.

[1:40:166] Galactic Poles: these are two edgepoints at opposite ends of the galaxy and are called the Dextral Pole, and the Sinistral Pole, in respective reference to the right and left Galactic Poles.

[1:40:167] Galactic Halo: one of the most wondermented aspects of galactic structure is that which is known as the Galactic Halo and due to its spheroidal shape, is highly adored and lauded upon in the Astronist Tradition, and is therefore commonly depicted in Astronist Art and holds a plethora of symbolical and representational meanings within Astronist Symbology.

[1:40:168] Kosmetrically, the Galactic Halo is considered spheroidal and encompassing of much of the galaxy, especially so from an observational viewpoint; the brightness and intensity of stars create the Galactic Halo.

[1:40:169] Out of all the wonders that Astronism and Cosmic Philosophy bring, the one most simple, yet so outstanding factor is the Ultimate Unification; there exists one night sky that we all wonderment upon no matter our race, ethnicity, faith, nationality, gender, sexuality, knowledge, or ability; by this notion, the night sky of stars is the one uniting factor of humanity that the Astronist Tradition of philosophy entirely dedicates itself to, and wholeheartedly supports the reascension of in all the minds, and hearts of humanity.

[1:40:170] The process that is herein and henceforth known as a Galactic Encounter is the very fate of the galaxy in which we reside, The Milky Way, for it is destined to encounter the Andromeda galaxy over a period and process of billions of years, wherein the two galaxies are poised to merge together.

[1:40:171] The cosmic process of the Galactic Encounter is an occurrence that is to be most wondermented, adored, and lauded upon for the collision, integration, and harmonisation of two galaxies is a feat of such immensity, complexity, and sheer cosmicality that there exists very few processes that can compare.

[1:40:172] The abundance of processes involved in the Galactic Encounter and the integral role of gravity to this cosmical occurrence are all evident of the immensity of this procedure and its multi-galactic scale.

[1:40:173] Kosmetrically, the most important point of contemplation is that of the changing shape of the galaxies throughout this process and the consequential shape of the supergalaxy that will be left in its place; the essential points of focus for kosmetrists are the shapes, patterns, and positionings the two galaxies during the process of the Galactic Encounter.

[1:40:174] The Galactic Encounter beckons the entire reorientation of the two galaxies involved in terms of the positionings of all the star systems, the infusement of the two galactic cores into one, and the subsequent changes in the overall shape of the new supergalaxy.

[1:40:175] By this notion of two, or more entities combining to form one, we can attribute this to the process that is henceforth known as monisation; the process whereby two or more entities, whether physically or abstractly, combine to become one.

[1:40:176] A similar process of Galactic Cannibalism is defined by a Galactic Encounter in which one of the two galaxies is considerably larger than the other, and so, the smaller of the two is overcome, and absorbed into the larger of the two.

[1:40:177] Due to the galaxies of The Milky Way and Andromeda being similar in size, this cannot be considered a Galactic Encounter of Galactic Cannibalism, but instead, an encounter of equal measure and scale between the two galaxies involved.

[1:40:178] Again, it is the contemplative penchant of the kosmetrists to focus their attentions onto the changes in shaping, positioning, and pattern during this consequence of Galactic Cannibalism.

[1:40:179] The next galactical process that has kosmetric significance is that of Galactic Evolution due to the three-pronged stage that it occurs by, including Galactic Formation, Galactic Mergence, and Galactic Death, and attempts to study the vast differences in shapings, positionings, and patterns that occur throughout these different stages of Galactic Evolution which is essentially, the life of the galaxy.

[1:40:180] This is an instance of kosmetric study that requires an overlap to scientific studies as the kosmetrists in this particular field of contemplation must take their inspirations from our current innemic and empirical knowledge about the stages of Galactic Evolution, thus demonstrative of the important intersections between philosophy and science.

[1:40:181] Geodesic contemplations are a small area of philosophical focus within kosmetrics that relate to kosmetrists measuring the shortest possible distance between one point on a sphere to another, especially when used on planetary, lunar, and other cosmic spherical entities.

[1:40:182] Specifically, kosmetrists deal with deriving meaning from these differences in the shortest possible routes between one point and other, while those whom study geodesics are concerned with actually finding the lines of routes themselves.

[1:40:183] A kosmetric approach to geodesics and geodesy helps create a wider contemplation about the nature of spheres and holds that the greatest our contemplations

are of spheric shapes in both quantity and depth, the greater our knowledges will be of all the cosmical entities that are structured by spherical or spheroidal shapes.

[1:40:184] Rotality is a major instrument of study used throughout many different disciplines within Astronist Philosophy, but its home remains within the discipline of kosmetrics, thus it shall be contemplated by kosmetrists in isolation from its other kinds of application.

[1:40:185] Rotality is, in essence, the philosophy of rotation, and is so, by all accounts, one of the centralmost ongoing processes of The Cosmos that never seems to ever cease, and also seems to pervade all cosmical entities of orderity.

[1:40:186] Rotation and orderity are considered to go alongside each other for all that does rotate is also all that is considered ordered, and organised by cosmical standards; the moon, the planets, the stars, and the galaxies within which they all exist, all rotate around one another as rotations within rotations.

[1:40:187] Moons rotate around planets and planets rotate around stars, and the stars and their systems all rotate around the oblivionic core to form the galaxy; these are what we all know as orbits, of which the process of rotation is part of.

[1:40:188] We must also make distinctions between that which cosmical entities rotate around and how they rotate themselves; planets rotate around stars, but the planets themselves are also rotating too, and so are the stars, moons, and galaxies.

[1:40:189] By this notion, we have that which is henceforth known as a Rotational Multitude; an instance in which multiple entities are rotating around some central point to form their orbits, but they are also physically rotating, or turning, themselves as a separate, but inextricably linked process of rotation.

[1:40:190] By these notions of the vastness of rotality in The Cosmos, we are able to comprehend its position of centrality, and thus its importance in Cosmic Philosophy, and in wider Astronist Philosophy as interpreted to mean something of wider metaphorical contemplation.

[1:40:191] Like the planets, moons, and stars rotate and orbit, so do our lives; our lives rotate around our loved ones, our careers, our ambitions, and our health, happiness, and achievements; by this notion, we see the multi-disciplinary aspect of rotality, as is similar for many of the other instrument of study, and how rotality in particular now, has the ability to transcend its cosmical origins and traditional interpretations, to pervade ethical, familial, and the general matters of human life itself.

[1:40:192] However, we are discussing kosmetrics now, and that is the discipline in which we must not digress to far from; even if we do just take rotality in the terms of the one discipline of kosmetrics, therein arises a great amount of concepts and contemplations

about its nature when applied to the topics of kosmetrics, being shape, pattern, and position.

[1:40:193] From these three outlined topics of kosmetrics, we shall work backwards and begin with positioning; due to the naturity of rotality itself, the positioning of planets and moons and stars, due to both the rotations of themselves as well as the orbitalities they create from their rotations around their correspondent entities, their positionings are in constant dynamic and motional change.

[1:40:194] The Cosmos is certainly alive and moving at speeds we could never hope to naturally match or surpass and the majority of these movements are caused by the rotalities of the cosmical entities, and their subsequent orbitalities.

[1:40:195] Due to constant movement, the main points of reference that we have of any cosmical entity is upon their return to the origination point from which they were first observed, which is demonstrated by all cosmical entities.

[1:40:196] This is another aspect of the naturity of rotality; the concept of rotational return; the fact that in the orbitalities and rotalities of cosmical entities, they do, at some point, in some time, pass through a point which had been in their previous rotation.

[1:40:197] Another aspect of the naturity of rotality is the absence of origination; there exists no origination point for any rotality because we were not present when any of the cosmical entities in question began their rotalities and orbitalities, so therefore, there cannot exist a point at which we know these two processes to have started from; this can be considered as somewhat of a paradoxy in the Astronist Tradition.

[1:40:198] In terms of pattern, rotality is the essence of cosmical patternwork for the movements and orbitalities of the planets, moons, and stars are all operated in sequence to their rotations, and form unique patterns when animated through two-dimensional and three-dimensional models.

[1:40:199] If one is to conduct any contemplation relating to the patterns of The Cosmos in a kosmetrical sense, then one must contemplate the rotality in some form, due to its centrality in the development of cosmical patterns.

[1:40:200] Again, rotality holds much influence over cosmical shapings for the stars of the galaxies rotate in their orbitalities around the galactic core which falls in alignment with the galactic disk structure; the question remains as to which of these is the superior over the other.

[1:40:201] Again, this remains a prominent question of contemplation in discussions of rotality in kosmetrics; were the physical components of The Cosmos created to allow the rotations and orbitalities of the cosmical entities to occur, or were the rotations and orbitalities created to fit in with the physical structure of the cosmical entities themselves?

[1:40:202] This is largely a question proposed about the superiority of one process, or physical structure upon another, and as this relates to the contemplations held within kosmetrics, this remains an important topic for kosmetrists to discuss.

[1:40:203] Nodes and nodal contemplations within the Astronist Tradition of Cosmic Philosophy largely relate to their scientific equivalents, in that they are concerned with the point of intersection between orbital path and another, most commonly The Moon and The Sun's in relation to The Earth, but this can be applied to any type of orbital course that intersects and crosses another; the point of crossing is known as the node.

[1:40:204] Nodal contemplations are split in two; the Ascending Node, and the Descending Node, which are both kosmetrically contemplated, especially so in relation to the directions that the node faces; either facing upwards, or downwards.

[1:40:205] Nodes themselves are simply the points of intersection, but it is their depictions along with the orbitalities of the cosmical entities that form shapes and patterns of brilliance that kosmetrists can then derive meaning and contemplate upon.

[1:40:206] In the Astronist Tradition, as should now be evident because of their frequent usage, there are those applications of study which are known as the Instruments of Study, of which the majority are categorised and listed within The Grand Cradle of Astronomy, and are also accessible to see completely in the discourse on the subject of Instrument Theory in The Grand Centrality; these are collectively known as Major Instruments.

[1:40:207] However, there also exists those which are known as Minor Instruments which are also detailed in the Instrument Theory discourse of The Grand Centrality, and these minors are generally either less utilised, less known, or are only able to be utilised within a specific discipline of Astronist Philosophy, whereas the Major Instruments are all multi-disciplinary.

[1:40:208] An example of a Minor Instrument is that which is henceforth known as nodality; this minor instrument of study specifically relates to contemplates and applications derived from the intersection of orbits of cosmical entities, and what then can be inferred about the cosmical entities involved, and the wider system within which they reside.

[1:40:209] Due to the lesser known and utilised aspect of nodality, it is considered a minor instrument, however, it can be used to refer to any type of intersection of two or more cosmical entities; in this case, it would be considered a major instrument as it can then be used across many different disciplines within the Astronist Tradition of Cosmic Philosophy.

[1:40:210] However, its original application and usage resides within kosmetrics in relation to orbital nodes, and for this reason, it must remain a minor instrument for its original purposivity is fairly niche and not multi-disciplinary.

[1:40:211] As aforeaffirmed when discussing the component parts of kosmetrics, the discipline philosophically contemplates, not only the shapes, patterns, and positions of cosmical entities in their entirety, but also, the topographical features found upon them.

[1:40:212] An example of this within kosmetrics is that of the macula, as derived from the mainstream astronomical term, which relates to any type of dark spot on a planetary, or lunar surface.

[1:40:213] Maculae hold particular interest to kosmetrists due to the abundance of the shapes they are formed by and the differences in their causalities, thus maculal contemplations are important to topographical tradition present within kosmetrics.

[1:40:214] From the contemplations of maculae, kosmetrists are able to derive meaning from the size, orientation, and positioning of the spot and again, presents an overlap between scientific study and philosophical contemplation.

[1:40:215] Meridial contemplations are also addressed within kosmetrics as important points of reference for measurement and investigation in relation to geodesy, which encompasses all philosophical contemplations of the meridian, collectively known as meridia when multiple meridians are referred to across different planets and lunar entities.

[1:40:216] Osculation in Astronist contemplations within kosmetrics relates to all orbits that are not affected by any perturbations, and may also be referred to as Orbits of Orderity, while perturbed orbits are henceforth known as Orbits of Disorderity.

[1:40:217] Because perturbations redirect, or digress an orbit from its original path, they are considered highly chaotic and progenitors of disorderity in the cosmical system which positions them as the oppositism to the process of osculation; an ordered orbit.

[1:40:218] Strictly contemplated from a kosmetric perspective, the kosmetrist is interested in the difference in shape, positioning, and pattern between the original osculating orbit, and the perturbed orbit.

[1:40:219] Osculations may also be contemplated in isolation in kosmetrics which focuses on an unperturbed orbitality of a cosmical entity, and the shapings, patterns, and positionings associated with this osculative orbit.

[1:40:220] Parallaxics is a branch of contemplations within kosmetrics that essentially deals with the philosophy of parallax, and specifically concerned kosmetrists with this topic, whom are herein and henceforth known as parallaxicists, will contemplate the concept of the parallax in all its many possible applications, and contextualisations.

[1:40:221] Essentially, the most concern for parallacticists to consider is the effect of positioning of celestial entities when observed through a viewfinder such as a telescope, in relation to their real positionings and shapings.

[1:40:222] Any type of distortion of any cosmical entities through an observational apparatus is considered within the discipline of parallactics within kosmetrics, especially when such distortions concern shaping, positioning, or patternwork of The Cosmos and its progeny.

[1:40:223] In addition to this, parallactics also deals with the distortions or change in features, characteristics, or perceptions when cosmical entities are physically viewed from different angles, not through observational apparatus, but through an actual, physical viewership.

[1:40:224] These two breadths of contemplation make parallactics a much larger branch of kosmetrics than perhaps initially realised and even just a shallow investigation into parallactic contemplations, reveals the importance of positioning in the demonstration of appearance, feature, character, and function.

[1:40:225] In essence, the philosophy of parallax explores the impacts of the parallactic effect in cosmical terms, with five major branches of parallax emerge which address their corresponding entities, and includes Solar Parallax, Planetary Parallax, Lunar Parallax, Galactic Parallax, and Cosmic Parallax.

[1:40:226] Cosmic Parallax has a wide breadth of corresponding entities, and includes all non-star, non-planet, non-lunar, non-galactic entities, and thus includes entities such as quasars, pulsars, nebulae, and supernovae, among others.

[1:40:227] The branch of philosophical study and contemplation that is herein entitled and henceforth known as synodics, in a kosmetric contextualisation, deals with the alignment of two or more celestial entities so as they seem to exist in the same, or near the same place, to a particular observer.

[1:40:228] Synodic contemplations in a kosmetric sense, focus themselves on the changes and distortions caused to shaping, positioning, and pattern when two or more entities are astronomically aligned, the most prominent example of which being a solar eclipse.

[1:40:229] Relating to an eclipse specifically, the loss of light, the distortion of both The Sun and The Moon, as well as the perceived distortion in their shapings is caused by the alignment of their positionings.

[1:40:230] The Moon seems as though it is just as large as The Sun so as to cover it almost entirely, and although we obviously know this to be a proclamation of falsity, there

remains only that which we can observe, and from observation alone, this is what could be interpreted, thus demonstrating the distortions caused by certain positionings.

[1:40:231] The main distortions to celestial pattern in the context of an eclipse is, of course, the reduction and redirection of light, thus causing the light to bounce off The Moon, and from there, disperse as light does.

[1:40:232] Essentially, synodics contemplates the distortions caused by the alignment of celestial entities, and it is the role of the synodists, as kosmetrists with special interests in this particular topic, to contemplate such issues, derive meaning, and create new ideas of consequence, circumstance, and application, especially so in relation to instruments of study, and other cosmical entities and phenomena.

[1:40:233] The syzygy; one of the most highly wondermented phenomenas of The Cosmos, which relates to the perfection of the alignment of two or more celestial entities, but typically is depicted in Astronist Art, as the alignment of all the planets of a star system with the central star.

[1:40:234] Syzygyology, as a branch of philosophical contemplation within kosmetrics, deals with the wider ideas of any type of perfect oppositions in positioning between celestial entities, or any type of positioning that is deemed to be in perfect alignment between two or more celestials.

[1:40:235] Syzygyological thoughtpaths are deemed to comprehend The Cosmos in a utopian reality wherein all cosmical entities are perfectly positioned, enshaped, and enpatterned to conduct their proposed functionalities.

[1:40:236] In a much broader context that transcends kosmetrics, syzygyology can be considered to address perfection in The Cosmos in general, and all ideas and concepts of perfectionism derived from cosmical occurrences and phenomena; it remains the essential penchant of all syzygyologists however, to focus their attentions on the perfections in opposition that are presented throughout The Cosmos, which births the cosmology of The Perfect Cosmos.

—

[1:40:237] Not particles, or matter, but the space between you and I.

[1:40:238] That which we cannot see for we exist within it and that which we cannot touch, taste, or smell.

[1:40:239] However, we can hear it.

[1:40:240] If space is the medium which The Big Bang created then the static we hear when we quiet ourselves and our minds to just listening, then we can hear the space around us and we therefore comprehend that it remains alive.

The Hierarchy of The Cosmos (Dynastesiology)

[1:41:1] Any simple contemplation of The Cosmos soon reveals a distinct hierarchy in existence that pervades all aspects of The Cosmos and endures at the foundations of the very structure and function of The Cosmos.

[1:41:2] To address this, and related ideas, a newfound discipline of cosmic philosophical contemplation must herein be established, and this is to be henceforth known as dynastesiology, as derived from the word dynasty, so as to mean the dynasty of The Cosmos, and the familial ties that each and every cosmical extant entity extricably shares.

[1:41:3] Dynastesiologists contemplate The Hierarchy of The Cosmos through studying that which is henceforth known as The Conventional Structure which is described herein, within this discourse, but also by rearranging this convention, and reorganising the structure in a way that aligns with their own understanding of The Cosmos.

[1:41:4] A hierarchy that do not align with The Conventional Structure is henceforth known as an Anomalous Structure of cosmical hierarchy, but this does not intend to suggest its inferiority to The Conventional Structure for equality in ideas is essential, and if at all, it is often the Anomalous Structures, there exists greater diversity than in The Conventional Structure.

[1:41:5] However, from this, we must make the purposes of each of these structures clear for it remains the very purpose of The Conventional Structure to provide the foundations for The Anomalous Structures to build upon, to rearrange, to deconstruct, and to newfound ideas of unicity in relation to cosmical hierarchy.

[1:41:6] Dynastesiological contemplations are derived according to those which are known as The Eight Brackets; these are size, abundancy, frequency, rarity, orbitality, orderity, cosmicality, and habitability.

[1:41:7] Each of these brackets accounts for the overall status of the investigated entity, and each of the brackets has an equal footing; the combined conclusions from each of these brackets forms the hierarchy, of which this overall process is henceforth known as bracketment.

[1:41:8] Each of the brackets are largely self-explanatory, and those which relate to a particular instrument of study, such as orbitality and orderity, share the same definition and application of the instrument of study to which they are associated.

[1:41:9] There exists the concept of dynastesia within this discipline, as derived from the title of the discipline itself; this concept of dynastesia relates to the proper completion of

the philosophical application of bracketment, so as to make a conclusion about how a celestial properly fits within The Hierarchy of The Cosmos.

[1:41:10] The Conventional Structure in the Astronist Tradition of the philosophical discipline of dynastesiology is herein briefly described and henceforth loosely known by the following applications.

The Universe

[1:41:11] Due to the naturity of The Universe being infinite in all possible and impossible dimensions and avenues, The Universe forever remains The Encompasser of the cosmical hierarchy, and that which The Cosmos, and all that exists within it, reside within.

The Cosmos

[1:41:12] It is only logical to place The Cosmos after The Universe for the cosmical hierarchy identifies and categorises all the different types of entities in existence within The Cosmos, and therefore, The Conventional Structure maintains that The Cosmos is the entirety of itself in all ways according to The Eight Brackets.

The Metagalaxy

[1:41:13] The immense and incomparable size of the metagalaxy, as the transcendental version of all galaxies in combination, as well as their unmatched frequency by galactic clusters, and their overall abundancy.

[1:41:14] But again, the cosmicality of the galaxies in full combination and totality highlights both their orderities, orbitalities, and their amalgamated habitabilities ; consider the unparalleled nature of all galaxies of The Cosmos combined into a concerned totality; this is the metagalaxy and by The Conventional Structure, it rests proudly in third position of the cosmical hierarchy.

Superclusters

[1:41:15] As the prominent features of The Metagalaxy, superclusters are considered to be in the fourth position within the cosmical hierarchy of The Conventional Structure due to them being classified as metagalactic structures, and their amalgamated habitabilities, their immense frequencies, and their abundancies throughout The Metagalaxy.

[1:41:16] The orderities of the superclusters are some of the most intense of all orderities, and although they themselves hold no orbitality, the amalgamated orbitalities of all the star systems of all the galaxies as part of the superclusters, there exists an ever greater overall cosmicalities as a direct result.

Quasars

[1:41:17] Aside from all non-metagalactic structures of The Cosmos, quasars are considered to be at the highest of positions in the cosmical hierarchy according to The Conventional Structure.

[1:41:18] The immensity in size of quasars is undisputed and their distance in the cosmical plain from all other cosmical entities directs towards its rarity, though in this respect, both its frequency and abundancy are some of the lowest in comparison to all other entities.

[1:41:19] In addition to this, the habitability is fairly diminished to their largely unknown and constantly fluctuating natures, which is further bolstered by the relative isolation of quasars in The Cosmos.

[1:41:20] Orderity and orbitality are both considered to be at the highest of heights according to The Conventional Structure due to the orbitality involved in the functions of any quasar, thus demonstrating the eminent level of cosmicality associated with quasars in the Astronist philosophical tradition.

Black Holes

[1:41:21] Despite the lowness of their habitability, frequency, and the traditional nature of black holes oriented towards chaosity resulting in low cosmicality, the high consideration for size, abundancy, orbitality, and orderity compensate to position black holes, also known as oblivions in the Astronist Tradition, towards the higher ranks of the cosmical hierarchy as approached by The Conventional Structure.

Galaxies

[1:41:22] There exists few greater contributors to orderity, orbitality, and cosmicality than that of galaxies, and due also to the size, the abundancy, and their relative frequency, especially so in relation to a metagalactic structure and supercluster, causes galaxies to be raised to a position of relevance within The Conventional Structure of the cosmical hierarchy, that is still considered within the High Rank.

Novae

[1:41:23] Due to the lack of abundancy, orbitality, and frequency of novae of any type, and due to the questionable orderity and cosmicality of novae, they are placed below galaxies within The Conventional Structure of the cosmical hierarchy, which is logical as they do only exist within galaxies, no matter their determined sizes.

[1:41:24] The non-applicability of novae towards habitability also causes distinct unsuitability and difficulty for novae to interact with and relate to The Eight Brackets of dynastiology. There remains only the brackets of size and rarity to stand in favour of novae due to the importance of their occurrence in the evolutions of stars.

Stellar/Galactic Regions

[1:41:25] As a cosmical entity derived only by the Astronist Tradition, and not by any natural means, the Stellar Regions of galaxies are largely geographically, politically, or civilisationally motivated, which reduces their overall dynastesiological standing.

[1:41:26] However, due to their high ranking in the brackets of size, abundancy, orderity, orbitality, and habitability, the Stellar Regions of galaxies, also known as Galactic Regions, are considered to be deserved of receiving the bordering level of the High Rank in The Conventional Structure, though this is expected to be the most contested of all the entries.

[1:41:27] All entries into the cosmical hierarchy below that of the stellar/galactic regions are considered as part of Low Rank and all above the entry of nebulae are considered as part of that which is henceforth known as High Rank according to The Conventional Structure of the cosmical hierarchy.

Nebulae

[1:41:28] The highest level as part of High Rank is given to nebulae of all kinds in The Conventional Structure due to their considered prominence in the brackets of cosmicality, relative size in relation to those entries which are ranked below, as well as in the bracket of orderity due to their importance in the formational stages of stars.

[1:41:29] Nebulaic frequency, abundancy, and orbitality are all either majoratively insignificant or are only partially applicable, thus resulting in nebulas not reaching High Rank within The Conventional Structure of the cosmical hierarchy.

Star Systems

[1:41:30] A single star system is the essence of the cosmical orderity; it is within these amalgamations of the central star, planets, moons, and smaller celestials that the majority of the most iconic cosmicalities are considered, which therefore explains their high level of cosmicality, orderity, and orbitality.

[1:41:31] In relatively high ranks also are the brackets of frequency and abundancy which can both be considered completed in their own regards, although as is evidential in all applications of bracketment, when frequency and abundancy are high, rarity is proportionally low as direct result.

Stars

[1:41:32] Alongside planets, the most abundant and frequently existent entities of The Cosmos, stars are the beacons of light, hope, and wonderment in The Cosmos and are the mostly adored and lauded aspects of cosmical phenomena.

[1:41:33] In dynastesiological terms, stars are positioned fairly low despite their importance in wider Astronist Philosophy; this is due, in part, to their relatively small size in relation to the larger cosmical phenomena discussed herein, as well as their distinct lack of habitability alone, and their low ranking in terms of rarity as should be expected due to their high ranking in the brackets of frequency and abundance.

[1:41:34] Stars of the essence of orderity; they are the cosmical structure that form the centrality for the majority of orbitalities, especially those of planets and moons, and as a result, their cosmicality is considered to be the highest, even towards the levels of those entities within the High Rank.

Planets

[1:41:35] Similarly to stars, planets hold an even greater abundance and frequency, as well as being the followers to cosmical orderity and orbitality, thus demonstrating their overall high level of cosmicality.

[1:41:36] However, it is the habitability bracket that planet succeed the highest in, out of all other cosmical entities in both Low Rank and High Rank according to The Conventional Structure, for planets remain the hubs of life in The Cosmos, and nowhere else does life thrive than on planetary worlds, whether that life be considered sentient or non-sentient.

[1:41:37] The size and rarity brackets do pull down planets to maintain a central position within Low Rank, but it remains a solidly placed one at that for not without planets, could many of the entities ranked below here exist, such as moons, asteroids, meteors, as well as both sentient and non-sentient life entries.

Pulsars

[1:41:38] Due to the naturity and size of pulsars, they lack relevance in size, abundance, and frequency, and even their level in orderity and orbitality, and as a result, their cosmicality are in question.

[1:41:39] However, as is the case with most other applications of bracketment, when frequency and abundance are low, rarity rises in proportion, though the final bracket of habitability is also of almost non-existence, and due to this, pulsars are generally considered to be of extremely low rank due to the mixtures of unsuitability and inapplicability associated with them in The Conventional Structure.

Dwarfs

[1:41:40] As a subentry derived from planets, dwarfs are considered to have little importance in the overall cosmical hierarchy according to The Conventional Structure due to their reduced status from fully fledged planet.

[1:41:41] Dwarfs generally follow the cosmical orderity and orbitality as planets due, which does raise their cosmicalities, but they are considered to offer little the star systems in which they reside, unless their habitabilities are properly formed to hold sentient, or non-sentient life.

[1:41:42] Also, their abundancies and frequencies are difficult in quantification and they do not share the same standardisation throughout all star systems that planets enjoy.

[1:41:43] Due to this unique blend of naturity, dwarfs also score low in terms of rarity and size, thus making dwarfs a cosmical entity with little relevancy to the overall cosmical hierarchy.

Moons

[1:41:44] As champions of cosmical orderity and orbitality, the cosmicality of moons remains considered as fairly high in relation to other cosmical entities, though rarity, size, and habitability all score lower for moons dynastesiological investigations.

[1:41:45] However, moons retain their positions in The Conventional Structure by their high abundancies, and frequencies as moons exist in almost every planetary system and in every star system.

Comets

[1:41:46] With our contemplations turning towards comets, we now enter the lowest ranks of The Conventional Structure with comets, asteroids, and meteors herein and henceforth collectively referred to in dynastesiology, and in some other discipline of Astronist Philosophy, and as originating from the Astronist cosmic philosophical discipline of familiology, which is latterdiscussed within the proceeding discourse.

[1:41:47] This group are named mobials in reference to their separateness, their movability, and their majorative association with The Chaos.

[1:41:48] Comets hold a fluctuating rank in relation to size, because in relativity to the other cosmical entities mentioned, comets would be considered as small, but in relation to the other mobials, comets are the largest so indefiniteness is inevitable when contemplating comets in this regard.

[1:41:49] Comets, unlike their asteroidal cousins, hold little orderity and orbitality, which makes their overall cosmicality fairly low, although in the Astronist Tradition, comets are provided with special adorations and laudations despite their inherent chaotic naturities.

[1:41:50] In relation to habitability and frequency, comets hold little rank here, but this is compensated by their higher rankage in the brackets of abundance and rarity, which forms a perfect balance between these two conventionally opposing brackets.

Asteroids

[1:41:51] Considered to be the cousins of comets, asteroids sit within the mobial family of cosmical organisation, but unlike their meteorial brothers and their cometical cousins, asteroids hold a higher level of both orbitality and orderity due to their frequent presence in orbit around planets, moons, and other larger celestials, which in turn, causes asteroids to have a higher level of cosmicality.

[1:41:52] Both frequency and abundance are also considered extremely high in relation to asteroids due to their presence in all aspects of The Cosmos, but as a direct result, the rarity of asteroids is extremely low, as is expected due to the negative correlation associated with rarity and its fellow brackets of frequency and abundance.

[1:41:53] However, both the brackets of size and habitability score lowly for asteroids, thus reducing their overall rankage and placing them towards the bottom of The Conventional Structure.

Meteors

[1:41:54] The Conventional Structure maintains the principle that meteors must always belong at least one level below asteroids in any cosmical hierarchy, and never above asteroids as meteors are considered to be inferior to asteroids in every way throughout all the brackets, and due to the considered brotherly nature between the two entities, meteors are always considered to be the smaller, disordered, and the much more chaotical versions of asteroids.

Sentients

[1:41:55] Those whom first enter into dynastesiological study, may find the inclusion of both sentient and non-sentient beings as unfair due to the naturity of these and their largely inapplicability to the majority of the brackets, and because of this, these final two entries may often be completely omitted from future investigations into the cosmical hierarchy.

[1:41:56] However, dynastesimal principles maintain that all that exists within The Cosmos must be contemplated in some form and applied to The Eight Brackets, so to omit the phenomena of life seems tantamount to defiance in relation to this dynastesimal principles.

[1:41:57] The inapplicability of orbitality, and orderity for sentients mean these cannot be considered, but the overall cosmicality of sentients can be; sentients are the very essence of cosmicality for within them, there exists some of the most complex systems in existence,

and although they are progenials of progenials, sentients are considered highly cosmical according to The Conventional Structure.

[1:41:58] However, the abundancy of sentients is extremely high due to our concentrations on certain worlds, such as The Earth for humanity, yet our frequency is also non-existent due to our current empirical knowledges not revealing any populations of sentients other than our own civilisations, but from this, we can quickly digress into discussions not related to dynastial investigations, so caution is advised when dealing with such topics.

[1:41:59] Due to this non-existence of frequency, the rarity of sentients, according to The Conventional Structure, is also of the highest it can be out of all other entities and phenomena mentioned in this investigation.

[1:41:60] Habitability, although this does not relate to sentients themselves, sentients are products of habitability, and so, one could again argue that habitability is intrinsic to sentience, and therefore, this should also be the highest it can be on the ranking scale.

[1:41:61] Overall, sentients and their non-sentient cohabiters, defy many of The Eight Brackets, and due to their naturities and positions of uniqueness, they cause extremities in the results of the bracketments, however, despite these extreme highs and lows in ranking, both sentients and non-sentients are to remain at the bottom of the rankings according to The Conventional Structure.

Non-sentients

[1:41:62] Similar to the dynastesiological relationship between asteroids and meteors, The Conventional Structure insists that non-sentients can never be ranked above sentients in cosmical hierarchies because non-sentients are inferior to sentients in every way on the scales of The Eight Brackets, and any existing fluctuations above, are not able to be considered by the brackets due to their relatively low significances.

[1:41:63] For this reason, it is held that non-sentients should always remain coupled with sentients in the final rankings of a dynastesiological investigation, but always either one or more rank below the entry of the sentients due to the pervading inferiority in existence between non-sentients and their sentient superiors.

[1:41:64] In The Conventional Structure, the lowest rung is granted to the non-sentients; those living organics and organisms that inhabit the worlds of The Cosmos, but do not present any sentient tendencies, attributes, or any potential to develop sentience.

[1:41:65] The brief outline of The Conventional Structure herein is conducted in such a way to allow for the invitation of all dynastesiological philosophers to attempt to create their own cosmical hierarchies.

[1:41:66] There exists no absolutism in The Conventional Structure for it merely acts as a foundation to summon those with cosmic philosophical minds of interest to interpret the cosmical hierarchy whichever way they do so know, feel, and imagine.

[1:41:67] Essentially, the ascription of The Conventional Structure herein sets the precedent for the overall culture and approach to dynastesiological contemplations about the cosmical hierarchy; this is the essence of the purpose of The Conventional Structure.

[1:41:68] Contemplations that take place dynastesiologically are done so under the auspices of The Eight Brackets for any deviation from these brackets cannot be considered a dynastesiological investigation.

[1:41:69] This, in turn, makes dynastesiology a discipline of strictness due to the bounds of its philosophical contemplations, which is unlike the majority of the other disciplines within Astronist Philosophy, but this defines the discipline and corners off contemplations from overspilling into other closely related disciplines.

[1:41:70] Despite this, dynastesiologists persist to hold a wide breadth of philosophical discourse and contemplation within the bounds of The Eight Brackets, and due to their rearrangements being practically infinite when interpreted by different philosophers, there shall always remain room for further dynastesiological discourse.

[1:41:71] This, therefore, points to the reason for the establishment of The Eight Brackets, and the inability for dynastesiologists to deviate from The Eight Brackets, for any addition to them would result in an even more infinitely contemplation of complexity, leading only to digression and non-conclusion.

[1:41:72] Having said this, there does exist a ninth category of application, although it is not to be named as a bracket for the purposes of saying within The Eight Brackets structure, and this is aptly called relevancy.

[1:41:73] Due to its vastity of application and interpretational aboundment, the category of relevancy is not provided with the status of being a bracket, and to stay within the bounds of The Eight Bracket structure of dynastesiology, should not be given the same importance as the other applications.

[1:41:74] Nevertheless, as is evidential by its given name, the application of relevancy measures the overall relevance of that which is being considered, and is typically given in a conclusive manner to avoid interpretations of raising relevancy to the status of The Eight Brackets so as to stay within the auspices of that which is considered proper dynastesiological contemplation.

The Families of The Cosmos

(Familiology)

[1:42:1] The main purposity for the creation and integration of the cosmic philosophical discipline of familiology is to present an organisation of cosmical entities in defined and distinct families, to solve the problem of philosophical disorganisation of cosmical entities and phenomena, and for easier reference of certain related groups of cosmical entities in philosophical discourses.

[1:42:2] By this notion, it is the main penchant of familiologists to contemplate cosmical entities according to their distinct characteristics, features, and functionalities and to categorise such entities into familial groups.

[1:42:3] In the Astronist Tradition, as defined herein and henceforth, there exists The Seven Cosmical Families, each of which consisting of three to five different entities with all of these groupings chosen according to their features, characteristics, positionings, and their similar naturities.

[1:42:4] The discipline of study of Familiology has a less formal name to which it is referred, and is known also as Cosmical Organisation so as to indicate the organisational aspect of familiology and its arrangement of different cosmic entities and phenomena into different groups, known as families.

[1:42:5] Within familiology, there exists those which are herein first mentioned and shall therefore be henceforth known as The Seven Cosmical Families, and it is these seven groups that shall form the basis of familiological discourse and contemplation.

[1:42:6] The first family of discussion is the Mobial Family which includes the three members of asteroids, meteors, and comets, with asteroids being that which is henceforth known as holding the title of the familiarch; this is the entity which is considered to be the most prominent within the cosmical family in subject.

[1:42:7] In the Astronist Tradition of familiology, meteors are considered the brothers of asteroids, and comets are considered to be the cousins of both meteors and asteroids.

[1:42:8] The second family of entry into this discourse on the cosmical families is that which is henceforth known as the Filamial Family which includes The Metagalaxy in its own entirety, as well as the filaments, and the Local Group, in relation to the specific group of galaxies in which The Milky Way is part of.

[1:42:9] In this particular family, The Metagalaxy is considered the parent to both filaments and the Local Group, and both of those are considered siblings of one another, but The Metagalaxy is considered the familiarch of the grouping.

[1:42:10] The third family of The Seven Cosmical Families is that which is henceforth known as the Clusterial Family which consists of globulars, superclusters, and regular star clusters which are all considered to be cousins of one another, with superclusters considered to be the familiarch of this cosmical family.

[1:42:11] The fourth family discussed herein is henceforth known as the Terrial Family which relates to all terrestrial, or partially terrestrial entities and includes planets, moons, and dwarf planets, with planets being the familiarch of this cosmical grouping.

[1:42:12] The Terrial Family is most often described as the planets and dwarf planets being sisters with moons as their cousins; the most generalised of all the cosmical families, this grouping includes all the different types of planets from those which are strictly terrestrial, to those which are gas, or any other type of planetary structure.

[1:42:13] The fifth family introduced herein is that which is henceforth known as the Gargantial Family which includes four members unlike all preceding families which have all only included three members; these four members are galaxies, stellar streams, black holes, and quasars.

[1:42:14] Initially, such a quartet of entities may seemingly be without similarities, but the string of parallels consists in the form of their shared gargantuan sizes, hence the entitled name given to the familial grouping.

[1:42:15] In this cosmical family, galaxies are constituted as the familiarch due to their abundancy and frequency, and their considered importance in Astronist traditional approaches to cosmicality and the wider cosmical system and orderity.

[1:42:16] With galaxies as the central figures to the Gargantial Family, quasars are considered and described to be their grandfathers, while black holes are considered to be their cousins, and stellar streams their own offspring.

[1:42:17] The Solial Family is the sixth in line of the cosmical families and consists of all solar entities in The Cosmos, and is the only family with five members in total, and includes stars, star systems, novae of all types, magnetars, and pulsars.

[1:42:18] The familiarch of this cosmical grouping is, of course, the entry of stars themselves due to their central and intertwined role throughout all the other entries; star systems are considered to be the mothers of stars, novae as the descendants of stars, pulsars as their sisters, and magnetars as their brothers.

[1:42:19] The seventh and final cosmical family of familiology is that which is henceforth known as the Nephial Family, named so due to the cloud-like naturities and appearances of each of its members, of which there are four.

[1:42:20] Of these four members, there includes nebulae which is also the familiarch for this cosmical family, proplyds, haloes, and molecular clouds; molecular clouds are described and considered to be the grandmothers of nebulae, with proplyds considered to be the sisters of nebulae and haloes as the cousins of nebulae.

[1:42:21] All of the entities aforementioned that have been categorised into cosmical families have been that which is henceforth known as familised, or may described as familial, however, there exists one cosmical phenomena that is what is known as infamilised, meaning that they do not fit in with any of The Seven Cosmical Families of familiology, and these cosmical phenomena are voids.

[1:42:22] Voids are described, in familiological terms, as infamilial, meaning that they are not considered to be part of any of The Seven Cosmical Families due to their dissimilarity with all of the other cosmical entities.

[1:42:23] However, this does not mean that voids should be removed from familiological discourse; in fact, this poignance in separation provides a distinct challenge for familiologists to familise voids, and other non-categorised and new emerging cosmical entities that have not been mentioned herein either due to their current obscurity, or their unknown existence at the time of the writing of The Grand Centrality.

[1:42:24] Familisation should be considered an important philosophical contemplation process, and is considered so throughout Astronist Philosophy, because without familised entities, and the whole discipline of familiology, philosophers are forced to explore a disorganised cosmos; one with little categorisation; one with rampant ambiguities and obscurities of what each cosmical entity is, and to which cosmical family it most fervently resembles.

[1:42:25] Contemplating familiologically means approaching cosmical discussions through the kaleidoscope of these seven different cosmical families, and through this organisation of celestials and cosmicals, a unique approach to Cosmic Philosophy emerge, and one that can be applied to many other aspects of theories and within other philosophical discipline of the Astronist Tradition.

[1:42:26] Familiology remains a small branch of wider Astronist Philosophy, yet its role is formed clearly and should not be regarded in any lower prestige or importance than any of the other discipline established herein due to its shorter length.

[1:42:27] Familiologists are tasked with maintaining the general familiological principle of the organisation of The Cosmos in whichever way such philosophers see fit, by taking The Seven Cosmical Families as the foundations for their own organisations and categorisations of The Cosmos and its many progeny.

The Heterogeneity of The Cosmos (Heterogenology)

[1:43:1] It is the penchant of all philosophers of the Astronist Tradition to contemplate the many avenues of thought process related to The Cosmos, yet underpinning them all is the principle of the heterogeneity of The Cosmos; the idea that The Cosmos is the ultimate heterogenous entity in existence and there exists no other creation within The Cosmos that is as diverse and vast as The Cosmos itself.

[1:43:2] The heterogeneity principle marches on further than this to the core of that which is known as cosmicality; under this principle, it is argued that The Cosmos is built upon a certain diversity that is certainly finite due to the ultimate naturity of The Cosmos, but is vastly pervading.

[1:43:3] The heterogeneity of The Cosmos is the principal approach to the Astronist understanding of The Cosmos and wider Astronist Cosmology, but this does not mean to say that cosmical heterogeneity supports any notion denying the existence of commonalities in The Cosmos.

[1:43:4] Familiologically, there exists certain categories of commonality in The Cosmos into which all the different progenies are placed into and although this pertains to a homogeneous Cosmos, heterogeneity supports and underpins this.

[1:43:5] Homogeneity and heterogeneity exist alongside one another and it is up to the philosophical approach of the tradition to which one aligns oneself as to whether one supports the former or the latter.

[1:43:6] The Astronist philosophical approach, as aforementioned, supports the heterogeneity of The Cosmos, whilst understanding some of the influences of homogeneity in the cosmical orderity and system.

[1:43:7] Of all the moons, planets, stars, galaxies, and metagalactic clusters, there exists homogeneity in relation to their different categories and familiological ties.

[1:43:8] However, heterogeneity prevails in that all these different progenies are unique to themselves, and even though they can be categorised, and even though their characteristics, appearances, and functions do overlap, they ultimately hold unquity in their essences, and therefore diversity, and therefore contribute to heterogeneity.

[1:43:9] Each and every progeny holds a certain combination of appearances, functionalities, characteristics, positionings, and other features which supports its own unquity, and the diversity of The Cosmos therein.

[1:43:10] An instrumentation shall now be conducted in relation to the heterogeneity of The Cosmos, the first of which being the instrument of study of abundance.

[1:43:11] The abundancies of the cosmical progenies is all reminiscent of the heterogeneity of The Cosmos in its entirety; in the context of The Heterogeneous Cosmos, there must exist a large abundance of progeny within The Cosmos in order for the principles of cosmical heterogeneity of be viable.

[1:43:12] Therefore, it is concluded that without the great amount of abundance in the cosmical progenies, there would not exist any need for the heterogeneous approach to The Cosmos to exist for heterogeneity promotes vast diversity, and without great abundance, there cannot be great diversity.

[1:43:13] Following on from our contemplations of the instrument of abundance applied to heterogeneity, we must also contemplate the role of frequency in relation to heterogeneity.

[1:43:14] Initially, it would seem frequency plays a much smaller role in The Heterogeneous Cosmos than its comparter instrument of abundance; whether the progeny of The Cosmos exist or are positioned closely to one another or not does not hold huge amounts of sway of their differences, or similarities.

[1:43:15] In the context of The Cosmos, The Earth and Venus are two worlds that are as close to one another as two planets possibly could be, yet their similarities in appearance are scarce.

[1:43:16] It is essentially held that there exists frequency in The Heterogeneous Cosmos for the purpose of spacing and positioning.

[1:43:17] However, this trajectory of thought is overthrown because if any notion were to be pressed regarding cosmical frequency, it would be that each coordinate of The Cosmos that a progeny exists at is ultimately unique that the application of the instrument of frequency is the greatest of all supporters of the principles of The Heterogeneous Cosmos.

[1:43:18] There stands no greater diversity than that of the differing positions between each and every cosmical entity within the entirety of The Cosmos; not without concepts of frequency could we understand the proximity and distance, and the subsequent coordinations, of cosmical entities.

[1:43:19] Upon conclusion, despite one's potential initial misunderstanding of the importance of frequency to the Heterogenous Cause, it is, in fact, one of the approach's greatest advocates due to the nature of that to which it relates.

[1:43:20] When applying the instrument of centricity to the concept of cosmical heterogeneity, we discover the centrality of heterogeneity to the cosmically ordered system, and The Cosmos's wider structure.

[1:43:21] Venturing into territories associated with concepts of cosmical naturity, the feature of heterogeneity holds a staunch centricity in relation to the cosmical structure that can neither be rivalled, nor replaced by any other aspect, or feature of cosmical existence.

[1:43:22] In the Astronist Tradition, it is of course held that heterogeneity is central to the existence of The Cosmos and is considered, not as feature of The Cosmos, but to be an intrinsic and inextricable aspect of what The Cosmos essentially is by its own naturity and structure.

[1:43:23] Centricity can be considered a supporter of the Astronist approach to understanding the heterogeneity and homogeneity of The Cosmos due to its mixed approach that is majoratively supportive of heterogeneity, but still considered homogeneity's significance in certain relations.

[1:43:24] One of these relations is centricity; that which is centre to The Cosmos, or to a cosmical progeny, the most prominent example of which being cores of galaxies, and the cores of star systems, and by this notion, also includes the instrument of study of corality as a intrament in this instance.

[1:43:25] An intrament in the context of instrumentation is an instrument of study that is applied under the auspices of another instrument in this particular instrumentation; in this instance, corality is the intrament of centricity for the contemplation, in this regard, has occurred in such a way that corality has been discussed within centricity.

[1:43:26] These can be considered as an aspect of homogeneity that cannot be understated, or overlooked by Astronist philosophers, and therefore, must accepted as playing an integral role in certain structures of cosmical progenies.

[1:43:27] Further to contemplations regarding centricity, the concentricity of The Cosmos is also another supporter of the Homogenaic Fact; the philosophical approach that supports an homogenous understanding of cosmical features and structures.

[1:43:28] Concentricity, by its own very nature, attempts to define the commonalities between cosmical progenies in relation to the similar concentric pattern of their structures; by this notion, heterogeneity cannot be argued for in the face of logic, reason, and fact.

[1:43:29] Yet one could notionise that there exists diversity in all things, including the concentric structure of cosmical progeny; in this regard, it is understood that the concentric patterns of each and every cosmical entity are different in some way whether it be by their overall size, their specific shape, or by the distance between each ring of the concentric pattern.

[1:43:30] In any respect, this notion bypasses constructs of The Cosmos suggesting homogeneity because even in this category of structure, there exists a great diversity;

although concentricity pervades all and is homogenous in that fact, the way in which the progeny are concentrically positioned differs from system to system, and from galaxy to galaxy; by that notion, heterogeneity ultimately prevails.

[1:43:31] Heterogeneity in relation to the instrument of chaosity and The Chaos as a wider concept is telling of the pervading nature of heterogeneity for The Chaos and all the progeny under its influence are perhaps some of the most diverse and dissimilar collection of entities that there could possibly be.

[1:43:32] There does exist homogeneity in The Chaos in relation to certain entities repeatedly being categorised as chaotic such as black holes and comets, but the heterogeneity in The Chaos is also prevalent in the unquities of the progenies of which it is composed.

[1:43:33] By this notion, heterogeneity, although we speak of it mostly in the context of The Cosmos in its entirety, is it also pervading of that which is known as The Chaos in the Astronist Tradition.

[1:43:34] Following on from these contemplations, it is an appropriate time to discuss the heterogeneity of that which is considered transcendent of The Cosmos and The Chaos in the Astronist Cosmology, which pertains to both The Universe and The Divine.

[1:43:35] In this regard, there exists an infinite amount of diversity in both The Universe and The Divine, both for theistic thinkers and non-theistic thinkers in their respective and individual interpretations.

[1:43:36] By this notion, heterogeneity, according to the Astronist Tradition is transcendent of both The Chaos and The Cosmos, and even pervades The Universe and the very essence and naturity of a divinical entity.

[1:43:37] The instrument of composity is easily related to the ideas of heterogeneity in the notion that there exists an interconnection to all progenies of The Cosmos for there may exist confusion in relation to this notion.

[1:43:38] Heterogeneity of cosmical entities does not constitute any further lack of interconnection between the progenies, which could easily be interpreted by the vast diversity that is expounded in the Heterogenic Principle in relation to The Cosmos.

[1:43:39] Despite the diversity of cosmical progenies, the Astronist Tradition commands that the instrument of composity and the subsequent cosmology known as The Composite Cosmos both provide an important perspective to heterogenous thinking in relation to The Cosmos, and call for philosophers not to forget the interconnected naturity of all cosmical progenies, despite their unquity and the heterogeneity that commands them and The Cosmos as whole.

[1:43:40] By heterogenological study and related contemplations, we begin to grasp an even sharper understanding of The Cosmos in a new way that hasn't been replicated in other disciplines.

[1:43:41] By this notion, heterogenologists hold both a great responsibility, as well as a grand gift in that they are provided with a unique opportunity to study and contemplate The Cosmos in a way that other disciplinists do not come across in their own disciplines of study.

[1:43:42] In contemplations of heterogeneity in The Cosmos, the instrument of cosmicity takes a central role for in essence, a heterogenation, which is a specific type of contemplation that is reserved just for notions of heterogeneity, is an attempt to understand The Cosmos in a certain way; a heterogenous way.

[1:43:43] The Heterogenous Cosmos defies the instrument of cosmicity in the sense that the Astronist Tradition considers heterogeneity to be the embodiment of that which is understood to be cosmical; heterogeneity is the cosmical system itself in the diversity of the system, in the vastity of the system, and in the assortment of functionalities associated with the progenies of The Cosmos.

[1:43:44] In this respect, heterogeneity, when applied to the instrument of cosmicity, is the essence of itself, and so there exists no other entity of contemplation that can rival the cosmicity of heterogeneity because heterogeneity, in the Astronist Tradition, is considered to be the champion of cosmicity.

[1:43:45] Heterogeneity in relation to the instrument of study of criticality is understood with respect to the second definition of the instrument and this is mainly inclusive of philosopher's and interpreter's comprehension and reaction to the Astronist approach to understanding The Cosmos by a heterogeneous framework.

[1:43:46] There is no end in the interpretations with regards to the Astronist approach to understanding The Cosmos, and this should be promoted as another platform for philosophical discussion which further demonstrates the philosophical spirit and whether philosophers of the tradition agree or disagree with the official Astronist approach, all interpretations contribute to the Astronist Tradition either way.

[1:43:47] This calls to mind the importance of the instrument of criticality to the overall discussion of Cosmic Philosophy, and even wider philosophy in general; the interpretations, contemplations, and opinions of others when presented with a concept is the essence of what philosophy is, has been, and shall continue to be for eras and traditions henceforth.

[1:43:48] Heterogeneity is difficult to measure in relation to the instrument of dyadicity due to the nature of dyadic contemplation strictly encompassing interactions between only two entities whereas the nature of heterogeneity relates to a vast diverseness of entities.

[1:43:49] Even with this differentiation there still exists a way to apply dyadicity to the heterogeneity of The Cosmos; the essential method consisting of this is to magnify The Heterogenous Cosmos to just two entities and contemplate these in isolation, but always in the context of The Heterogenous Cosmos.

[1:43:50] For the instance of this instrumentation, we can focus our attentions on the two main exemplars of heterogeneity in The Cosmos: stars and planets and their dyadic interactions in relation to cosmical heterogeneity.

[1:43:51] Stars and planets hold a great amount of heterogeneity in their own essences whether this be demonstrated by the diversity in their appearances, their coordinations, their sizes, their proximities to one another, or in the lengths of their existences and the events that occur during the existences.

[1:43:52] In the stars and planets of The Cosmos we see heterogeneity in its prime; we see the diversity of cosmical progeny in character, content, and substance, and specifically relating to dyadic interaction, there exists no greater example than the orbitalities of planets around stars, the rotations planets and stars, and the latter affects the former in that regard.

[1:43:53] The diversity in the lengths of orbitalities, the proximities of orbitalities, the rotations and tendencies of stars and planets in relation to their affects and interactions with one another are all examples of dyadic interactions that are heterogeneous across the vast expanse of The Cosmos.

[1:43:54] Applying the instrument of dynamicity to the heterogeneity of The Cosmos is of course in relation to the change, the activity, and the progressions made in The Cosmos by a cosmical progeny.

[1:43:55] It can be argued that it is only the dynamic nature of The Cosmos that has caused the existence of heterogeneity in The Cosmos; without the changes, activities, and progressions in occurrence in The Cosmos, it is plausible to notionise whether any type of diversity can manifest.

[1:43:56] Therefore, the dynamicity instrument is the central component to the development of the heterogeneity of The Cosmos, and it is the incomprehensibility of the vast amount of changes, activities, and progressions in The Cosmos in occurrence in simultaneity that is the most fascinating element of heterogeneity to the Astronist Tradition, and further affirms the distinct wonderment that the whole Astronist Tradition has with heterogeneity in The Cosmos, and even the wider concept of diversity and its nature.

[1:43:57] The application of extrinsicity of heterogeneity in The Cosmos pertains to all opinions, interpretations, and notions that heterogeneity is not important to The Cosmos, especially when considered to be inferior to homogeneity.

[1:43:58] This, of course, is not the view held in the Astronist Tradition, but this does not mean that philosophers of the Astronist Tradition cannot spend time contemplating the extrinsicity of heterogeneity; if contemplated properly, the conclusions drawn shall only further bolster discussions about the true naturity of The Cosmos which is entirely positive and in alignment with that which is known as the Philosophical Spirit of the Astronist Tradition.

[1:43:59] Despite the vastness, grandity, complexity, and diversity of The Heterogeneous Cosmos, the principle of cosmicity and cosmicness must retain its foundational grip, and continues to affirm that The Cosmos is ultimately finite in its naturity, and therefore, heterogeneity is also finite by this same naturity.

[1:43:60] No matter the vastness of The Heterogenous Cosmos, that vastness has an end, and according to the Astronist philosophical tradition, that is the endpoint from which The Universe begins.

[1:43:61] The focality of heterogeneity involves taking into account all aspects of The Heterogenous Cosmos in order to conclude its own overall importance as a balanced judgement.

[1:43:62] In the Astronist Tradition, the highest amount of focality is given to heterogeneity due to its centricity to the cosmical system and orderity for heterogeneity is itself considered to be the essence of what The Cosmos is, and so, its highest level of focality can be derived from this notion.

[1:43:63] Formity in relation to the heterogeneity of The Cosmos involves contemplations regarding the formation of The Heterogeneous Cosmos, the processes involved in this, and the factors contributing to it, and invokes other instruments into the discussion, such as orderity, naturity, and motionality.

[1:43:64] In the Astronist Tradition, it is considered that the Heterogenous Cosmos is extricable from The Cosmos itself and therefore, the development of The Cosmos is the development of heterogeneity in The Cosmos in absolute synchronicity.

[1:43:65] The development of all the cosmical progenies and the vast expanse of space in The Cosmos have formed the heterogeneous naturity of The Cosmos that the Astronist Tradition identifies as central and paramount.

[1:43:66] The extricability between The Heterogenous Cosmos and The Cosmos itself speaks volumes about the importance of heterogeneity to The Cosmos in relation to its own formation.

[1:43:67] Heterogeneity may be interpreted as lacking orderity due to the vastness of The Cosmos to which it relates, as there does stand the principle that the greater the vastness, diversity, and complexity, then only logical is it to notionise that all these diverse and individual parts of the whole are most challenging to organised, control, and order.

[1:43:68] However, by viewing the example that is the functioning of The Cosmos itself, it is then that we do see the orderity that it evident throughout The Cosmos which defies the previous principle, despite the logic present in its words.

[1:43:69] In essence, it is a mixture of the motionalities, functionalities, and the brilliant history of the development of The Cosmos that has formed that which we now see and understand as cosmical heterogeneity, thus establishing the formational history of The Cosmos as the principal driver of heterogenic approaches to understanding cosmology.

[1:43:70] It is interesting to contemplate the future of heterogeneity in relation to our discussions about The Heterogenous Cosmos; essentially, the Astronist position on such a contemplation considers that the heterogeneity of The Cosmos and its progeny shall continue on in an inextricable relationship.

[1:43:71] We also see graduality in this relation because of the gradual nature of the development of The Cosmos, and as a result, in proportion, the heterogeneity of The Cosmos also holds graduality in its own naturity.

[1:43:72] The diversity of The Cosmos shall continue; its vastness shall continue; its complexity shall continue; all in the growth of The Cosmos, until of course it end comes, and it is by the majestic cosmical, universal, and divinical forces that The Cosmos shall one day end as all finite entities must, and it is only at that point, that the heterogeneity shall end for their inextricability from one another.

[1:43:73] The heterogeneity of The Cosmos stands in complete proportionality to the trajecture of The Cosmos itself; if The Cosmos decreases in size and progenial abundance, then the heterogeneity of The Cosmos shall decrease in proportion, and vice versa which demonstrates the proportional naturity of heterogeneity.

[1:43:74] Imnemnic applications to the concept of cosmic heterogeneity largely consists of ideas about the scientific certification of the primacy of heterogeneity in The Cosmos, especially over homogeneity, and draws upon ideas from empirical evidence in order to either bolster heterogeneity, or to disagree with its primacy.

[1:43:75] The concept of heterogeneity is considered to be aligned with the ideas expounded by the instrument of matrixity which adheres to the absolute primacy of the cosmical orderity in all circumstances.

[1:43:76] The Heterogeneous Cosmos is the essence of cosmical orderity, therefore it is only logical and natural that it is supportive of matrixity, and as The Cosmos continues to accelerate in its grows, so shall its own heterogeneity, and as a result, so shall the matrixity of The Cosmos become greater and greater.

[1:43:77] In heterogenic terms, we speak very little of The Chaos due to its transcendence above the concept, but this does not mean to suggest that heterogeneity support chaotic influences, but instead, heterogeneity, by its own very naturity, is all encompassing of The Cosmos, which many demonstrate contentions with matrixity during future discussions and applications of the instrument to the heterogenic concept.

[1:43:78] Despite our greater understanding of heterogeneity and its contributions to our understanding of The Cosmos in the Astronist Tradition, there shall always remain an air of mysteriousness towards heterogeneity and its naturity, which is why mysteriousity is an important instrument to apply to the heterogenic concept.

[1:43:79] A great unknownness remains about the true gravity of heterogeneity and the true and physical extent of its pervadation throughout cosmical existence; mysteriousness is not inherent negative, but demonstrates a requirement for greater philosophical contemplation in order to demystify the concept to foster greater clarity, comprehension, and understanding.

[1:43:80] Like many other instrumentations conducted within The Grand Centrality, the instrument of naturity is present in almost all applications of each instrument due to its own pervading and integral nature.

[1:43:81] The naturity of heterogeneity is form through an accumulation of all the other applied instruments of this instrumentation, but the main essence of the naturity of the concept of heterogeneity is its cosmical proportionality, its inextricability from The Cosmos, and its characteristic of pervading through all aspects of The Cosmos in complete symmetry with The Cosmos.

[1:43:82] Similarly to the instrument of naturity, that of orderity also has pervasive tendencies and is naturally entrenched in many other applications of instrument, but essentially, the cosmical orderity is also the essence of heterogeneity with the two being inextricable from one another according to the Astronist Tradition.

[1:43:83] Planetarity is a really important application of instrument in the context of heterogeneity because planets, as a major category of cosmical progeny, are one of the prominentmost exemplars and supporters of the concept and principles of heterogeneity in The Cosmos due to their vastity in appearance, characteristics, functionalities, histories, proximities, and in all other variabilities.

[1:43:84] Primarity is another essential instrument to apply to heterogeneity because it reaffirms the stance taken by the Astronist Tradition that heterogeneity holds primacy over homogeneity in a cosmical context.

[1:43:85] The application of the instrument of study of primarity explores this supremacy of heterogeneity and attempts to draw the rationalities for this decision by the Astronist Tradition, the main reason for such an approach is due to the intrinsic nature of The Cosmos as holding diversity as its most central characteristic.

[1:43:86] Although homogeneity provides order in the sense of categorisation, these categorisations are considered to be merely human constructions; in the essence of The Natural Cosmos itself, heterogeneity is triumphant and supreme due to the unquestionable diversity of the progeny of The Cosmos in all three aspects of heterogeneity; in character, content, and circumstance.

[1:43:87] Applying the instrument of purposivity to heterogeneity involves the contemplation of the purpose of that particular concept in Cosmic Philosophy; from the Astronist traditional perspective, the main purpose of the concept of heterogeneity exists in order to development order and structure to one's overall understanding of The Cosmos in a way that places diversity as the central characteristic.

[1:43:88] Depending upon one's approach, the purposivity of heterogeneity could change dramatically, but the essential purpose stands in relation to the functionality, naturity, and orderity of heterogeneity in The Cosmos.

[1:43:89] Sensicality, in relation to the concept of heterogeneity, consists of contemplations of rationality and common sense applied to the concept; the logical grounding for the concept is specifically addressed within this particular instrument, but is also founded through each of the other applied instruments; the Astronist Tradition argues for the logicity of the heterogeneity of The Cosmos and argues for the rationality of the concept in all circumstances.

[1:43:90] Solarity, of course, relates to stars in the overall heterogenic framework of The Cosmos, and similar to the instrument of planetarity, considers the way in which the diversity of all different stays by the variables of their appearances, sizes, functionalities, and proximities all support the supremacy of The Heterogeneous Cosmos concept.

[1:43:91] Within this instrumentation, multiple references have been made to the simultaneous and synchronous naturity of heterogeneity, especially with regard to its relationship with The Cosmos itself.

[1:43:92] Because of this, the instrument of synchronicity must be applied and understands that the principal essence of heterogeneity in its vast diversity is for multiple events involving cosmical progeny are always in occurrence at the same time.

[1:43:93] Finally, the instrument of vastity must not be overlooked in this heterogenic instrumentation for it stands at the heart of what heterogeneity essentially is; vastity is considered to be the father of diversity, and diversity is the essence of heterogeneity.

[1:43:94] Not without vastity could heterogeneity assume its role in the Astronist traditional understanding of The Cosmos, and therefore, its application in this context is necessary.

The Introspective Cosmos (Introspectics)

[1:44:1] Introspectics is a major discipline of study within Cosmic Philosophy, as part of the Astronist philosophical tradition, and involves taking a perspective of philosophical understanding of The Cosmos that is essentially inward-looking and encourages one to enact that which is known in Astronist Philosophy as cosopathy.

[1:44:2] Cosopathy stands in close association with empathy, but specifically from the perspective of The Cosmos itself; in introspectics, one must think from the perspective of The Cosmos in its entirety, or at least attempt to do this, so that one can then conduct an introspection of The Cosmos.

[1:44:3] An introspection involves the investigation into the infrastructural and internal functionalities of The Cosmos from the perspective of The Cosmos, and thus requires the introspective perception.

[1:44:4] Introspectics has developed a wide range of unique concepts, branches, theories, and ideas that are all collected and considered to be part of its study, of which all shall be addressed and contemplated in this discourse.

[1:44:5] First, we approach the concept of cosmic introspection itself and what the role of an introspector, or an introspectress actually consists of.

[1:44:6] Initially, an introspection is split into two types; an Intrinsic Introspection and an Extrinsic Introspection, the former of which relates to elements of The Cosmos that are essential and belong naturally to The Cosmos, and the latter involving the opposite to that; an identification of that which is not naturally associated with an element to The Cosmos.

[1:44:7] To exemplify, an Intrinsic Introspection conducted with basic tenets reveals that the most intrinsic elements of The Cosmos are gravity, speed, light, and dimension, as well as the metagalaxy.

[1:44:8] To exemplify, an Extrinsic Introspection conducted with basic tenets reveals that the most extrinsic elements of The Cosmos are singular progenies, yet such is curtailed by the idea that if all the singular progenies were removed, would The Cosmos be as it is.

[1:44:9] The results from this simple extrinsic introspection reveal three ideas to us; the first of which is known as The Essentiality of Narrative and involves the idea that without every occurrence and every entity in existence, the current state and existence of The Cosmos, and its narrative, would not exist as it does now.

[1:44:10] This first idea then leads us onto a discussion about a dichotomy of ideas; the first idea posing that nothing is essential within The Cosmos and that even if everything was

removed, The Cosmos would still exist, would still be accelerating and expanding, and would still be following the narrative that it has already; this is to be henceforth known as inomnitialism.

[1:44:11] The oppositism to this is henceforth known as omnissarism which holds that all that exists as part of The Cosmos is essential to the existence of The Cosmos and even removing just one element, or part would absolutely alter the narrative, structure, and essential nature of The Cosmos as it is now.

[1:44:12] Omnissarist ideas are more supported by those of the Astronist Tradition rather than inomnitialist thoughtpaths; The Omnissary is termed as such in order to refer to The Cosmos and everything within it as essential to its existence, thus The Omnissary is another term for The Cosmos in that sense.

[1:44:13] This dichotomy of essentiality and inessentiality further bolsters the importance of the conductation of introspective investigations, whether be with an intrinsic or extrinsic leaning to such investigations.

[1:44:14] Inomnitialist and omnissarist ideas can also be used outside the discipline of introspectics wherever their utility is deemed relevant, and although the Astronist Tradition is certainly omnissarist in its leaning, this does not mean that all adherents of the Tradition also need to be omnissaristic in their orientations on the essentiality of The Cosmos and those entities that exist within it.

[1:44:15] Introspectical thoughtpaths are those which are characterised by a stance of introspection, and may easily transcend the discipline of introspectics; they must just involve the instance of the introspective perception.

[1:44:16] Thus, to contemplating and debate introspectically is to always do so from an introspective perception of the subject involved, the most common subject of which, in introspectics, is of course The Cosmos.

[1:44:17] Introspectors and introspectresses can be in reference to anyone that conducts an introspection, but the proper term to refer to someone that dedicates their philosophical study to the discipline of introspectics is known as an introspectrist; the terminologies used in this context are therefore important to reference differing roles within the discipline.

[1:44:18] During our contemplations on the discipline of introspectics, we approach two important concepts that originate from introspectics, yet are applicable to the majority of other disciplines and theories within Cosmic Philosophy, especially so in relation to the discipline of ultimatology and the instrument of study of finality.

[1:44:19] These two concepts are henceforth known as the Initial Singularity and the Final Singularity and for their proper utility, should always be considered in unison; the former

relates to the beginning of The Cosmos, known in a non-Astronist context as The Big Bang, while the latter relates to the end of The Cosmos.

[1:44:20] But instead of just relating to the beginning and end of The Cosmos as cosmical events, these concepts point to the conceptualisation that The Cosmos began as a singularity; a single infinitely dense and infinitely small point known as the Initial Singularity.

[1:44:21] Whether The Cosmos ends in a similar way at a singular point is something to be discussed within the auspices of ultimatology, but the idea of the Final Singularity remains prominent by the fact that the Astronist Tradition supports some kind of finality to The Cosmos due its adherence to the principles within the discipline of limitology.

[1:44:22] Introspections on the Initial Singularity and the Final Singularity consist of looking inwardly, as if one is The Cosmos, and contemplating ideas about the connections between the beginning and the end, whilst invoking concepts from other disciplines such as limitology and ultimatology.

[1:44:23] The idea of the Singularity of Cosmos is another prominent concept within introspectics as it relates to the argument that The Cosmos itself is a singularity due to the fact that the Astronist Tradition always considers The Cosmos as a well ordered singular whole composed of composite parts.

[1:44:24] The idea of the Observable Cosmos exists in relation to part of The Cosmos that humanity can physically observe, known outside the Astronist perspective as the Observable Universe, as this falls within the subdiscipline of introspectics henceforth known as Observology.

[1:44:25] Due to the fact that introspectics deals generally with ideas of perspective and observation, the discipline also deals with the act of observation through the concept of observance; of course, observation is central to all aspects of Cosmic Philosophy, especially in the devotional and non-devotional practices within Astronism.

[1:44:26] The concept of observance lays the foundations for the action of observation; in Astronist Philosophy, observance involves the visualisation, and the interpretation of The Cosmos, and the application of the knowledge received after such visualisations and interpretations.

[1:44:27] Essentially, observance holds a wider definition than just observation alone, and instead incorporates all aspects of perceiving, interpreting, applying, and imparting knowledge about The Cosmos; these four are considered collectively in the Astronist philosophical tradition and are known as ospination, which is, of course, closely associated with the concept of observance.

[1:44:28] Observologists contemplate the act of observation and its role in astronomy, stargazing, cosmology, and wider Cosmic Philosophy, as well as contemplating the concept of observance, and its associated and collective action henceforth known as ospination and they generally attempt to derive concepts from ospinatory acts.

[1:44:29] Observality is the instrument of study which observologists may use to measure the extent to which an ospination is considered to have taken place, or more generally, can refer to any application of the concept of observance to any subject, even those beyond the discipline of introspectics.

[1:44:30] The main branch of observology is henceforth known as opticology which deals with philosophical contemplations about the utility of different optical systems in telescopes for the purposes of their own efficiency in astronomical observation.

[1:44:31] Opticologists are also tasked with the contemplation of future optical systems, mechanisms, and techniques of astronomical observation, either hypothetically, or those which have practical viability.

[1:44:32] Opticality is a little known instrument of study that lays the foundations for opticological contemplation and measures the extent to which a particular cosmical entity is able to be optically observed, as well as the extent to which a particular optical system, mechanism, or technique is adapted to efficiently observing the cosmical entity in subject.

[1:44:33] Both observology and opticology have a strong tradition of terminology that originates specifically from their contemplations of the observation of The Cosmos and its many facets, and although these terms may be used in other disciplines, their origination in these two branches of introspectics points to the relevancy of these two relatively small branches.

[1:44:34] The first of these terminologies is that known as abberation which, in its philosophical context, involves there existing a major defect in one's philosophical conceptualisation formed by the way in which one has observed the subject in question.

[1:44:35] Such a defect can be termed as a misobservation and is going to perhaps be commonplace during philosophical contemplation for although we deal with philosophy, we must also consider fact, and despite philosophy being an open door of thought and knowledge, reality, fact, and logic must also prevail over our final considerations.

[1:44:36] An active galaxy is that which is actively interacting with another galaxy, especially so if this is observable through systems of optics and also provokes contemplations about the activities of galaxies.

[1:44:37] Airglow and nightglow are considered to be the same phenomena in the Astronist Tradition and invokes philosophical contemplations, and is considered to be a major subject of Cosmic Devotion in the Astronist Tradition.

[1:44:38] Albedation is a specific type of contemplation and devotion in the Astronist Tradition involving planets, satellites, and other non-luminous objects in The Cosmos.

[1:44:39] The oppositism to albedation is that which is henceforth known as candation which involves contemplation and devotion to luminous entities in The Cosmos, such as stars, galaxies, and nebulae.

[1:44:40] Astral apparition is a period of time during a stargazing event when a particular celestial is observable, usually not just a star, but a particular planet, galaxy, or another type of cosmical phenomena, and when a specific introspection is conducted towards this subject.

[1:44:41] Bolides are of course exploding meteors, which are certainly pre-Astronist in their terminological founding, but in the Astronist Tradition, bolides are considered beyond this in terms of their observation during stargazing events which is to be contemplated philosophically thereafter.

[1:44:42] Magnitude, known as magnitudity in its proper Astronist context, is a measure of the extent of the observable celestial entities during any given stargazing event and is only considered an instrument of study from an introspective point of view, not from a wider Astronist philosophical perspective.

[1:44:43] A unique term within observology and opticology is that which is henceforth known as twilation, also termed as twilament, which relates to all specific contemplations on twilight after its observation as a twilight is considered a cosmical phenomena in the Astronist Tradition.

[1:44:44] In observology and opticology, and wider introspectics, to collimate is to reorientate one's philosophical beliefs, opinions, and stances on a particular topic, due to having witnessed a new cosmical observation; collimatory experiences are therefore imperative to greater philosophical understanding and enknowledgegement; collimation is therefore a central processes in introspectics, but also, wider Astronist Philosophy.

[1:44:45] A very important idea that originates from introspectics is that which is henceforth known as the diaphragm; this is a mental apparatus that may be used by philosophers in order to orientate their ideas along a particular self-constructed spectrum.

[1:44:46] This spectrum shall allow differing levels of leanance towards a topic in order to measure the resulting consequences of one changing their leanances; diaphragmic contemplations are those which are conducted using the apparatus of the diaphragm.

[1:44:47] Although a diaphragm is firmly originative within introspectics as a technique used primarily by introspecticists, it permeates through the essence of the Astronist philosophical tradition and easily be utilised in many other disciplines.

[1:44:48] Connected to the idea of the diaphragm, a sequence is a collection of different ideas that form the apparatus of a diaphragm and is therefore a central component to the construct of a proper diaphragm.

[1:44:49] A doublet is a concept within introspectics that contains two elements, and is again another concept that can be pervaded throughout other disciplines; an example of this are the Initial Singularity and Final Singularity.

[1:44:50] A doublet is not exactly a dichotomy as the two elements involved don't necessarily oppose one another like in a dichotomy.

[1:44:51] The extent to which a philosophical concept, theory, or opinion is changed from its omnidoxical origin is known as eccentricity.

[1:44:52] There also exists the concept known as brilliancy in observology and opticology which is the extent of light cast by the celestials of a particular night sky, especially when referred to collectively, of which The Moon is most likely to be the largest contributor.

[1:44:53] Closely associated to the act of collimation, the act of libration is a small change in one's philosophical orientation while collimation relates to a whole reorientation in one's beliefs on a certain topic; this can also be applied in all other areas of Astronist philosophical investigation, but it remains important to emphasise its origination within introspectics.

[1:44:54] Another term originating from within observology and opticology is that which is henceforth known as lenticulation which relates to a stargazing session during which no telescopes or other optical aids are used and in which only the eyes are utilised for cosmical observation.

[1:44:55] An essential term originating as part of observology and opticology is that which is henceforth known as mountation; this includes the facts, theories, and philosophies that a philosopher may use to support and justify their opinions.

[1:44:56] Mountation is rooted in introspectics, but is an integral aspect of all philosophical enquiry, and both branches of introspectics, observology and opticology, must always be credited with being the originators of this term.

[1:44:57] Obliquity, in its Astronist philosophical context, is directed towards a philosophical idea that is vaguely outlined rather than directly expressed, usually due to either its complexity, abstract nature, or its controversialism.

[1:44:58] Although not immediately understandable as introspectical, the concept of obliquity can, again, be applied to any circumstance of its appearance within Astronist philosophical investigations.

[1:44:59] In observology and opticology, an orthoscope, or an orthoscopic device is any type of eyepiece attached to one's face that is used during a stargazing session for the purposes of observation; orthoscopic devices complete the family of devices utilised during stargazing and other events of cosmic devotion.

[1:44:60] Prominency is a general concept in wider Astronist Philosophy that originates from the branches of introspectics and involves a concept considered to be the most crucial, essential, and relevant.

[1:44:61] Without the concept of prominence present in our philosophical contemplations, we lack the ability to categorise our reflective thoughts upon different philosophical concepts; this means that our investigations shall lack structure; we cannot afford for this to remain true, therefore, prominency is essential to all in-depth Astronist contemplations that address multiple concepts that require classification.

[1:44:62] From the concept of prominency originates the belief henceforth known as prominism which involves the idea that only the most prominent concepts of each discipline are worth studying and contemplating by Astronist philosophers.

[1:44:63] The benefit for prominists is that they argue that prominism eliminates all the unnecessary aspects of Astronism, and clarifies it by only addressing its most important points of contemplation, thus, prominists understanding prominism to be the superior interpretation and investigative method when approaching Astronist philosophy, and perhaps even wider non-Astronist traditions of philosophy.

[1:44:64] Refraction, although also originating from within introspectics, is a major concept of wider Astronist Philosophy due to the fact that it involves a complete oppositism to one's ideas on a topic than one once had held.

[1:44:65] Refraction is similar to collimation in that it relates to reorientation of one's philosophical beliefs, but refraction is one step further than even collimation in that it relates to one's complete oppositism to one's formerly held beliefs.

[1:44:66] Refraction is especially characterised by a sudden oppositism, or in an unexpected way rather than a gradualised, or structured way of reorientation, which is typically caused by some sort of external influence, especially that which is henceforth known as a refractive trigger.

[1:44:67] Although an action primarily part of occurrology, sungrazing is considered here due to its importance in observation; sungrazers conduct stargazing activities before the sun has set.

[1:44:68] The final term originating from observology and opticology is that which is henceforth known as waxing, as part of the process of waxation, which may also be

termed as waxment and involves the instance in which The Moon demands greater attention during a stargazing event than any other celestial in the night sky.

[1:44:69] Waxation most commonly occurs due to a temporary inflated size of The Moon due to the time of the month in the moon phases, and may also be termed a lunarsence event and due to The Moon's centrality in this instance, the observation of the night sky is affected.

[1:44:70] As has been demonstrated by the number of previous insentensations, the terminological impact of observology and opticology, and the wider discipline of introspectics, holds a great permeating influence over many other aspects of Astronist Philosophy.

[1:44:71] Digressingly, this also highlights the relevancy of terminology in general in the Astronist philosophical tradition and the immense influence and impact that the construction of terms have in influencing philosophical investigation.

[1:44:72] The Astronist Tradition prides itself on its extremely strong terminological tradition, and witnessing the demonstrated importance of terminology internally acts as a microcosm for the relevance of the impact of terminology externally for the permeating nature of terms causes them to be a great technique of tirition.

[1:44:73] Although The Cosmos is considered to hold many more dimensions, that which we consider herein are the three dimensions of space and all that is three dimensional must hold height, width, and depth.

[1:44:74] Within the auspices of introspectics, we must consider this structure of the dimensionality of The Cosmos as an important aspect to the conduction of introspections about the nature of The Cosmos in aid of the furtherance of our understanding of its overall structure.

[1:44:75] Astronist Cosmology understands the dimensionality of The Cosmos to take, of course, three consistent forms, all of which are also, of course, limited by the principles of the limited nature of The Cosmos.

[1:44:76] The first of these relates to height and is henceforth known in Astronist Philosophy as zenithence, as derived from the original pre-Astronist term of zenith.

[1:44:77] The Zenith in Astronist Cosmology is considered to be the most important of all the dimensions, and the one that is to be most contemplated; zenithality is the measure of The Zenith, or zenithence in any particular circumstance.

[1:44:78] Zenithality is considered to be an instrument of study, but only within the discipline of introspectics, not in the wider auspices of Astronist Philosophy.

[1:44:79] The essential characteristic of zenithence is the achievement of the highest height within the boundary of The Cosmos; zenithence is described in the Astronist Tradition as relating to the Top of The Cosmos.

[1:44:80] Due to height being considered a form of cosmical superiority, zenithal contemplations are assigned with a great deal of centrality for their ability to permeate throughout different meanings and circumstances in our lives.

[1:44:81] In Astronist Philosophy, one may dedicate their life, or a period within their life, to achieve The Zenith in whichever context it may arise; this involves mastering something to the highest degree possible.

[1:44:82] When this Path to The Zenith, as it is termed in the Astronist Tradition, is applied to one's contemplations of The Cosmos, this is henceforth known as Zenithism.

[1:44:83] Zenithists consider the only purpose of a philosopher of The Cosmos to achieve a new understanding of The Cosmos, to form a new cosmological concept, or to reach a level of enknowledge of The Cosmos that no other has reached prior to them.

[1:44:84] Zenithism involves a distinct obsession with contemplations regarding The Zenith as the most superior of all the dimensionalities and zenithists are those often caught with centralising their opinions, and ideas around The Zenith.

[1:44:85] In order to distinguish the two definitions, The Zenith relates to the concept of achieving the highest form of something, or the highest state of something, and zenith alone relates to the actual first physical dimension of The Cosmos, with latter influencing the concept of the former, of course.

[1:44:86] The second of the three dimensionalities of The Cosmos considered within introspectics is that which is henceforth known as nadence, as derived from the pre-Astronist world, nadir.

[1:44:87] Nadence relates to that which is the physical lowest point of The Cosmos in direct oppositism to the zenith, which relates to the physical highest; nadencial contemplations attempt to define inferences in relation to that which is at the lowest point.

[1:44:88] Surprisingly, the Astronist Tradition does not consider nadence to be symbolically inferior, morally corrupt, or a place of lesser importance as is often considered in the traditional Western philosophical tradition, mainly due to the instilled concepts of heaven being symbolically above and hell being symbolically below.

[1:44:89] The Astronist Tradition insists that it is not influenced by such pre-Astronist symbolisms, and although zenithists consider the zenith dimensionality to be superior to all other dimensionalities, the inferiority of nadence and closed infinence are purposefully

left unaddressed in order to steer away from such symbolisms of height pertaining superiority and morality, and lowness pertaining inferiority and immorality.

[1:44:90] The final dimensionality of The Cosmos perceived by the Astronist Tradition is that which is henceforth known as Closed Infinitude; in non-Astronist terms, Closed Infinitude relates to both the depth and width dimensions of The Cosmos.

[1:44:91] To the observer, both the depth and width of The Cosmos seem to be infinite, although it is reaffirmed that The Cosmos is indeed limited in its space by the concept of Closed Infinitude.

[1:44:92] Infinitude, of course, relates to infinity, yet Closed Infinitude acknowledges this seemingly existent infinity, while also reaffirming the closed and limited nature of The Cosmos; therefore, Closed Infinitude is the most prominent way that the Astronist perspective understands the nature of the breadth and depth of The Cosmos structure, and combines these two dimensionalities into one.

[1:44:93] Although not a dimension in its own right, limitence is the overarching concept to describe the limitation of The Cosmos in the context of its dimensionality and permeates the three Astronist perspectives on the dimensionality of The Cosmos, including Closed Infinitude, Nadence, and Zenithence.

[1:44:94] The concept of limitation, which is manifested within the concept of limitence in this specific context, is central to reaffirming the stance of Astronist Cosmology on the nature of The Cosmos as a limited entity and without the concept of limitence present, there could not exist the three perspectives on dimensionality from the Astronist philosophical tradition.

[1:44:95] Moving away from our address of the dimensionalities of The Cosmos, we now focus on the concept of lenticularity; lenticularity is a central concept of introspectics and involves an introspection that is primarily structured upon one's visual perception of The Cosmos, and the worlds within it.

[1:44:96] This is different from the other Modes of Introspection that is henceforth known as menticularity; menticularity involves all introspections structured upon those imageries, and contemplations that originate from one's mind rather than have experienced

[1:44:97] Lenticularities are considered a class of philosophical contemplation that relates to all contemplations made during a stargazing event, or an idea that comes to one's mind during their observation of the stars, rather than afterwards.

[1:44:98] In addition, menticularities are considered a class of philosophical contemplations which originate only from the mind or imagination, and are not directly influenced or triggered by that which one sees around them.

[1:44:99] In the context of introspectics, the concept of potentiality relates to a subject that is considered to be useful for conducting introspection upon; the extent of a subject's utility for introspection relates to the extent of its potentiality to produce introspective results.

[1:44:100] Thus, the extent of a subject's potentiality really narrates the extent of its usefulness to introspectors; without potentiality, there cannot exist introspectivity for the potentiality of the subject is the factor upon which the introspection is based.

[1:44:101] The branch of introspectics henceforth known as spectrics, as inspired by the pre-Astronist and non-philosophical discipline of spectroscopy, deals with all considerations of the ways in which different elements of The Cosmos interact with one another.

[1:44:102] By this definition, the subdiscipline of spectrics transcends the discipline within which it originates, and pervades many other aspects of philosophical contemplation in the Astronist Tradition.

[1:44:103] However, the subdiscipline of spectrics is essential introspectal at its very core nature and even if it is applied outside of introspectics, its introspective nature is always apparent.

[1:44:104] Spectrality is the instrument of study associated with spectrics, and is used in relation to concepts applied to spectral notions, but like other instruments of study within introspectics, spectrality is only considered an instrument of study within introspectics, and not by the wider Astronist philosophical tradition.

[1:44:105] An example of a contemplation within spectrics may consist of the way by which The Sun interacts with The Earth which shall then lead on to a whole plethora of considerations regarding biology, ecology, and the emergence of life, and all the philosophical areas concerned with this.

[1:44:106] In essence, spectrics announces a whole new understanding of philosophical natural contemplation and incorporates all aspects of majority of concepts outside of introspectics in wider Astronist Philosophy in order to fully construct a spectrition, which is termed as a type of introspection specific to to the subdiscipline of spectrics.

[1:44:107] Spectricity is another instrument of study within the subdiscipline of spectrics that is separate from spectrality as spectricity measures the extent to which a spectral contemplation leads on to other discussions, with some spectric contemplations endlessly expanding into different discussion due to the nature of the topic they address, especially if the initial topic is broad to begin with.

[1:44:108] Spectresses and specters, and their scholarly counterparts known as spectricists, may conduct their spectrition on any particular topic as long as it makes reference to the way in which two or more cosmical elements interact with one another.

[1:44:109] Due to the broadened nature of the subdiscipline of spectrics, philosophers of the Astronist Tradition are encouraged to specialise in other areas of The Philosophy in order to enhance their spectritions.

[1:44:110] The term that is known as the aperture in introspectics is one of the central terms within the discipline due to the fact that it relates to the extent of the breadth of one's introspection.

[1:44:111] Certain introspections are broader than others due to the nature of the topics they address; the aperture of the introspection is determined by the extent of the concepts it covers, the depth to which the introspector delve with regards to their contemplations on the topics, and the aperture is often determined by other scholars and philosophers regarding published introspections.

[1:44:112] Again, aperture is a term of philosophical categorisation that may transcend introspectics if the philosopher wishes it so, although the origin of the term will always be rooted within introspectics.

[1:44:113] The nature of aperture is fundamentally structured upon the philosophical knowledge, experience, and imagination of the individual conducting the introspection; apertural studies is a minor discipline within introspectics that studies the variations across different measures of aperture.

[1:44:114] Aperturism, those of which whom follow it are henceforth known as aperturists, are those philosophers which believe that all philosophers should always be seeking to further improve and wider their apertures as they believe this to be in alignment with the Philosophical Spirit, and any resistance to broadening their aperture is fundamentally non-philosophical.

[1:44:115] To conduct any introspection of The Cosmos is to come across the consistencies of The Cosmos; those elements of The Cosmos which remain inescapable, no matter one's intensity on bypassing them.

[1:44:116] The most prominent example of such cosmical consistencies is the Cosmic Background Temperature which is a subject of philosophical contemplation within introspectics due to the fact that all cosmic introspections take place within the context of this background temperature.

[1:44:117] Radiation remaining from the non-Astronist period known as the Recombination Era of cosmological history, the Cosmic Background Temperature does not concern philosophers due to its actual temperature, nor due to its cosmological structure.

[1:44:118] Instead, it is of interest to philosophers due to the fact of its continued existence and the fact that its causality has occurred due to the effects of The Big Bang, for which it is considered evidence to support, and later, the expansion of The Cosmos.

[1:44:119] In the Astronist Tradition, it is generally held that that which is consistent is that which is permanent and essential to the structure of the entity in subject and without the consistency in place, the entity is argued to not exist as it currently understood to exist; this is applied to the idea of the Cosmic Background Temperature, but may also be applied to a vast amount of others topics within The Philosophy.

[1:44:120] In addition, philosophers may also demonstrate their interest in the Cosmic Background Temperature due to it being one of the oldest, still existing, remnants of The Big Bang.

[1:44:121] Such questions philosophers may pose and contemplate with regards to the Cosmic Background Temperature may include the nature of its consistency, the nature of its permeation through The Cosmos, and the nature of its relationship with the expansion of The Cosmos.

[1:44:122] As we conduct our discussions about the discipline of introspectics, we are beginning to understand the conduction of a true introspection and it is within introspectics, that Astronist Philosophy addresses the nature of the source of authority.

[1:44:123] Introspectics is the inward-looking analysis of The Cosmos from the perspective of The Cosmos, therefore it seems prudent to designate introspectics as the discipline of philosophical study to address the nature of authority.

[1:44:124] In the Astronist Tradition, it is unequivocally The Cosmos that is the source of authority for humanity for humanity is wholly existent within The Cosmos, we are entirely bound to the laws and nature of The Cosmos, and as our current physical selves, we cannot leave The Cosmos due to our bound existence within it.

[1:44:125] Everything we do and cannot do is expounded by The Cosmos and everything we think, experience, and exist as is within The Cosmos due to our ability to conceptualise anything beyond The Cosmos, such as in The Universe, or anything truly Divine, due to our own cosmicality.

[1:44:126] To reiterate, The Cosmos is the source of authority for humanity and everything else that exists within The Cosmos; this proximity of authority between The Cosmos and everything existent within it is henceforth known as premisence.

[1:44:127] In Astronist discussions of authority, there exists a three-pronged structure based upon the considered proximity between everything existent within The Cosmos, The Cosmos itself, The Universe, and The Divine.

[1:44:128] Premisence describes the proximity of authority between The Cosmos and everything existent within it; the concept of unisence describes the proximity of authority between The Universe and everything within The Cosmos, and the concept of divisence describes the proximity of authority between The Divine and everything within The Cosmos.

[1:44:129] These three concepts form the structure of the Astronist approach to authority and if one is to describe the difference between the authority within premisence and the authority within divisence, the major initial difference is proximity.

[1:44:130] The Divine is considered to be the ultimate authority, yet its proximity to that which exists within The Cosmos in our existences holds less proximity than the authority of premisence, or even unisence.

[1:44:131] The source of authority of The Cosmos is The Universe for The Cosmos exists within The Universe; secondarily to this, The Universe is also the source of authority for all that exists within The Cosmos too for the entirety of The Cosmos is within The Universe, though in this case, The Universe is considered to hold secondary authority, also known as midproximity.

[1:44:132] Here, we must introduce the different levels of proximity; proproximity is the type of proximity of authority derived between The Cosmos and all that exists within it and is the primary source of authority in this case.

[1:44:133] Midproximity is the type of proximity of authority derived between The Universe and all that exists within The Cosmos and preproximity is the type of proximity of authority derived between The Divine and all that exists within The Cosmos.

[1:44:134] Proproximity, midproximity, and preproximity further structure the Astronist approach to the ideas of authority within its own cosmology with the overall consensus holding that The Cosmos remains the principal source of authority while The Divine remains somewhat distanced in its authority, despite its dominion over both The Universe, and The Cosmos, and all that exists within these two realms of existence.

[1:44:135] This structure of cosmological authority is not meant to undermine the intercessional powers, or indeed the creativity, or centrality of The Divine to all existence, but instead, understands The Divine to play a lesser role in cosmical affairs while its wholly ordered creation known as The Cosmos is the primary actor in commanding authority for that which exists within its periphery.

[1:44:136] This branch of introspectics that discusses the nature of authority in Astronist Cosmology is henceforth known as Existential Jurisdiction for it addresses all ideas in relation to the differing levels of authority and the proximities of such authorities for different subjects addressed.

[1:44:137] The idea of cosmic authority is henceforth known as cosmodom and is understood by the Astronist Tradition to be the primary source of authority for humanity, and everything else that exists within The Cosmos for we exist within the Cosmic Jurisdiction, and secondarily to that jurisdiction, the Universal Jurisdiction, and then ultimately, Divine Jurisdiction.

[1:44:138] Moving from our discussions of authority in the Astronist Cosmology, we must now consider the idea of the array within introspectics which, by its mainstream astronomical definition, relates to a group of telescopes and antennas used for one purpose.

[1:44:139] In its philosophical and introspectal context, an array refers to a group of people conducting introspections together, or conducting philosophical investigations together; this is henceforth known as arrayal philosophy and is a fairly rare and unique form of philosophical conduct.

[1:44:140] For the majority of our explorations into the practices of Astronist Philosophy, we have most often considered such practices to be conducted alone within the depths of one's mentality, and such philosophical understandings, orientations, and discoveries only being shared with one another through debate.

[1:44:141] Not with the intention to undermine this standard system of philosophical practice is arrayal philosophy developed, but instead, with the intention to further broaden the way in which philosophy can be practiced and applied.

[1:44:142] The central aspect of arrayal philosophy expounds that philosophers should prioritise their philosophical investigations to being conducted in small groups rather than individually, and the results of their philosophical application should then be presented in debate with each of the group's members contributing.

[1:44:143] Arrayists are those whom believe that arrayal philosophy is the healthiest and most productive form of philosophical practice with its main emphasis placed on philosophy as a group activity and practice from the outset rather than an individual activity, and only later a group activity during philosophical debates.

[1:44:144] Arrayal philosophy is a form of Astronist Philosophy just like individual philosophy and debatory philosophy are also forms of Astronist philosophical practice.

[1:44:145] As a form of philosophical practice, arrayism restructures the way by which philosophy should be practiced and forms a newfound system of how philosophers to approach philosophy as a practice rather than just a facet of scholarly study, with the arrayistic approach pivoted on the emphasis of the interactions between the philosophers rather than an emphasis of interactions between the philosophers and The Philosophy.

[1:44:146] Quadratures are the positions of the moon or a planet when it is ninety degrees from its star as viewed from another planet; quadratures come in eastern and western variations and are a highly revered cosmic positional phenomena, especially so in relation to their orthogonality.

[1:44:147] Quadratural depictions in Cosmic Art are henceforthly considered to be the epitome of cosmical proportion, and perfection in shape, and due to this, quadratures, when they do occur, or are depicted, are considered to be signs of cosmic orthogonal perfection and proportionality.

[1:44:148] Astrophotography is considered a major activity within occurrology and one that should always be encouraged by philosophers of The Cosmos, whether they themselves are participating, or whether it is other people.

[1:44:149] Astrographics is a branch of introspectics that is very closely associated with astrophotography in that it deals with all contemplations of human productions of how The Cosmos appears, another important contributor to which is cosmic art.

[1:44:150] Astrophotography is highly encouraged as both a hobby and a profession in the Astronist Tradition as an activity that will only further bolster one's philosophical enknowledgement, experience, and enthusiasm.

[1:44:151] Astrographers attempt to compare, define, and analyse the different ways by which artists and photographers have both depicted and photographed The Cosmos and its progeny in order to reveal the differences and similarities in the cosmic philosophical undertones in the works produced.

[1:44:152] Understanding astrography in this way further broadens the subdiscipline for astrographical study as it places greater emphasis on the philosophical inferences made from creative expressions and works of art.

[1:44:153] Autoguidance and autoguiding is the practice of assisting philosophers in learning about The Cosmos, bolstering their philosophical orientations, and helping them to learn about how to properly argumentate and philosophise in alignment with the principles of the Philosophical Spirit.

[1:44:154] Autoguiders are not necessarily qualified teachers, but are instead considered to be assistants to learners of Astronist Philosophy and are more than likely to appear in philosophical societies; the term originates from within introspectics as an autoguiders is someone that assists introspectors and introspectresses with their introspections.

[1:44:155] The practice of autoguidance is largely arrayalist in leaning as it encourages philosophers to interact with one another in order to help the lesser enknowledge learn more about Astronist Philosophy, and the proper ways by which it can be practiced.

[1:44:156] The Philosophy of Comparison is the next area of introspectics that shall be discussed in this discourse and is classified as another subdiscipline of introspectics that introspectivists can superspecialise themselves towards.

[1:44:157] After such a superspecialisation has occurred, the introspectivist, or introspector, can then also hold the title of comparatrist, comparator, or comparatress.

[1:44:158] Firstly, we must address why the philosophy of comparison is included within the discipline of introspectics in order to justify its inclusion.

[1:44:159] Essentially, a conduct of introspection is a conduct of inward examination and involves a rich tradition of comparison between different cosmical elements in order to draw up a fully augmented introspection.

[1:44:160] The main tool with which one is to explore the philosophy of comparison is the instrument of study of comparity which is, again, only considered an instrument of study within introspectics; these such instruments of study that are not recognised by the wider Astronist philosophical tradition are to be henceforth known as semistruments.

[1:44:161] Comparity is the measure of the stringency between the similarities and differences of two or more cosmical entities; stringent similarities are characterised by a strict connection made between two or more cosmical entities that must be justified.

[1:44:162] Instringent similarities are characterised by a more interpretational connection of similarity made between two or more cosmical entities that needn't be justified to the extent of a stringent similarity.

[1:44:163] These principles of stringency are the proportion for the context of differences; stringent differences are characterised by justified strict disconnections and instringent are characterised by an interpretational disconnection that needn't be as justified.

[1:44:164] Those which are known as the Five Components of Comparison within the philosophy of comparison are consistent of the nature, appearances, functions, characteristics, and purposes of the entities in subject.

[1:44:165] These Five Components can be utilised as the most fundamental aspects to creating a fully augmented comparison between two or more cosmical entities; the key word here is fundamental for these components can be added to in order to further expand the comparison, but it is important that these components remain for they construct the foundations of comparison.

[1:44:166] A comparison that is constructed within the context of the discipline of introspectics is henceforth known as an introspective comparison; comparison remains an integral aspect of good philosophical practice and so, is again, another aspect of

introspectics that originates from within the discipline, but permeates throughout many other aspects of Astronist Philosophy, and even wider philosophical application.

[1:44:167] The Astronist philosophical tradition is very encouraging of the utility of technology in order to further its awareness through tiriton, as well as for the aid of educatory purposes, an example of this is the digital system henceforth known as Starfield.

[1:44:168] Starfield is introduced within introspectics due to the fact that it can be utilised as an aid to introspections, but essentially, it is a digital system that displays The Cosmos, specifically groups of star systems, known as sectors, as well as groups of sectors, known as regions.

[1:44:169] Starfield can be used for introspections as aforementioned, but can also be utilised for a wide range of other philosophical purposes including waymarking, one's enknowledgement about new worlds, constructing lessons about astronomy and The Cosmos, and can be utilised for exploratory circumstances as it is the Starfield system that is likely to be used for the purpose of distinguishing between discovered and undiscovered worlds, star systems, sectors, and regions of the galaxy.

[1:44:170] Starfield is therefore considered to be one of the most important inventions to construct for the furtherance of our practical enknowledgement and discovery of The Cosmos, and the Astronist Tradition encourages the establishment of organisations and companies which shall create their own Starfield systems to help improve the overall efficiency of Starfield digital systems.

[1:44:171] There exists three concepts originating from within introspectics that align with the structure and hierarchy expounded by the Astronist Cosmology; these are known as the Cosmical Sphere, the Universal Sphere, and the Divinical Sphere.

[1:44:172] These three concepts act as another way of classifying different introspections and the results derived from such introspections; whether these results are cosmical, universal, or divinical with these being categorised in their different appropriate spheres.

[1:44:173] This concept does vastly transcend from introspectics and is instantly a concept to be applied throughout the entirety of Astronist Philosophy for the better structure and categorisation of concepts, opinions, and results of philosophical contemplation.

[1:44:174] Another major subdiscipline with introspectics is that which is henceforth known as chromatics which deals with and encompasses all contemplations and concepts in relation to the occurrence of consecutive events in The Cosmos.

[1:44:175] Chromaticists attempt to make inferences through these consecutive events about the naturity, orderity, and functionality of The Cosmos, and utilise all different instruments of study in order to do so.

[1:44:176] Chromatical ideas are developed for the purpose of better understanding the nature of cosmical events, especially those which happen in set patterns and repetitive structures.

[1:44:177] An example of a concept of chromatics relating to consecutive cosmical events would include the death of a star as its expansion, then its contraction, then its supernovae occur consecutively; another example would be the phases of The Moon as seen from The Earth which happen in a repetitive and consecutive order.

[1:44:178] The identification and later designation of cosmical events to be chromatic is the initial struggle for chromaticists to overcome, but the general requirement for a chromatic event is that its predecessor has occurred as part of a larger series or process without any interruption in between.

[1:44:179] In addition, just because one type of event is chromatic does not mean all of the other events in that same type are also chromatic; this is why often chromaticists focus on events that have actually happened and they consider these singularly rather than considering types of events generally.

[1:44:180] A common occurrence during an introspection is that which is known as a diffraction; this is the instance by which an introspection begins with a narrow and specific topic and goal, but ends with a much broader address due to the fact that unturned concepts have caused greater ponderance than the initial goal of the introspection had expected.

[1:44:181] Diffraction is not a fault in the work of introspector, but instead, considered a natural occurrence due to the character of introspective analysis for when an introspection on even the most niche of topics is conducted, that does not mean to say that it shall stay niche.

[1:44:182] If anything, diffraction is a sign of the introspector choosing a good topic for introspection for new concepts are discovered and new theories made regarding those concepts from a topic that had initially been considered narrow that has now broadened far beyond its original understanding.

[1:44:183] Therefore, diffraction is a desired occurrence and even though its applications are rooted within the procedure of introspection, The Diffraction Principle stands as a symbol for all of the Astronist philosophical tradition and holds that all Astronist philosophers, of whichever discipline, should always be hoping and encouraging the occurrence of diffraction.

[1:44:184] The philosophy of inertia relates to all the contemplations surrounding cosmological entities that have tendencies to remain unchanged, or without large amounts

of change during their existences, and is the oppositism to dynamism; dynamic entities; consistently changing entities.

[1:44:185] The subdiscipline within introspectics that deals with inertia, its naturity, its interactions with cosmical orderities, and the routes by which it occurs is considered within inerteology.

[1:44:186] Inertialism is the stance that the unchanged entities in The Cosmos are those which demonstrate greater importance in the cosmical orderity and these inertial entities are considered to be superior in their relevance than the dynamic entities.

[1:44:187] Inertiality is the instrument of study associated with inertial contemplations and attempts to measure the extent to which a cosmical entity changes throughout its existence in order to identify whether it is inertial, or dynamic.

[1:44:188] There are two different levels of inertia that can be applied to cosmical entities; the first is positive inertia and the second is ambiguous inertia; the former relates to those entities which are absolutely inertial at their core of their naturity and purposity, while the latter is more ambivalent about its inertia.

[1:44:189] The same can be applied to dynamic entities with positive dynamism and ambiguous dynamism holding the same definitions as their inertial counterparts.

[1:44:190] The identification of these different levels of inertia and dynamics provides inerteologists with that which is henceforth known as The Permute Spectrum; the spectrum by which we measure and place different cosmical entities according to their level of inertia or dynamism.

[1:44:191] To provide beginning inerteologists with an idea of examples to be placed onto The Permute Spectrum; one of the most positively dynamic entities in The Cosmos are comets; they are constantly in motion, they are constantly changing in their appearance, and the entire process of their formation is dynamic; comets are perhaps the least inertial entity in The Cosmos, other than The Cosmos itself of course.

[1:44:192] Furtherso, the inertiality and dynamicity of The Cosmos itself is another area for inerteologists to consider and they are encouraged to present results identifying this aspect of The Cosmos and whether The Cosmos itself is truly inertial or dynamic.

[1:44:193] Another important area for inerteologists to contemplate and further discuss is concerning the correlations between dynamism and inertia in relation to that which is chaotic and that which is firmly cosmical in relation to the measurement of orderity.

[1:44:194] Questions to be posed within this area of study would be, is there a definite correlation between that which is considered to be part of The Chaos and that which is

dynamic in its nature? Or is there a greater correlation between that which is cosmical and that which is inertial.

[1:44:195] Other explorations within this area may consist of whether firmly cosmically ordered entities are much more inertial in their natures than chaotically natured entities.

[1:44:196] Moving on to third to final subdiscipline of introspectics and we reach the contemplations in relation to brightness and shadow in The Cosmos.

[1:44:197] The three main aspects of consideration here are the lucida, the penumbra, and the umbra; each of which is to be contemplated separately and for different reasons, due to the differences in their natures.

[1:44:198] The lucida, in its Astronist philosophical definition, is the brightest star in the night sky of any given night and it is often the lucida that is referenced in relation to cosmic devotion as devotees and devotees look out for the lucida to wonderment upon due to its prominence in the night sky.

[1:44:199] The lucida is considered to be the most important star in any stargazing event and due to its prominence of brightness, is most commonly the subject of cosmic devotions.

[1:44:200] Lucidity is the semistrument relating to the lucida and contemplates the reason for the lucida's occurrence, the cosmical entity that is the lucida, and the lucida's relationship with other entities in the night sky, as well as the measurement of the devotionality.

[1:44:201] Devotionality is the measurement of the extent of the devotions for an individual towards a particular cosmical entity, and is considered semistrumental, rather than instrumental.

[1:44:202] Lucidal devotions are consistent of identifying the lucida, observing it, contemplating its juxtaposition between other entities in the night sky, and its overall wondermentation.

[1:44:203] In Astronist Philosophy, the penumbra presides as the middleground between cosmic brightness and cosmic shadow, the two extremes of which are the lucida and the umbra respectively.

[1:44:204] Penumbral contemplations surround all phenomena that neither consists of extreme brightness, as in the lucida, or extreme darkness or shadow, as in the umbra, and so by this understanding, penumbral contemplations are much more abundant than any of its two counterparts.

[1:44:205] However, a wider contextualisation of that which is the lucida considers it to be anything that is the brightest entity when compared to a group of others, and this is the same umbras which can be more widely considered as the darkest entities in comparison to a set of other entities.

[1:44:206] In Astronist Philosophy, the umbra relates to all shadows in The Cosmos, as well as the darkest entity in comparison to a chain of others, as has been aforementioned.

[1:44:207] Umbral contemplations may also relate to discussions on the ambiguous dark matter and dark energy that exist within The Cosmos, as well as also in relation to that which is chaotic, and may also attempt to derive correlations between umbral characteristics and greater leanance to The Chaos.

[1:44:208] The subdiscipline of introspectics known as stratomy, the studiers of which known as stratonists, concern themselves with the distribution, age, classification, and economic importance of cosmic entities, as well as the history of interactions between these such entities.

[1:44:209] Stratonic investigations attempt to identify cosmical entities by forming a profile that includes the characteristics of measure and study as aforementioned in the previous insentensation.

[1:44:210] Therefore, stratomy can be considered the zoology, botany, geology, and ecology of cosmical entities as it draws concepts of investigation and measurement variables from these natural sciences and is one of the largest branches of introspectics.

[1:44:211] Although stratomy is very much a branch of introspectics, its application is also integral to two other philosophical disciplines within Astronist Philosophy which are latterdiscoursed, and include formatology and structurology.

[1:44:212] Therefore, although its origins certainly shall always lay within introspectics, stratomy is a cross-disciplinary philosophical subject that employs the techniques of natural sciences in order to make philosophical conclusions about cosmical entities.

[1:44:213] The final topic of discussion in this introductory discourse on the vast Astronist philosophical discipline of introspectics is that which is known as transpirations, which collectively refers to all six forms of transpiration in Astronist Philosophy.

[1:44:214] In its Astronist philosophical context, transpiration involves the occurrence of revelations and discoveries in relation to The Cosmos; this may come in either a scientific setting, and philosophical setting.

[1:44:215] Cosmotranspiration is the first of the group known as The Six Transpirations; this relates to all discoveries, revelations, and unknowns about anything related to The

Cosmos becoming known, and therefore, stands as the central process of Cosmic Philosophy.

[1:44:216] The other types of transpirations that form The Six are henceforth known as astrotranspiration, philosophotranspiration, sentranspiration, unitranspiration, and divinotranspiration.

[1:44:217] Astrotranspiration relates to all discoveries of the stars; philosophotranspiration relates to all discoveries of new philosophical perspectives, concepts, and theories; sentranspiration is the discovery of new sentient life; unitranspiration is the revelation of new concepts and theories in relation to The Universe, and divinotranspiration relates to similar revelation about The Divine and its naturity.

[1:44:218] Transpiration is the central desire of all philosophers; to achieve, to discover, and to enknowledge, therefore, transpiration describes the essence of the purpose and need for philosophers; by this notion, transpiration transcends introspectics and relates to the entirety of Astronist Philosophy and even wider philosophical enquiry despite its origination within the discipline of introspectics.

[1:44:219] As has been demonstrated by this discourse on introspectics, the discipline encompasses a vast array of widely varying topics which subsequently provides introspecticists with a vast range of topics upon which they are able to conduct introspections.

[1:44:220] In addition, this also means that introspecticists hold a large responsibility in addressing many issues within Astronist Philosophy; furthererso, the huge amount of terminologies associated with and originating from the discipline of introspectics also demonstrates its centrality in the Astronist philosophical tradition.

[1:44:221] The discourse on The Introspective Cosmos has been constructed in order to introduce the discipline of introspectics to those whom wish to carry on its study, and further development.

[1:44:222] The wider Astronist Tradition considers introspectics to hold a great potentiality in its continued development and expansion for the majority of its subdisciplines are vastly interconnected with other disciplines and their branches, as well as consisting of a large space to expansion within itself.

[1:44:223] That has been the purpose of this discourse; to introduce the vast discipline of introspectics whilst also acknowledging the fact that one discourse simply cannot do this vast discipline justice due to the scope of its potentiality.

Life in The Cosmos (Sentientology)

[1:45:1] To those whom do not support our sentientological endeavours, or to those whom intend to spread doubt amongst humanity about the existence and potentiality of the worlds beyond our own, the Astronist Tradition does not seek to argue with ignorant peoples and institutions and employs the principles of moratorium, which are lattermentioned, and exist within the discipline of logicology.

[1:45:2] The Astronist Tradition considers such peoples and institutions whom show resistance and disagreement with the principles of sentience and the beauty and potentiality of The Cosmos to be highly regressive and thus, the Astronist Tradition needn't hold any relations or argumentations with such peoples or institutions as their agendas have been set, thus leaving no room for philosophical debate of the subject.

[1:45:3] It must now be clearly stated for the future henceforth that the Astronist Tradition is now, and shall always be that which we consider as pro-sentient, rather than anti-sentient; that is, the Astronist Tradition will always believe in the existence of sentience in every form that it could possibly exist in, the main categories of which shall now be outlined.

[1:45:4] The principal concept to address within sentientology is that which is known as sentience; the Astronist philosophical definition of sentience; the nature of sentience; the dissimilarities between different sentiences, and so on.

[1:45:5] Firstly, the Astronist view on the definition of sentience can be described as collectively relating to all organic entities of The Cosmos; namely, this includes all living matter of The Cosmos that is composed by a biological structure, including plants, animals, and sapiens, rather than a geological structure, such as those of planets and moons, or a cosmical structure, such as those of stars, black holes, and quasars.

[1:45:6] By this notion, the Astronist Tradition does not equate sentience with the intelligence of humanity, as is considered by its mainstream definition; instead, the Astronist definition of sentience is much broader in its understanding.

[1:45:7] Essentially, in the Astronist Tradition, the understanding and utility of the term, sentience, is more of an overarching term for all living, and biological matter in The Cosmos.

[1:45:8] Organicism, in the context of sentientology, relates to this organic view of sentience; understanding sentience through the paradigm of that which is organic living matter, rather than that which is an intelligent living entity for intelligence needn't be organic, especially so in a transhuman and technological advanced setting.

[1:45:9] Sapience, or sapient sentience, and its associated philosophical theory henceforth known as sapienism, is the specific type of sentience relating to human beings as particular species of intelligent organic matter.

[1:45:10] Rather than being placed on some higher pedestal of knowledge and predetermined existence, sapienism understands humans as a natural phenomena just like plants, animals, and all other living organisms.

[1:45:11] However, sapienists only consider sapiens to be sentient beings, and therefore, do not consider the existence of sentience beyond The Earth to be actualised until the discovery of other sapient, or humanoid xenolic beings; this is also known in the Astronist philosophical tradition as The Sapient Principle.

[1:45:12] In addition, sapiency is described as the measure of a living organisms' identifiability to that of a human being; high sapiency suggests proximity to the human being, while low sapiency suggests distance from that which can be considered human.

[1:45:13] It must be clearly noted herein that the utility of sapiency must only be used for philosophical purposes, and never for the discrimination of one organic living entity from another to the Astronist Tradition condemns; it must therefore only be used for the purpose philosophical classification; any other usages are considered violations of its original intended function.

[1:45:14] However, other forms of sentience do also exist and are also philosophically considered within the Astronist Tradition in addition to sapient sentience.

[1:45:15] Microscopic sentience relates to organic matter that is present on worlds beyond The Earth that are only visible through the utility of a microscope, however, by the broadened definition of that which can be considered sentience, the Astronist Tradition considers this to be so.

[1:45:16] In fact, the Astronist Tradition holds great anticipation for the discovery of microscopic sentience on other worlds due to the fact of its own potentiality to expand into greater forms of organic life, as did occur during the evolutionary history of life on The Earth.

[1:45:17] To shortly digress, when the history of the development and evolution of life on The Earth is provided as an example and backdrop context to justify life on other worlds in whichever application it is made, that shall be henceforth known as evolification.

[1:45:18] Returning, that which is henceforth known as verdural sentience relates to all plant life, herbage, and all types of vegetations found on planets other than The Earth.

[1:45:19] Faunal sentience, which relates to all animals found on worlds other than The Earth, but also has three distinct derivations including ornithal sentience which relates to

birds on worlds other than The Earth, entomologic sentience which relates to insects on other worlds.

[1:45:20] Finally, marinal sentience which relates to fish found on other worlds, which itself can be broken down into two distinct derivations; pelagic sentience and demersal sentience which respectively relate to marine life inhabiting the upper layers of the sea, and marine life inhabiting the lower layers of the sea, especially the seabed.

[1:45:21] The final type of category of sentience that is considered by the Astronist Tradition, is that which is henceforth known as xeno sentience, and its counterpart philosophical theory, xenoism, is the type of sentience similar to sapiens, therefore they can be considered intelligent, but they don't necessarily have to be humanoid; essentially, these are any type of species that is intelligent but has not yet been encountered by humanity, and therefore, does not exist in the history of the evolution of The Earth; they can also be described as inevoluc.

[1:45:22] The concept and process of xenology, despite its origination in the context of philosophical investigation within the Astronist Tradition, will certainly be one day utilised as a process of scientific differentiation.

[1:45:23] The basic premise of xenology is to identify the extent to which a particular species is actually xenologic by their natural biological structure, as well as by their behaviour, and characteristics, and this is especially done in contrast to which can be considered sapient, with proximate xenology indicating a distinct xenologic nature, while an disproximate xenology indicating an indistinct xenologic nature, meaning the species is more approximated towards sapient, faunal, or verdural tendencies and characteristics.

[1:45:24] There is a concept within sentientology known as aberration and it stands at the heart of the Astronist approach to all argumentations in relation to sentient life, especially those waged against institutions and individuals that doubt, challenge, or even intend to mock the existence of life beyond The Earth.

[1:45:25] Aberration, or the Aberration Principle, as it is henceforth known in the Astronist Tradition, holds that the discovery of sentient life is inevitable and all institutions and individuals whom oppose or doubt sentient life beyond The Earth are encouraged to wait patiently for that which is considered to be the greatest discovery of all time; the discovery of life beyond The Earth.

[1:45:26] Aberration, or aberrationism, is named such due to the fact that certain religious and non-religious institutions may well view the discovery of the existence of life beyond The Earth as an unwelcome abnormality in the status quo of humanity's religious, political, social, and existential way and understanding of life.

[1:45:27] To all philosophers of the Astronist Tradition whom attempt to convince the doubters of life beyond The Earth, a little note is presented herein to say that some people

of this world shall not ever believe even if that which they do not believe in is standing right in front of them; there will always be the doubters of the world.

[1:45:28] And it is often the case that they doubt due to their own inhibitions and comfortability, therefore there is not anything you can do to solve their doubt for it is that which is known as internal doubt; they do not doubt of that which you speak, but more, they doubt themselves and the beliefs that they have carried with them for the majority of their lives.

[1:45:29] Such a revolutionary change in human understanding of our purpose in The Cosmos is bound to create distress and discomfort for many peoples of this world, but the Astronist Tradition considers the philosophers of the world to lead the masses in this revolution of discovery and exploration.

[1:45:30] It is considered to be the responsibility of the philosophers to lead humanity towards newfound destinations in the physical sense, but more importantly, in the mental sense for you needn't travel a metre to travel millions of miles in your mind; it is this mental movement that the philosophers of the Astronist Tradition are expected to accomplish.

[1:45:31] However, this is no easy task, as it shouldn't ever be for the philosophers of all generations have always had the greatest tasks of galvanising the masses and awakening them to new systems, the majority of philosophers either failure at which and the world only realises their genius after their burial, or they are killed due to their revolutionary thoughts; either way, to be a philosopher is to be a struggler, but it is these struggles that shall make us stronger for the victory.

[1:45:32] Returning to our discussion of aberration, the aberrationist philosophical school is definitive of the entire Astronist approach to sentientology, which is why it has been addressed at the beginning of this discourse on sentientology for it sets all precursors to the way by which Astronist traditional philosophers may approach the argument about the Real Existence of sentient life beyond The Earth.

[1:45:33] Now moving on, we discover the concept henceforth known as Real Existence in sentientology which refers to the different natures of existence in relation to sentient life and differs according to the justifications made for the existence of sentient life beyond The Earth.

[1:45:34] Due to the aforeaffirmed definition of sentience in the Astronist Tradition and its different levels, it can be argued that sentience corresponds to the same meaning as the word, life, in mainstream usage.

[1:45:35] Essentially, whichever phrase or term is used, the Astronist Tradition believes in life in all its forms, both discovered and undiscovered; in believes in life on other worlds of course, and it believes in the nature of this life on worlds beyond our own in a

microscopic form, plant form, animal form, in a humanoid form, and in forms still unknown to us our knowledge.

[1:45:36] Just as The Cosmos is the most diverse entity we know, so is life as it does share that quality with that from which it entirely originates; life is cosmic in its naturity and like the cosmic, life is diverse and is full of unknowns about its character, its nature, its origin, its purpose, and the majority of other aspects regarding its existence.

[1:45:37] The term that is henceforth known as sentiency measures the extent of the sentience in a particular star system by the number of inhabited planets, the type of sentience found on such planets, the amount of civilisations, and the level of the advancement of such civilisations.

[1:45:38] There exists a branch of study within sentientology that is henceforth known as sentientics, which sentienticists study, and deals with mapping the sentient life, and the different forms of sentient life, on different planets, in different star systems, and across different sectors and wider regions of the galaxy; of course, a study for the far future of course, but still a discipline of importance to contemplate.

[1:45:39] Sentieneity can be described as existing in the state of sentience, especially in such a way that one is able to recognise one's own sentience in relation to another's sentience, and other forms of sentience as understood by the Diversity of Sentience.

[1:45:40] In the Astronist Tradition, that which exists as Robotic Sentience, or Droid Sentience relates to all sentience derived from technological innovation and it is the prerogative of the Astronist Tradition to universally recognise all robots that can speak, listen, interpret, act upon command, and interact with society as organics do to be sentient droids/robots, though they must not be placed within the same category as organics, which groups all natural lifeforms together.

[1:45:41] That which is understood to be the Life Force is a concept within sentientology that is characterised by a distinction in purpose, character, function, appearance, and behaviour of that which is existent within The Cosmos.

[1:45:42] Although not connected to the concepts of the soul like in its mainstream definition, the Astronist Tradition considers there to exist a distinct, yet untouchable and largely indescribable essence to all that exists within The Cosmos; an essence of reality that is difficult to place, yet still remains.

[1:45:43] The Astronist Tradition considers this to be the Life Force, and although the Tradition encourages all Astronist philosophers to ponder the concept of the Life Force, it is accepted by the Tradition that the Life Force shall remain forever beyond the reach of that which exists within The Cosmos, simply due to the divinity of Life Force.

[1:45:44] The importance of the inclusion of the contemplation of the Life Force within the discipline of sentientology stems from the idea that Life Force is part of the cause of sentience in The Cosmos.

[1:45:45] Philosophers of the Astronist Tradition are encouraged to contemplate on the possibility of the concept of Life Force and its connection with The Divine, whether it exists in The Universe beyond in The Cosmos, the naturity of this universal existence

[1:45:46] The general approach by Astronist Philosophy is inclined to accept, or at least recognise the fundamental ideas of hylozoism due to the principle that everything existent within The Cosmos holds some kind of connection with life, depending on the definition one pins to life or to the state of being alive; also, hylozoism is not opposed to anything that Astronist Philosophy expounds which points in the favour of its own acceptance by Astronist philosophers.

[1:45:47] Due to this, the Astronist Tradition can agree, but may not entirely embrace the ideas of hylozoism due to the Astronist distinctions between the definitions of life, sentience, and existence.

[1:45:48] Life is understood to be anything that has presence within The Cosmos (therefore all matter), while sentience is considered to be anything organic or robotic that has a lifespan or intelligence to the different degrees of sentience, while existence relates to all things with a physical and non-physical reality, and therefore includes all cosmic entities, all universal entities, and all that is divinical too.

[1:45:49] Due to these distinguishments of definition, the Astronist approach to understanding life could be labelled as hylozoist but rather than the Astronist Tradition standing in firm alignment with hylozoism, the Tradition shall prefer to interpret this as its cosmology standing in neutrality, or impartiality with regards to the hylozoistic philosophy.

[1:45:50] There exist four major orientations of sentientology, often collectively related to, simply as, the Four Orientations of Sentientology, and each of which forming the distinct territories of how an individual or a philosophy can approach sentientological contemplations, and it is the purpose of this portion of the discourse to address these four orientations, explain them, and expound the Astronist perspective.

[1:45:51] Sentientism is the first of these orientations and holds the belief in sentience beyond The Earth; this includes all types of sentience; animals, plants, humans, and other species; this, out of all the orientations, captures the Astronist perspective most accurately.

[1:45:52] Antisentientism is the second of these orientations and holds the disbelief in sentience beyond The Earth; this is the most extreme of all the orientations as it does not believe in any form of life exists beyond The Earth and is the most non-Astronist orientations.

[1:45:53] Extraterrestrialism is the third of these orientations and holds the belief in the existence of humans, humanoids, or other intelligent species beyond The Earth; this is firmly Astronist in its outlook and the distinction between this and sentientism must always be affirmed as this orientation only relates to the belief in humans and other intelligent beings living beyond The Earth.

[1:45:54] Anti-extraterrestrialism is the fourth and final of these orientations and holds the disbelief in the existence of humans, humanoids, or other intelligent species beyond The Earth; this differs from antisentientism in that it believes in other non-intelligent forms of life live beyond The Earth, but does not believe in any type of intelligent life beyond The Earth.

[1:45:55] Sentientist approaches encompass the extraterrestrialist approaches to the question of life beyond The Earth, but the latter relates only to humanoid and intelligent species and it is that wherein we see the distinction between these two approaches.

[1:45:56] In opposition, antisentientist approaches also encompass the anti-extraterrestrialist approach in relation to the question of whether life exist beyond The Earth, but the latter relates only to humanoid, or intelligent species wherein we see the distinction between the two approaches.

[1:45:57] Of this discourse on sentientology, we shall address two final aspects; the first is the Fermi Paradox, of which we shall discuss the Astronist perspective on some of the suggested solutions to the paradox, after which we shall end the discourse by completing a full instrumentation with a sentientological premise.

[1:45:58] The essential postulation for the Fermi Paradox is to address the centralmost question of all sentientological contemplation; considering humanity hasn't found other life, where are the sentient beings of The Cosmos?

[1:45:59] Further to this, the Astronist Tradition understands the Fermi Paradox to be a valuable resource of philosophical and contemplative stimulation due to the wealth of questions that it seems to endlessly produce.

[1:45:60] There are eleven aspects to the Fermi Paradox to which we shall address and discuss the Astronist approach, the first of which is the technological isolation of civilisations due to virtual reality rather than actual reality.

[1:45:61] The Astronist approach agrees that this solution is certainly of possibility due to the potentiality of the advancement of technologies as based upon the premise of humanity's current progression towards technological development.

[1:45:62] However, such a solution is also considered to be tragic if true, but the possibility of something happens does not mean that it is the reality; it is tragic because, if true, this

solution means that the possibility of humanity discovering other sentient life ever so more difficult.

[1:45:63] This points to the potentiality for the advent of technological progress to cause inevitable obstacle to the exploration of The Cosmos and the subsequent discovery of sentient life beyond The Earth.

[1:45:64] The second of the solutions to the Fermi Paradox is henceforth encapsulated by the term, neocatastrophism, and points to the occurrence of major planetary catastrophes that stop the development of life through world extinctions.

[1:45:65] The most prominent of these in the history of The Earth, of course, is the extinction of the dinosaurs, and so easily could this have occurred to humanity, and to which lengths would we be able to venture in order to survive such a catastrophe?

[1:45:66] This is the most logical and natural solution to the paradox regarding the reason for that our efforts in sentient seeking have not yet produced fruit; neocatastrophist ideas are supported by the Astronist Tradition due to their very logicity and naturality.

[1:45:67] The inevitability of catastrophes in The Cosmos are infrequent at best, and are not set to increase in their abundancy, however, they do occur as phenomena of The Cosmos and for this reason, its potentiality to remain as a probable solution must be considered.

[1:45:68] The third of the solutions to the Fermi Paradox is structured upon two different ideas that must be cumulated together to form one idea; these two ideas relate to the chronology of The Cosmos and humanity's position within this chronology.

[1:45:69] The first of these ideas is henceforth known as preliminism and suggests that humanity exists too early for the development of other sentient civilisations; preliminist ideas suggest that humanity is the first of all sentient civilisations in The Cosmos, and is a point of subject from which philosophical discussions and contemplations are expected to germinate; this concept is also known as The First Civilisation Theory.

[1:45:70] The second of these ideas is henceforth known as dilatism and suggests that humanity exists long after the last sentient civilisation became extinct and therefore, the human civilisation is considered to be the final civilisation of sentience in The Cosmos, another name for which is henceforth known as The Last Civilisation Theory.

[1:45:71] Preliminist and dilatist approaches to sentientological contemplation provide a greater breadth and depth of philosophical investigation, but also, they simultaneously produce a starkly sobering aspect to contemplations surrounding sentience beyond The Earth, and although the Astronist Tradition certainly supports neither preliminism nor dilatism, these remain important sentientological philosophies.

[1:45:72] The next of the solutions to the Fermi Paradox involves the suggestion that sentient beings, especially if their natures are similar or more extreme to that of humanity's, are too violent or dangerous for one another.

[1:45:73] This is proposed to inevitably lead to the destruction of sentient civilisations from the inside out due to the jealousy, the viciousness, and the potential brutality of the inhabitants of such civilisations.

[1:45:74] Certainly a solution that is feared by the Astronist Tradition, the reality of which is, however, not entirely inconceivable due to the relatively high possibility of this occurrence due to our current understandings, instances, and demonstrations of humanity's brutal naturity.

[1:45:75] The next solution to the Fermi Paradox with major implications attached to its contemplation is that which is henceforth known as extensivism and proposes the questions as to why The Cosmos exists in such a large capacity as it does despite its own limitation, if it is not harbouring sentient life other than humanity on The Earth.

[1:45:76] This points to the purposivity of The Cosmos in the state of its expansion and although it does not entirely constitute a solution to the paradox, it raises questions that transcend beyond their immediate proximities, and extend to stimulate further contemplations in relation to cosmic purpose, cosmic expansion, and cosmic composity.

[1:45:77] This particular solution to the paradox draws further questions about the point of The Cosmos in its current existence and is a powerful notion to press in the face of those whom doubt the authenticity of the notion of sentient life beyond The Earth, and a notion that would be difficult to refute when properly assembled during a philosophical debate, and therefore one that the Astronist Tradition is inclined to support and utilise.

[1:45:78] The sixth of the solutions to the Fermi Paradox exists in relation to the idea that there is an unknown communication of other civilisations that they utilise which has caused the lack of humanity's ability to recognise sentient life due to the communications used by such life being so different from humanity's that we cannot detect it.

[1:45:79] This approach to the paradox is henceforth known as innominatism and argues that all of humanity base our exploratory procedures upon our own evolution and development and as such, our explorative premise is based entirely upon this self-application, in turn, greatly limiting our own explorative abilities.

[1:45:80] This particular solution points to the centrality of communication in the exploration and intended discovery of sentient life beyond The Earth, but the identification of the possibility of unknownness of such vital communication is unnerving to say the very least, but nonetheless, this demonstrates, yet again, the potentiality of technology to become an obstacle in sentient seeking.

[1:45:81] The seventh solution to the Fermi Paradox is henceforth encapsulated within the philosophy of isolism and is also known as The Lonely Cosmos with its essential premise consisting of the notion that sentience is at best very rare, as in, is only in occurrence once or twice for every galaxy of The Cosmos.

[1:45:82] This solution demands that there does exist sentient life, but so very rarely that its own significance is undermined as a result, and points to the suggestion that despite sentient life's existence, the fact that it is so rare means that it may as well not exist due to humanity's inability to ever come across it.

[1:45:83] Such a solution leads to contemplations on the concept that is henceforth known as The Human Cosmos; this concept expounds that humanity is alone because The Cosmos was made for us, therefore there is no need for any other sentient life to exist; this tends to be the moratorational belief of many of the religious traditions.

[1:45:84] Of course, the Astronist Tradition is opposed to such solutions and suggestions due to its beliefs and principles with regards to sentience, but isolist ideas should be considered nonetheless, especially due to the logicity that they do align themselves with which the Astronist Tradition is always inclined to respect.

[1:45:85] The next solution of the Fermi Paradox is encapsulated by the concept of Sentient Self-creation, also henceforth known in the Astronist Tradition as fabrism.

[1:45:86] This philosophy holds that the expansion of human civilisation is inevitably going to reach the point at which the different civilisations of humanity across different planets will differ so much from one another that they evolve into different humanoid species as a result of a long chronology of evolutionary transformation.

[1:45:87] Due to the prophesied occurrence of this, it is held that these new forms of sentience that have originated from our original civilisation demonstrate our ability to create sentience from ourselves, as is the fabristic approach.

[1:45:88] Fabrism does not address whether there is other forms of sentient life in The Cosmos, but instead looks towards how humanity, as a civilisation, can create its own varying forms of sentience across different planets and furtherso, fabrists consider this as a responsibility of humanity to undertake.

[1:45:89] Fabrists may believe in other sentient life in The Cosmos, or they may not but they are essentially very anthropocentric in their approach due to the fact of their belief in our civilisation as the one to populate other worlds with new forms of evolved sentient life.

[1:45:90] The Astronist Tradition is certainly in agreement with the spirit of the ideas of fabrism due to its belief in the responsibility of humanity to populate worlds beyond The

Earth, and if this is to inevitably lead to the evolution of humanity into different species, then the Astronist Tradition can only accept this inevitability of natural processes.

[1:45:91] The ninth solution to the Fermi Paradox is encapsulated by the philosophy that is henceforth known as invisism, believers of which are known as invisists, and may also be described in non-Astronist terms as the Zoo Hypothesis.

[1:45:92] This solution holds that there does exist many other forms of sentient life in The Cosmos, however, it is held that such life is hiding from humanity due to be fearful of humanity's reaction to their discovery of other sentient life.

[1:45:93] Therefore, invisists are pro-sentient in their leaning, however, the Astronist Tradition does not support such suggestions due to the illogicity of such claims and the possibility of the truth of such claims being fairly narrow in realistic terms.

[1:45:94] The tenth and second to final solution to the Fermi Paradox is to be henceforth known as asynchronism and is similar to the solution formed by preliminism and dilatism in the Astronist Tradition, and pivots around the idea of time and the chronology of The Cosmos.

[1:45:95] Essentially, this solution holds no affirmation that humanity exists at the same time as other sentient civilisations in our galaxy due to the vast chronological expanse of the galaxy's timescales.

[1:45:96] Asynchronists hold the concept of Rare Coexistence at the heart of their argument and believe for certain that during humanity's exploration of The Cosmos, it is inevitable for explorers to discover those which are known as artefacts of past civilisations.

[1:45:97] Asynchronism, as a philosophical approach to sentientological contemplation, is not entirely non-sentient and neither is it anti-sentient by any means, but instead, exhibits pro-sentient tendencies due to its belief in sentient civilisations, however, it argues that the lifespans of such civilisations are swallowed by the immense scale of cosmic time that would make two or more civilisations meeting a highly unlikely event.

[1:45:98] Due to the logicity of the asynchronist approach, the Astronist Tradition is inclined to acknowledge the asynchronist notion due to keep in alignment with the Philosophical Spirit, but the very notion of Rare Coexistence that asynchronism supports is fundamentally opposed to the beliefs of the Astronist approach.

[1:45:99] The final proposed solution to the Fermi Paradox is captured by the philosophy of distenism, the adherents of which are known as distenist and is also known outside of Astronist terminology as the Sustainability Solution.

[1:45:100] Distenism prophesies that the inevitability of the collapse of a civilisation through the expansion of the civilisation into space is the reason for the supposed lack of sentient life in The Cosmos.

[1:45:101] Distenism therefore opposes humanity's exploration of The Cosmos as it prophesies the downfall of human civilisation if such a cosmic exploration is embarked upon which is entirely in opposition to the Astronist Tradition of course.

[1:45:102] Despite this, distenist approaches to the Fermi Paradox are largely pro-sentient as they do recognise the existence of sentient civilisations on worlds beyond The Earth, but instead invoke matters of practicality into the idea of the implosion of such civilisations if they do embark upon spacial endeavours.

[1:45:103] It can be argued, therefore, that distenism holds a notion that is very far from the fundamental aspects of the Astronist Tradition's approach to sentientological contemplation, and even wider beliefs in relation to humanity's exploration of The Cosmos.

[1:45:104] All of the solutions and suggestions proposed to combat the Fermi Paradox and all of the Astronist Tradition's responses to them must all be considered in the context of the post-omnidoxical era, meaning after The Omnidoxo has been demonstrated to the world, and Astronist philosophers from all nations converge their minds on the same subjects that have been addressed herein.

[1:45:105] This contextualisation allows for us to understand that there exists a vast resource of contributions that will inevitable be made, and are encouraged to be made to the Astronist philosophical tradition, especially so in this specific aspect, towards the Fermi Paradox; all future contributions and solutions to the unravelling of this paradox are of the utmost priority of the Astronist Tradition to encourage to flourish so that we are able to further develop our understandings of the paradox and how we are to approach it.

[1:45:106] Now we shall begin the final segment of our discourse into the discipline of sentientology and the way by which we shall conclude our discourse shall consist of a full instrumentation in relation to a sentientological context.

[1:45:107] The first of the instruments of study that we shall apply to sentientology is abundancy and relates to the measurement of the quantity of sentient civilisations beyond The Earth.

[1:45:108] From the perspective of the Astronist Tradition, The Cosmos is abundant of sentient life in all its possible forms, and this belief remains a central characteristic to Astronist Philosophy.

[1:45:109] The abundance of sentient life within cosmic existence is perhaps the most distinctive aspect to Astronism, and the predominantly held solution to the Fermi Paradox

in the Astronist Tradition is that humanity has not yet explored The Cosmos, or understands The Cosmos enough, and therefore implores for the Humanic Exploration of The Cosmos to proceed.

[1:45:110] The application of the instrument of study of bipolarity to sentient life is manifested in the bipolarity of the belief in sentient life or the disbelief in sentient life; this dichotomy forms the basis of sentientological argument and philosophical enquiry.

[1:45:111] In this instance, the application of bipolarity is therefore central to philosophical contemplations in relation to sentient life and its existence and, of course, the Astronist Tradition remains steadfastly on the side of the belief in sentient life.

[1:45:112] The application of calendarity to a sentientological context is manifested in the idea that the timescale of our search for sentience is so minute compared to the scale and chronology of cosmic time, which acts as the basis for the Astronist solution to the Fermi Paradox.

[1:45:113] The discovery of sentience in The Cosmos is the central aim of the Astronist Tradition to achieve and it is considered to be the central component to changing the entire course of human history and civilisation.

[1:45:114] It is in this notion that we see the application of centricity for the discovery of sentient life is the centricity of the Astronist Tradition; this type of centricity can be said to be relative to all forms of centricity, including abstract, physical, futural, cosmical, and predictional for this particularity of centricity is applicative to all these forms of centricity.

[1:45:115] The centricity of sentience in the Astronist Tradition can be seen by the relevance given to its contemplation and disciplination in the form of sentientology and it is the inclination of the Astronist Tradition to always focus its philosophical premise on the in-depth contemplation of sentient beings, and the naturity of sentience in a wider sense.

[1:45:116] The Astronist Tradition holds the existence of sentience in The Cosmos to be in full alignment with the cosmical orderity, and in fact holds that any notion of the non-existence of sentience is a notion of disorderity.

[1:45:117] The Astronist Tradition insists that sentient beings, including humanity itself as a sentient civilisation and species, are integral aspects of the cosmical system and are the essences of cosmical orderity, and therefore, the application of the instrument of cosmicality is important to wider contemplations of sentientology.

[1:45:118] The application of dynamicity relates to the changes, the activities, and the progression found in sentient beings and their civilisations.

[1:45:119] The Astronist Tradition understands sentient beings, sentient civilisations, and the concept of sentience itself to be one of the most dynamic aspects of cosmic philosophical contemplation.

[1:45:120] This understanding is based upon the premise of humanity's own set of changes, activities, and progresses during its own history and it is by further study and deeper contemplation of such ideas that we understand the immense abundance and frequency of changes, activities, and progresses found in relation to sentient beings and their civilisations.

[1:45:121] The sentient beings of The Cosmos in which the Astronist Tradition considers to exist is characterised by change from the moment of its own inception; change is the naturity of sentience across all applicative categories of appearance, function, and purpose.

[1:45:122] We see the extent of the activities of sentient beings in both action, mentality, emotion, and philosophicality and it is across these four dimensions that we measure activity within the context of dynamicity.

[1:45:123] Sentient beings are in constant action, as humans are every day of our lives; this physical action is expressed in our daily abilities and functions and the Astronist Tradition considers there to exist a great deal of dynamicity in that.

[1:45:124] The dimensions of mentality, emotionality, and philosophicality are all integrally connected to one another and all of which contribute to the extent of the activity associated with the formation of sentience itself and what makes an entity characterised as sentient.

[1:45:125] The final aspect of the instrument of dynamicity is progression and according to the perspective of the Astronist philosophical tradition, the only avenue of progression for sentient beings and civilisations is to explore The Cosmos and learn of new worlds and the natures of those worlds, and the species of sentience living upon those worlds which is entirely integrated into the purpose of the Humanic Exploration of The Cosmos.

[1:45:126] The Astronist Tradition considers sentience and sentient beings and civilisations to be an essential element of cosmic existence and therefore, the Tradition does not understand there to be extrinsicity associated with sentience as that would be tantamount to opposition to the centricity of sentient life and therefore contradictory to the Astronist Tradition.

[1:45:127] Instead, the Astronist Tradition emphasises the intrinsicity of sentient life as a necessity to the purpose and structure of our existences and remains a fundamentality to all philosophical enquiry.

[1:45:128] The application of the instrument of finity must be applied to sentience as sentience is part of The Cosmos, and therefore, as a direct result, sentience is limited and is therefore finite, and holds a finite naturity.

[1:45:129] By this notion of finiteness, sentience is limited in its abundance and in the extent of its distribution, and the extent of its ability to conceive notions due to its cosmical naturity; due to this principle, sentient beings will be forever by their own naturity.

[1:45:130] After taking into account the relevancy provided to the concept of sentience and the existence of human beings in The Cosmos, the Astronist Tradition understands the application of the instrument of focality to make conclusions about the overall importance of sentience in The Cosmos.

[1:45:131] The existence of sentience holds little importance in the structure and formation of The Cosmos itself, but the existence of sentient beings provides depth and meaning and a distinct purpose to The Cosmos; in addition, the existence of sentient beings also links The Cosmos to The Divine, if such a connection between sentience and divinity is so believed.

[1:45:132] The Astronist Tradition introduces previous contemplations regarding the dynamics of sentient life, the intrinsicity of sentient life, the believed abundancy of sentient life, and finally, the overall centricity of sentient life in order to derive of conclusion about the focality of sentience and sentient beings and civilisations.

[1:45:133] In essence, the Astronist Tradition considers the exploration, discovery, and progression of sentient civilisations, and the study and contemplation of sentience to be one of the most focal and distinctive aspects of the Astronist philosophical tradition.

[1:45:134] The fundamentality of sentience and sentient beings in The Cosmos is in fact very low due to the unnecessary role that sentient beings play in the structure and formity of The Cosmos, however, looking at sentient beings in this way from a different contexts increases their fundamentality.

[1:45:135] The Astronist Tradition maintains that sentience and sentient beings and civilisations play a transcendent role in relation to The Cosmos, and despite their lack of involvement in the formation, structure, and development of The Cosmos, the Astronist Tradition considers sentience to hold a divine functionality within The Cosmos; a functionality that provides purpose, and greater meaning to The Cosmos.

[1:45:136] Despite the Astronist Tradition's opposition to notions that The Cosmos wasn't created for humanity, or even for any sentient beings, the Astronist Tradition considers sentient life to hold some indeterminate role of purpose in The Cosmos; sentient life is considered to be central to the purpose of The Cosmos, but also, not entirely intrinsic so that nothing else can be considered as important as sentient life.

[1:45:137] When we consider The Cosmos philosophically through the lens of the instrument of functionality, we consider the rotalities and orbitalities of planets, and the occurrence of cosmic phenomena, but when we point towards the sentient beings and civilisations, what can we derive of their functionalities in The Cosmos?

[1:45:138] Essentially, the Astronist Tradition understands sentience in whichever form it does arise to be the populous of The Cosmos for without such life, The Cosmos remains a lifeless entity, and it is in this notion, that we understand the greatest functionality of sentient life to be, and therefore, that is how sentient life is appropriate to the cosmical orderity.

[1:45:139] The Astronist Tradition considers the instrument of study of futurity to be the most important instrument to apply to sentient life and the concept of sentience for the Tradition understands the future of humanity to lay within the gaining greater knowledge of the naturity of sentience, and of interacting with sentient civilisations beyond The Earth.

[1:45:140] Due to this belief, the Tradition understands sentience and sentient life to be the most important of all the philosophical contemplations that relate to times yet to come for space exploration is considered to be the inevitable future of humanity, and therefore, the discovery of sentient civilisations is considered to be central to the future of humanity.

[1:45:141] Scientific investigation stands on the side of the Astronist Tradition in the belief of the active search for sentient life beyond The Earth, and it the Tradition believes that the Astronist philosophical world must always work in alignment with that of the scientific world.

[1:45:142] The innemny of sentience beyond The Earth in The Cosmos is what shall solidify the belief of the Astronist Tradition to the entirety of the world and shall quieten all the doubters to the notion of the existence of sentient life across The Cosmos.

[1:45:143] The Astronist Tradition rests on the faith of the existence of sentience beyond The Earth on other worlds, but the reaffirmation and reinforcement of this belief through its scientific and empirical investigation and discovery shall be the singlemost defining event in the entirety of human history beyond all other occurrences and historical events, and the Astronist Tradition shall prepare and position itself henceforth to become central to this revolutionary event to further strengthen its institution within human civilisation and thought.

[1:45:144] The instrument of study of motivity applied to sentient life is to reveal the truth behind the reason for the Astronist Tradition's consideration of sentient life's centrity to its philosophical contemplation; the motivation behind such is pivoted around the belief in the beauty and vastity of The Cosmos as an extension of the immense naturity of The Cosmos, and the interlaction between The Cosmos, The Universe, and The Divine, as premised by the Astronist Cosmology.

[1:45:145] Mysteriosity is integral to the notion of sentience and the existence of sentient beings in The Cosmos, certainly so from humanity's current perspective, and even so with faith in sentient beings, one can still appreciate the mysteries of sentience; there still remains a great deal of mystery surrounding the naturity of sentience, and the truth behind the purpose of sentient life, and its proposed connection with divinity.

[1:45:146] The naturity of sentience is a major area of contemplation within the discipline of sentientology and stems entirely from the application of the instrument of study of naturity to the concept of sentience.

[1:45:147] The naturity of sentience, according to the current established beliefs of the Astronist Tradition, can be described in three different veins of comprehension; the first is characterised by limitation, the second by immense potentiality, and the third by its providence of a greater purpose and meaning to The Cosmos.

[1:45:148] The first of such naturities is limitation, and this provided to us by the overriding principle of the limited state and naturity of The Cosmos in which the sentient life we consider herein exists.

[1:45:149] The second of such naturities aforementioned as immense potentiality points to the practically immeasurable and unmatched ability for sentient life to provide ample abundances of opportunity, similarly to the way in which children and the young in general exist as beacons of future possibilities.

[1:45:150] The third of such naturities, henceforth known as the providence of purpose, notionises sentience as a means of satisfying our philosophical contemplations of The Cosmos and its own purpose, as well as to feed our own self-importances and to portraying humanity and other sentient life in The Cosmos as having an important role to play rather than being easily disposable elements of little worth.

[1:45:151] The Astronist Tradition considers the notion of sentience beyond The Earth to be the most progressing notion of all notions for it urges debate on the topic, and encourages the initiation of the Humanic Exploration of The Cosmos which itself is considered to be the epitome of progression from the perspective of the entirety of Astronist Philosophy.

[1:45:152] Essentially, after studying Astronist Philosophy, it would be impossible for one to deny that progressivity is not, in at least one way, connected to sentient life every time it is invoked as an instrument of study to be applied.

[1:45:153] When apply purposivity to sentient life in The Cosmos, the most essential factor is provided as population; without the populous that sentient life provides, The Cosmos becomes a dimension void of life and despite the beauty and the ability of cosmic entities to be endlessly devoted to, they alone lack something that sentience holds the essence of.

[1:45:154] The Astronist Tradition maintains that its belief in and notion of sentient life beyond The Earth is entirely formed by a series of logical steps with the rationality of such formed by notions of the size of The Cosmos, the existence of life on The Earth as a determiner of life on other worlds, and the proven set of planetary characteristics required for life to evolve.

[1:45:155] The Astronist Tradition holds rational justification as one of two parts of the binary structure of sentientological argument, the second part of which being faith in the existence of sentience.

[1:45:156] It is in the believers that the Astronist Tradition bases its philosophical contemplations of sentience upon and it is the believers that the Tradition entrusts with knowing the mysteries of sentience; the rationalisers are considered secondary in their importance and trustworthiness to the believers and the faithbearers; those are whom we must invest for they held trust in the Philosophy and the words it expounds long before the rationalisers and their need for proof.

[1:45:157] This hierarchy of rationalisers and faithbearers is central to Astronist philosophical contemplations of sentience and the status quo in which the concept of the Primarity of Peoples is introduced.

[1:45:158] The Primarity of Peoples attempts to hierarchise the different categories of people according to whether they consider something by faith, or evidence, or a mixture of both; in certain areas, the Astronist Tradition considers faith to be the primarity, while in other areas, evidence is given the primarity.

[1:45:159] The Astronist Tradition also maintains that faith is not in opposition to reason and holds the belief in the existence of sentient life beyond The Earth to be a form of rational faith; something that is not entirely known yet, but the belief of which is stemmed from physical realities.

[1:45:160] In a sentientological contextualisation, the instrument of study of symbioticity focuses itself on the symbiotic relationship between sentient beings and The Cosmos; this is derived from the mutual interactions found between sentient beings and The Cosmos in which they reside.

[1:45:161] The derived symbiotic relationship between sentient beings and The Cosmos allows us to draw a firm conclusion of philosophical inference stating that the natures, originations, and purposities of sentient beings and The Cosmos in which they reside are ultimately and forever entwined for as long as they shall both exist.

[1:45:162] The symbioticity of sentience and The Cosmos can best understood and evidentially demonstrated by humanity's symbiotic relationship as a microcosm; humanity is entirely dependent upon The Cosmos, and its microcosm of nature, and is

interacting with The Cosmos on a daily basis for existence, survival, knowledge, growth, and progression.

[1:45:163] The final instrument of study of this sentientological instrumentation is that which is known as the instrument of vastity which bases its application to sentience on the immensity of the potential diversity of sentient beings in The Cosmos.

[1:45:164] Due to the Astronist Tradition's firm belief in sentient life beyond The Earth in an abundant way, and as a postcursor to this, it is also held that a vast array of diverse sentient beings exist and it is this Diversity of Sentience that is considered to be the greatest element of The Cosmos and the greatest gift that the creator of The Cosmos has provided.

[1:45:165] The Astronist Tradition stresses the Humanic Exploration of The Cosmos to realise and discover the vastity of sentience in The Cosmos as the central reason for space exploration.

Cosmic Connections to the Terrestrial World (Cosmoapplication)

[1:46:1] Upon one's closer observance of the natural world, one is bound to notice the consistencies between the structure of The Cosmos and the structures of the natural world; the greatest example of this that one could easily understand is manifested by simply entering one's garden to find the structure of a leaf, and any plant for that matter.

[1:46:2] A cosmoapplication related to the leaf, especially so of the nasturtium plant which has a core from where the stem acts as the infrastructure for the leaf, and on the front side of the leaf, different channels appear which stretch to different distances.

[1:46:3] One without much imagination may ponder as to how this relates to the cosmical structure, but in the core of the leaf, I see the star as the core of the star system; in the veins of the leaf, the endpoints of which I see as the different planets perched at different distances from the core star and the perimeter of the leaf demonstrates the edge of the star system.

[1:46:4] The growth of the plant from the seed to its sprout, I see this as the expansion of The Cosmos from the moment and point of its own creation; another consistency between plants of the natural world and the cosmic world is the metagalaxy.

[1:46:5] Look at such structures as the Laniakea Supercluster and I notice the startling similarities between the way by which all its millions of offshoots stem from the central stream of light and how the roots of all plants and trees hold a similar structure both in appearance and function.

[1:46:6] For The Cosmos, light is its equivalent of water for the life of plants, as is another connection made between these two seemingly distant and unconnected entities to the untrained, or unphilosophised mind; such notices of consistencies are all philosophical, rather than scientific, but just by these few examples, we understand that there is certainly a great deal of consistency between the natural world here on The Earth and of course all worlds, and the cosmic world.

[1:46:7] This is obviously due to the fact that the natural world of the plants, insects, animals, and marine life, is of course part of the cosmic world as a microcosm here on The Earth and in all things that share origins, they too exist in consistency; this is how we can conduct any cosmoapplications at all.

[1:46:8] There is also a strong tradition of terminology within the discipline of cosmoapplication, which stands alone as its own distinct discipline of philosophical contemplation; these terminologies can be found within The Grand Lexicon of Astronomy, and we must also not forget that cosmoapplication is an essential element to

the study of naturology which is latterdiscoursed, as well as general naturological contemplation.

The Natural & The Rational

(Orbanology)

(Naturality & Rationality)

[1:47:1] That which is known as naturality in the Astronist philosophical tradition must not be confused with the instrument of study of naturity, but instead, is to be henceforth considered as the quality of being based upon that which is natural rather than that which is rational for the Astronist Tradition recognises that the two do not always align with one another.

[1:47:2] Naturality & Rationality, known as orbanology, is a major branch of philosophical disciplinarity within Astronist Philosophy dealing with wide variety of different concepts and areas of study, including causality, relativity, origination, the nature of intuition, and the equilibrium and naturality and rationality are categorised as utensils of philosophical enquiry in their terminological contexts.

[1:47:3] The relationship between naturality and rationality can be considered dichotomous in its nature, but also, can be considered symbiotic as the two can often be considered to interact with one another, and at times support one another, but this is entirely dependent upon the nature of the topic addressed.

[1:47:4] The nature and purpose of the relationship between naturality and rationality is based upon the distinction in premise according to the justifications one may use to make a conclusion about a particular entity's existence, or the occurrence of an event.

[1:47:5] Naturality can be used in the presupposition that nature overrides rationality in a particular scenario; when nature defies current human logicity and extends beyond the current rational comprehension of the human mind; this can be seen in some of the most extreme cosmic entities such as the singularity of black holes, and the edge of The Cosmos.

[1:47:6] In parallel to this, the utility of rationality is fulfilled by the presupposition that reason and logic are best applied to answer the questions posed by philosophers and aligns itself with the instrument of inneminity and empirical knowledge, but is ultimately left vulnerable to being overrode by naturality in anything it cannot explain with rational arguments.

[1:47:7] The first major subdiscipline within Naturality & Rationality that is to be discussed within this discourse is that which is henceforth known as causology; this subdiscipline deals with the contemplations surrounding the nature of causation, and it is from which the instrument of study known as causality originates.

[1:47:8] Causologists attempt to utilise either of the utensils of naturality and rationality to draw conclusions about the cause of the origins of certain entities, as well as the cause of the occurrence of certain cosmical events and phenomena.

[1:47:9] As part of this, causologists typically begin with utilising rationality to explain causations, but if such rational thought cannot explain, it is often the utensil of naturality that philosophers turn in order to complete their explorations of cause.

[1:47:10] Causology acts as the foundation for a new type of philosophical investigation that is henceforth known as Causological Philosophy; this type of philosophy holds as its premise, the cause of all entities and events to be the most important aspect for philosophers to pose.

[1:47:11] The Astronist Tradition is certainly a supporter of Causological Philosophy and its premise of causation being the most important aspect of philosophical enquiry and is also a supporter of utilising the instrument of causality as the measurer of the nature of the cause of a particular entity or event.

[1:47:12] Henceforthly, the philosophers of the Astronist Tradition are to most commonly use Causological Philosophy in order to explore subjects such as the cause of The Cosmos, the cause of cosmic phenomena, and the nature of causation in The Cosmos, and it is this type of philosophical investigation that is highly encouraged by the Astronist Tradition.

[1:47:13] From the Astronist perspective of causation, the essential premise is that all that is caused within The Cosmos is caused cosmically so, and due to the principle of limitation of the naturity of The Cosmos, all causation is limited by its own naturity.

[1:47:14] The Astronist Tradition defines causation in The Cosmos to be completely separate from causation in occur beyond The Cosmos in The Universe, or in any Divine existence, in a composite it.

[1:47:15] This composite approach understands causation of individual composite entities to be completely separate from everything outside The Cosmos until we consider the causation of The Cosmos itself which is dependent upon that which exists outside of it.

[1:47:16] In Causological Philosophy, the Astronist Tradition maintains the difference between fallible causation and pure causation; the former of which relates to entities or events of cosmic existence that have occurred by the actions by sentient beings, while the latter relates to entities and events that have occurred by the creativity of The Cosmos alone.

[1:47:17] Fallible causation is considered to be bound by the naturity of sentience, specifically humanity, and so, such causation is marred with motivation, intention, circumstance, profit, and emotion, and therefore, cannot be trusted due to these impurities, as reflected by humanity's impurities.

[1:47:18] However, that which is known as pure causation is considered to only be bound to the creative efforts of The Cosmos, and by extension, that which exists beyond The Cosmos, as the engineer of The Cosmos, whether this be some universal, or divine entity.

[1:47:19] Essentially, the Astronist Tradition maintains that only pure causations can be trusted as they are not marred by the impurities of sentience and would include the processes of nature, the procedures of planets and stars, and the brilliant creations and phenomenas of The Cosmos such as the supernovae, the quasars, and the nebulae.

[1:47:20] These two types of causation that are introduced by the Astronist Tradition are indicative of the potential for further categorisations to be made about causation and the vast amount of philosophical enquiry that is possible for causation.

[1:47:21] The next of the major subdisciplines within the discipline of orbanology is henceforth known as purpology, scholars of which are to be known as purpologists, deals with the vast amount of questions regarding the purpose of The Cosmos, the purpose of The Universe, and even discusses the purpose of The Divine.

[1:47:22] Essentially, purpology transcends all concepts and disciplines in that it attempts to drill to the central aspect of all existences and conceptualisations in that it raises the difficult question of purpose.

[1:47:23] These questions of purpose are to be raised about the entirety of the concepts of Astronist Philosophy and by this notion alone, we understand the breadth and depth of purpology to be a vastly potential subdiscipline that requires the greatest of minds to attempt to contemplate for to contemplate the purpose of The Cosmos, The Universe, and The Divine inspired from Astronist Cosmology is no easy feat to accomplish.

[1:47:24] In the context of Astronist Philosophy, that which is known as relativity holds an important place within orbanology as it is the measure of the extent of the comparison of effect between two or more different entities or events meaning that an example of the measure of relativity would consist of the inference of the effect between the comparison of one concept to another.

[1:47:25] Cosmical Relativity is a specific type of relativity that relates only to cosmical entities, such as the extent of the effect between one planet and another for example, and the subsequent impact upon the concept in discussion for a comparison can hold great consequence to way in which a philosopher may perceive an issue.

[1:47:26] That which is known as the equilibrium within the context of the discipline of orbanology relates to an important tool that can be used by philosopher during contemplation and attempts to derive a balance between relativities; a balance between comparisons of two or more entities or events, the collective term for which is henceforth known as equilibria.

[1:47:27] Equilibrarian philosophers of the Astronist Tradition are characterised by their incessant search for a balance between concepts, entities, or some other form of subject; equilibrarians find the essential purpose of philosophical enquiry to be to find balance between subjects.

[1:47:28] Without this discovered balance, equilibrarians find there to be no solution to the philosophical enquiry as balance between conflicting ideas is considered to be the only route for settling philosophical disputes or investigations.

[1:47:29] Equilibrarians always search for the balance between entities or concepts; for example, this could consist of the consideration between one planet and another; an equilibrarian philosopher would immediately search for the similarities and differences between these two planetary entities in terms of their functions, appearance, or any other physical characteristics in order to draw multiple balances according to different categories.

[1:47:30] When we understand and apply the instrument of naturity to a cosmical entity, we, as philosophers, must consider the entity according to its most intrinsic elements and it is to this understanding that we bring to that which we henceforth known as astrophysicality which is classed as a subdiscipline within orbanology.

[1:47:31] Astrophysicality addresses the naturity of stars specifically and attempts to derive conclusions about the originations, functionalities, physical features, and metaphorical qualities of stars.

[1:47:32] Astrophysical philosophers attempt to derive such astrophysicalities which must include these four different elements of enquiry in order to be considered fully formed and it is through these derivitions that philosophers attempt to understand the naturity of stars.

[1:47:33] A further branch of astrophysicality is henceforth known as astrophysiology which attempt to derive the naturity of stars similar to its parent discipline, astrophysicality, but instead focuses itself on the nature of the relationship between sentient beings and the stars of The Cosmos and primarily bases its derivitions upon philosophical, and metaphorical concepts with a smaller focus made on physical concepts.

[1:47:34] Astrophysiology, despite its relatively some size as a discipline within a subdiscipline, holds an important place in our comprehension of Cosmic Devotion for it is to the stars that humanity is most likely to observe and cosmically devote upon.

[1:47:35] Astrophysiological contemplations are of extreme importance for the Astronist Tradition to uphold and encourage philosophers to consider for they are considered to greatly enhance one's perception of The Cosmos, especially the philosophical and metaphorical role that stars play within the cosmical system.

[1:47:36] The next major subdiscipline of orbanology is henceforth known as originetics and although it certainly must remain a subdiscipline of orbanology, the subject that it addresses pervades throughout the entirety of Cosmic Philosophy.

[1:47:37] As its name suggests, originetics concerns itself with the philosophy of origination and poses questions about the nature of the origins of certain entities, both cosmical and non-cosmical; both physical and abstract.

[1:47:38] Essentially, originetics encompasses the entirety of origin and raises further questions about the origins of all existing entities, especially in relation to Astronist Cosmology, and concerns itself with immense questions such as the origins of The Cosmos, The Universe, and The Divine, both as concepts and as physical entities.

[1:47:39] Understanding originetics in this way allows us to see how vast of a subdiscipline it remains for it also incorporates history into its study for to understanding the originations of concepts, we must also understand the time periods, the contexts, and the circumstances in which these concepts arose; this can be applied in relation to Astronist Philosophy itself, but also, other traditions of philosophy, as well as religious traditions.

[1:47:40] Originatory contemplations can be considered endless until we begin to contemplate Divine interventions into origination because for example, we can say that tree originates from The Earth which originates from The Cosmos which originates from The Universe which originates from The Divine, if one is theistic in their outlook.

[1:47:41] Essentially, originetics has the tendency to always search for the essential part of something by putting aside that which it considers inessential and tends to always end at some divinical conclusion as that which is known as the Ultimate Origination.

[1:47:42] However, other origineticists may not consider origination to be homogenous, and may consider everything in existence to have its own unique origination which would certainly defy ideas of The Divine, but also, ideas surrounding singularities and the interconnectedness of The Cosmos and all that exists within it; this belief is henceforth known heteriginism and disagrees notions found within the discipline of heterogenology.

[1:47:43] Astronist philosophers are highly encouraged to explore the philosophy of origination, also known as the philosophy of origin, as that is considered to be the best trajectory towards gaining a greater understanding of the naturity of all existent entities for it is the belief in the Astronist Tradition that origination is inextricably linked to the naturity of the subject.

[1:47:44] Originetics is, of course, a subdiscipline of orbanology, but by its own very nature, is multi-disciplinary due to the fundamental questions that it poses about all existing entities, but another area of originetics for Astronist philosophers to explore is that which is known as non-existent origination.

[1:47:45] That which does not exist physically but only mentally must have some imaginal or psychological origination and that which does not exist either mentally or physically does not exist at all, but does that mean that it has no originations; in addition, what constitutes origination? Does something have to be existent for it to have an origination? Finally, does everything that exists have to have an origination for it to exist? This is known as either meta-originetics, or as ontological originetics, for it poses questions that relate to the nature of existence, being, and origination itself.

[1:47:46] By these notions outlined, we have only begun to explore the vastity that is originetics, but by outlining these notions, we have perfectly understood that originational contemplations are incredibly demanding of the philosopher, as well as requiring a great deal of experience in philosophical enquiry in order to attempt to address.

[1:47:47] There is a subdiscipline of orbanology that is non-Astronist in its origin though it remains a cornerstone to orbanological study and contemplation and it is known as noology.

[1:47:48] Noologists of the Astronist Tradition are concerned with questions in relation to intuition as both a concept, but also as a physical occurrence and attempts to create connections between intuition, action, and consequence.

[1:47:49] In addition, noological contemplations study and consider both intuition and reason as a phenomenon of the mind, and often juxtaposes reason in relation to intuitivity, while exploring the similarities and differences between these, and the ways in which the Astronist Tradition uses them and encourages the use of them to its philosophers in relation to different topics, especially those in a cosmical, or ethical context.

[1:47:50] It can be outlined herein that the Astronist Tradition typically emphasises intuitivity over reason when contemplating philosophical ideas about The Cosmos and it is the tendency of the Astronist Tradition to employ intuition as a means of knowledge and understanding especially when addressing a topic that we know little about, such as The Cosmos and its progeny.

[1:47:51] Therefore, a greater amount of contemplations, studies, and debates around the nature of intuition and reason, and the relationship between these two elements, and how different groups of philosophers believe these two elements should be applied points to the overall relevancy of the noological discipline.

[1:47:52] To relate back to foundations of orbanology, intuition is considered to be in alignment with naturality and reason is, of course, in alignment with rationality; noology can be considered a deeper study into these two aspects of orbanological contemplation.

[1:47:53] The Cosmos is of course a physical entity composed of countless composite parts but the Astronist Tradition maintains that The Cosmos is perceived by humanity to be abstract and something of a disproximation rather than a centrality.

[1:47:54] It is the sole ambition of the Astronist philosophical tradition to ratify this perception that humanity has in relation to The Cosmos; it is the ambition of the Astronist Tradition to centralise The Cosmos in our lives; to bring The Cosmos to become a proximate entity in our hearts; this is the perhaps of the innovation of the discipline of astronomy.

[1:47:55] The concept that is henceforth known as the Reification of The Cosmos deals with the idea of making The Cosmos into the centrality of our lives and civilisations, especially to be perceived as an entity with proximity to our hearts, minds, and souls, and something that humans can look towards for knowledge, reassurance, hope, and fascination in times of worry, uncertainty, discord, and despair.

[1:47:56] The Cosmos is of course real to us, but the Astronist Tradition understands there to exist a distinct difference between what humanity currently perceives to be The Cosmos and the potential role that The Cosmos and its progeny could play in our lives and civilisations, and The Reification of The Cosmos is the process through which this shall occur.

[1:47:57] It could certainly be argued that the Reification of The Cosmos is the most important of all the missions of the Astronist philosophical tradition and this particular belief is henceforth known in the Tradition as reifism for its places an emphasis and centrality on reification in the overall purpose and ambition of Astronism.

[1:47:58] Reifists therefore believe that the greatest responsibility of the Astronist Tradition is to entirely fulfil the process of the Reification of The Cosmos and they believe this to be the most important practical actions that all Astronist philosophers should contribute to in their communities and civilisations; essentially, reifists seek reification in all circumstances.

[1:47:59] That which is henceforth known as the subdiscipline of metaphilosophy, which is non-Astronist in its origination, remains an extremely relevant branch of orbanological study for it concerns itself with the nature of philosophy itself and the different ways in which philosophy can be used for betterment, and the views of the Astronist Tradition on the future of philosophy.

[1:47:60] With its study rooted in The Twenty Five Foundations of Philosophy, which do remain outside The Omnidoxy as part of The Grand Centrality, these twenty five precepts form the basis of the Astronist Tradition's understanding and categorising of what philosophy is, how it is to be used, and how it is to interact with religious traditions, as well as with society and how it is to serve the people of a civilisation.

[1:47:61] For this reason, metaphilosophers should always refer back to The Twenty Five Foundations of Philosophy in order to take inspiration to derive notions about metaphilosophical concepts, however, the Astronist Tradition's view of philosophy itself shall be further explored within this orbanological discourse.

[1:47:62] The Astronist Tradition considers philosophy to be the one true outlet for human inspiration, knowledge, and experience and as predicated by The Twenty Five Foundations, philosophical tradition is considered to be entirely and fundamentally distinct from religious tradition.

[1:47:63] Astronist Philosophy considers philosophy to be the future of greater human intellectuality, civilisational establishment, and personal and interpersonal development rather than other sources of human thought such as religion, and ideology which have been the dominant forces of sentient civilisation organisation since the occurrence of that which is henceforth known in the Astronist Tradition as the Subversion of Philosophy.

[1:47:64] The Subversion of Philosophy is proclaimed, by the Astronist Tradition, to be the premeditated undermining of philosophy throughout human history by various political, religious, cultural, and social organisations, institutions, and governments, the pinnacle hallmark of which being the professionalisation of the philosophy.

[1:47:65] The Astronist Tradition does not disagree with granting the high level of integrity and value that professionalisation of a discipline provides for philosophy certainly deserves such, however, with philosophy's professionalisation has also subsequently resulted in its disproximation from society, the daily lives of humanity, and its centrality in civilisational function.

[1:47:66] This disconnect is identified by the Astronist Tradition to be the ultimate ambition of those whom seek to further the Subversion of Philosophy, the orchestrators of which have utilised professionalisation to satisfy their own subversive motivations, thus reducing philosophy from its once central place in the functionality of human society to little more than a fossil of thought reserved only for those whom are considered to be worthy of its graces, which only further isolates the discipline from the wider world and the peoples of the world, that the Astronist Tradition understands, who are in most need of philosophy to enhance the purpose, the substance, and the depth of their lives.

[1:47:67] The Astronist Tradition considers the aim of philosophy to be the creation and development of societies and civilisations through the installation of systems of thought as formed by different traditions of philosophy and in a personal context, philosophy aims to shape meaning, character, trajectory, and identity.

[1:47:68] That which is known as atomism, which is also a non-Astronist originative term, addresses the theoretical approach that the most efficient form of analysis is to separate each elementary component of that which is in subject into distinct and separate categories in order to contemplate them individually without the occurrence of unnecessary conflictions.

[1:47:69] The Astronist Philosophy is a proponent for the atomist approach to theoretical analysis, mainly due to the fact that when contemplating cosmical concepts and entities,

one is often faced with a plethora of phenomena and events with overlapping authority and functionality which often makes Cosmic Philosophy a challenge to deeply analyse.

[1:47:70] Atomism allows for each of the elements of that which is in contemplation to be separated in a way that is agreed logical and fair by the philosopher so that the philosopher, and their audience, can better grasp the individuality of the subject rather than becoming confused with overlapping elements; by this notion, the Astronist Tradition can be considered to be preferential to atomism by the nature of the atomistic approach to theoretical analysis and its remarkable ability to fit in with the exploring the naturity of The Cosmos and its progeny, as well as with notions of The Composite Cosmos.

[1:47:71] Within orbanological study, we must also address seven pre-Astronist theories and apply the Astronist perspective to those theories in order to determine a conclusion about the Astronist philosophical agreement or disagreement with the nature of the theories addressed.

[1:47:72] In order to improve one's understanding of these theories, there is, herein, provided a non-Astronist definition of each of the theories, which shall be used as a basis for the Astronist view of these theories; the definitions are distinguished by their italic font.

[1:47:73] The first of these theories is known as conceptualism, the non-Astronist definition of which is:

universals can be said to exist, but only as concepts in the mind.

[1:47:74] The Astronist Tradition does not accept conceptualism due to the fundamental aspect of Astronist Cosmology and the existence of The Universe, the Astronist Tradition therefore does not accept that only universals can exist in the mind due to their existence in The Universe, and due to the existence of The Universe itself.

[1:47:75] The second of these theories is known as determinism, the non-Astronist definition of which is:

all events, including human action, are ultimately determined by causes regarded as external to the will.

[1:47:76] The Astronist Tradition considers there to be a dichotomy between willed action and unwilled action, the former of which relates to actions attributed to that which is known as sentient will and the latter relates to actions attributed to that which exists externally to the will of sentients.

[1:47:77] By this notion, the Astronist Tradition can be said to be in partial agreement with the doctrine of determinism as it does regard an undetermined portion of actions to be

external to the will, but in an equal way, the Tradition also understands there to exist another undetermined portion of actions to be attributable to sentient will.

[1:47:78] As a result, the Astronist Tradition cannot correctly be labeled as a determinist philosophy, but instead, it can be said to be of a semi-deterministic orientation due to that which it introduces known as the Dichotomy of Will.

[1:47:79] The third of these theories is known as emotivism, the non-Astronist definition of which is:

regarding ethical and value judgements as expressions of feeling or attitude and prescriptions of action, rather than assertions or reports of anything.

[1:47:80] The Astronist Tradition supports the notions that emotivism expounds and therefore, emotivistic approaches to theoretical analysis of Astronist Ethics can be applied; furthermore, the Astronist Tradition considers emotivism to be a powerful utensil for philosophical enquiry into the ideas and concepts of ethics.

[1:47:81] The fourth of these theories is known as nominalism, the non-Astronist definition of which is:

universals or general ideas are mere names without any corresponding reality. Only particular objects exist, and properties, numbers, and sets are merely features of the way of considering the things that exist rather than existent themselves.

[1:47:82] The Astronist Tradition is a staunch supporter of nominalism as it does not consider names that sentient minds have devised and applied to concepts to be correspondent to a physical reality, but instead, a conceptual reality of a sentient species' own creation.

[1:47:83] The main premise upon which the Astronist Tradition supports nominalism is in the example of that the names to which we ascribe concepts cannot be fairly said to merit a corresponding reality to the entities of The Cosmos; it cannot be said that conceptual entities correspond an equality between physical cosmical entities.

[1:47:84] The fifth of these theories is known as phenomenalism, the non-Astronist definition of which is:

human knowledge is confined to or founded on the realities or appearances presented to the senses.

[1:47:85] The Astronist Tradition is also a staunch supporter of the doctrine of phenomenalism for it supports the logical notion that sentient knowledge is directly and solely sourced from, and therefore confined to sentient experience which is bound to the extent of one's own senses.

[1:47:86] This phenomenalist outlook is most readily expressed through the Astronist Tradition's approach to the discussion of the human understanding of The Cosmos, especially in the statement holding that humanity's knowledge of The Cosmos is directly attributive to humanity's ability to explore The Cosmos.

[1:47:87] This points to the reason for the Astronist Tradition's logical insistence that humanity's knowledge and understanding of The Cosmos, and therefore humanity's exploration of The Cosmos is so greatly disproximated from the extent that is required in order to make conclusive claims about our knowledge of The Cosmos.

[1:47:88] This notion alone demonstrates the integration of phenomenism into the Astronist Tradition and therefore, the Astronist Tradition can be classed as a phenomenalist philosophy.

[1:47:89] The sixth of these theories is known as prescriptivism, the non-Astronist definition of which is:

the imposition of rules of correct usage on the users of a philosophical concept, tradition.

[1:47:90] The relationship between the doctrine of prescriptivism and the Astronist Tradition can be described as one of great interest for the Astronist Tradition, even now during the writings of its inception, is expected to always struggle in the face of maintaining the proper application of its Tradition whilst also keeping within alignment of the Philosophical Spirit.

[1:47:91] One of the essential principles of the Philosophical Spirit is the Openness Principle; the idea that philosophy must remain an open enquiry that people can interpret and apply by their own personal understanding is necessary to maintaining the Philosophical Spirit which the doctrine of prescriptivism may begin to clash with due to its own principle of correct usage.

[1:47:92] Despite the importance of the Astronist Tradition maintaining its alignment with the Philosophical Spirit, it also finds importance in its prescriptivist responsibility for a tradition cannot remain a tradition if the correct usage of its philosophies are not protected by the imposition of rules.

[1:47:93] Finding the balance between the imposition of rules and the protection of the openness and interpretative nature of philosophical enquiry is an ongoing challenge for the Astronist Tradition to maintain, as is the same for other traditions of philosophy that wish to stay in alignment with the Philosophical Spirit.

[1:47:94] The seventh and final of these theories is known as subjectivism, the non-Astronist definition of which is:

knowledge is merely subjective and there is no external or objective truth.

[1:47:95] The Astronist Tradition supports the principal doctrine of subjectivism by the notion that every individual's knowledge is directly impacted by their own experiences; if it were not for experience's affects on knowledge, subjectivism would not be correct, however, the truth is that experience is directly influential over knowledge.

[1:47:96] Due to each and every individual's unique experiences, the Astronist Tradition cannot logically that knowledge isn't subjective; this is most importantly associated with the extent of humanity's knowledge of The Cosmos; in addition, imagination is what we call a derivition of knowledge just as experience is regarded.

The Oblivions of The Cosmos (Obliviology)

[1:48:1] It is time now to turn to an extremely stimulating, yet complexing discipline of Cosmic Philosophy, as part of Astronist Philosophy, that remains shrouded in mystery due to humanity's lack of knowledge and comprehension of black holes in The Cosmos.

[1:48:2] The major discipline dealing with the philosophical contemplation and scholarly study of black holes, their natures, their alignment with the cosmical orderity, their ultimations, their functionalities, their purposes, and all other aspects of black holes is henceforth known as obliviology.

[1:48:3] Obliviologists are tasked with an immense responsibility that should not be undertaken lightly with proper philosophical enquiry and as the Humanic Exploration of The Cosmos commences, and humanity's knowledge expands, the discipline of obliviology is expected to expand in parallel form.

[1:48:4] Obliviological contemplations can lead to a great deal of confusion regarding the nature of The Cosmos and therefore, ignites questions about other aspects of Cosmic Philosophy and the subsequently associated concepts.

[1:48:5] By this very notion, our introduction to obliviological study and contemplation may lead to a greater number of open ended concepts and questions than we originally began with, but this is not something to fear; instead, this is something that, as philosophers, we must be prepared for, and ready to embrace.

[1:48:6] If one does end a philosophical enquiry with a greater abundance of questions than answers then that is the sign of a successful philosophical enquiry as it has created a greater extent of questions for future generations of philosophers to further contemplate; this is a principle that all philosophers, especially those of the Astronist Tradition, should always remember during their investigations.

[1:48:7] That which is henceforth known in Astronist Philosophy as The Oblivionic Centrality relates to the body of questions that address the reasons for why black holes exist at the centre of galaxies, quasars, and are themselves centralities by their own natures, as they pull everything else towards them, and they control matter for a certain extent beyond your presence.

[1:48:8] In the Astronist Cosmology, stars are presented as the central points of existence in the voidal space of The Cosmos, and it is around these stars that we do orbit and depend upon but in fact, after considering black holes and their positions in The Cosmos, it is revealed to us that black holes are the centralities of the cosmical plain.

[1:48:9] Black holes are that which exist at the centre of galaxies? Black holes are that which exist at the centre of quasars? Black holes, by their own functionality and naturity, are centralisers to themselves for the level of their gravitation is so great that they pull everything within the oblivionic influence in towards them; this creates the oblivionic centrality.

[1:48:10] This calls into question the way in which we are to understand the naturity of The Cosmos itself and its infrastructure entirely; up to this point, we have understood The Cosmos as being ruled by orderity, but by this notion of oblivionic centrality, we now understand that disorderity and chaoticality play a much greater role in the cosmical system than we may wish to admit.

[1:48:11] How can it be that something so chaotic and so unknown and so affiliated with disorderity such as an oblivion could be the controller of galaxies and quasars, the overseer of The Cosmos, as well as being its central devourer into which every ounce of matter shall be drawn.

[1:48:12] If we, as a civilisation and as a planet, do depend upon the star around which we rotate and orbit, then we also equally depend upon the galaxy in which our star resides, and if we do depend on the galaxy in this way, then we do so equally depend upon that which exists as the controller of the galaxy; the oblivion that rests at the galaxy's core.

[1:48:13] Is The Cosmos therefore controlled by disorderity rather than orderity? Is the naturity of The Cosmos truly aligned with orderity at all? This calls into question the entirety of the Astronist approach to cosmology, but are we to be fearful of this contention? We are not. Are we to feel threatened by this contention? We are not.

[1:48:14] Instead, philosophers of the Astronist Tradition should challenge themselves with attempting to understand this contention in the effort of solving it for it remains the characteristic of a true philosopher to not run in fear or defend due to feeling threatened, but instead, return with counter measures to the proposed contention, or to think of new ways of understanding the Astronist Cosmology; without the embracement of such contentions when they do inevitably arise, we become religionists rather than philosophers, and this is something we cannot let occur for if that does take hold, we risk losing who we first set out to become.

[1:48:15] The concept of The Oblivionic Centrality, and especially that which is known as black hole dependency, both draw upon a frightening idea that the entire existence of humanity, The Earth, and even The Cosmos itself are all entirely dependent upon a category of phenomena that we do not even understand in the slightest.

[1:48:16] If we are dependent upon the stars, and the galaxies, and even The Cosmos itself, at least we know of these entities and phenomena, and we can continue our endeavour towards understanding them further, but with oblivions and our supposed dependence upon them, the fear is that we shall never truly understand them for what they are

entirely; perhaps we are bound to never being able to understand that which we depend upon.

[1:48:17] There is an existent concept within the discipline of obliviology that is henceforth known as the Universal Horizon which is an extension to the term of the event horizon, which is a mainstream physics-originative term.

[1:48:18] The Universal Horizon concept relates to the idea that black holes are not an oblivion at all but are instead portals to that which is known as The Universe in the Astronist Cosmology; by this notion, black holes are transportational devices in a similar way to wormholes, but unlike wormholes, black holes can transport information and entities into The Universe in this concept whereas wormholes can only transport within that which is known as The Cosmic Boundary.

[1:48:19] This concept demonstrates black holes as the connectors between The Cosmos and The Universe which raises them to an even greater importance than if they remained oblivions.

[1:48:20] The relationship that gravity holds with the oblivions of The Cosmos is one that remains shrouded in mystery due to a general lack of knowledge and understanding about the alignment of gravity to either orderity, or disorderity; whether the mechanism of black holes controls gravity, or whether gravity controls the mechanism of black holes.

[1:48:21] When oblivionologists attempt to contemplate this relationship, they are likely to come across questions regarding the physical positioning of gravity in relation to black holes themselves; essentially, is gravity existent inside a black hole, behind a black hole, or even underneath one?

[1:48:22] Such questions shall require innemnic contributions, but in all, remain majoratively philosophical due to the general lack of innemnic knowledge of the naturity of black holes.

[1:48:23] Gravity is, of course, the central component of the black hole functionality from our current innemnic understanding of black holes, but it is this component of gravity that is perhaps the most sobering of all when relating to the dependence of all that is cosmical on black holes.

[1:48:24] The entirety of The Cosmos is dependent upon gravity for all the planets, stars, and galaxies are suspended within The Cosmos by gravity and thus, are only able to keep in such positions, and are only able to conduct the movements by which they are natured due to the prevalence of gravity in the cosmical system.

[1:48:25] Linking this notion back to the previous about the intrinsicity of gravity to the existence of oblivions, we derive that the question about gravity's true loyalty, whether it rests with orderity, or disorderity, is perhaps the most important of all questions of Cosmic

Philosophy for in answering that question, one is able to designate the true nature of the most intrinsic element of The Cosmos.

[1:48:26] A major discipline of philosophical study is that which is henceforth known as singuletics which is the study of the nature of singularities both within black holes specifically, but also in the wider vicinity of The Cosmos.

[1:48:27] Singuleticists must attempt to derive the nature of singularities including how they are understood to function, their purposities, the extent of their orderity and disorderity, as well as the role they play in the cosmical system.

[1:48:28] Due to the little that we innemnically know about singularities, the breadth of this discipline is vast and of even greater potentiality for challenging philosophers to contemplating something that is so distant in physicality, as well as difficult in imagination.

[1:48:29] The principal aspect of a singularity that must first be addressed is its holding of infinite tendencies due to it functioning at an infinite value and due to the principles of the limitation in The Cosmos due to the established nature of The Cosmos in the Astronist Cosmology, Astronist Philosophy considers singularities to be beyond The Cosmos in a fundamental way.

[1:48:30] By the notion of a fundamental way, it is meant that singularities are not cosmical by their natures due to their infiniteness and because of this, they must exist in a state of universality, whether that be as part of The Universe, or to at least be entirely under the jurisdiction of universal principles, rather than cosmic principles, which are those that govern the cosmical system as we know it.

[1:48:31] Due to the agreed nature of singularities as being universal, that does not mean to say that black holes are universal, though the relationship between The Universe and black holes is something of obliological contention that requires much greater contemplation, even so beyond this very discourse.

[1:48:32] It should also be of contemplative curiosity that singularities, especially so in the case of black hole exist at the centre; by this notion, singularities are the centralities of centralities if we consider black holes to be the centralities of galaxies, and therefore the centralities of the many star systems of The Cosmos and so on.

[1:48:33] Further so, we understand singularities as ultimations, as the manifestations of absoluteness, and as a class of entity that no matter how much we attempt to comprehend, we know that we never shall fully do so because of the universal nature that is henceforth ascribed to singularities, and the Astronist Tradition holds that universals are ultimately incomprehensible to cosmicals.

[1:48:34] If we assume that the universality of singularities is indeed true, and therefore the infinity of singularities as a notion is also real, then this draws upon further questions relating to the presence, the importance, and the overall naturity of black holes themselves because if at the centre of black holes these singularities do reside, then this connects black holes with something that is universal and infinite for singularities, to our present innemnic knowledge, but also by the considerations of the Astronist Tradition, do not exist separately from black holes themselves.

[1:48:35] If this be so true, then we must direct our contemplations towards how black holes can hold a presence in The Cosmos yet remain somewhat connected to The Universe; the Astronist Tradition's approach to such an enquiry is by the introduction of that which is known as The Chaos in the Astronist Cosmology, which is present in both The Cosmos and The Universe as that which is known as a state of transprotraction.

[1:48:36] By all accounts of the Astronist approach to singularities, therefore, singularities remain not of The Cosmos, but of The Universe by their own very naturities, but further questions also arise as to the transportability to singularities to enter The Universe, which is something that is not held by the Astronist Tradition due to the incompatibility of that which is cosmically-originate and that which is universally-originate, essentially meaning that which is cosmical cannot exist outside The Cosmos; this is henceforth known as Cosmical-Universal Incompatibility Principle.

[1:48:37] In essence, a singularity is an extremity of density and in effect pushes the laws and abilities of The Cosmos beyond its limitations; by this notion, the Astronist Tradition continues singularities to exist beyond The Cosmic Boundary because by the laws of The Cosmos, they should not exist, at least not within The Cosmos itself; by this notion, singularities cannot be within The Cosmic Boundary so they must exist without.

[1:48:38] If something has infinite properties, or an infinite amount of value then it cannot be cosmical due to the principle of the limitation of The Cosmos due to its own naturity; singuletics continues to be one of the most puzzling and challenging aspects of obliological contemplation and study, and it remains something that both innemnic experimentations, as well as philosophical contemplations are vying for clarity over.

[1:48:39] Pondering what is beyond the singularity, if anything is something that we must direct our contemplations towards in order to think, in unity, about all the different possibilities that singularities do present.

[1:48:40] One may ponder why light, if it truly is the fastest element in The Cosmos, that it cannot escape beyond the event horizon of a black hole; this is quickly answered by the Astronist approach to cosmology; by this notion, the Astronist Tradition maintains that black holes are entirely universal by their naturity rather than at all cosmical; the cosmicality of black holes ends beyond the event horizon, after that moment, black holes are categorised by the Astronist Tradition as universal phenomena.

[1:48:41] However, this does not mean that when one looks at a black hole that that which they look at is universal; instead, it is the only when one physically passes the event horizon themselves that they can perceive the universality of a black hole; looking at a black hole from outside the event horizon is categorised by the Astronist Tradition to be cosmical; this forms the concept that is henceforth known as the Trility of Oblivions which demonstrates the trilism derived about the naturity of black holes to exist both cosmically, chaotically, and universally.

[1:48:42] Therefore to clarify, the Astronist Tradition understands black holes in a three-dimensional existence; the way in which cosmical entities perceive black holes is in their cosmic state but in truth, black holes exist chaotically as part of The Chaos, and as for their third dimensionality, black holes are also considered to be universal due to the existence of singularities at the central of them.

[1:48:43] Furtherso, the reason for which light cannot escape black holes beyond the event horizon is because beyond the event horizon, black holes are universal and light is cosmical and therefore, universality is superior to cosmicality and so it is impossible for anything cosmical to exist in a universal dimensionality.

[1:48:44] The concept within obliology that is henceforth known as Absolute Extremity is an attempt by terminological means to describe the naturity of oblivions in a way that encapsulates their somewhat infinite and ultimate nature, as well as their connection to The Cosmos through their existence in the state of The Chaos, as is described by the use of the word extremity in the concept title; by this notion, black holes are extremators of cosmic limitation.

[1:48:45] The title of Absolute Extremity may be used in place of the terms of oblivions and black holes due to the fact that it broadly encompasses the naturity of this phenomena.

[1:48:46] Despite the penchant of obliologists to explore and attempt to understand black holes, the Astronist Tradition maintains that due to the naturity of black holes as holding a three-dimensionality, they shall forever remain beyond the comprehension of cosmical minds, yet this does not mean that we should be discouraged in our contemplations of this for learning of a greater abundance about black holes shall lead to a refined understanding of the naturity of The Cosmos, the naturity of singularities, as well as the relationship and interactions between The Cosmos, The Chaos, and The Universe.

[1:48:47] There have been some scientists and even some philosophers who have contemplated whether black holes even exist due to the fact that a black hole has never been observed and although the Astronist Tradition must accept their freedom to do this due to the Tradition's alignment with the Philosophical Spirit, equally so the Astronist Tradition does not accept notions that oblivions do not exist.

[1:48:48] Without question, in the entirety of Astronist Philosophy, black holes certainly do exist without any doubt and any resistance to the existence of black holes can be described

as being non-Astronist in their character due to the importance of oblivions derived in Cosmic Philosophy.

[1:48:49] At the heart of obliviological contemplation exists one of the greatest paradoxes in Cosmic Philosophy; the fact that black holes, the largest of all oblivions of The Cosmos are born in the brightest phenomena of The Cosmos known as supernovae; how can something so impossibly dark be birthed from something that is so impossibly bright.

[1:48:50] Perhaps one of the greatest contradictions of existence, this paradox is henceforth known as the Oblivionic Origination Paradox and is the most puzzling of all obliviological concepts that oblivionologists need to deeply contemplate.

[1:48:51] By this notion of the supernovaic origination of black holes, there is a connection made between something that is considered chaotical (black holes) with something that is considered to be cosmical (supernovas).

[1:48:52] Perhaps this connection means that supernovae are chaotical? Or perhaps black holes truly are cosmical by their natures due to their originations existing in one of the most phenomenal events of The Cosmos?

[1:48:53] The origination of oblivions in supernovas calls into question all that we had aforeshadowed about the nature of black holes, but this is the purpose and glory of Cosmic Philosophy for it remains a vast expanse of new ideas without end of contemplations about elements of the subject that had previously been considered true, right, proper, or real.

[1:48:54] The Oblivionic Origination Paradox draws our attention upon two of The Ten Cosmical Elements known as lightness and darkness as we see these manifested in the phenomena of supernovae for the former and in black holes for the latter.

[1:48:55] By the connection between these two phenomena, there is an integrality highlighted between these two cosmical elements despite their supposed dichotomy, but in the instance of oblivionic origination, they do work together, or do they?

[1:48:56] Perhaps a supernovae signals not only the death of a star, but also the loss of lightness over its battle with darkness and so, darknesses victory is manifested in the creation of an oblivion; an ultimate darkness.

[1:48:57] The Cosmos is full of contradictions, but they only arise as contradictions because our minds cannot hold the required capacity to understand them and so we press upon the title of contradiction as means to entitle something we are not able to comprehend.

[1:48:58] Yet, it remains true that from the perspective of humanity, there does exist an entire array of contradictions in and about The Cosmos, but without such contradictions, there would not be Cosmic Philosophy as we do adore it.

[1:48:59] Obliviologists go henceforth and contemplate such contradictions of the black holes of The Cosmos so that you may one day make a breakthrough that no other mind has managed to achieve; only contemplations about black holes will lead us to a greater understanding of them.

[1:48:60] Another approach to understanding the nature of the relationship between black holes and supernovae is to consider black holes as the corpses of stars which makes them part of the evolutionary journey of stars rather than existing as their own distinct classification of cosmical entity.

[1:48:61] To consider black holes in this way still retains the idea that lightness and darkness are integrally connected and that black holes originate from supernovae, but perhaps this calls into question even greater concerns in relation to the centrality of black holes to the cosmical system.

[1:48:62] Stars are considered, by the Astronist Tradition, to be the driving forces of cosmical orderity and the beacons of the cosmical system, but if black holes are not distinct entities, and are truly part of stellar evolution then this means that the epitome of what the Tradition understands to be chaotic is actually very closely related to, and a successive part of the most heralded progeny of The Cosmos.

[1:48:63] This demands our contemplation for it calls into question the true role of oblivions in the cosmical system; how can it be that entities of such disorderity and chaosity are intrinsically connected to the most ordered and cosmical entities? It is the henceforth considered to be the responsibility of obliviologists to explore this question it, again, makes remarks about the true naturity of black holes, their importance in the cosmical orderity, and the true role they play in The Cosmos.

[1:48:64] From the various different concepts that have been introduced in our obliviological study, the evidence points to the notion that oblivions are both central and fundamental to the structure, functionality, and evolution of The Cosmos, and despite our knowledges of black holes still lacking by great proportions, the more we contemplate, the less of an unbalance there will be between that which we know and that which we do not.

[1:48:65] One of the most curious occurrences in the origination and creation of black holes is that which is known as the Initial Creation concept which is entirely innemnicly originative and relates to the fact that black holes are created in less than a second.

[1:48:66] They do take millions of years to grow of course, of which their size is directly proportional to the speed at which they are able to accrete the matter around them, but the fact their Initial Creation commences in a matter of milliseconds is demonstrative of their instantaneousness but also means that just because an entity forms in a short period, does not mean that it is set to be in existence for a short period.

[1:48:67] The instantaneity of black holes is considered to be another of their physical features, but one of the most pressing questions in all of obliviology is whether the Initial Creation of black holes should instead be retermed as The Great Transition, which instead upholds the idea that black holes are evolutionarily transitioned from their stellar predecessors rather than distinct entities of their own.

[1:48:68] Some astronomers, and even fellow philosophers have notionised the argument that due to the fact that we cannot currently observe black holes, then we can safely assume they do not exist; despite the non-Astronistness of this proclamation, it is gaining ground among certain groups, especially those which are negativistic, or defeatist towards The Cosmos and its progeny to begin with; these such arguments only emboldened such groups in their endeavours to restrict, control, and even completely disintegrate and undermine the potential of humanity's perception and knowledge of The Cosmos.

[1:48:69] This notion is such a simple one for minds so great as scientists and philosophers for they should know that just because their visions do not hold the capacity to perceive black holes, does not equate to the notion that black holes do not exist, and this is the approach of the Astronist Tradition.

[1:48:70] The Astronist Tradition notionises, in a wider general sense about similar ideas in relation to non-vision non-existence, that the spectrum upon which our eyes were created is not capacitated to see such an oblivion, and also important is the application of this idea to the mind, which is also incapacitated to think of such oblivions.

[1:48:71] Another notion against the non-vision non-existence theory is that which holds that air is invisible, yet we know it is there because we depend upon, therefore we depend upon that which we cannot see; this is an ironic turn of notions if ever there was one for those whom notionise that such we cannot see is such we cannot be sure exists, but by this very notion, such people contradict their own existences for their existence depends upon an invisibility.

[1:48:72] Why are such invisibilities so integral to existence? For when one continues on in contemplations about invisible entities, one soon understands that the forces of The Cosmos, especially including gravity, all hold the property of invisibility; this strikes the notion that those which are henceforth known as invisories are more cosmically fundamental than those entities which are henceforth known as the visories; that which we can see is not that which is most fundamental; a curious notion indeed, and one that could very well hold relevance to a greater understanding of the cosmical system.

[1:48:73] In order to describe black holes in a very simple notion, we have the concept of The Four Veries; very massive, very diverse, very dense, and very gravitational; for the mass of people to be able to understand black holes, The Four Veries are essential for they explain black holes in the most simple of terms which is important to mass understanding of them.

[1:48:74] Another point of interest for oblivionologists and one that further solidifies the connection between black holes and their stellar counterparts is the notion that neutron stars are actually nearly black holes themselves due to their immense density, though they lack the massivity to constitute their formation into a black hole.

[1:48:75] Despite this incapacity of neutron stars to become black holes, the very fact that they exist as one of the closest entities in characteristics to a black hole is demonstrative about the wider connection between oblivions and stars in The Cosmos.

[1:48:76] The very fact that neutron stars are still classified as stars but almost demonstrate the full characteristics of a black hole, except for their massivity, is telling about the true nature of stars and their true relationship with black holes; perhaps this demonstrates the final element of proof that is required to place a full link between black holes and stellar entities.

[1:48:77] And if that be true, then we must establish that which is henceforth known as a bridged discipline between heliology and obliviology that concerns itself with the nature of this founded connection and relationship between oblivions and stars; this bridged discipline shall be henceforth known as stellarology.

[1:48:78] Stellarologists are tasked with contemplating the concepts, theories, and proclamations made during our brief enquiry and discovery of the relationship and interconnection between stars and black holes, but they are also tasked with expanding upon this initiality in order vastly grow that which is known as philosophical vitality; the extent of philosophical investigation and contemplation that is given to an area of study, or even a specific theory, especially measured by the amount of philosophers contemplating it during a specific period of time.

[1:48:79] That which is known as the Stellarological Purpose describes the essential basis for the establishment of the bridged discipline of stellarology as to widen the philosophical vitality of the oblivionic and stellar interconnection theory, as well as to explore in a more general way, the relationship between oblivions and stars.

[1:48:80] Return to our obliviological contemplations now, there exists a concept within obliviology that is henceforth known as Oblivionic Orchestration that introduces a entirely new type of philosophical contemplation for it encourages the philosophers of black holes, especially those contemplating the collisions of black holes, to consider these as the sounds of instruments.

[1:48:81] From the sound of a instrument, we are able to detect its distance from its position on the scale, and the general nature of the instrument being played by the type of sound heard; cosmologists have learned most about black holes through the resonances and audios recorded of them; the usage of sound as an instrument of contemplation should therefore also be useful for philosophers in a similar way.

[1:48:82] From the sounds of black holes, oblivionologists can derive the size, the general distance, and the nature of the collisional event that has occurred between two black holes, or between a black hole, and another type of celestial entity.

[1:48:83] The contemplative practice of orchestration can and should be applied to other disciplines of Astronist Philosophy wherever it may be relevantly applied as it practition is expected to introduce new ways of perceiving The Cosmos and its progeny, by utilising our minds in application to our sense of hearing.

[1:48:84] With the introduction of the contemplative outlet of orchestration in relation to the sense of hearing here, we must also introduced herein its counterparts which are to be applied to all other relevant disciplines, theories, and concepts which, when considered collectively, form that which is henceforth known as Sensory Philosophy.

[1:48:85] The next of which is henceforth known as visionation which relates to the application sight to philosophical contemplation, and is perhaps the most widespread of all the applications of Sensory Philosophy, and is most commonly applied to one's vision of cosmical entities, and in a wider sense, the general environment in which they exist.

[1:48:86] That which is henceforth known as contigation relates to the application of the sense of touch to philosophical contemplations and is the third branch of Sensory Philosophy and relies on philosophers to touch and physically interact with objects, and the wider environment in which they reside in order to derive concepts, and to come to conclusions about the nature of the object, or the environment that they come into physical contact with.

[1:48:87] The fourth branch of Sensory Philosophy is termed as tastation which, of course, is associated with the application of philosophical contemplations in relation to that which the philosopher can taste, and with the final branch of Sensory Philosophy which relates to the sense of smell and is henceforth known as aromation, are the two least utility forms of Sensory Philosophy, though their introduction is still relevant as they may still have their uses.

[1:48:88] It is important to understand that which is known as the Principle of the Mind within Sensory Philosophy which upholds the human mind is the domineering, precursory, and entirely dependent factor in all applications of senses to philosophical contemplations for those senses are wholly dependent upon the activity, capacity, and ability of the mind.

[1:48:89] Despite the digressional introduction of Sensory Philosophy in this discourse on obliviology, Sensory Philosophy is not classified as being within obliviological study, but is instead an entirely distinct area of Astronist Philosophy as it is not a discipline in and of itself; instead, Sensory Philosophy can be described as a collective of instruments to which philosophical contemplations may be applied rather than a particular study, for each of the practitions aforeintroduced in this discourse, can be applied to any relevant discipline of

Astronist Philosophy, which means that they are therefore cross-disciplinary, or transcendental in their classification.

[1:48:90] That which is innemically known as an exotic compact object, and is commonly referred to as a gravistar, which remains the preferred mode of attribution from the perspective of the Astronist philosophical tradition, is of great relevance to our deeper obliological contemplations.

[1:48:91] To make introductions, that which is known as a gravistar, a term of scientific cosmological originations, is even more relative to a black hole than even a neutron star which further reinforces the concepts that stellarologists do spend their time contemplating.

[1:48:92] A gravistar, as one step even further towards oblivionism than a neutron star holds the exact mass and density as a normalised black hole, but is instead made of exotic matter; the essential difference in characteristic between the two is that gravistars are dense balls rather than infinitely dense points like a real black hole exists as.

[1:48:93] The most crucial difference between gravistars and black holes is embodied in one single word; infinity.

[1:48:94] Gravistars, though they are as close to infinity as a cosmical entity can reach, and are subsequently teetering on the edge of oblivion, they are not infinite in their natures, which means they must remain cosmical, though their classification as a star is somewhat contested, and should be.

[1:48:95] The exotic matter that gravistars are made up of cause them to be impossible to with the human eye, and therefore, their true natures are still ultimately unknown with some scientists even doubting whether they exist at all, and are instead miscalculations for another type of obliogenic entity.

[1:48:96] Whatever be the case with gravistars, these are to be added to the growing list of curious entities to be philosophically discussed and contemplated within the discipline of obliology.

[1:48:97] To counteract notions of the inexistence of black holes, the concept that is henceforth known in obliological contemplation as the Trail of Destruction relates to the one avenue of observation that proves the existence of black holes.

[1:48:98] The Trail of Destruction concept looks towards the large patches of The Cosmos that are noticeably voidal after the presence of a black hole; these holes in intergalactic gasfields have been innemically discovered as holding a huge vastness, with some found to be large than entire galaxies, The Milky Way included, which is no feat achievable by anything other than an obliogenic object.

[1:48:99] The huge holes that black holes leave behind are henceforth known as Cosmic Cavities, or Intergalactic Cavities and although they are voidal in nature and appearance, they are distinct from being classified as actual voids for true voids are not caused by oblivionic activity, but simply just a lack of activity altogether.

[1:48:100] Intergalactic Cavities can be described as features of The Cosmos, and innemnically prove the existence of black holes to all doubters of the existence of oblivions for such doubters are able to see such destroyed regions of The Cosmos with their own eyes; black holes themselves may be presently invisible to our observations, but the dismantlements they cause of The Cosmic Structure is not so invisible.

[1:48:101] Another form of identification for oblivions are the shockwaves that they create when they have collided together; in a wider cosmic philosophical context, the study and contemplation of shockwaves and their affects on The Cosmos and its progeny, as well as the nature shockwaves is henceforth known as tantology, and is studied by tantologists.

[1:48:102] One of the most interest aspects of contemplation in relation to the perception of space, The Cosmos, and its progeny has emerged from obliviological study is that concept which is henceforth known as The Interspace Enquiry.

[1:48:103] The Interspace Enquiry entails the question of how far away one would need to be from something cosmically large in order to see it in its entirety; the extent of this distance is henceforth measured by the semistrument of interity; the extent of the interity is the distance that one has to be coordinated in order to see the entity in its entirety.

[1:48:104] The Interspace Enquiry, despite its origination within this discourse of obliviology, and despite its official classification as being part of the discipline of obliviology, is applicable to all other areas of Cosmic Philosophy that relate to a progenial entity.

[1:48:105] The Interspace Enquiry attempts to understand the perception of distance and proximity in The Cosmos in a distinctly philosophical way by forming ideas about the way by which we are to visually perceived, and understand the physicality of The Cosmos in its true of scales for it remains true that one would need to be trillions of miles away from most relatively large cosmic entities such as star systems and galaxies in order to see them in their entireties.

[1:48:106] As an extension of The Interspace Enquiry, there is that which is introduced herein and is henceforth known as The Interspace Formula; this formula holds that one must be at least twice as far away from the entity as the size of the entity exists; if The Solar System is calculated at approximately seven point four billion miles in size, then one would need to be stood at least fourteen point eight billions miles away from The Solar System in order to be within a chance of perceiving it.

[1:48:107] The Interspace Formula can be considered a element of The Interspace Enquiry as a way to physically and numerically calculate interity rather than only applying abstractions; in essence, The Interspace Formula is considered an important addition to all interspatial enquiry, and the Astronist Tradition sees the potential for the Formula to expand as The Interspace Enquiry itself expands after its own great vitality.

[1:48:108] In obliological study, that which is henceforth known as The Mathematical Paradox address any notions in relation to the fact that mathematics doesn't work for black holes, and especially if these such notions attempt to say that because of this lack of function for mathematics, then black holes do not exist; essentially, The Mathematical Paradox relates to any instance in which mathematics, physics, or even any other innemnic method is unable to make conclusions about that which the method is applied to.

[1:48:109] The Astronist Tradition, in this case, holds that black holes exist beyond logicity and rationality due to their three-dimensionality of chaoticity, cosmicity, and universality, and that which is universal and chaotic cannot be understood by logic and rationality, and by extension, is all the more difficult for mathematics to grasp.

[1:48:110] At this point, the Astronist Tradition upholds the importance of philosophy and philosophical enquiry and investigation entering the arena of discussion as the only other viable avenue of conclusion and understanding for black holes through the discipline of obliology; in the instance of oblivions, all we have are our contemplations for the laws, rules, and knowledge we hold of the way by which celestials work is entirely compromised.

[1:48:111] This is because the naturity of oblivions and the naturity of mathematics simply do not comply with one another on the most fundamental of levels; black holes are beyond rules, beyond orderity, and by the notions expressed in this discourse, are partially beyond cosmicity.

[1:48:112] There is a process of black holes that has only recently been scientifically discovered, and is the Oblivionic Evaporation process, which is known as black hole evaporation in non-Astronist contexts, and begins with the notion that all information becomes part of the black hole after everything that is within its influence enters it.

[1:48:113] However, with Oblivionic Evaporation, which is the gradual reduction of the mass of the black hole due to Hawking radiation, the black hole disappears from existence eventually, but that raises the question of where the information goes once the black hole has fully evaporated, and it is in opposition to the laws of physics to suggest the inexistence of information.

[1:48:114] In a mainstream physics context, this is known as the Information Paradox which, in an Astronist context, is henceforth known as the state of Ultimate Information

Loss; due to the transcendence of this beyond the innemnic ability to conceive, this issue therefore becomes one of Cosmic Philosophy, rather than an exclusively scientific issue.

[1:48:115] The Astronist Tradition herein proposes some potential solutions, or just simply some interesting notions in relation to the Ultimate Information Loss.

[1:48:116] The first of these notionises that the information within the black hole that is purported to been lost is so lost as soon as it enters the black hole rather than being lost at the point of the evaporation of the black hole, as is presumed in the theory about Hawking radiation, as that theory presumes that the information is still somewhat accessible or in storage even after it has entered the black hole and is still in some existence during the black hole's lifespan.

[1:48:117] The second suggestive notion about Ultimate Information Loss from the perspective of the Astronist Tradition entails the notion that when something enters a black hole, it enters an existence wherein information is not governed by the same principles as they are in The Cosmos, and therefore, our attempts to apply cosmic existence principles and laws to such informations that do enter oblivions is fruitless because of the very fact that the oblivionic laws of existence are incomparably different from those of The Cosmos.

[1:48:118] The Astronist Tradition, as derived from the principles of the Astronist Cosmology, holds that such oblivionic laws are so different from those that govern The Cosmos because of the influence that The Chaos and The Universe have over the existence of oblivions; black holes do certainly hold some cosmicality, or else we would not be able to perceive their existence, but due to the chaotic and universal forces that also govern the existence of black holes, the application of cosmic laws and ideas to information that enters black holes is doubtful to ever provide conclusions.

[1:48:119] Also derived from the principles of the Astronist Cosmology is that of the third approach to the Ultimate Information Loss, and consists of the notion that all information that does enter a black holes becomes entirely part of The Chaos and so, it is no longer part of The Cosmos, and therefore cannot be evaporated because evaporation is cosmical process, not a chaotic one.

[1:48:120] The fourth solution proposed by the Astronist Tradition consists of the notion that black holes hold the ability to transform all information that enters it into energy that is then used to power its functionality; this energy that is powering the oblivion is evaporated through thermal radiation.

[1:48:121] By this notion and proposed solution to the Ultimate Information Loss, the information of subject is transformed, or transferred rather than lost completely and because the information is not made inexistent, but is instead transferred, or transformed, then this bypasses the notion of information inexistence, which entirely avoids the Ultimate Information Loss.

[1:48:122] The fifth solution that is gauntleted herein holds that all information is stored in the singularity of the black hole which remains in existence even when the rest of the black hole has evaporated; this is able to occur because the singularity, as it is perceived by the Astronist Tradition, is entirely universal rather than existing cosmically, or even chaotically.

[1:48:123] Therefore, this exempts the singularity from being included in notions of information loss due to the fact that the information of subject is no longer part of The Cosmos, nor is it still part of The Chaos; this is considered to be the most prominent of notions suggested by the Astronist Tradition.

[1:48:124] The final solution proposed by the Astronist Tradition towards Ultimate Information Loss is that which is entailed by the notion that information becomes the black hole and therefore the information is lost when the black hole evaporates because the information is the black hole itself rather than a separated entity that is stored within the black hole; such a notion is poised to redefine the way in which we contemplate the singularity, as well as the entire nativity of oblivions.

[1:48:125] As an extension to this notion, the Astronist Tradition considers singularities to be positively unnatural, and therefore they are not cosmical by their very core nativity; as a result, they are categorised as positively universal due to the infiniteness of their nature which is the sole characteristic of that which is universal.

[1:48:126] That which is termed as The Oblivionic Interior Enquiry in the Astronist philosophical tradition of the discipline of obliviology ponders the question of what if we are living inside a black hole?

[1:48:127] The Oblivionic Interior Enquiry supports the notion that The Big Bang was caused by, or originates from the singularity of a black hole, which subsequently notionises that those which are termed as baby universes exist at the singularity of every single black hole that has ever been in existence in The Cosmos.

[1:48:128] By this notion, we understand that every black hole in every galaxy of The Cosmos is therefore harbouring baby universes within them which are waiting to come into existence; the process of which singularity is designated to become into another Big Bang is left to future contemplators for our current contemplations of this theory are in their infancy at best due to its introduction herein.

[1:48:129] I shall now introduce one of the prominentmost of all concepts and theories introduced and contemplated within this discourse of obliviology and it addresses the connection between black holes and an existence before The Big Bang.

[1:48:130] It is from the Astronist cosmological understanding that The Oblivionic Orifice Model emerges and is subsequently assembled herein and now; this model consists of

both a visual aspect, but also an abstract notion, the latter of which shall be introduced herein, and the former will need to be introduced at a later time, but herein its equal importance to the overall concept is granted.

[1:48:131] The Oblivionic Orifice Model holds that outside The Cosmos there exist that which is known in the Astronist Cosmology as The Universe which existed before The Cosmos began with the occurrence of The Big Bang.

[1:48:132] The link between black holes and the time before The Big Bang is made when black holes are understood as existing as orifices that link The Present Cosmos to that pre-cosmic existence known as The Universe in the Astronist Cosmology.

[1:48:133] By this notion, black holes should be imagined and understood as openings to The Universe, but because we and all other matter within The Cosmos are cosmic by our very core natures, we cannot exist within The Universe, as has already been affirmed, but also, neither can we travel through black holes in order to reach either The Universe, or any other higher form of existence, though the contemplations and conceptualisations of such notions are encouraged in order for the Astronist Tradition to stay within alignment to the Philosophical Spirit.

[1:48:134] Therefore, The Oblivionic Orifice Model understands oblivionic evaporations as the process of the closing up of these orifices to The Universe and in relations to that which is discussed and reintroduced as the Black Hole Cosmology of Astronist Cosmology, black holes are said to devour The Cosmos to the point at which The Cosmos collapses in on itself into the expanse of The Universe.

[1:48:135] By this notion, The Oblivionic Orifice Model understands that The Universe is in fact devouring The Cosmos and is using black holes to do so, if the Black Hole Cosmology is to be followed.

[1:48:136] It is important to note that The Oblivionic Orifice Model is not dependent upon the Black Hole Cosmology for its functionality and usage, and exists as its own independent theory with its central notion being that black holes are orifices to The Universe; whether this is connected to the end of The Cosmos, or the devourment of The Cosmos is up to the individual contemplator.

[1:48:137] Any notion that designates black holes as nonexistent just because we cannot understand, or we cannot seem is more likely to be merely evidence of a lack of understanding of black holes rather than evidence of an inexistence of them.

[1:48:138] In the context of Cosmic Devotion, the Astronist Tradition upholds that Astronist philosophers should believe in oblivions in general, and with the aim of gaining more knowledge and greater understanding of black holes, followers of Cosmic Devotion of Astronist Philosophy must devote to oblivions, the primary manifestation of which being black holes, but the Astronist philosophical tradition also suggests that there may

well exist other manifestation of oblivion, and it is these that oblivionologists must always take notice for the discovery of new forms of oblivion.

[1:48:139] To clarify, in the context of Astronist Philosophy, especially so within Cosmic Philosophy, an oblivion is that which exists with a singularity in some form.

[1:48:140] The term that is known as a naked singularity is not an Astronist originative term, but it is important in the study of singuletics, as part of obliviology, that we introduce its definition as it may one day form part of a newfound form of oblivion; in essence, a naked singularity is a singularity that is observable because there is no event horizon to enclose it.

[1:48:141] This, however, does not mean that such a type of singularity is any less universal than a normal singularity, however, the fact that such a singularity would be observable is a difficult notion to swallow, especially for the Astronist Tradition, as singularities are considered universal, and therefore unobservable by cosmical entities; such notions shall be henceforth expand upon in greater depth in order to form a fully augmented view of them from the Astronist philosophical and traditional perspective.

[1:48:142] That which is known as the ergosphere, as derived from mainstream physics, is the region of a black hole from which energy could still escape, and therefore rests prior to the event horizon.

[1:48:143] The Astronist Tradition considers the ergosphere to still be cosmical by its nature and therefore, that which is ergospheric is the perfect embodiment of three-dimensionality that has been aforeaffirmed in this discourse; that which holds that there is a distinct cosmicality, chaosity, and universality.

[1:48:144] There is a prominent process within the study of black holes that is known in non-Astronist contexts as spaghettification, but in an Astronist philosophical context is henceforth known as nihilation; nihilative contemplations surround notions of the instance in which an object that falls into a black hole would be stretched and ripped apart by immense gravitational forces; the nihilativity of something compares other forms of Cosmic Death to nihilation, which is considered the worst form of Cosmic Death.

[1:48:145] The contemplation of nihilation is of great concern to oblivionologists because it relates to the occurrences within a black hole, whereas the majority of our contemplations in this discourse have focused on black holes externally, rather than internally, except for the contemplation of the singularity.

[1:48:146] That which is known in mainstream physics as the Penrose Process relates to the utility of a black hole's energy through various different technological methods, such endeavours of which the Astronist Tradition wholly supports and is accustomed to help fund; in fact, such projects provide an anthropic usage of black holes, which can be used to

justify our greater research and attempt at understand, despite this being a sufficient enough reason alone.

[1:48:147] The final aspect of a black hole that we must contemplate in this discourse before we end with Oblivionic Issues and an Oblivionic Instrumentation is the contemplation of that which is known as the point of no return, but formally as the Event Horizon.

[1:48:148] The Event Horizon is that which is henceforth known in Cosmic Philosophy as an indesignation, which means that it is officially categorised into any dimensionality such as The Cosmos, The Chaos, The Universe, or The Divine; the event horizon is an example of these rarities and is indesignated due to the opinion of the Astronist Tradition.

[1:48:149] Beyond the event horizon, no object, not even light, may escape the influence of the black hole, but we must contemplate what the difference is between existence prior to the event horizon, and after it; what is the nature of this difference and why is the point of the event horizon where it is?

[1:48:150] If event horizons are regions beyond which events within them cannot affect, or be affected to an outside observer, then the boundary of the event horizon certainly marks the difference between the states of chaosity and universality in a black hole for it is beyond the event horizon that outside observers cannot affect because that which is beyond the event horizon is in a universal state and that which is in a universal state cannot be interacted with that which is in a cosmical state.

[1:48:151] We shall now address the six problems that still persist in relation to black holes and these are henceforth to be collectively known as the Oblivionic Issues; it is important to note that these are not philosophical issues, but originally mathematical ones and therefore, to apply philosophical conclusions to some of these issues would be fruitless for the issues do not stem from a philosophical origin and to apply philosophical parameters to them would therefore be without cause or effect to the issue in subject.

[1:48:152] The first of these is known as the No-hair Theorem, or the No-hair Conjecture which upholds that all black holes and their solutions of the Einstein-Maxwell equation in relation to gravitation and electromagnetism can be identified by a total of three external parameters including mass, electric charge, and angular momentum.

[1:48:153] Hair, in the title, remains the metaphor for the matter which formed the black hole, or that which has, or is falling into it and due to such objects falling beyond the event horizon, they remain permanently inaccessible to all external observers; this is a problem of mathematical origin as physicists utilise mathematical parameters in order to derive an understanding about black holes and the nature of the objects that falling inside them.

[1:48:154] The second of the Oblivionic Issues is that which is known as Cosmic Censorship which resonates in two varieties, the first is titled as weak, and the second is

titled as strong, with the former asserting that there can be no singularity visible from the event horizon, and with latter focusing on the deterministic outlook of the theory of general relativity in relation to the observability and the classical fate of entrants into a black hole.

[1:48:155] The third of the Oblivionic Issues is that which is known as the Alternative Models which embodies a mathematical theory that attempts to avoid other Oblivionic Issues such as Ultimate Information Loss, as it is known in the Astronist philosophical tradition, as well as the issue of the unobservability of the black hole's event horizon.

[1:48:156] The fourth of the Oblivionic Issues is in fact a solution to Ultimate Information Loss in and of itself, and is known as Black Hole Complementarity and it is these such attempts to provide solutions to some of the most difficult of issues to approach which demonstrates the similarity in outlook between scientists and philosophers for both sets of people are constantly attempting without certainty of success and it is this determination and deep adoration for the subject they concern themselves with that we must applaud.

[1:48:157] That which is known as ER=EPR is the fifth of the Oblivionic Issues and states that entangled particles are connected by wormholes and therefore could reside as a basis for unification of general relativity, as well as quantum mechanics in order to derive a theory of everything.

[1:48:158] The final of the Oblivionic Issues is that which is known as the Final Parsec Problem, which concerns itself with how supermassive black holes are said to merge with one another with the essential problem arising in the notion that it would take billions of years for them to orbit closely enough to merge, longer than the age of The Cosmos itself; therefore, there must an accelerant of some description that is making the merge possible, and it is this accelerant that contemplators of the Final Parsec Problem should attempt to uncover.

[1:48:159] We shall conclude this discourse with a full instrumentation, as has been custom with many of the other discourses of disciplines of this disquisition, yet this one shall specifically focus on black holes of course; this specific type of instrumentation is henceforth known as an Oblivionic Instrumentation and this is that which we shall conduct herein and now.

[1:48:160] The abundance of black holes stands in parallel to the abundance of the galaxies of The Cosmos for at the centre of every galaxies lies one of these oblivions, but also, the abundance of stars can be said to stand as a parameter for the abundance of black holes, although not every star ends up being a black hole which means stars a less stable parameter for the abundance of black holes.

[1:48:161] Nevertheless, the abundance of black holes as a distinct phenomenal entity is still as significant as some of the other most prominent and abundant celestials of The Cosmos.

[1:48:162] As the comparter instrument to abundancy, we shall now also consider the frequency of black holes which, except for the instance of black hole convergence, is typically very low due mostly to the disproximity of galaxies.

[1:48:163] As an extension to this contemplation of the frequency of oblivions, we are able to derive an understanding of the central nature and characteristic of black hole; they exist as lonesome, separated, and devourmental entities and so they are destined to have low frequencies by their naturities, also except for during the occurrence of the Black Hole Cosmology, wherein black holes are the only existent entities, and their frequencies are so high that they begin to devour one another.

[1:48:164] Despite the lack of frequency in relation to black holes, there can exist binary black holes, but the length of the occurrence of this is only destined to be short for the central functionality of black holes is devourment and therefore, they are destined to devour one another.

[1:48:165] The main instance of binarity in relation to black holes is the convergence of black holes, but the most common binary feature of black holes, as in two components, is that which exists prior to the event horizon, henceforth known as prerizon, and that which exists post event horizon, henceforth known as postrizon.

[1:48:166] This demonstrates an aspect of binarism to the naturity of black holes which is derived as fundamental to the motionality of black holes, as well as their dynamicity; these components of black holes must somehow have knowledge of one another to know when one begins and when the other ends, but whether these two oblivionic components do work together for the functionality of the black hole is a question posed herein that should be further discoursed upon in the future.

[1:48:167] Throughout our discourse on oblivions, one element of our discussion that has caught many a conclusion is that oblivions, despite their alignment with chaosity, and disorderity, are physically central, abstractly central, futurally central, cosmically central, and predictionally central; essentially, in all the ways an oblivion can be central, it is considered so, a conclusion as such that is difficult to accept, though must be accepted due to the realities that our contemplations have unfolded.

[1:48:168] Despite the centrality of black holes in relation to the cosmical structure, and despite their three-dimensionality that is aforeaffirmed, they are still considered majoratively chaotic by their naturity due to their perceived disorderity and the functionalities they do express; therefore, black holes are considered to be the most prominent of entities that stand in alignment with The Chaos.

[1:48:169] Furthererso, black holes are expected to be depicted as the most common of phenomena of The Chaos, so much so that black holes are to become synonymous with The Chaos as part of the Astronist Cosmology.

[1:48:170] Despite the lack of our knowledge about black holes, we can still derive a great deal of composity in relation to them, as we cumulate all the different parts of a black hole that we have aforescussed into one insentensation.

[1:48:171] The composity of black holes is revealed when we consider the existence of the ergosphere, the inner and the outer event horizon, the singularity, the accretion disk, and the photonsphere; when these segments of a black hole are listed in such a way, the compositeness of black holes is revealed to us as the contemplators.

[1:48:172] We are also able to contemplate concentricity in relation to black holes as firstly, they do constitute the centre of all galactic concentricities, and from the images that been imagined of black holes, we can derive their circularity, and by understanding their compositeness, we can also derive their concentricity from this.

[1:48:173] This further demonstrates the prevalence of the concentric pattern and structure of The Cosmos, even so in such a chaotical entity, but this also expands upon the notion the prevalence of concentricity even beyond The Cosmos, for perhaps the concentric shape and pattern is also prevalent in a universal context; if so, does that derive that concentricity is in fact the singlemost consistency in existence?

[1:48:174] The application of the instrument of corality to oblivions is the most prominent form of its application as the cores of the majority of entities in The Cosmos are either black holes presently, or are destined to inevitably reside as black holes in some evolutionary period.

[1:48:175] Again, as the notion has been aforescussed, the fact that black holes either are presently or are to exist as the cores of cosmical structures, even including some of the largest cosmic phenomenas such as quasars, this ignites a disturbing notion that black holes are essential central to the cosmical system despite their officially classified and perceived disorderity and chaosity; this notion shall remain of the prominentmost issues of Cosmic Philosophy, not only obliology.

[1:48:176] If black holes are abundant, and if they are centralities as aforementioned, and if they are integral to the operations and functionalities of The Cosmos, then why must we still consider them to be against cosmicality?

[1:48:177] Black holes are not entirely incosmical for one third of their three-dimensionality is of course cosmical so any notions suggesting that black holes are not cosmical at all need to understand that if they were not cosmical at all we, as cosmical entities, would not be able to perceive them and they would not exist within The Cosmos like they do.

[1:48:178] The Astronist Tradition sustains that black holes must be cosmical to a certain extent so that they may still exist within The Cosmos as they do, however, the Tradition also maintains that at their core, black holes are not in full alignment with the cosmical

orderly, like planets, stars, and galaxies are, and because of this they are considered as part of cosmical disorderly, despite the cosmicality that they do still command; this remains one of the prominent contentions in relation to the contemplation and study of black holes in Cosmic Philosophy of the Astronist philosophical tradition.

[1:48:179] The criticality of black holes is one of the highest of any phenomenal entity in The Cosmos due to the devourmental naturity of black holes, and their ability to reek cosmic disaster as manifested by the devourment of solar systems, the radiation bursts that it exhumes, as well as the voidal regions it leaves behind in its wake, as is further discussed within the concept of the Trail of Destruction.

[1:48:180] The application of the instrument of dyadicity to black holes is manifested by the aforementioned regions of prerizon and postrizon, but the interactions of these entities, as aforementioned, is currently unknown and inconceivable with present understanding of the natures of these two elements.

[1:48:181] Another area of application for dyadicity is the interactions of the different composites of oblivions and how they function together which are to be henceforth contemplated by oblivionologists.

[1:48:182] The dynamicity of a black hole measures the affect on the change, the activity, and the progress of the black hole in relation to time, distance, and evolution, and also includes the comparison of these three components of black holes to other progenial entities, as well as The Cosmos in its entirety.

[1:48:183] Black holes are one of the largest driving forces of change in relation to both The Cosmos in its entirety, as well as cosmical progeny individually, examples of which include the devourment of stars and star systems, the centrality of galaxies, and the devourment of progenial entities.

[1:48:184] Essentially, the change segment of the application of dynamicity to black holes is high, as is the activity segment of dynamicity for black holes are often the centre of activity in The Cosmos, especially so due to their positions at the cores of galaxies, as well as black holes exhuming radiation and other bursts of energy.

[1:48:185] The final component of dynamicity is progression and even though we may speak of black holes is a tendency of negativity, they do possess a progressive role in that they force movement, but they generally do not provide advancement as is the hallmark of progression.

[1:48:186] Due to singularities existing infinitely and due to their classification as stapular parts of every black hole, there is a distinct eternality in relation to black holes, specifically the nature of the foreverness of singularities, as well as the subsequencies of such a feature.

[1:48:187] Even after black holes have evaporated, the singularities are still said to exist afterwards, but in what capacity, and whether such singularities are truly eternally existent is another question for singuleticists to contemplate for will singularities still exist in some capacity even when The Cosmos has dissolved?

[1:48:188] Foreverness in both concept and physical being is fundamentally non-cosmical as it is most accurately described for the essence of cosmicality is limitation and order, while foreverness invokes limitlessness and therefore, a sense of disorder for the continuation of order of an infinite amount of time is considered impossible by the entirety of the Astronist Tradition; this is henceforth known as The Infinite Continuation principle which, despite only its first mention here, is to be considered as one of the most fundamental aspects of how Astronists understand the maintenance of order.

[1:48:189] One question that is posed in relation to the finiteness of black holes is whether the occurrence of the evaporation of black holes signifies a sense of finity for black holes, as another aspect of their existence, and therefore, are black holes more finite than they are infinite, and which parts of them are more so, or less so finite?

[1:48:190] From the vast array of contemplations that we have embarked upon in our obliological discourse, we can consider the overall importance of black holes in The Cosmos, so as to apply the instrument of study of focality, to be of great immensity.

[1:48:191] This conclusive judgement of the focality of black holes arises due to their central positions in relation to star systems and galaxies, their ability to control cosmic affairs, as well as their general uniqueness in role as part of The Cosmos, and futherso in addition to their close connections to all of the major celestial entities, such as the stars, the galaxies, and the quasars.

[1:48:192] Considering each of these aspects of black holes independently, and later cumulating them into one focality of importance leads us to determine that obliions hold an immense amount of importance to the general functionalities of The Cosmos as is abounded by the perceived intrinsicness of black holes in relation to other entities in The Cosmos.

[1:48:193] As we now know and as is self-evident, the instrument of study of formity contemplates the formation of the entity to which it is applied, and in the case of a black hole, as has been discussed within our obliological discourse, the initial formation of obliions is generally less than a second, while they then take millions of years to develop to the immense sizes they are able to grow to.

[1:48:194] Futherso, the formation of black holes can also be understood as an event intrinsically tied to that of a supernova, and in a similar way to our current understanding of the way by which The Cosmos is thought to have begun, the formation of black holes is also paired with a big bang of sorts, but in a much inferior way to The Big Bang itself of course.

[1:48:195] To apply the instrument of formity in its proper way, we must invoke the instruments of orderity, naturity, and motionality in our conclusion of formity of black holes.

[1:48:196] By any means, and despite the categorised naturity of black holes as disordered and chaotic, the way by which they form cannot be said to match this officialised belief for their supernovaic originations, their stellar precursors, and the general procedure by which black holes form is exactly that; a procedure; something that is methodically established and therefore tends to follow a set course of actions and therefore cannot be described as disordered whether generates further disturbances in relation to the true nature of black holes.

[1:48:197] Moving onto the naturity of black holes in relation to the instrument of formity now, and as was described in the previous insentensation, the entire formation of black holes cannot fairly be described as disordered, or in any way chaotically as the process is directly interconnected with the most ordered and cosmical entities of The Cosmos; stars.

[1:48:198] Essentially, even after this lengthy obliological discourse, the true naturity of black holes, especially in relation to their formations which stand contradictory to their generally and officially ascribed naturities, remain to allude us for we still cannot not entirely comprehend their naturities.

[1:48:199] As the final portion of a proper application of the instrument of formity, we must also coapply the instrument of motionality, which includes understanding the formation of black holes according to motion; incomprehensible explosions, radiation bursts, immense gravitational pressures, and incomparable cosmic forces are all objective characteristics of black hole formation.

[1:48:200] However, despite the fact that these characteristics do sound like the essences of disorderity, they can in fact be understood as more proximate to the essence of orderity for the most violent and traumatic of events can be the beacons of order in The Cosmos, for The Cosmos itself formed from the most violent of occurrences to ever be conceived.

[1:48:201] The instruments of fundamentality and functionality are inextricably linked with one another and in the context of oblivions, such are necessary in the evolutions of stars, are necessary in the functionality of galaxies, and are also necessary in the functionality quasars, and therefore, we can safely conclude that the fundamentality of oblivions is profound, as is further demonstrated by other similar applications such as those of focality, intrinsicity, and imperativity.

[1:48:202] Functionality is a product of purposity and so, for an entity to function, it must first hold a purpose; the purpose to which a black hole is associated has been touched upon in a variance of instances throughout our obliological discourse, yet one definite purposity has not yet been determined.

[1:48:203] For this reason, the functionality of black holes must remain an open question to all obliologists for the purpose to which we apply our understanding of the functionalities of black holes is yet determined for a precursor to be undetermined that leaves the postcursor also undetermined; this is an area that the Astronist Tradition greatly encourages greater discussion for obliologists to enact in order to derive a determination of functionality in relation to purpose.

[1:48:204] We can derive fusionality in relation to black holes by the notion that black holes fuse with the information that enters them; by this notion, information and the black holes into which the information falls become as a oneness, as is aforementioned in this discourse in relation to a solution of the Ultimate Information Loss.

[1:48:205] We may need to look to further applications of the instrument of fusionality in order to comprehend other areas confounding us about black holes; perhaps the mysteries that enshroud the instrument of fusionality are set to clarify open questions in relation to obliions.

[1:48:206] The imperativity of an entity is measured by the immediacy of the event, which is dependent upon the observer/perceiver, so in relation to black holes, one could argue that the imperativity of black holes to humanity at present is fairly low, yet another philosopher could argue that the imperativity of black holes skyrockets when the perceiver is a galaxy, or a star, or some celestial entity within proximity to a black hole, or even a sentient observer within proximity of a black hole; essentially, when applying the instrument of imperativity, one must always remember that the extent of the imperativity is dependent upon the perspective from which you are conducting the instrumentation of imperativity from.

[1:48:207] Through this obliological discourse, it is fair to say that a balance between innemnic knowledge and philosophical contemplation and understanding has attempted to have been struck, however, the balance of which I speak is certainly unstable due to the constantly changing levels of innemnicity and the unknown in relation to black holes.

[1:48:208] To understand innemnicity at its core, one must understand that it works in a very contradictory fashion meaning that when an innemnic, known in non-Astronist fields as empirical, finding has been made, the concepts and theories surrounding such a find often only reflect the lack of our understanding, or raise new queries to the subject so in essence, an attempt to gain greater innemnic understanding is often rewarded with only a greater misunderstanding of one's initial thoughts of the subject, or with a greater gap between that which is thought to have been known and that which is not known at all.

[1:48:209] Essentially, one's intention for this discourse has been to strike an innemnic accord between the influence of current scientific knowledge and the influence of the principles and concepts of Astronist Cosmology, which may well result in some medianic hybrid between innemnicity and disinnemnicity.

[1:48:210] The application of the instrument of study of matrixity to black holes strikes that which is henceforth known as an Absolute Oppositism to The Matrix for The Matrix advocates for a strict adherence to cosmical orderity, so as not to allow any chaotical or unknown influences, including those of a universal naturity, to pervade the cosmical system, yet this describes the entire functionality, naturity, and fundamentality of the oblivions within The Cosmos.

[1:48:211] By the very nature and characteristics of oblivions, they can be regarded as the essential embodiment of the instrument of study of mysteriosity in The Cosmos; oblivions are the primary manifestations of cosmic mystery, as is further bolstered by the general air of unknowingness surrounding them in their entirety, and this is not to be just applied to the chaotic portions of black holes, but to their cosmical and universal aspects too; by this notion, we derive the mysteriosity is not just a measure of chaoticness, but rather a more transcendent application.

[1:48:212] But what are the essential elements of oblivions that make them so very mysterious? The first of which can be included as the event horizon as the prominentmost these due to the issues regarding its classification, as well as it acting as the barrier beyond which normal physics and law and reason are abolished.

[1:48:213] Other facets of mysteriosity include the invisibility of oblivions, the lack of understanding of what is beyond a black hole, how they work, and a lack of understanding about the purpose of oblivions.

[1:48:214] The orbitality of black holes is something that we have not yet addressed, despite the length of this obliviological discourse, but the essential notion here is that those black holes which are not supermassive, and those which do not dwell at the centre of galaxies, must orbit around the galaxy in order to keep in pace with its motions and all the other celestials that do also orbit; this demonstrates the ability of black holes to orbitality, therefore a keystone to cosmicality.

[1:48:215] However, regarding the supermassive black holes at the centre of galaxies, these are the orbit itself for all other celestials of the galaxy do orbit around it and are therefore tied to their controller; obliviologicalists are henceforth tasked with contemplating this further.

[1:48:216] The shape of black holes is something that we presently do not hold extensive knowledge of, and despite the vast amount of imagery and the general consensus of the Astronist Tradition holding the tendency to support oblivionic circularity, Astronist philosophers are nevertheless encouraged contemplate the variations of shapes of black holes.

[1:48:217] Furtherso, the application of the instrument of orthogonality relates to the notion that black holes are shaped in right angles, and is therefore in opposition to the

notion of oblivionic circularity, yet this notion draws upon the principles of the Philosophical Spirit because even though the orthogonality of oblivions is most likely false, the very fact that we are able to contemplate it is a central component of philosophical enquiry.

[1:48:218] The application of the instrument of primarity measures the importance of black holes in order to emphasise its importance over another entity; oblivionists consider black holes to hold ultimate primarity over all other entities in The Cosmos, while disoblivionists only consider black holes to hold primarity over certain entities, including stars, galaxies, quasars, and other celestial phenomena.

[1:48:219] The instrument of progressivity contemplates the physical progression of an entity in terms of motion as the sole determiner of progression and in relation to oblivions, the determiner of progression is the expansion in size of the black hole during its formation and later existence before its begins to evaporate.

[1:48:220] The instrument of progressivity also attempts to determine the nature of what progression means in relation to different sets of criteria which, in this particular circumstance, points to what progression means in relation to oblivions; the Astronist Tradition understands progression in relation to oblivions as measured by the extent of the information and objects devoured by the oblivions throughout its existence as the sole determiner of its progressivity.

[1:48:221] Therefore, each black hole has a unique progressivity as is reflected in their size; therefore, stellar-masses, supermassives, and quasars all hold varying degrees of progressivity with progressivity being directly proportionate to the greater the size of the oblivion in subject.

[1:48:222] The application of rationality to black holes is often fraught with an ability to come to a conclusion about how black holes suit the natural order, or the laws of physics; this is because oblivions, as has been upheld during this discourse by the Astronist Tradition, are not wholly cosmical, and therefore they cannot be applied to by cosmical means of understanding,

[1:48:223] Essentially, black holes defy rationality because they are not structured in the same way, and they do not function in the same way that any wholly cosmical entity does function, or is structured, therefore the application of rationality holds a great deal of limitation in the extent of its ability to make rational conclusions about oblivions; thus, the application of rationality to black holes is considered one of the primary issues of obliviology that studiers of the discipline must contemplate further in order to resolve.

[1:48:224] However, the application of rotality in relation to black holes is much clearer for us to contemplate herein for there exists three presently known forms of oblivionic rotation; a retrograde rotation, prograde rotation, as well as a state of irrotation which

means that the black hole itself stays stagnant yet the accretion and the photonspheres do still enact their rotations.

[1:48:225] The fact that there exist these different forms of rotation for oblivions demonstrates another sense of cosmicality to black holes for stars, galaxies, quasars, and other celestials also hold varying levels of rotality, and in different forms so by the notion of rotation, black holes are not different from many of the other celestials in The Cosmos.

[1:48:226] As one of the primary functionalities of celestials, rotation must be understood in relation to the instrument of functionality which will further assist us in our applications of that different instrument in the context of its oblivionic application.

[1:48:227] Further so, the very fact that black holes interact with the cosmical system at all in relation to rotation is a positive sign that black holes are not entirely disassociative to The Cosmos and its orderities, yet this calls for further concerns in relation to the balance of cosmicality, chaosity, and universality in relation to black holes; one of the major open questions of obliviology is held as what is the dominant naturity of black holes out of these three forms, or is a balance trility the ultimate answer as has been aforescussed?

[1:48:228] The application of the instrument solarity explores that which is known as the stellar-oblivionic relationship which involves an attempt to better understand the interactions between stars and black holes, the precursory nature of stars in relation to black holes, as well as the way by which we are to understand the devourment of stars by black holes.

[1:48:229] An application of solarity to black holes also addresses notions of comparison between the ways by each these different entities function, as well as contemplating the extent to which both of these entities align with the cosmical orderity and the comparison of such extents.

[1:48:230] Black holes and star systems hold the greatest of all symbiotic relationships, and it is to this that the instrument of symbioticity is best applied for the star systems of all galaxies are commanded by their oblivionic controller in terms of rotation and orbitality around the galactic core.

[1:48:231] Despite the digression, we must address the notion that if black holes are the cores of galaxies, and if they do therefore control the star systems within a galaxy, are black holes not just galaxies themselves?

[1:48:232] One would be correct in countering that galaxies are made up of a multitude of different entities rather than just one, and this is the official view of the Astronist Tradition, but this notion should still stand and there remains no issues in contemplating it further for it is interesting if nothing else.

[1:48:233] Returning to our application of symbiocity, we can derive, just by a simple contemplation of analysis of the interactions of black holes and their roles in The Cosmos that they share a symbiotic relationship with all the main entities in that which is known as the Cosmic Pantheon which henceforth refers to celestial entities considered collectively.

[1:48:234] For this reason, one may argue that despite the disorderly and partial cosmicality of black holes, they are very much symbiotic for their cooperation with other entities of The Cosmos can be described as something of a commonality.

[1:48:235] To counterbalance this conclusion, we must note that this is made in relation to black holes in general, however, if we apply this to certain parts of black holes, the symbiocity is lost, especially in relation to the segments of the event horizon, anything within the event horizon, and the central singularity.

[1:48:236] These segments of the oblivion are entirely non-cosmical, and therefore, to suggest there exists a symbiotic relationship between cosmic entities and these oblivionic segments is almost inexistent due to the event horizon and especially the singularity, existing in a state of pericapation, as it is to be henceforth known.

[1:48:237] To be in a state of pericapation is in a cosmic philosophical context, as an Astronist-originative term, is to be distinctly disconnected from the wider Cosmos, which is especially demonstrated by the state that a singularity exists in; encapsulated, and therefore a distant, remote, and isolated entity.

[1:48:238] The Astronist Tradition considers only a few different entities to be in a pericapative state, which includes the singularity of a black hole, the event horizon of a black hole, the cores of worlds, and the cores of stars; pericapation is characterised by an inability to either physically, or mentally reach, understand, or be able to associate the entity with any other; an inability to complete all three demonstrates that which is known as circumcapation which is the most extreme form of pericapation that only singularities of black holes are currently able to achieve.

[1:48:239] To apply the instrument of synchronicity to black holes is to attempt to alineate other entities that hold their functionalities at the same time as black holes, exist in parallel to black holes, or hold the same lifespan as black holes.

[1:48:240] The first segment of the instrument is perhaps the most difficult to apply, but we can draw upon the fact that galaxies must enact their functions in time with the functionalities of black holes due to the latter existing within the former.

[1:48:241] The second segment of the instrument of synchronicity can be vastly applied to all entities that exist in the same time to black holes, but not necessarily in proximation to the black hole itself; this can be anything from stars, to star systems, to planets, to nebulae; this segment is usually applied in relation to galaxies.

[1:48:242] The third segment of the instrument of synchronicity as it is applied to oblivions produces that which is known in the Astronist philosophical tradition as an omniritus which is a paradox, or an inability to apply the instrument and to receive a rational conclusion.

[1:48:243] The time it would take for a black hole to evaporate, which marks its lifespan as that is the end of its existence is currently understood to far outreach the current age of The Cosmos itself; even the largest of celestial entities do not have projected lifespans in that range, and therefore, nothing can be applied to this and therefore an omniritus is left.

[1:48:244] Perhaps the most suitable instrument of application to black holes out of any other is that which is known as vastity; the vastity of oblivions is incomparable to any other extent of vastness, whether that be compared to the vastness of the information oblivions can devour, or by the sheer gargantuaness of oblivions.

[1:48:245] Essentially, whether the oblivions of The Cosmos are able to be applied to vastity is another notion to contemplate, but herein we do continue to apply it especially so in the complexity of black holes and the interconnectedness of their functionalities, as well as all the operating segments that do exist within and outside them; another for oblivionologists to contemplate for sure.

—

[1:48:246] Throughout the history of humanity, every single individual has sought, throughout every day of their existence, the answers to their existence, have pondered the question of creation, and have placed those contemplations into ideas, into systems, and even into people, objects, or events that have occurred here upon The Earth.

[1:48:247] We have described the creator in as many ways as there exist people to describe it, and our civilisations throughout the millennia have created countless idols, prophets, words, images, and concepts in an attempt to describe ultimatum, or absoluteness.

[1:48:248] However, in all of this time, there has been little to no considerations taken to those entities which really do merit our devotions, and our contemplations, and our idolisations; these are the progenies of The Cosmos, and it remains the penchant of Astronist Philosophy to direct our hearts, minds, and souls towards understanding and seeing celestial entities in this way.

[1:48:249] The religious traditions speak of the almightiness of that which they understand as God, and they place their faith in words, and speeches, and imageries; these is not where the Astronist philosophical tradition places its faith and despite the affirmed existence of The Divine in the Astronist Tradition, there exists a more proximate manifestation of what we understand as ultimatum and absoluteness to humanity and these exist in The Cosmos, and these are what we call oblivions.

[1:48:250] The next section of this contemplation is dedicated to those whom downplay the significance of The Cosmos and its progeny, to those whom attempt to dispel the Astronist Tradition's awe of the celestials, and to those whom do not fully understand the true immensity of the entities we are addressing, as well as the disbelievers of the existence of these entities and their significancies to the entirety of existence.

[1:48:251] One must now close one's eyes and imagine, by all that their minds may muster no matter how unimaginative they may be, a black hole, and one must imagine oneself in front of that black hole.

[1:48:252] They should imagine a gaping hole the size of millions of suns like in the day, or the size of trillions of moons like in the night; before one would know what was happening to them they would be enveloped by this hole, but for imaginary purposes, we shall ignore the laws of this entity.

[1:48:253] One should imagine this oblivion before them, and they should imagine that they can see how it has no beginning and it has no end from their point of view standing before it; they should imagine to see a string of light from a nearby star being draw to the oblivion, but eventually disappearing into the darkness; a star, even millions of times brighter than the sun we see, love, and dependent upon, is overwhelmed by the darkness of this entity.

[1:48:254] And finally, we imagine the darkness; a darkness incomparable with any darkness found upon any planet, or found in any corner of The Cosmos, or of our own selves, within our bodies, or within our minds; this darkness is eternal, as it defies cosmicality, it is featureless, as it resembles nothing else, and it is relentless in its devouration of all that strays to close.

[1:48:255] Standing before this entity, into which you shall fall upon the end of this contemplation, you cannot honestly say that the traditions you follow, or may not follow, can prepare you to contemplate the entities of ultimation such as this.

[1:48:256] In the face of oblivion, you can forget your sayings and your rituals, your beliefs and your opinions, your hopes and promises and the promises that have been made to you for there exists only one truth in Astronist Philosophy; the moment in which you come face to face with oblivion is the moment in which you understand the confoundation of The Cosmos, the incentricity of oneself, and the insignification of our beliefs.

[1:48:257] And now at this contemplation's end, the metaphorical barrier protecting you from the oblivion is removed and you fall for entirety into a bottomless hole in a trench of spacetime that is both inescapable, incomprehensible, and inmanifestational.

—

[1:48:258] Levitate a sheet of paper in front of you; this paper resembles space, time, matter, and The Cosmos.

[1:48:259] Take a pen, or pencil and stab a hole, large or small, through the paper; this hole is what we know as a black hole; a tear in the plane that is The Cosmos.

[1:48:260] All that enters it cannot escape, and all that exists in The Cosmos cannot exist within it, including space, and time, and matter, and light, and all we know true; with your sheet still in levitation, now look beneath it, beneath hole, and ask the question many have asked before you, what is that underneath, or beyond the hole?

[1:48:261] It cannot be The Cosmos as we know it for a tear in sometime cannot lead to that same place.

[1:48:262] Logic tells us that for something to exist, there must be a medium within it, around it, or beyond it; is this the same for black holes?

[1:48:263] Perhaps it is the penchant of the philosopher to be entrapped by his own thoughts.

[1:48:264] The more that happens to oneself, no matter the severity and pain caused, the more one will be able to discuss and contemplate through their own experiences, personal attachment, and greater understanding of the subject in question.

The Philosophy of Astronomy (Astronomology)

[1:49:1] The discipline that is henceforth known as astronomy is considered to be one of the most important discipline of Astronist Philosophy, especially so when in relation to the practical application and implementation of the Astronist philosophical tradition into any society, or civilisation.

[1:49:2] Astronomology concerns itself with the philosophy of astronomy, but more specifically, it relates to the implementation of Astronist Philosophy into a society, the effects of such an implementation, the methods of such an implementation, and also addresses the justifications for such an implementation to occur, as are held by the Astronist Tradition.

[1:49:3] Astronomological contemplation centres on the role of astronomy in not only human civilisation, but more widely, sentient civilisation of all kinds; it is important to note herein that the Astronist Tradition does not limit itself to be applied to human sentience, but instead, sentience of all variations so as to be in preparation for the future of human civilisation which is expected to come in contact with other sentient civilisations.

[1:49:4] Astronomologists are therefore tasked with creating methods of Astronist philosophical implementation, the different approaches to which can be titled either by the nature of the type of implementation used, or by the name of the philosopher that created the method.

[1:49:5] Astronomology is very closely associated with Astronarianism, however, the two are distinguished in that the latter relates more to a political, educational, and economic system, while astronomy relates more to the implementation of a social and cultural system centred on astronomical observation and wider Astronist Philosophy; the two are certainly linked though and this must always be observed by astronomologists in their contemplations and in their proposed methods.

[1:49:6] The Astronist Tradition considers astronomy, to not only be an activity of science and technology, but primarily, a philosophical activity that draws upon greater knowledge, and comprehension of The Cosmos, and astronomical observation is an activity from which we are able to derive belief, meaning, and substance in our lives for every human individual always requires these three aspects, hence the popularity of religious tradition throughout human history.

[1:49:7] Astronomology is also concerned with naology, though naology is not a branch of astronomy, however, naology deals with Astronist philosophical buildings and their study and contemplation.

[1:49:8] In an astronomical context, Astronist philosophical buildings are considered central to the entire process of implementing astronomy into any society for they stand as proud manifestations of astronomical observation, and cosmological study, as well as symbols of cosmic devotion, Cosmic Philosophy, and the commanding aspect that a building brings to a society is certainly something that naology gains inspiration from religious traditions.

[1:49:9] Astronomy praises Astronist philosophical buildings for their ability to stand as beacons of philosophy and astronomy in societies and in wider civilisations just as the phrontisteries do stand as beacons of education, and administrative buildings do stand as beacons for corporate and governmental operations.

[1:49:10] Similar to the way in which churches once stood as the central buildings in a society, Astronist philosophical buildings of whichever category are considered by the Astronist Tradition to be the new central buildings in a society, and it is to this aim that astronomical study and contemplation strives.

[1:49:11] With all contemplations and studies of astronomy, one must always remind oneself of the context of astronomy in the Astronist sense; as aforementioned, astronomy is considered to be a philosophical activity primarily, not just a scientific activity, which in turn, points astronomy towards become something larger than it is currently perceived.

[1:49:12] In essence, astronomy is considered by the Astronist Tradition to be humanity's outlet of vision towards The Cosmos; it maintains that without astronomy, we are blind to The Cosmos and the workings of its progeny.

[1:49:13] To extend our discourse of astronomy beyond the initial introduction, we turn to address one of the most important concepts of all astronomical study and that is manifested in that which is henceforth known as significancy.

[1:49:14] Significancy is a semistrument that measures the relevance, centralence, and the overall significance of astronomy, philosophy, and the entity that is known as The Cosmos in relation to a particular community, society, nation, or civilisation.

[1:49:15] To define between these four organisations of sentient beings, the Astronist Tradition understands a community to consist of a limited amount of individuals, typically all of whom either know one another, or are in close association, or acquaintance with one another, and they generally live in the same geographical locality, such as in a village, or a small town.

[1:49:16] A society is considered to consist of something larger, and typically involves all classes, religious groups, philosophical groups, wealth groups, and all ages as opposed to a community which generally holds a single parameter of similarity between all included in the community; a society, though larger than a community, generally consists of a city,

and its suburbs, or a region; a geographical area that is grouped according to the news that affects their geographic area.

[1:49:17] A nation is intertwined with the notion of the state and includes absolutely all peoples in residence in a country and also includes the government of the country and the system by which it governs.

[1:49:18] Finally, we have the term that is often used in Astronist philosophical contemplation which is civilisation; this is the entirety of nations of a species regarded collectively, especially with regards to an entire planet, but also relate to continents too depending on the context of its usage, but in relation to a planet should be considered the default option for philosophers of the Astronist Tradition.

[1:49:19] Significance is the central component of astronomical contemplation and review as it considers the importance of astronomy and the extent of its centrality in society, which may be used in parallel to the influence of Astronist Philosophy in a particular society, but these two parameters should also be distinguished, though a correlation is useful to make between the role of Astronism in a society and the extent of the significance of astronomy in that society.

[1:49:20] However, the separation of measuring astronomical integration and Astronism is not an easy undertaking, and one that the Astronist Tradition remains suspicious of for the Tradition intends to credit itself with the integration of astronomy and with the reascension of philosophy into human civilisation, and the separation of Astronist Philosophy from these two occurrences does not seem productive to the Astronist cause, and neither does it appreciate the contributions of the Astronist Tradition; this remains an important point of contention for astronomers to debate and take stances on.

[1:49:21] The extent of the significance of a particular nation, society, or civilisation is determined by the extent of the following parameters: the integration of astronomy into culture, the amount of astronomy events in regular occurrence, the amount of astronomical societies, the amount of philosophical societies, the amount of education directed towards astronomy; essentially, anything that includes astronomy, philosophy, or cosmology, the extent of its popularity, or its integration into the culture of the society.

[1:49:22] A term that is important to astronomy is almanac as it relates to a type of published documentation that astronomers write about their findings in relation to astronomy, mainly consisting of essays, reports, and philosophical contemplations about the significances of astronomy across different parameters of people groups.

[1:49:23] Almanac documentations are, therefore, central to astronomical study and not without these documentations can astronomical investigations be properly demonstrated and within the Astronist Tradition, documents that are created almanacally are reserved for astronomical enquiries.

[1:49:24] Both words of technical astronomy origination, azimuth and altazimuth are methods of gathering information for astronomical investigation with the former relying solely on official statistics about demographics and trends while the latter relies on opinions and beliefs of the philosopher themselves as well as mass questionnaires for the populous; another way of classifying these can be that azimuth methods are quantitative and altazimuth methods are qualitative.

[1:49:25] In the construction of an almanac, both of these methods are likely to be used, unless the introduction to the almanac specifies otherwise, with almanacs focusing on just one of these methods for its information known as monadic almanacs.

[1:49:26] The Astronist Tradition envisions a society and a civilisation whose central premise is the observation, enknowledge, and exploration of The Cosmos, and it considers astronomy, philosophy, and education to be the three core themes to accomplishing these three aspects of the Astronist perspective of a civilisation with astronomy forming the physical element, philosophy consisting of the mental element, and education forming the practical element.

[1:49:27] Derived from a mainstream astronomical terminology, the term ephemeris holds a different meaning within astronomy as it relates to the practice of observing, calculating, or using digital technology in order to map out positions of different star systems, or even different planets in relation to others, and is most likely to be turned into the verb, ephemerise, and ephemerisation.

[1:49:28] To conduct an ephemerisation is considered to be an important proponent of Cosmic Devotion, though it is most often excluded from the main forms of Cosmic Devotion including wonderment, adoration, and laudation.

[1:49:29] Astronomologists can use the process of ephemerisation as a means to ignite interest in the different star systems and galaxies and their positions in the galaxy, especially for philosophical, or educative purposes.

[1:49:30] In the Astronist Tradition, there is an event, or a sequence of events that is prophesied to occur after the reascension of philosophy and that is henceforth known as The Astronomic Revolution; astronomologists are encouraged to beckon this to occur, and as a result, it is something of major importance to study and contemplate within the discipline.

[1:49:31] The Astronomic Revolution involves three stages: the Reascension of Philosophy, the Integration of Cultural Astronomy, and the Concatenation of Astronarianism.

[1:49:32] The first of these relates to the return and recentralisation of philosophy into human civilisation; the second of these relates to the integrative ambitions of astronomy for the activities of astronomy; the third of these relates to the sequence of

social, political, and cultural events that establish and institutionalise the previous two elements, the entire process of which remains unique to each Astronomical Revolution.

[1:49:33] The Astronomic Revolution stands as the precursor to the establishment of the Astronist characteristics of a society therefore it remains a critical aspect, not only of astronomy, but also in Astronarianism, though it must always remain within the former.

[1:49:34] The branch of study of astronomy that is henceforth known as satellitics focuses itself to entities in relation to larger entities, around which they rotate, and upon which they depend which can be said to be more of a structurological or formatological discipline, and this is always recognised, yet it remains within astronomy.

[1:49:35] The second of the two parts of the subdiscipline of satellitics deals with the contemplation of the utility of technology in The Cosmos by sentient civilisations, the nature of this utility, the consequences of such a utility, as well as the role of engineers and technologists in the Humanic Exploration of The Cosmos.

[1:49:36] Satallity is the semistrument that is to be used in satellitics, and like the same way in satellitics itself, is split into two portions, so to its corresponding semistrument; to form different satellitics by using its corresponding semistrument remains the most important achievement for satelliticists.

[1:49:37] As a result, the first portion of satallity measures the extent of the dependence and the relationship between a small cosmical entity in relation to a larger cosmical entity, the second portion measures the extent of the usage of technology in a particular scenario, the extent of our dependence upon this technology, and the extent of the effects of technology in terms of spacial progression, cosmic knowledge, and the positive impact that space exploration is expected to have on the improvement and development of technologies.

[1:49:38] The first portion of satellitics and the type of entities to which it addresses can best be understood when considering the relationship between a moon and the planet around which it rotates, or the relationship between a planet and the star around which it orbits.

[1:49:39] The term that is known as organon, which isn't an Astronist originative word, relates to an important means of communication for enknowledgement and philosophical enquiry.

[1:49:40] Essentially, the organonic method consists of communicating astronomical concepts and recovered data in a vocal, and visual way through the use of digital technologies, such as via holographics, screens, and oral-lead presentations; the type of approach is also expected to improve the depth of philosophical enquiry as these vocal and visual outlets are considered to encourage philosophical contemplation, and

discussion amongst audiences which is hopefully then communicated back the astronomologist presenting the organon.

[1:49:41] To approach something organonically is to consider it according to its translatability to a mass audience, particularly an audience who are most likely unaccustomed to the delights, but inevitable complexities that form the nature of philosophy; organonicity measures the extent of a group of concepts or a set of result's expressability to an audience that isn't necessarily philosophical attuned.

[1:49:42] By these notions and introductions to organons and the organonic method, as well as the utility of organonicity as a measure of the ability for a concept to be expressed, we understand organons to be essential to the study of astronomy for the most important differentiation between astronomy and other Astronist philosophical disciplines is that the purpose of the former rests on its ability to be applied to the wider world.

[1:49:43] Furtherso, it is the principle of astronomical study to be able to be applied to practical circumstances for astronomy is not just contemplated and left at such contemplations with conclusions, instead, it is essential that the results that astronomy derives are administered onto real world circumstances for the philosophy of astronomy addresses notions about the way in which astronomy interacts, is applied, and is integrated into a particular society, or civilisation.

[1:49:44] The final branch of astronomy that is to be outlined in this discourse is that which is known as gnomonics, which is not an Astronist originative term, however, it does correspond to astronomical contemplation for it relates to the construction and placement of sundials and cosmodials in the context of their Astronist and Cosmic philosophical significance.

[1:49:45] Astronomologists, or gnomonicists, can use the prevalence of the population of sundials and cosmodials constructed by The Institution of The Philosophy of Astronism to demonstrate the extent of the influence of Astronist Philosophy in a particular geographical area as these dials act as symbols that demonstrate that the town or village in which they are constructed is an adherent of, aware of, or at least accustomed to Astronist philosophical ideas.

[1:49:46] These dials can therefore also be said to act as waymarks for Astronist philosophical adherence and awareness, however, within gnomonics, there exists two levels of gnomonicity in correspondence to the sundial and the cosmodial.

[1:49:47] A sundial that is erected demonstrates either an aware or an accustomed populous, whereas an erected cosmodial demonstrates adherence, therefore, the cosmodial holds greater weight than the sundial in terms of gnomonicity, which itself relates to the extent of the abundance of either cosmodials or sundials in a particular geographic region in order, therefore, to calculate the extent of the adherence or awareness in that region.

The Prophetical Cosmos

(Prophetics)

[1:50:1] One of the most exhilarating disciplines within Astronist Philosophy that a philosopher can study is that which is henceforth known as prophetics, as studied by propheticists.

[1:50:2] Prophetics deals with the future of humanity in The Cosmos specifically, and branches out into other species in the subdiscipline of xenoprophetics, however, the primary subject at present study is the future of humanity.

[1:50:3] The Astronist philosophical tradition has a unique and distinctful understanding and outlook for humanity's future civilisations in The Cosmos and it can be easily justified to say that humanity remains prophetical throughout its existence and argues that it is the naturity of humanity to depend upon and gain all their understandings from.

[1:50:4] Prophecies have been central to human storytelling and human progression since the dawn of our civilisation and this is not to change with the Astronist Tradition, though the nature and subject of the prophecies that we expound are markedly dissimilar from those prior.

[1:50:5] It is not the sole responsibility of a propheticist to create prophecies, though that is often one of the main results of prophetical philosophical enquiry, but instead, their primary responsibility rests in deciphering The Ten Grands, which are lattermentioned in this discourse, as well as deriving prophetical ideas from their philosophical investigations, solely from the Astronist worldview.

[1:50:6] Prophecies are notions predicated upon future occurrences, most commonly, in Astronist Philosophy, focusing on space exploration and colonisation as the theme of the Astronist worldview for these are considered to be the centralities of future humanity civilisation from the Astronist perspective.

[1:50:7] Prophetics is perhaps one of the most naturally subjective disciplines of Astronist Philosophy as it is solely based upon the interpretations and beliefs of the individual perceiver and how their outlook corresponds to the Astronist view of humanity's future civilisation.

[1:50:8] I may not ever be able to travel across The Cosmos, but I can certainly do so in my imagination; in fact, it is that activity upon which Astronism is founded.

[1:50:9] The question should not be how large The Cosmos is, but instead, at which capacity is your mind able to imagine it?

[1:50:10] If a philosopher of the Astronist Tradition is to specialise in prophetics, they must be constantly forward-thinking, positive, and progressive in their outlook.

[1:50:11] One of the most unique elements of the discipline of prophetics is that it holds the ability to influence the development of Astronarianism, as it closely responds to the social, political, and economic branch of Astronism known as Astronarianism; for this reason, propheticists hold an even greater responsibility for the inferences they make and the conclusions to which they arrive are considered to directly impact on the way people see the future of humanity, and therefore, this shall affect the way in which they believe their society, their politics, and their economy should be governed and operated.

[1:50:12] It is not illogical to notionise that prophetics holds a very central position in Astronist Philosophy as the philosophical tradition is entirely centred on the future rather than the past, as the vast majority of religious traditions, and even other philosophical traditions are.

[1:50:13] The Astronist Tradition is structured upon prophecies of the future of humanity in The Cosmos and the exploration of space and the enknowledgement of humanity through space discovery; without these prophetic foundations, Astronism, and that we term as the Astronist worldview would not exist as it does; essentially, prophetic discourse is central to the Astronist philosophical tradition for the Tradition is a futurocentric one, and to uphold this futurocentricity, it most important that the Tradition continues renewing and revitalising its prophecies, and the way in which it prophesies.

[1:50:14] The discipline of prophetics is primarily structure upon those which is known in the Astronist Traditions as The Ten Grands, or The Ten Grands of Prophecies; these are ten different prophecies that the Astronist Tradition holds concerning the future of humanity in space from the Astronist worldview perspective.

[1:50:15] It is The Ten Grands that upon which propheticists base the vast majority of their Astronist prophetic ideas from, unless they derive them from other prophetic areas of the Philosophy; either source is acceptable as long as it is within the auspices of the Philosophy itself.

[1:50:16] It is in this discourse of prophetics that we shall outline The Ten Grands in their traditional senses, and it is by these senses that propheticists are to understand the Astronist official, or traditional view of the nature of prophecy, and the ten individual prophecies that form the basis for the discipline of prophetics to flourish.

[1:50:17] The discipline of prophetics is majoratively structured by The Ten Grands of Prophecies which are the ten prophecies upheld by the Astronist Tradition, all of the titles of which feature the word, grand, as is part of the Astronist style, hence the collective name for these prophecies; it is from these ten prophecies that propheticists shall derive their concepts from and based their philosophical enquiries upon.

[1:50:18] In addition to The Ten Grands of Prophetics, there also exists a few more areas of study and contemplation for propheticists to embark upon which are latterdiscoursed after our introduction to The Ten Grands.

[1:50:19] The first of The Ten Grands is that which is henceforth known as The Grand Impentination; this prophesies the occurrence of a full-scale out-Earth which, in the Astronist Tradition, relates to leaving The Earth for a permanent period of time.

[1:50:20] The Grand Impentination understands that there will be billions of people that leave The Earth to go out to explore The Cosmos and the newly discovered and undiscovered worlds of The Cosmos, both as part of governmental or organisational schemes, but also, as part of private groups.

[1:50:21] To impentinate is a verb of the Astronist philosophical tradition that relates to leaving a planet for a permanent period as opposed to a temporary expedition; the essential distinction is that impentimators do not know, or have not decided when, or if they will return to the planet that they are leaving.

[1:50:22] Impentinal activity may sound grossly frightening to those whom have never travelled far, of whom there are many, but there are also many whom crave to travel, and with a chance to travel across The Cosmos, it is prophesied that billions shall wish to embark upon impentinal peregrinations.

[1:50:23] To think and philosophise impentinally is to believe in the prophecy of The Grand Impentination, but is also to hold a mindset that craves and believes in the Humanic Exploration of The Cosmos, as well as the idea that humanity is responsible for exploring The Cosmos and it is this responsibility that we must fulfil by impentinating our populous throughout the habitable moons and planets that we do come across in our exploratory efforts.

[1:50:24] The next of The Ten Grands is that which is henceforth known as The Grand Cognisation which prophesies the discovery of brand new species of animals, plants, and other forms of life, as well as totally new habitat structures and environments as an inevitable extension to humanity's exploration of new worlds.

[1:50:25] Cognisation relates to the entire process of exploring new worlds, discovering new species of life of those new worlds, and especially includes the moment these new species are documented for the first time in journals and other forms of archival and informative works, and especially during a distinct period of discovery on new worlds, known as locaments, the people whom lead such eras are henceforth known as locamenters, or locamentresses.

[1:50:26] Locamental periods relate to distinct eras of time in which a great deal of discovery and exploration occurred on a particular world, with cognisation being a direct subsequence to locamental periods of discovery.

[1:50:27] The prophecy of The Grand Cognisation is, of course, expected only to occur once the Humanic Exploration of The Cosmos has gone fully underway, and presupposes the existence of sentient life on other worlds, as is customary in Astronist Philosophy, and as is explored in much greater detail in the discipline of sentientology which has been aforescored in this disquisition.

[1:50:28] Cognisers is a term of prophetics relating to those individuals whom embark upon cognisation, but may also be those whom believe that The Grand Cognisation will occur as it is prophesied so.

[1:50:29] The Astronist Tradition heralds this particular prophecy to be one of the greatest imaginable for it expounds the very essence of the Astronist worldview; the craving of knowledge, of new discoveries, and of cosmic exploration that Astronist Philosophy is best known and adored for.

[1:50:30] Cognisational beliefs centre themselves on the idea that it is humanity's solemn duty to explore The New Worlds of The Cosmos, as they are collectively referred to in the Astronist Tradition, and to explore to such an extent, that they discover endless amounts of new species of animals, plants, and even many new forms of life that are not known, or existent on The Earth.

[1:50:31] The Astronist Tradition also emphasises the great importance of journalising the discoveries derived from The Grand Cognisation and praises the cognisers whom do manage to record, describe, experiment, and study the new species of their discovery.

[1:50:32] The third of The Ten Grands of Prophetics is that which is henceforth known as The Grand Technologisation; this prophesies the development of human technology to the point at which space travel becomes a commonplace means of transportation

[1:50:33] After The Grand Technologisation has been realised, the cosmic distances that we currently do not have the technology to travel to and fro will become dramatically less drastic, and much more practical to travel throughout.

[1:50:34] It is for the reason of the prophecy of The Grand Technologisation that the Astronist philosophical tradition implores Astronarianism and the educational philosophies and branches of The Astronist Methodology to encourage young people to embark upon careers in spacial engineering, space technology, rocketry, and other space-related subjects due to their intrinsicity to the accomplishment of The Grand Technologisation.

[1:50:35] Whether by hyperdrives, or some other form of fast space travel, the advancement of human technology in space in the form of spaceships and vehicles is an essential and unavoidable aspect of the Humanic Exploration of The Cosmos; without the occurrence of The Grand Technologisation, the other prophecies of Astronist Philosophy

will not occur, rather many technologists, those whom support The Grand Technologicalisation, believe in the supremacy of this particular prophecy over all the other nine prophecies of The Ten Grands.

[1:50:36] The fourth of The Ten Grands of Prophetics is that which is henceforth known as The Grand Humanisation, which is commonly referred to in Astronist Philosophy, though this particular title may not be included during its previous references in other disciplines of the Astronist Tradition.

[1:50:37] The Grand Humanisation consists of the prophecy that there will occur a lengthy process of the envisioning, creating, and establishing of colonies and later, civilisations of humans on worlds other than The Earth, which is considered to be the principal and centralmost aspect to the Humanic Exploration of The Cosmos, especially from a practical perspective, rather than a purely theoretical or philosophical perspective.

[1:50:38] The Grand Humanisation is not only a prominent part of prophetics, but has managed to pervade many other disciplines and concepts of Astronist Philosophy due to its primary place in the Humanic Exploration of The Cosmos, and for this reason, The Grand Humanisation could be considered the most important prophecy to all of Astronist Philosophy and the Astronist worldview, not simply just one discipline, or even a group of disciplines of the Tradition.

[1:50:39] The fifth of The Ten Grands of Prophetics is that which is henceforth known as The Grand Xenisation which prophesies the process of the normalisation of relations between human and non-human sentient beings.

[1:50:40] The Astronist Tradition is the first proponent of peace and harmony between humans and non-human species originating from worlds other than The Earth, and although the natural instincts of humans may be to attempt to dominate, segregate, or demoralise species other than their own, the Astronist Tradition is now and henceforth condemning of this attitude.

[1:50:41] The Astronist Tradition only presupposes this of humanity's instinctual reaction to other species due to humanity's interactions with different races and people groups of its own species; if humans find it difficult to accept their own species, despite differences in race or mindset, then their acceptance and harmonisation with non-human sentient beings is unlikely if they are left to their own devices in this regard.

[1:50:42] The Grand Xenisation is a solemn undertaking as it relates to the realistic approach of humanity towards the acceptance of, and interaction with, the different xenic species that we are inevitably going to come across during the Humanic Exploration of The Cosmos, as it presupposed by the Tradition due to its adherence to sentience in The Cosmos, and due to the contemplations of sentientology.

[1:50:43] The population of The Cosmos with countless civilisations is the aim of the Astronist Tradition, therefore we must accept that when our explorers do discover non-human sentience, we must accept that they hold their own sovereignty of the worlds they populate, and they hold just as much a right to exist as humanity does; xenisation is heavily related to contemplations of Astronist Ethics, specifically xenical ethics.

[1:50:44] The next of The Ten Grands of Prophecies is that which is henceforth known as The Grand Philosophisation which prophesies that as part of the Humanic Exploration of The Cosmos, humanity will ultimately explore the philosophical and religious traditions of civilisations and settlements on worlds other than The Earth, and sharing, in reciprocation, the Astronist Tradition with the sentient beings the explorers do happen to meet.

[1:50:45] The Grand Philosophisation is perhaps the most important of all the prophecies for the expansive efforts of Astronism for it remains the penchant of all ideas to be known by as many sentient beings as possible, and this remains true for the Astronist philosophical tradition which is certainly not discriminatory to which species adhere to its ideas, or embark upon philosophical enquiries under its guidance and inspiration.

[1:50:46] Philosophisers, those whom are particular proponents for The Grand Philosophisation, hold the belief that the spread of philosophies throughout The Cosmos must remain the principal goal of humanity as these philosophies are considered to be reflections of humanity's identity, humanity's ambition, humanity's nature, and humanity's history.

[1:50:47] It is the penchant of Astronism for future civilisations of The Cosmos to be erected in its name, or in the name of a derivation of its tradition and to this, there is no shame attached for the spread of ideas is the progression of the intelligent minds, and thus, the progression of entire civilisations, as we have witnessed about our own history here upon The Earth.

[1:50:48] The Grand Philosophisation should not be taken to be the main priority or reason for the Humanic Exploration of The Cosmos, but instead, an inevitable occurrence after the interaction of humanity and other sentient civilisations; to just imagine the philosophies and worldviews of the millions of civilisations of The Cosmos and to think that humanity shall one day bask in such wealths of knowledge and philosophical thought is the most exciting of all notions presented in the entirety of The Omnidoxy, and one that simultaneously reveals the great importance of the prophecy of The Grand Philosophisation.

[1:50:49] The seventh prophecy of The Ten Grands of Prophecies is that which is henceforth known as The Grand Opentisation and prophesies the heralding of the establishment of mixed civilisations of human and non-human sentients on worlds beyond The Earth shall create diverse societies beyond current comprehension.

[1:50:50] To opentise involves working towards the establishment of civilisations with populations of human and non-human sentient beings, and also works towards the cohesion of human populations with non-sentient civilisations, of which The Grand Xenisation is considered to be the precursor to.

[1:50:51] The Grand Opentisation also incorporates notions of creating societies and civilisations whereby there exists an equality, as predicated by civil law, between each of the different sentient groups with populations in the civilisation, and is considered, by the Astronist Tradition, to herald a future version of Astronarianism.

[1:50:52] From the perspective of Astronist Philosophy, The Grand Opentisation is considered to be the only way for the successful achievement of the Humanic Colonisation of The Cosmos and by the Astronist philosophical tradition, only in societies and civilisations of equality should we desire to live, and so, those are societies and civilisations that we shall create on worlds beyond The Earth; we must learn from the mistakes of our own here upon The Earth if we are going to create long-lasting civilisations upon The New Worlds of The Cosmos.

[1:50:53] The eighth prophecy as part of the group of The Ten Grands of Prophetics is that which is henceforth known as The Grand Vennisation and prophesies that during the Humanic Exploration of The Cosmos, the worlds that are deemed uninhabitable, such as gas planets, or worlds that do not have the correct topography or climate for human habitation, will be utilised in other ways for civilisational benefit, or specifically for sentient benefit, which derives ideas about senticentricity.

[1:50:54] To vennisinise is to conduct the entire process of vennisation, which involves the identification of uninhabitable planets, their classification into categories of utility, planning how such worlds can be utilised, and then actually conducting the process of utilising the planets; for this reason, the process of vennisation is considered lengthy one.

[1:50:55] The different subjects of utility may include mining for materials, the extraction of resources, or any other viable and ethical usage whether that be on the surface of the planet, in the planet's atmosphere, or from the planet's orbit.

[1:50:56] Emboldened and justified by the fact that the majority of planets in The Cosmos are not habitable, vennisinisers, those whom vehemently support The Grand Vennisation, hold the prophecy to be the most of all those of prophetics as they considered vennisation to be a process of practicality, essentially, and inevitability as part of the wider Humanic Exploration of The Cosmos.

[1:50:57] As has been aforementioned, the ethical aspect of vennisation is bound to flare debate regarding the ethicality of different methods by which and subjects for which vennisation is conducted.

[1:50:58] The vennisational approach is characterised by a distinct positivity towards planets and moons that are not remotely habitable, as a non-Astronist approach may consist of negativity towards such planets and how they are not habitable, and therefore they are not worth studying, or exploring, or utilising; this is the exact oppositism to the vennisational approach, and subsequently, is the oppositism to the Astronist approach.

[1:50:59] The ninth prophecy of The Ten Grands of Prophetics is that which is henceforth known as The Grand Gargantuation believes in prophesying that there shall one day, after the Humanic Exploration of The Cosmos has long been established, there will exist planetwide civilisations of huge proportions and populations of all kinds of different sentient species on worlds far beyond The Earth itself.

[1:50:60] The key part of The Grand Gargantuation to note is that these civilisations that is prophesies have their own long histories, just as the human civilisation does on The Earth, and have developed over centuries, millennia, multi-millennia, or even across meganiums.

[1:50:61] The Grand Gargantuation is, of course, far beyond the state of humanity's exploration, knowledge, and perception of The Cosmos at the time of this writing, but the Astronist Tradition shall henceforth be credited with prophesying this to occur in however many years it may take.

[1:50:62] The Grand Gargantuation can be considered the ultimate ambition of the Humanic Exploration of The Cosmos, and one of the ultimate envisionments of Astronist Philosophy; essentially, The Grand Gargantuation can be considered the culmination of all the previously prophecies outlined in this discourse.

[1:50:63] It is not incorrect to suppose that The Grand Gargantuation shall signify the accomplishment of the Humanic Exploration of The Cosmos for the point at which we reach and realise we have reached The Grand Gargantuation, then there will be so many civilisations across the galaxy, filled with countless forms of human and non-human sentient life with thousands of years of history.

[1:50:64] The authority of the time can then, and only then, announce the Humanic Exploration of The Cosmos as complete in retrospect to the era here and now in which The Omnidoxy is written, which signifies the beginning of the Humanic Exploration of The Cosmos, which is the ultimate purpose to the creation of The Omnidoxy, and subsequently, Astronism itself.

[1:50:65] The last prophecy of The Ten Grands of Prophetics is that which is henceforth known as The Grand Wonderation which prophesies that humanity, after the Humanic Exploration of The Cosmos has occurred, will be able to experience wondermentation, through the observation of The Cosmos, or any one of its progeny and their phenomena from a perspective other than from on The Earth itself.

[1:50:66] Such a new perspective of The Cosmos is expected to drastically alter the way in which the mass amounts of people understand and comprehend The Cosmos, and is considered to be a very important accomplishment of philosophical progression and the overall progression of the human mindset for the Astronist philosophical tradition.

[1:50:67] As should now be evident after their introductions, each of The Ten Grands of Prophecies is interconnected with one another and some of which are actually dependent upon one another as precursors, and others form as subsequents of other prophecies; essentially, despite a prophet's, or any other people's affiliation with any particular prophecy, they must ultimately respect of the prophecies for the roles each of them play in that which is henceforth known as Prophetic Philosophy, a distinct branch of Astronist Philosophy dealing with all notions of prophecy and all inferences of prophecy from different philosophical concepts and philosophical enquiries.

[1:50:68] A subdiscipline of prophecies that is distinct from the study of The Ten Grands of Prophecies is that which is henceforth known as anthropics and deals with concepts solely concerning the Anthropic Principle; the idea expounding that all cosmic existence must be predicated and presupposed by the existence of humanity, and subsequently leads to notions in support of anthropocentricity

[1:50:69] The oppositism and counterpart to anthropics is anti-anthropics which is also classed as a subdiscipline of prophecies and concerns itself solely with concepts relating to the Anti-anthropic Principle; this expounds the oppositism to the Anthropic Principle, and holds that cosmic existence neither mustn't, nor cannot be predicated or presupposed by the existence of humanity and directly supports notions of cosmocentricity and anti-anthropocentricity, in opposition to notions of anthropocentricity in The Cosmos.

[1:50:70] Although an Astronist philosopher must still be able to take the side of the Anthropic Principle, due to Astronist Philosophy's adherence to the Philosophical Spirit, the Astronist Tradition, and the vast majority of Astronist Philosophy's orientations markedly hold the tendency to oppose the Anthropic Principle and generally do side with the Anti-anthropic Principle as a direct result.

[1:50:71] Anthropicists and anti-anthropicists alike concern themselves with exploring the two opposing principles, how they interact with one another, whether each of the principles can be simultaneously true, and they attempt to identify the differences between the two opposing principles.

[1:50:72] Anthropicity is the measure of the extent of humanity's relevance in cosmic affairs and existence and aligns itself with the Anthropic Principle while anti-anthropicity measures the extent of humanity's irrelevance in cosmic affairs and existence and obviously aligns itself with the Anti-anthropic Principle.

[1:50:73] Despite the title of the Anti-anthropic Principle, the philosophical orientation that surrounds it is not anti-anthropic in the sense that it doesn't oppose anthropic identity, or

human imposition in The Cosmos, but is primarily opposed to notions that place humanity at the centre of The Cosmos.

[1:50:74] Another distinct area of philosophical contemplation is conducted under the pre-Astronist doctrine known as meliorism, which holds the belief that the world, and in Astronist contexts, The Cosmos can be made better by human effort and intervention.

[1:50:75] Meliorist Philosophy involves the contemplation of the meliorist doctrine, but it is important to note that meliorism neither corresponds to the Anthropic Principle, nor does it correspond to the Anti-anthropic Principle; applying meliorism to these principles and intertwining them with the Astronist view of each of these principles is considered distraditional.

[1:50:76] By its most simple definition, Astronist Philosophy can only support the essence of meliorism by the notion that melioristic thoughtpaths are positive in their outlook for humanity, but neither centristic, but they also emphasise the importance of human work to better the environment in which humans reside.

[1:50:77] By such an account, Astronism can be said to be in full agreement with meliorism, however, many of the environmentalist orientations with the auspices of Astronist Philosophy will certainly oppose notions that humanity can better the world, and by extension, The Cosmos as they are more than likely to side with the notion that the surroundings of humanity would be much better without human interference.

[1:50:78] Despite the respect for the environmentalistic perspective on Meliorist Philosophy, this orientation is expected to be held by only a small amount of those within Astronist Philosophy, though the Tradition does uphold its principles of environmentalism, and does not advocate for unnecessary tamperation with the surroundings, or even inference with the environment when one thinks one may be achieving something positive for the environment, as the oppose may be true in the future.

[1:50:79] The final distinctive branch of the discipline of prophetics is that which is henceforth known as transhorology which deals with all notions, and discusses, contemplates, and studies the possibility, the circumstances, and the consequences on the human body and mind after travelling through spacetime.

[1:50:80] Transhorological contemplations centre on the cosmic progenies and phenomena of white holes, the possibility of travelling through black holes, but primarily focus on wormholes.

[1:50:81] The Astronist Tradition supports all notions of the possibility of travelling through spacetime through phenomenal distortions such as wormholes and it is transhorological study that ignites a brilliance of philosophical enquiry.

[1:50:82] Astronist Philosophy expects that during the Humanic Exploration of The Cosmos, there will be many interspatial journeys and it is this that will form the way by which humanity, and other sentient beings are able to practically navigate interstellar travel in realistic timescales, and for this reason, transhorological contemplations are of immense importance to the wider Astronist philosophical tradition.

The Psychology of Space (Spatial Psychology)

[1:51:1] The discipline of Spatial Psychology demonstrates an intersection between the studies of philosophy and psychology, scholars and practitioners of which contemplate how space travel and simply being in space impact upon the cranial, the brain, and the mental state of the human mind.

[1:51:2] Spaciopsychologists are concerned with the study of how travelling through space for short, or relatively long periods of time will effect one's physical brain and body, but also, how it is expected to impact upon the functionalities of their mind.

[1:51:3] Due to space travel still remaining a new and consisting of a relatively unknown quantity due to the lack of the abundance of humans whom have travelled through space for long distances, the effects of space travel, as well as just being in space reveals a new major branch of psychological study.

[1:51:4] In addition, Spatial Psychology consists of a branch henceforth known as Planetary Psychology, which relates to the study of the mental and physical effects of someone on a planet other than The Earth, and the consequences of living on such a planet, the primary candidate for such a study at the near future is Mars.

[1:51:5] Planetary Psychology invokes all possible scenarios that could occur psychologically here on The Earth and applies this to living on Mars; it is argued herein that there is a different psychological effect on the human brain for every planet that a human may stand and live upon.

[1:51:6] Spatial and Planetary Psychology do not only study the phenomena, the causes, and the effects of these circumstances on the human brain and mind, but they also attempt to provide solutions as to how humans can prevent such psychological and physical problems, as well as how they are able to combat such issues if they do arise.

[1:51:7] In the face of this new psychological discipline derived from Astronist philosophical enquiry, the Astronist Tradition attempts to intersect all the psychological investigations and experimentations with philosophical concepts, theories, and contemplations, in order to derived a final psycho-philosophical conclusion.

[1:51:8] With the founding of Spatial Psychology, as branch of both psychology and Astronist Philosophy, demonstrates the ability for both philosophy and mainstream psychology to work together and also demonstrates how psychologists and philosophers are able to work in unison for greater understanding, and furtherso demonstrates the close relationship between scientific and medical subjects and philosophy.

[1:51:9] There is a concept and branch of study within Spacial Psychology that is henceforth known as the Anthropological Cosmology which is a type of cosmology that is concerned with the role of humanity in the wider cosmical system and involves external concepts such as the Anthropic Principle, anthropocentrism, and others, in order to formulate an understanding of that which is henceforth termed as The Anthropic Cosmos.

[1:51:10] The study and contemplation of the Anthropological Cosmology attempts to construct a cosmos in which humanity's needs, wants, feelings, and ambitions are made central and the reason for the study of the Anthropological Cosmology to be included within Spacial Psychology is because this discipline primarily concerns itself with the human psychology in space and therefore, it seems only prudent to match the areas of study as they their focuses are placed upon a similar subject.

[1:51:11] Spacial Psychologists are primarily concerned with the psychological effects of being in space on humans; there is, however, a very specific branch of Spacial Psychology, known as Spacio-Sentient Psychology deals with the effects of space on other species' psychologies, which is also a derivation of Sentient Psychology that concerns itself with the psychologies of different sentient species, however, these two disciplines are those which are known as futerial disciplines.

[1:51:12] Futerial disciplines are those disciplines of study which are introduced in The Omnidoxy, but are not able to be studied at present due to the circumstances of reality not yet allowing for their study, thus, they can only begin to be studied in some future time when the circumstances of reality are suitable.

[1:51:13] The primary factor impacting upon one's physical brain and thus, one's psychological stability and ability is the difference in pressure between beyond on The Earth and beyond in space, or on a different planet with a different amount of gravitational pressure; an extension to this is the effect on the brain and the human psyche by wearing specialised clothing and suits.

[1:51:14] It is not only the effects of gravitational pressure that shall cause physical brain damage or alterations, although this is identified as the primary factor, but in addition, the environments in which humans reside are the secondary determining factors to human psychology.

[1:51:15] The environmental factor involves climate, the extent of urbanisation or rurality, the population density, the size of the abode, as well as the ability of people to live as they choose, and the comparisons of these to the living arrangements on The Earth.

[1:51:16] There is no mystery in why psychological damage would be caused if one was placed inside a darkened room alone for a lengthy period of time without hope of escape compared to being outside amongst the warmth and light of nature with abounding freedom; by this simple comparative notion, we can begin to understand the impact of our environment and the influence it holds over us.

[1:51:17] In addition, Spatial Psychologists must also concern themselves with the effects of the procedure of cryonics on the human brain, whether the human mind will be the same after a cryonic procedure, and whether the brain can return to normal, or pre-cryonic functionality once the individual has been defrosted.

[1:51:18] The importance of the study of cryonics in Spatial Psychology links to the practical utility of cryonics during voyages in space and it is expected that the experimentations and studies derived from the psychological analysis of the aftermath of cryonics on the human brain and mind will impact upon the Astronist ethical view of cryonics.

[1:51:19] The psychological study, and subsequently, the ethical decisions in relation to cryonics will inevitably impact upon the authorised usage of the procedure of cryonics which different cryonicists are bound to contemplate, argue against, and discuss.

[1:51:20] Another major affectant of the human psychology in the context of space and otherworld residence is that of the feeling of loneliness; spacefaring, at our present understanding of it as an activity, is one of remarkable loneliness, and even if one does travel with others, the group of people with which you communicate are the same individuals for the entire journey which may last years which demonstrates a limited pool of socialisation, henceforth known as a micropool, the opposite of which is henceforth known as a macropool.

[1:51:21] The question posted to a Spatial Psychologist is what would be the effects on a person's mental health and wellbeing after being aboard of a spacecraft for a lengthy period of time with either a micropool of individuals to socialise with, or being alone?

[1:51:22] In addition, Spatial Psychologists are also tasked with the ideas, theories, and experiments associated with sanity and insanity in space, as well as on other worlds which includes measuring different variants and stimuli and how these are found to improve or destabilise the sanity of human.

[1:51:23] Another area of study for Spatial Psychologists to address is that which is henceforth known as Spaceflight Preparation which includes all mental ability, sanity, and awareness tests that must be legally conducted before an individual can go spacefaring, as well as the providing techniques and services for the mental preparation for spaceflight, as well as for living on new worlds other than The Earth, which may be classed as a futural discipline at the present concern.

[1:51:24] Spatial Psychology holds a unique outlook from an Astronist philosophical understanding as it explores the harsh realities of space exploration and general existence in space, and the largely gruesome and unappealing aspects of space and otherworldly living.

[1:51:25] This stands in opposition to the general idealistic tendencies of the rest of Astronist Philosophy when describing, contemplating, and studying The Cosmos, and all other aspects of space, cosmic phenomena, and cosmic progeny.

[1:51:26] The Astronist Tradition generally presents and describes The Cosmos and spaceflight in positive and almost idealistic terms due to the centrality of space and cosmic phenomena existing at the core of Astronist Philosophy.

[1:51:27] This does not mean to say that the Astronist Tradition opposes the outlook and approach of Spatial Psychology, but instead, implores the study of this discipline due to the realities of space that it does expound, and does not see its description and presentation of space and The Cosmos as contrary to its philosophical view and understanding and Spatial Psychology is not considered to be an entirely philosophical discipline; it is considered to be half philosophical and half medical, and therefore, its non-idealistic view of The Cosmos is admissible due to the purpose of the discipline remaining not entirely philosophical.

[1:51:28] However, the comparison between The Cosmos we derive from the concepts and studies of Spatial Psychology and The Cosmos we derive from the concepts and studies of wider Astronist Philosophy remains an interesting point of contemplation as it demonstrates an internal difference and one that also signifies difference of cosmological understanding between different disciplines.

[1:51:29] A more philosophical aspect of contemplation within Spatial Psychology is the consideration of the interaction between a philosopher and a psychologist, and how they address one another, as well as contemplating the similarities and differences between philosophers and psychologists.

[1:51:30] That which is henceforth known as spacio-abasia and relates to the inability to walk in space and the inability to walk due to the effects of being in space for a long period.

[1:51:31] That which is known as aberration in the context of Spatial Psychology relates to a temporary lapse in behaviour due to the effects of being in space, which can relate to any sort of lapse.

[1:51:32] It is of major importance that spatial psychologists conduct ability tests in order to measure their mental capability of going into space and dealing with some of the basic mental traumas and phenomenas of spaceflight.

[1:51:33] The concept of abiosis in Spatial Psychology is one of immense importance as it relates to the absence of life on a particular world and the mental impacts on the human mind knowing that there exists no life, or very little life on the planet on which they reside, as opposed to the knowledge that all humans have when residing upon The Earth that

there exists billions of over humans alive in the same world; this is henceforth known as the abiotic complex.

[1:51:34] That which is known as spacial cause is an important area of study within Spacial Psychology dealing with all mainstream medical ailments, mental disorders, and diseases and their applications to space, how space may cause or worsen such illnesses and disabilities, or how space may cause these, or new ailments.

[1:51:35] It is therefore one of the main responsibilities of Spacial Psychologists to identify the various ailments, mental disorders, and diseases of mainstream medicine and to regard those in the environment of space, which provides Spacial Psychologists an opportunity to meet with Spacial Physicians from all the branches of medicine in order to identify the effects of space towards these different ailments.

[1:51:36] Spacial Psychology holds the important role of connecting the medical world to the philosophical world, specifically towards the Astronist philosophical world unlike any other Astronist philosophical discipline in linking two entirely separate subjects together for common understanding and mutual enknowledgement.

[1:51:37] As an extension to this, Spacio-physicians, in partnership with Spacial Psychologists, must explore all the different medical ailments that are prone to humans here upon The Earth and apply these to the new environment of space, as well as discover new ailments brought upon by being in the environment of space, or by being in the unfamiliar environment of a new world; this incorporates medical terminology into a philosophical context.

[1:51:38] Another point of interest for both Spacial Physicians in a physical sense, and Spacial Psychologists in a mental sense is the idea that space is an accelerant of age, and attempts to make firm conclusions on why this may be, and how this may be curtailed.

[1:51:39] That which is henceforth known as anacliticity is derived from the mainstream medical term anaclitic, and measures the extent of a person's tendency to be heavily emotionally dependent upon others; Spacial Psychologists may utilise this parameter in the context of spaceflight in order to derive whether spaceflight increases or decreases, or even triggers anaclitic characteristics.

[1:51:40] That which is known as alimentation, derived from the verb, to aliment, in this context, relates to the attempt to begin life on a desolate world; to ignite an environment and a habitat for an ecosystem to flourish; this remains central, not only as a concept of Spacial Psychology, but also as a concept in wider Astronist Philosophy, perhaps even moreso for the latter than the former.

[1:51:41] Spacio-atrophy, as it shall be henceforth known, relates to one of the most common impacts of being in space for a long period of time, and involves the wasting

away of an organic product, such as muscle, or bone which, in a spacial environment, is caused by the lack of gravity and the lack of proper utility for muscles especially.

[1:51:42] One of the most prominent of concepts within Spacial Psychology is that which is known as acquaintanceship; the extent of the knowledge that someone possesses about the circumstances and the environment in which they reside.

[1:51:43] Also, this concept considers what knowledge is, in relation to the person that possesses it; is it an ability, an external product of utility, an intrinsic part of one's soul, a function of the brain, or some other transitory and diminishable element of the mind, or body; in essence, what is the possession of knowledge and how does such knowledge effect our psychology; in the concept of acquaintanceship, we see the connection made between Spacial Psychology and the pre-Astronist philosophical branch of epistemology.

[1:51:44] Aforediscussed is the distinct type of loneliness associated, and now we must address the next of the major affectants of human psychology space and that is the unavailability of familial mental health support, as well as interpersonal mental health support, thus having to rely on digital means of medical contact through screens and automated responses.

[1:51:45] This unavailability of the familiar means of mental health support is expected to hold a hugely negative impact over the psychology of spacefaring peoples, but this is an issue that we can prepare for now, and it is something that Spacial Psychologists must be concerned with preparing for as it is considered to be their responsibility to find ways to make psychological support sufficiently available for spacefaring peoples.

[1:51:46] Another of the major affectants of human psychologies in space is the elevated levels of stress due to demanding tasks, incredible feats, and experiences that either a very small amount, or no humans at all have ever experienced before which invokes a sense of unknownness about such psychological and physical ailments which is a unique circumstance when compared to earthly medical ailments, all or most of which have been experienced by others in the past, or are at least known of.

[1:51:47] The elevation of stress in this way forces a greater demand on the human psyche to form tasks, to think in rational terms, and to be generally emotionally stable, and this is ultimately to the detriment to the psychological stability of that individual, thus this remains one of the major affectants.

[1:51:48] With space exploration and spaceflight, and also with otherworldly living, although not so much for the latter, it remains one of the harshest realities and one of the most vigorous affectants of human psychology in space is the markedly reduced amount of material comforts available to individuals.

[1:51:49] Much of the industrialised world has become wholly dependent upon, both practically, and mentally, and even in some cases, spiritually, emotionally, philosophically

dependent upon the material items available to purchase; what then must be the consequence of a reduction in such material comforts to the human psyche?

[1:51:50] Perhaps without our material comforts, the extent of one's depression, and one's emotional dejection would be heightened, in turn diminishing one's general morale; not exactly the mental state required for deep space voyages wherein the environments are unknown, and the consequences of such a voyage are unknown, despite the purpose for which the voyage was conducted being immensely and importantly clear to the voyagers.

[1:51:51] However, the reduction in material comforts is a major barrier to human psychological stability during spaceflight and is something that Spatial Psychologists are now tasked with studying, understanding, and attempting to resolve, though the Astronist philosophical tradition maintains that drugs are certainly not the answer.

[1:51:52] It remains important that the terminology of psychology is applied to the terminology of philosophy as it is the interaction between these two fields of study that progresses Spatial Psychology forwards as it remains both a philosophical and psychological subject.

[1:51:53] Despite the absence of the entirety of the vast array of psychological terminology in *The Omnidoxy*, that does not mean to say that such terminology is without usage or allowable applicability to the context of Astronist Philosophy for the very opposite is true, yet the Astronist Tradition always maintains that the distinction between that which is Astronist philosophical terminology and that which is mainstream psychological terminology must be upheld for reasons of distinguishment.

[1:51:54] With the incorporation of psychological terminologies into an Astronist philosophical context, we may now put a title to the concept of perception's bound to the knowledge of the perceiver, which shall be known as apperception and for this addition, and all the other additions of psychological origination, to the Astronist lexicon, the Astronist Tradition thanks and further demonstrates the important relationship between the fields of study of psychology and philosophy.

[1:51:55] Strictly part of the discipline of Astronist Philosophy known as cosmoapplication, though originating from the medical lexicon, which explains its place within the discourse of Spatial Psychology, arborisation relates to the idea of superclusters in the metagalaxy resembling the branches of a tree, or the branching structure of nerves in the human body.

[1:51:56] One of the most prominent titles and concepts within Spatial Psychology, which are also vastly applicable to wider Astronist Philosophy, and are categorised as twin concepts, or comparters are those which are henceforth known as proxemia, and disproxemia.

[1:51:57] Proxemia relates to the state in which a human has never lived, or resided on The Earth for a permanent period of time, but was actually born on The Earth, though left soon after birth, and such humans shall be henceforth known proxemians.

[1:51:58] Its comparter concept henceforth known as disproxemia relates to the state in which a human being has neither lived on The Earth, nor were they born upon The Earth, and such humans shall be henceforth known as disproxemians due to their disproximity to The Earth in both identity, and physical location.

[1:51:59] Inspired from its psychological and theoretical originations, the term attensity is known in Astronist Philosophy, and relates to the states of proxemia and disproxemia, and is the extent of the emotional, familial, ancestral, philosophical, and cultural ties with The Earth, and thus influences the extent to which they consider themselves to be earthian, and furtherso impacts upon their identiture.

[1:51:60] Another term inspired by its psychological origins and applied to an Astronist philosophical context is that which is known as auto-noetic which relates to the mental capability to place oneself in the past, in the future, or in counterfactual circumstances; the most important aspect of auto-noetic thought for Astronist philosophical purposes is, of course, the futural aspect.

[1:51:61] Auto-noeticity in its Astronist philosophical context and oriented towards the future relates to one's expected experiences, thoughts, ideas, and emotions during spaceflight, or during one's residence on a world other than the other, and thus leads to an examination of one's own thoughts, as well as one's perception of one's oneself, and how one believes oneself will act in a certain scenario in the future.

[1:51:62] Auto-plastic adaptation is the next term of psychological origination that shall be applied to an Astronist philosophical context, and relates to when an individual understands and accepts that they must change their religious or philosophical orientations and beliefs due to the inevitability of something, or the due to the present reality that is present to them; the ability to complete this is henceforth known as auto-plasticity, and the physical execution of it is henceforth known as auto-plasty.

[1:51:63] In Astronist Philosophy, the practice that is known as auto-shaping has a slightly different meaning from its originative mainstream psychological and instead relates to the practice of analysing the extent to which reward or punishment influences a person's philosophical beliefs, practitioners of which are henceforth known as auto-shapers, and they attempt to successfully derive and make conclusions about the authenticity of people's beliefs, and the extent to which they will align themselves with such beliefs according to the consequences associated with such an alignment; essentially, auto-shaping is the measurement of a person's loyalty to their philosophical beliefs by placing reward, and punishment, as a set of psychological tools before them.

[1:51:64] Avolition, in an Astronist philosophical context, relates to the discontinuation of an individual's motivation to either think philosophically, be involved in philosophical debate and discourse, or the demotivation to be associated with philosophical traditions in general, especially in favour for more religious traditions, enactors of which are henceforth known as avoliters, and therefore present avolitional tendencies.

[1:51:65] Aversivity is the measurement of the extent of one's dislike or disinclination to a particular philosophical concept, orientation, or denomination.

[1:51:66] Basilar concepts, and the semistrument of basilarity, both relate to that which exists at the base of something, either physically in The Cosmos, or conceptually in the mind in a foundational sense; in either sense, the basilar term originates from the medical lexicon, and can henceforth be applied to Astronist Philosophy through these avenues.

[1:51:67] That which is known as the practice of centration relates to one's tendency of focusing on the most prominent, or most discussed aspects of a philosophy, or philosophical concept, or theory rather than exploring other aspects, or lesser known, or even trying to develop new concepts and theories; it isn't wholly discouraged by the Astronist Tradition, though it is not considered to be philosophically expanding.

[1:51:68] The concept of circumstantiality in an Astronist philosophical context relates to the dependence on circumstance for a philosophical theory to be true, which can be an either an anthropic sense, as in between humans, or in a cosmical sense.

[1:51:69] Circumstantiality is also a semistrument for the measuring of the extent to which circumstance has an influence over the subject, or scenario's particular existence; for example, circumstantiality would measure the extent to which the circumstances of an event have an influence on its reoccurrence in different circumstances.

[1:51:70] Furthererso, circumstantiality can also be used to differentiate between universals and particularities, the former of which are not influenced by circumstance while the latter of which are.

[1:51:71] That which is known as penetrability in an Astronist philosophical context relates to the extent of a concept's ability to be understandable, acceptable, and widely disseminable; penetrability distinguishes between concepts that are naturally lucid, and those which are not; an alternatively term that may be used is lucidity.

[1:51:72] The term that is known as communality is, in the discipline of naology, is a type of state that an Astronist philosophical building is in when it is open for common use, or common public access, as opposed to when an event is in occurrence, and only certain amounts of visitors are able to enter.

[1:51:73] The associated philosophy of communality is communalism, which is a naological orientation, and upholds the principle and belief that Astronist philosophical

buildings should be solely built as a universal and communal public service rather than a private enterprise; both terms of communality and communalism are derived from medical nomenclature which confirms the reason for their inclusion in this discourse.

[1:51:74] The term that is known as conation, which is both philosophically and psychologically originative, relates to the anthropic issues of purpose, desire, or will in the performance of an action, which is addressed throughout Astronist Philosophy across different disciplines, especially so in Astronist Ethics for that is what it relates to.

[1:51:75] A term of biology, conspecific or conspecificity, relates to members of the same species while heterospecific, or heterospecificity, which relates to members of a different species, both of which are important to sentientological study, and are therefore most frequently used within that discipline; these also classified as twin concepts.

[1:51:76] Another pair of concepts that are classified as twins are contralateral and ipsilateral, which are medical terms by their originations, but in an Astronist philosophical context relate to different definitions.

[1:51:77] Contralateral concepts, measured by contralaterality, are those which are present on the opposite side of the philosophical spectrum from that which it originates, which can be most often seen in the existence of oppositism, or extremities; usually, a concept exists and an oppositism follows on afterwards, which is henceforth known as the occurrence of contralaterality.

[1:51:78] Ipsilateral concepts, measured by ipsilaterality, are those which are present on the same side of the philosophical spectrum from where they originate, and therefore demonstrate only a slight shift in orientation, an example of which would be two schools of thought that agree on almost every point of possible contention, though they do separate in their orientations in a few areas of contemplation.

[1:51:79] A term of psychological origination, counter-transference, in an Astronist philosophical context relates to the emotional reaction of a philosopher to a particular concept, or theory, especially so when such emotions are triggered by the past experiences of the philosopher, and as having been reminded by the concept, or theory in question.

[1:51:80] Another term of psychological origination that is herein incorporated into an Astronist philosophical context is that which is known as decentration and involves the ability of a philosopher to pay attention to, or can sufficiently debate two or more concepts simultaneously rather than contemplating or discussing one concept at a time; decentrative abilities of a philosopher are considered to be a sign of greater philosophical experience, and eloquence.

[1:51:81] That which is known as discriminability is the capacity of a philosopher to differentiate between two or more concepts, or theories by identifying the differences

between them; the extent of the differences between them corresponds to the level of discriminability.

[1:51:82] Dishabituation in the context of Astronist philosophy relates to the instance in which a new philosophical concept or theory is introduced, accepted, and disseminated by The Institution of The Philosophy of Astronism which results in a portion of its adherents to become confused and to experience a diminishment of their association with Astronism; this is culminated in feeling dishabituated; essentially, dejected by the introduction of something unknown, or by the occurrence of change.

[1:51:83] Derived from the anatomical and medical term distal, that which is henceforth known as distality in Astronist Philosophy measures the extent to which a concept is proximate to being central to a wider theory, but not necessarily fundamental.

[1:51:84] Derived from its medical equivalent, the term ectopic in an Astronist philosophical context is defined as a philosophical concept or theory that shares little to no connections with other concepts or theories of Astronist Philosophy which is a rare occurrence within the Tradition itself; the measure of ectopic characteristics is henceforth known as ectopicity.

[1:51:85] A term of Astronist origination, but is frequently used in Spacial Psychology thus demonstrating the purpose for its inclusion within this discourse, the term environmentality measures the extent to which the environment, as distinguished from circumstances and circumstantiality, influences the outcome of a philosophical concept, or even a philosophical debate, depending on the application of environmentality, of which environmentilities is the plural term.

[1:51:86] Of a similar terminological origination is that which is henceforth known environmentation is a specific type of instrumentation that analyses the environment in which instruments are applied and attempts to derive the influence of an environment in relation to the outcome of the instrumentation.

[1:51:87] That which is known as the process of equilibration is an important term as it relates to working towards the achievement of an equilibrium between a dichotomy of concepts, the ability to do so is regarded to be the signifier of greater philosophical understanding.

[1:51:88] A physiologically originative term, exteroception, in an Astronist philosophical context relates to the utility of concepts beyond Astronist Philosophy in order to support an Astronist originative argument or to complete an Astronist originative concept; such are henceforth known as exteroceptive concepts and/or arguments.

[1:51:89] Extramission and intromission demonstrate another set of twin concepts with the former relates to philosophical concepts, and experiences that philosophers search for themselves, either physically, or mentally, while the latter concept relates to philosophical

concepts, and experiences that come to the philosopher without the philosopher actively seeking them; Astronist philosophers should also attempt to derive the nature, superiority, differences, and other characteristics of extramissional and intromissional philosophical endeavours.

[1:51:90] To fractionate, and its associated term of fractionation, relates to the process of breaking down a philosophical concept, or theory into its component parts and is considered to be one of the most important element of philosophical theory.

[1:51:91] Haptic Philosophy, as inspired by the psychological term, relates to philosophical endeavours that are initiated by the sense of touch; physical interaction with the surrounding environment is considered to be one of the most important elements of philosophical enquiry; hapticity is the measurement of the influence of the sense of touch on the development of philosophical exploration.

[1:51:92] Scedasticity relates to the measurement of philosophical variation in the approach of the philosophical school, the abundance of the philosophy in terms of the extent of the concepts within it, and the level of impact the philosophy has over the functioning of society, or another real-world subject.

[1:51:93] Heteroscedasticity and homoscedasticity are twin concepts deriving from scedasticity with the former relating to greater variation between two philosophies or philosophical schools, and the latter relates to a lower variation.

[1:51:94] Heuristic approaches to philosophical education are characterised by allowing the philosopher to discover and learn all philosophical concepts, theories, denominations, and schools of thought themselves; by that notion, heuristic approaches are autodidactic in their nature.

[1:51:95] As derived by its medical and psychological origination, the term hybridism in an Astronist philosophical context relates to a philosophy, or a philosophical school that is a combination of two or more other philosophies, or philosophical schools; hybridists believe that such philosophies are superior to ordinarians, those philosophies or philosophical schools which are not hybrids, with ordinarianism supporting the superiority of those philosophical schools and philosophies which are not hybrids.

[1:51:96] Motility, as inspired by its psychological originating definition, relates to reactions to circumstances or responses that are wholly mental rather than physical, usually in order to purposefully suppress physical reactions so as to not allow oneself to be weakened or undermined, especially during a philosophical debate; such reactions are henceforth known as motilitive reactions rather than somaticity, or somatic reactions which are physical rather than mental.

[1:51:97] There exists another set of twin concepts in Astronist Philosophy that are inspired by their psychological and linguistic definitions and allow us to derive an understanding into the nature of a philosophical concept what it is asking of its audience.

[1:51:98] The first concept is known as illocution, or illocutive, and the second is that which is known as perlocution, or perlocutive; the former relates to philosophical concepts that order, warn, or promise in order to initiate an intended action while the later relates to a philosophical concept that is purely informative, mildly instructional, or largely neutral in its intention for, or in requirement for an subsequent action.

[1:51:99] Derived and inspired by its medical origination, that which is henceforth known as interoception in Astronist Philosophy refers to the concept and notion of whether abstract ideas are able to introspect itself in order to allow the philosopher to learn more about it; essentially, interoception is to the introspection of ideas themselves rather than physical entities, which is how it is usually applied.

[1:51:100] The practice of interposing, and its associated term of interposition, is one of obscurity within Astronist Philosophy for it is rarely applied, though we must still address it herein due to its psychological and medical origination.

[1:51:101] Essentially, in Astronist Philosophy, interposing is the practice of categorising a philosophical concept in-between two other concepts, typically due to the interposed concept resembling a middleground between the other two.

[1:51:102] That which is known as intraspecific, and its associated term intraspecificity, as inspired by its biological origination, relates to an Astronist philosophical concept that is concerned with only one species, rather than interaction between individuals or groups of one species.

[1:51:103] Inspired from a psychological origination, though the term itself, memorism, remains Astronist originative, in Astronist Philosophy, it is characterised by the practice of memorising certain aspects of The Cosmos itself, its progeny, or phenomenas such as cosmical events, but is most commonly applied to the memorisation of cosmic geography, and the countless different regions, and locations of cosmical phenomena; in a non-cosmical context, it relates to the memorisation of a philosophy, or just one philosophical concept.

[1:51:104] Memorism, though perhaps not provided with the prominence it deserves, remains an important aspect of Astronist philosophical learning, but the Astronist Tradition stresses the practice of informal memorism, or natural memorism, which is characterised by memorisation over an unregulated amount of time, essentially allowing the studier to memorise what they wish when they wish to do so, in order to separate that which is known as philosophical memorism, and religious memorisation, the latter of which is generally considered to be of greater regulation and formality.

[1:51:105] Astronist Philosophers can study the nature of memorism, its effectiveness in philosophical enknowledgement, and the general activities and orientations associated with its practitioners, which are henceforth known as memorists, and it is those of whom believe that memorisation is the superior form of philosophical enknowledgement.

[1:51:106] That which is henceforth known as the mytra in the Astronist philosophical tradition relates to one's individual, unique, and consequential relationship between themselves and The Cosmos; one's mytra is a combination of their physical, emotional, spiritual, mental, and philosophical interaction with, perception of, and relationship to The Cosmos and is lattercontemplated in much greater depth within the discipline of pneumovology, which includes a discussion about the nature of the mytra.

[1:51:107] Nativism, as derived by its psychological origination, relates to the belief in the innateness of mental capacities, mental structures, and conceptualisations in the mind rather than these being established through learning.

[1:51:108] Astronist Philosophy is opposed to the doctrine of nativism as it aligns itself with the Astronist-originate concept of enknowledgement which prioritises learning as the centralmost aspect of mental development.

[1:51:109] The Astronist Tradition does not entirely disregard nativist ideas, as it does maintain that certain capacities of our understanding and certain abilities of individuals are definitely innate by their natures, however, it remains strong in the orientation that it cannot agree entirely with a disregard for the presence and importance of learning to the development of human capacity, human conceptualisation, and the overall expansion of the human mind, therefore Astronist approaches tend not to be nativistic in their orientations.

[1:51:110] Nociception, which is a term directly derived from its psychological-origination, relates to the mind's interaction with pain, or even the potentiality for harm to the body and in Astronist Philosophy, our nociception is the connection between our mind and our body and specifically, what is happening to our body and the effect of this on our minds, as well as the engravation of this into the mind.

[1:51:111] That which is known as oblivescence in Astronist Philosophy, as inspired by its psychological origination relates to one's inability to remember a philosophical concept, especially its finer, and more obscure reasons and due to the vastness of Astronist philosophical concepts, the occurrence of oblivescence is expected to be commonplace.

[1:51:112] Derived from the medical term ocular, that which is henceforth known as ocularity in Astronist Philosophy is a semistrument that measures both an individual's capacity to envision, as well as the extent of their visions as a greater measure of their philosophical knowledge and understanding.

[1:51:113] Oneiric, as a term inspired from its psychological origination, and the Astronist-origivative term of oneiricity relates to dreams, but specifically the measurement of the influence of one's dreams on their philosophical enquiries and contemplations, and oneiricity is the semistrument that measures this.

[1:51:114] The associated philosophical orientation of oneiricism, and their believers who are henceforth known as onericists, hold dreams to be the central initiators of philosophical enknowledge, enquiry, and contemplation; essentially, onericists suspend the entirety of philosophy on the occurrence of dreams and attempt to connect one's dreams with one's philosophical ideas and enquiries.

[1:51:115] Originating during this first discourse on Spacial Psychology, the term that is henceforth known as oresy relates to the belief that philosophy is the one and only connection between a sentient person and that entity which is known as The Cosmos in Astronist Philosophy; essentially oresy, and its associated term of oresis, encourage philosophical enquiry and enknowledge for oresors hold that if one doesn't interact with philosophy, they do not hold a connection to The Cosmos.

[1:51:116] The practice of patterning is established in Astronist Philosophy as the raising of similarities between the concepts of an entire philosophy, or a philosophical school; this includes drawing similarities through the analysis of concepts and theories in order to develop that which is henceforth known as a patternation; a series of patternings culminated into one documentation.

[1:51:117] A medical term originally, that which is known as rebirthing holds a different definition in an Astronist philosophical context as it relates to the practice of systematically reviewing, changing, and reintroducing a philosophical idea after its degradation, or obscuration from the wider philosophical world.

[1:51:118] That which is termed as recency in the Astronist philosophical tradition relates to philosophical ideas that have originated in the past fifty years from the perspective of the perceiver.

[1:51:119] A very important activity in Astronist philosophical devotion and enknowledge, and as part of the Astronist philosophical discipline of occurrology, is that which is henceforth known as retination.

[1:51:120] To retinate is to count the number of visible stars in the night sky rather than to estimate the amount of stars; this practice is one of tediousness, but is a practice that exuberates philosophical discipline, a keen thirsty for cosmical enknowledge, and a devotion to The Cosmos and one's understanding of it.

[1:51:121] The practice encourages one to take the widest view possible of the night sky and is expected to lead them to the understanding that their knowledge of the stars is directly bound to their perception of the stars; it is breaking through this physical

perceptual boundary that remains the most important aspect of the Astronist philosophical experience.

[1:51:122] As derived and inspired by its psychological origination, the term that is known as subception is, in Astronist Philosophy, the practice of thinking of a philosophical idea without being stimulated by some experience, or some physical occurrence; this type of philosophical ideation is considered to stem from that which is known as The Unconscious Mind; the mind that is still active in exploring The Cosmos even when one's Conscious Mind is considered with other matters; these two minds work in tandem, with the former providing ideas to the latter when the latter is ready to receive them.

[1:51:123] As the oppositism to the term aforementioned in this discourse known as retination, that which is henceforth known as subtisation, or to subtise, is to estimate the number of visible stars in the night sky as opposed to retination which involves counting each visible star rather than merely estimating them.

[1:51:124] The occurrological practice of subtisation is considered inferior to retination by the Astronist Tradition, but it is also given a precursory role to retination; subtisation is therefore considered to be the precursor, though not the necessary precursor to retination, and subtisation is still considered to be an act of devotion and an inspirer of philosophical enknowledge and enquiry.

[1:51:125] Derived from its medical origin, the term that is known as tangentiality relates to the ability for a philosophical concept to lead a tangent and conclude with a topic of little resemblance to that with which it began; tangentiality is also the measure of the extent of this; concepts that resemble tangentiality are henceforth collectively referred to as tangentials.

[1:51:126] The term that is known as territoriality, as well as the associated philosophical orientation of territorialism, in an Astronist philosophical context relates to the nature of Organised Philosophy, and the admittance that Organised Philosophy remains territorial at its nature, and the study of the extent of this territorial nature and how far it is engrained into Organised Philosophy of Astronism.

[1:51:127] That which is known as veridical which is a non-Astronist originative term relates to truth and truthfulness, and in an Astronist philosophical context, relates to the contemplation of the nature of truth and its relationship with Astronist philosophy, which proclaims that there exists no absolute truth in the human perception of The Cosmos because the human perception and understanding of The Cosmos is entirely bound to the knowledge of humanity and due to the limitations of the knowledge of humanity, we cannot ever be sure that that which we perceive and understand is true.

[1:51:128] Veridical contemplations are measured by the semistrument of veridicity and this is something that Astronist philosophers in general should henceforthly contemplate,

and is typically categorised within Astronist Ethics, but is introduced within this discourse due to the origination of the term veridical.

[1:51:129] From its medical terminological origination, abarticulation in Astronist Philosophy relates to the displacement of a philosophical concept from its originally categorised place within Astronist Philosophy, especially as a displacement from its originally designated discipline.

[1:51:130] To conduct adduction in an Astronist philosophical context involves promising a philosophical concept so as to place in front of other concepts in correspondence to its perceived importance; by this notion, promising and adduction work hand in hand with the former relating to deriving the importance and the latter relating to accomplishment of this.

[1:51:131] Derived from its medical origination, to ambulate, or to complete an ambulation in the context of Astronist Philosophy is to embark upon a travelling journey to different regions in search of philosophical inspiration, especially as an equivalent to a religious pilgrimage, but much less obligatory as well as being much more personal and unique to the individual and where they deem they will find the greater amount of philosophical enknowledge and inspiration.

[1:51:132] Anteversion and retroversion relate to the rotalities of planets and other celestial entities, with the former relating to forward rotation, and the latter relating to backward rotation with anteversional and retroversional concepts sprouting from this nature of rotation of celestials.

[1:51:133] When a philosophy, a philosophical school, or even a philosophical concept or theory is experiencing its highest level of popularity throughout the history of its existence is that which is termed as a state of apicality.

[1:51:134] Derived from its medical origins, that which is known as the articular of The Cosmos in Astronist Philosophy relates to the physical connectedness of different celestial entities like the connectedness of the joints of the body; articularity is the study and measure of the articular structure of The Cosmos, which is especially seen in the metagalaxy and its structure.

[1:51:135] Atavism, as also derived from its medical origination, in an Astronist philosophical contextualisation relates to one's belief in a philosophy that was once also held by a distant ancestor and not by one's parents, practitioners of such are henceforth known as atavists.

[1:51:136] A valve in Astronist Philosophy is to be henceforth understood as the controlling factor between a contemplation and the conclusions derived from that contemplation, with bivalves and trivalves demonstrating contemplations that require two or three factors in order to reach a conclusion respectively.

[1:51:137] An example of a valve would be the introduction of evidence, a physical justification, or a some logical argument in support of the contemplation in order to make the conclusion; essentially, the valve is the midpoint between the contemplation and its ability to make a conclusion of that which is contemplates; valves will remain an important factor of philosophical theory and an important component in understanding the inner workings of Astronist philosophical enquiries.

[1:51:138] Derived from its medical and dental terminological origination, a cavity in the context of Astronist Philosophy relates to a philosophical concept that exists only in an abstract application rather than be able to be applied to the physical reality; cavity remain locked in an abstract existence.

[1:51:139] The occurrence of confabulation relates to the conversations conducted about Astronist Philosophy, but only in an informal, colloquial, and casual setting as opposed to a debatory setting, or even a discussion between friends; confabulations about Astronist Philosophy are conversations about the philosophy rather than discussions about it or the concepts within it.

[1:51:140] Debility, in the context of Astronist Philosophy, relates to the sudden inability to conduct philosophical thought or enquiry either due to mental or physical illness.

[1:51:141] Decompensation in an Astronist Philosophy contextualisation is one of the most important concepts, especially so in relation to today's current affairs and the way by which the government of this nation has conducted itself.

[1:51:142] Decompensation relates to the removal of an institution, or a portion of a society, or culture without infilling that removed portion with a compensative alternative; an example of this comes to mind in the government's decentralisation of religious traditions and attempting to infill the void of a religious society with materialism; the alignment of government with materialism has only lead to unhappiness, suicide, anxiety, and drug-taking; despite the harsh realities of decompensation that is what we must contemplate.

[1:51:143] The instance of a decussation in Astronist Philosophy occurs when two philosophical concepts intersect once with one another, but then do not ever intersect or interact ever again.

[1:51:144] Declusation, which is an Astronist-originitive term that is inspired by medical terminology, relates to the cutting off of a philosophical concept from the philosophical school to which it belongs, especially so in an official capacity by the leading scholars or prominent philosophers of a school of thought.

[1:51:145] The act of disarticulation, in an Astronist philosophical context, occurs when a debater interrupts the explanation of another debater's logical argument, especially with a

logical counterargument; this practice, in Astronist debatory procedures, is discouraged due to its resemblance of the lack of respect for one's fellow debater.

[1:51:146] Directly derived from and inspired by its medical meaning, the practice of dolorimetry relates to the measurement of mental or physical pain in relation to their ability to conduct better philosophical enquiries, and attempts to draw correlations between greater amounts of pain in one's life and the greater capacity they hold to conduct more refined philosophical enquiries, and a generally greater ability to thinking philosophically and contemplate more deeply than those without as much pain.

[1:51:147] That which is henceforth known as eventration in Astronist Philosophy relates to the association of a specific philosophical school or philosophical concept with an event, especially in aid of its awareness, support, or dissemination, and is most commonly associated with starlight festivals; eventration is considered to provide events with distinct philosophical purpose and meaning rather than them being conducted for the sake of being conducted.

[1:51:148] Euplasticity relates to the state of a philosophical school's quick revival or recovery after being obscured; to attain the euplastic state, the philosophical school is generally backed by investors to try and invigorate a philosophical movement to reinstate the school of thought that they are supporting.

[1:51:149] To excoriate in an Astronist philosophical context is to lead a campaign against a philosopher and the school of thought, concept, or theory that they support or that they founded; an excoriation involves a public campaign against the individual and their philosophy and the media is most often used as the main tool to achieve the excoriation.

[1:51:150] That which is known as the state of exogeneity, and exogenous discussion and debate, relates to contemplations and concepts that have arisen from non-Astronist originations, but are nonetheless discussed by Astronist philosophers; exogenous concepts are important to Astronist philosophical discussion, but by the principles of the Astronist Tradition, exogenous concepts and theories must remain distinguished from those which are endogenous in their origins.

[1:51:151] Another term for an exogenous state is exoticity, but this particular term specifically relates to entire philosophies and their contemplations by Astronist philosophers while the former relates to individual schools of thought, concepts, or theories.

[1:51:152] The philosophical procedure that is termed as explantation in an Astronist philosophical context relates to the process of transferring a philosophical concept or theory that has originated from one philosophy, or philosophical tradition to another philosophy, or philosophical tradition in order to apply that concept or theory to this new philosophical medium; a philosopher that conducts this is henceforth known as an explantor, explanter, or an explantress.

[1:51:153] That which is henceforth known as the Principle of Exangeny firmly holds that philosophical thought is the primary stimulus of all sentient minds and also presupposes material possessions, emotional qualities, and mental or physical stimulants other than philosophical thought to be inferior.

[1:51:154] There is a set of twin concepts in relation to the Principle of Exangeny, and these are exangenation and disexangenation, the former relates to the embracement of philosophical thought into their lives and agree to philosophical thought as the primary stimuli, while disexangenation relates to the deprivation of the mind through the forsaking of philosophical thought as the primary stimuli.

[1:51:155] Exangenous and disexangenous approaches to philosophical thought and one's interaction with philosophical thought and the application of this to one's life with the former championed and the latter discouraged.

[1:51:156] Another set of twin concepts are those which are henceforth known as exteriorisation and interiorisation, the former of which relates to the act of a philosopher of contemplating a concept or theory who isn't a specialist of the discipline in which the concept resides, also known as unspecialised contemplation, and the latter of which is contemplating a concept as a specialist of the discipline in which the concept resides, also known as specialised contemplation.

[1:51:157] As derived from its psychological origins, a philosophy, a philosophical school of thought, or a philosophical concept, or theory is described as an extroversion in Astronist Philosophy if it concerns itself with concepts of the external world beyond the mind; essentially, concerning itself with that which remains actual rather than abstract.

[1:51:158] That which is known as a floccule in Astronist Philosophy, which is directly derived by medical terminology, relates to the grouping of between three and five philosophical concepts together, usually because they share similarities in subject, in aim, or in origination.

[1:51:159] Derived and inspired by its medical terminological origination, the procedure of hyperextension in an Astronist philosophical context relates to the application of a philosophical concept to an extent beyond the proper means of its application, or the originally intended means of its application.

[1:51:160] An iatrogenic concept in the context of Astronist Philosophy relates to a concept or theory that solves one philosophical issue, or paradox, but unintentionally causes the rise of another issue or paradox as a direct result of its solution of the initial issue; iatrogeny is an occurrence that is welcomed by the Astronist Tradition of philosophy as it is considered to be a sign of philosophical progression and leads to further enquiry, discussion, and contemplation.

[1:51:161] Of a similar vein of thought is a concept that is henceforth known as idiopathy, which relates to an idiopathic concept, which is a philosophical concept or theory that has an unknown origination.

[1:51:162] The final concept to be introduced and to be further contemplated generally by Astronist philosophers is acentricity, or that which is acentric, also known as decentricity, or that which is decentric.

[1:51:163] Both of these versions of spelling relate to the same concept which is a disbelief that the centre of something, whether it be physical or abstract, is right to be corresponded to importance; due to the ideas expounded in the discourse of The Aesthetic Cosmos, the acentric approach is highly unorthodox, but this doesn't mean it shouldn't be considered.

The Spirits of The Cosmos

(Pneumovology)

[1:52:1] There exists a discipline within Astronist Philosophy that is neither major, or nor minor, yet remains the undercurrent of the philosophical tradition, and can be described as concerning itself with the mystical and ethereal concepts and phenomena of The Cosmos; this discipline of Astronist Philosophy is henceforth known as pneumovology, the studiers of which are henceforth known as pneumovologists.

[1:52:2] An alternative term for pneumovological discipline is that which is henceforth and more simply known as vology, as a more colloquial term for the discipline, of which the term vologist is the way in which we should address those specialised in the study of vology.

[1:52:3] Dedicating an entire discipline of Astronist Philosophy to the study, discussion, and contemplation of mystical, ethereal, and invisible entities may initially seem counterintuitive to all else that is contemplated in Astronist Philosophy, but the actuality is that Astronist Philosophy attempts contemplations about the mysteries of existence whether these be the cosmical mysteries, the anthropic mysteries, or the spiritual mysteries, and it is these spiritual mysteries, or ethereal mysteries that are addressed within the discipline of pneumovology, which further affirms its importance.

[1:52:4] Throughout all the cultures, philosophies, religions, and civilisations that humanity has created and established, the inclusion, the depiction, and the dichotomical role of that which is known as The Devil has been present.

[1:52:5] Known by as many names as its dichotomical counterpart, it should be henceforth known due to the clarification herein and now that The Devil in all its many forms and depicted occurrences is considered an abstraction according to the Astronist Tradition, and although the Tradition does not consider it to be a real entity, that does not mean to say that it is not dangerous.

[1:52:6] The Astronist Tradition maintains that some of the most deadly and disastrous entities and occurrences of human history have so happened from abstract notions; think of the wars that have been waged in the name of ideas and from that, do not underestimate the immortality of ideas, as well as their ability to pervade and hold the minds of humanity in order to influence action; one only need conduct a short analysis of the history of human civilisation and nationship see the reality of this notion and the countless lives that have been lost, torn apart, and uplifted by the ideas that either have expounded, or the authority at the time of their lives has expounded.

[1:52:7] Apologies for the digression, but to those whom adhere and advocate for the rule of refraining from speaking about religion and politics wish for us only to speak about the

trivialities of the world with the king of triviality being sport and the queen of triviality being material possessions.

[1:52:8] In the Astronist Tradition, especially so within the discipline of pneumovology there exists a concept that is henceforth known as The Inexplicable Element of The Cosmos, which really stands at the heart of pneumovological study as it interprets The Cosmos, as one of The Ten Cosmical Elements, in its mystological form.

[1:52:9] Essentially, a pneumovologists understands The Cosmos, not purely as a physical entity, although that still remains part of their understanding, but primarily they understand The Cosmos as a spiritual, mystological, and pneumovollic entity; something that holds an incorporeality, a distinctly and uniquely philosophical numinosity, and is, for all intents and purposes, an entity that is somewhat alive.

[1:52:10] Not alive in the sense that it has a beating heart, but in the sense that it retains a certain sense of vigority, it holds dynamics, and it exists in an animated state; this is the essence of pneumovologists must perceive The Cosmos in order to study in the particular way that they must; in a pneumovological way; in a spiritual and mystological way.

[1:52:11] To understand The Cosmos in this way is to take the Pneumovollic View and to achieve this understanding is considered to be of great cosmic philosophical experience; this type of Cosmos may also henceforth be known as The Pneumovollic Cosmos, or The Living Cosmos.

[1:52:12] To embark upon pneumovological study and contemplation, one must remove oneself from the chains of reason and logic for although these two components of thought do serve us well in the safety of our own civilisation, they do not fare so well in this arena.

[1:52:13] The principal issue with both rationality and logic is that they are ultimately bound to the extent of the perceiver's knowledge, experience, and understanding which practically renders them useless in a realm of which the perceiver knows so little, has experienced minute amounts, and understands essentially nothing of the subject; this subject, and this realm that one speaks of in this regard is The Cosmos, and beyond that, of course, is The Universe, and beyond even that is The Divine, and so and so forth depending upon one's beliefs and the extent to which they are willing to label such dimensions of authority, orderity, and nature.

[1:52:14] Any notions holding that The Cosmos, or any of its progeny must align with our frameworks of logic and reason is detriment to the possibility of the fullest extent of cosmic existence and ultimately harmful to wider thoughtpaths; however, such notions of system and structure serve many of the disciplines of Astronist Philosophy well, but again, they do not work as fittingly in the pneumovological arena of thought.

[1:52:15] If we are to attempt to understand The Cosmos on a different level, not a higher level for the Astronist Tradition believes not in such manmade hierarchies, but simply a

different level, then we must forsake our smatterings of knowledge, our rules of logic, and even our instruments of study for none of these work when we consider The Spirits of The Cosmos; the study of pneumovology is therefore introduced.

[1:52:16] It remains true that ideas are the hardest elements of cosmic existence to eliminate; once an idea is created, there stands very little in its way of being eradicated for its very nature is conceptual, rather than physical, and in this way, it defies cosmicity.

[1:52:17] Whether ideas are transversable across The Cosmos into The Universe, or into some Divine existence, that is currently unanswerable for no individual knows the true extent of ideas; from where which they originate, and to which extent they exist; their transversion across cosmic, universal, and Divine dimensions is a concept that shall not only puzzle pneumovologists, but philosophers and peoples of all kinds until the end of The Universe.

[1:52:18] But herein we have touched upon the very greatness of ideas and their naturities for it is their mysteriosities in relation to their true existences that is their most puzzling, yet most genuine of all elements.

[1:52:19] We must see the irony in the notion that all we are and all we have ever been is ideas, yet we know so very little about them; this remains true for The Omnidoxy itself to which I dedicate myself to writing; all I write of are the ideas of my mind in relation to the world and The Cosmos in which I reside and know and experience; the very complexity of the nature of the ideas themselves perhaps stands as no greater contradiction, those too are which have sparked the minds of philosophers since the beginning of human thought itself.

[1:52:20] The exploration of the ideas themselves as that which we write of is known as the meta-conception in the Astronist Tradition and is one of, if not the most colourful of all the explorations enacted by the Tradition.

[1:52:21] There are those entities of The Cosmos that do not belong in The Cosmos and they are not explainable, knowable, or unknowable by the capacity of our sentient minds, yet they do exist, and it is this acceptance of their existence that the Astronist Tradition upholds.

[1:52:22] The prominentmost segment of pneumovological study and contemplation is that which is termed as Astronist Mysticism, the subdiscipline dealing with which is henceforth known as sidereology; the collection of ideas within Astronist Philosophy associated with a belief in the union between oneself and The Pneumovollic Cosmos as that which is known as The Absolute.

[1:52:23] Astronist Mysticism is also characterised by a defined connection between spirituality and knowledge which are notoriously separated throughout the rest of Astronist Philosophy, but they remain linked within Astronist Mysticism.

[1:52:24] Astronist Mysticians hold that a Greater Knowledge of The Cosmos is inaccessible without the influence of spirituality due to the limitation of the intellect to understand The Pneumovollic Cosmos without applying spirituality.

[1:52:25] But the essential component of Astronist Mysticism is the belief of one's union with The Cosmos in both a spiritual, philosophical, and metaphorical sense and the achievement of this Cosmic Union, as it is henceforth known, is structured upon three different actions, known as The Three Deeds.

[1:52:26] The first of The Three Deeds is henceforth known as The Presence of The Cosmos which involves the acknowledgement, acceptance, appreciation, advocacy, and annunciation of the existence, the occurrence, and the being of The Cosmos in the particular way that pneumovologists perceive it.

[1:52:27] The second of The Three Deeds is henceforth known as The Experience of The Cosmos which involves practical and mental contact and observation of The Pneumovollic Cosmos.

[1:52:28] The third of The Three Deeds is henceforth known as The Knowing of The Cosmos which involves the demonstration of one's awareness of The Cosmos as it is considered to be something that few individuals are expected to fully comprehend, yet this is explicitly not to be interpreted to be a secret, but instead a unique ability for certain individuals to reach.

[1:52:29] The Three Deeds are central to the practice of Astronist Mysticism as an extension of one's practice of Astronist Philosophy but Astronist Mysticism is considered to be one of the action-based forms of Astronist Philosophy as is similar to Cosmic Devotion.

[1:52:30] One of the primary responsibilities of pneumovologists is to study The Three Deeds in all their aspects, but their responsibilities also rest in developing these deeds in order to further develop the Astronist approach to mysticism.

[1:52:31] In addition, the comparison of The Three Deeds of presencing, experiencing, and knowing of The Cosmos is another important theoretical practice for observologists to enact in order to derive a greater understanding of each of the deeds, and how they are to interact with one another.

[1:52:32] One of the key elements of practice and achievement within the Astronist variation of mysticism is that which is henceforth known as espormation; to esporm is to

complete a personal transformation of one's individual identity after mystic, and pneumovological activities and contemplations.

[1:52:33] The practice of esporming demonstrates the ultimate achievement within Astronist Mysticism for it the internal and external transformation of one's body, one's mind, and one's spirituality is the ultimate goal of mysticistic practice for to reach that which is termed as the esporic state is to both be and demonstrate a distinct perspicaciousness that is considered to be unique to the Astronist endeavour of mysticism; therefore, perspicacion is the action of approaching something perspicaciously which is an adjective that the Astronist Tradition intends to synonymise with Astronist Mysticism.

[1:52:34] When one has successfully espormed, they have completed The Three Deeds to their entireties and have reached a point of understanding of The Cosmos that is only reachable once one has successfully espormed.

[1:52:35] There are the espormers and the espormesses and these individuals are henceforth considered to be the leaders of Astronist Mysticism, who are expected to contribute the most to the development of the Astronist mystical tradition, as well as the establishment of new concepts, theories, and branches of the tradition throughout all future generations.

[1:52:36] That which is henceforth known as the Cosmic Faith theory expounds the notion that one can hold a similar sense of faith in the entity that is known as The Cosmos in Astronist Philosophy, as people also hold faith in Gods, saints, and icons in all the different religious traditions.

[1:52:37] This notion does not mean to deify The Cosmos, but it does intend to the place The Cosmos as an entity to which all peoples may turn to express their sorrows, to laden with their problems, to discuss their dreams, and to inspire their actions, thoughts, and ambitions.

[1:52:38] Despite the fact that The Cosmos is not of course considered divine or godlike in Astronist Philosophy, it does nevertheless play a similar role as the one that God may play in some of the religious traditions; the roles of the overseer, the carer, the inspirer, the confidante, as well as the wellspring of grand knowledge.

[1:52:39] Understanding the Cosmic Faith theory, and understanding The Cosmos in this way is one of the most important understanding within pneumovology as well as in Astronist Mysticism for this role is the most fundamental for The Cosmos to retain and for the Astronist Tradition to preserve.

[1:52:40] Cosmic Faith theorists are tasked with expanding, developing, and further contemplating upon the Cosmic Faith theory for I do suspect that there exists a great deal more of development to be achieved with this theory before it can be described as entirely

fulfilled and established, but the Astronist Tradition shall always commemorate its origins within this particular discourse of The Omnidoxo.

[1:52:41] Those which are known as Societal Constructionism and Cultural Constructionism in the context of Astronist Mysticism exist as applicational extensions to the Cosmic Faith theory.

[1:52:42] Societal and cultural constructionism point to the notion that the nature of cosmic mystical experience must be tailored to the particular societal, cultural, and perhaps even theological issues, circumstances, and situations of the time and place in which an individual, or group reside.

[1:52:43] Societal Constructionists believe that the social and societal aspects of cosmic mystical experience are superior to the other forms of the application of experience, while Cultural Constructionists and Theological Constructionists believe that their respective aspects are superior or primary.

[1:52:44] In addition to those which are categorised as The Three Deeds, followers of the Astronist branch of mysticism are also tasked with seeking out that which is known as The Pental Trajectory which is structured by the achievement of those which are collectively referred to as The Five Mystical Pursuits.

[1:52:45] Astronist mystics that follow and prioritise The Three Deeds are to be henceforth known as deeders, or deedresses, while the Astronist mystics that choose to follow and prioritise The Pental Trajectory are to be henceforth known penters, or pentresses, and those Astronist mystics that choose to follow and prioritise both endeavours of Astronist mysticism are to be henceforth known as entirers, or entireses.

[1:52:46] We shall now outline The Five Mystical Pursuits and attempt make a foundation for how one may wish to adhere to and carry out each of these endeavours if they so choose to prioritise them; the essential notion with regards to these pursuits is that if one is embarked upon, all must be completed at some point, or one should have the intention to complete them; this notion is henceforth known as The Requisitory Principle.

[1:52:47] The first of The Five Mystical Pursuits is henceforth known odysstation, followers, enactors, and completers of which are to be known as odysstatist, whom are obligated to physically journeying through The Cosmos during some time in their life, but no specification is made to how far they should travel, where they should travel to and from, or for what reason they should travel only that they should in general terms.

[1:52:48] The second of The Five Mystical Pursuits is henceforth known as rovation, followers, enactors, and completers of which are to be known as rovaters, or rovatists, whom are obligated to journeying with The Cosmos in knowledge.

[1:52:49] Specifically, this relates to the journey of enknowledge about The Cosmos that a rovater is tasked with embarking upon throughout their lives; rovation is a lifelong pursuit rather than one or two different occurrences therefore rovational practices are transcendent and all-encompassing rather than like other pursuits which are concentrated in different events, and actions.

[1:52:50] The third of The Five Mystical Pursuits is that which is henceforth known as explication and this involves the explanation of one's understanding of The Cosmos as a conveyance of their knowledge of The Cosmos, followers, enactors, and completers of which are known as explicators, or explicatresses.

[1:52:51] Explication is itself characterised by Five Doings which are essential to completing it in its entirety and these include development, dissemination, disquisition, debatement, and dissection.

[1:52:52] In this context, development relates to the maturation, advancement, and progression of an idea, or set of ideas with the aim of enhancing them, while dissemination focuses on the tiring of the ideas in subject to the largest and most far-reaching extent of a population.

[1:52:53] The disquisition portion of the Five Doings focuses on the recording, the writing, the literary discoursing, and the essaying of philosophical material while debatement focuses solely on the verbal discourse of such materials in order to strengthen their ideas and theories for the better.

[1:52:54] Finally, that which is known as dissection as part of the Five Doings is focused on deep philosophical analysis, contemplation, and reconstruction, as well as the scrutinisation of all proposed concepts, theories, notions, and opinions; in completing these Five Doings to their fullest extents, one can only then say that they have achieved the pursuit of explication.

[1:52:55] That which is henceforth known as the practice of symposiation is the fourth of The Five Mystical Pursuits and is very closely associated with the practice of debatement as part of the pursuit of explication as symposiation involves the discussion and debate of one's understandings of The Cosmos, but one must now be thinking about how these two differ from one another.

[1:52:56] Essentially, symposiation differs from debatement in that it centres on the discoursing and debating of philosophical issues, ideas, and theories in an official capacity within an Astronist philosophical building, while debatement remains much more informal, and typically relates to the discussion of philosophy amongst friends and relatives, or in smaller groups, especially outside an official philosophical debate in an Astronist philosophical building.

[1:52:57] The fifth and final part of The Five Mystical Pursuits is that which is henceforth known as enosation and is considered to be the hardest of all the pursuits, especially so in present times, which makes the completion of The Five Mystical Pursuits currently impossible, but we must remember that these pursuits are futural and are not necessarily best applied to our present civilisation, and neither to the present knowledges and perceptions that we do hold.

[1:52:58] Followers, enactors, and completers of enosation are to be known as enosaters, or enosatresses and are tasked with their own unification with sentient beings in The Cosmos, which means both communicatively, philosophically, and in relation to actually greeting non-human sentient individuals; of course, the completion of this pursuits is first dependent upon one's completion of the pursuit of odysstation, unless sentients find humanity themselves before we can master the art of space travel as it is considered to be in the Astronist Tradition, an art that is.

[1:52:59] The completion of enosation is secondly dependent upon first the discovery of sentient life, and secondly the encounterment between human civilisation and other sentient civilisations, whether they be humanoid or not therefore the completion of the enosative pursuit is considered to be the most difficult to achieve in the present time due to humanity's current inabilities in relation to space travel and our general knowledge of The Cosmos and what lives within it other than ourselves.

[1:52:60] However, the Astronist Tradition continues to withhold the place for enosation for it considers the pursuit to be one that shall encourage mystics to do all they can within their abilities and fields in order to enosation for the Astronist Tradition encourages all its philosophers and its followers to seek challenges out, and to embark upon them with every fibre of energy they can muster from within their hearts, bodies, minds, and souls.

[1:52:61] Moving on from our discussions of The Five Mystical Pursuits of Astronist Mysticism, we must now outline and contemplate one of the most important practices of Astronist Mysticism, despite its inorigination from both Astronist terminology, and philosophy, though the hybrid of which we speak is very much originative to the Astronist Tradition, and it is that which is henceforth known as Cosmic Meditation.

[1:52:62] Of course, sages and mystics and followers of many religious traditions have practised some form of meditation throughout their lives and the history of the traditions, and the Astronist philosophical tradition sees itself as no different as it intends to introduce a new form of meditation known as Philosophical Meditation, of which Cosmic Meditation is a branch.

[1:52:63] The essential differentiation between Philosophical Meditation and other pre-Astronist forms of meditation is that Philosophical Meditation focuses on deriving greater knowledge and understanding of a subject from the meditation, or a higher level of contemplation of a subject from the meditation while pre-Astronist forms focus on utilise meditation of purely ritual or spiritual purposes, or for the purposes of relaxation.

[1:52:64] The branch of Philosophical Meditation that is henceforth known as Cosmic Meditation is of particular relevance to Astronist Mysticism, which explains its introduction within this discourse as Cosmic Meditation involves thinking of and centring oneself on The Cosmos which means contemplating about The Cosmos or any one of its progeny solely without any other distraction or any other contemplative subject.

[1:52:65] The traditional meditative practice of silence is utilised, as opposed to humming or chanting, with the purpose of singularising The Cosmos in one's mind so that one only may contemplate The Cosmos during their meditative practices in order to derive greater knowledge of The Cosmos, a greater understanding of The Cosmos, and most primarily, to inspire new ideas about The Cosmos.

[1:52:66] Essentially, Cosmic Meditation is a facet that one may use in order to enknowledge oneself, to gain a greater understanding of the cosmic subject which they do focus their meditations upon, and/or to inspire oneself into thinking of totally new concepts in relation to The Cosmos or its progeny, or the way in which these function and is therefore an important practice that acts as an aid to think of new philosophical ideas about The Cosmos, and thus cemented into the foundations of Astronist Mysticism as a staple practice of the Astronist mystic tradition.

[1:52:67] Despite the non-Astronist originative practice of meditation being part of Astronist Mysticism, the practice of asceticism is not considered to be part of the practices or requirements of Astronist Mysticism.

[1:52:68] This is because the Astronist Tradition considers asceticism to be an entirely religious conviction rather than being rooted in a philosophical basis and in the Astronist Tradition, it is not considered to mean anything more or less if one does indulge in their desires for desire is considered to be drive the mind forth into previously unforeseen territories, while ascetic practices are considered to only inhibit one's ability to think, feel, love, wonder, and ultimately, to philosophise which stands in opposition to the essences of the purpose of the Astronist Tradition.

[1:52:69] Despite this, the Astronist Tradition remains an outspoken critic and discourager of hedonism which Astronist Philosophy opposes as it considers the centralisation of happiness in one's life to be more prohibiting than freeing for the Tradition maintains that the most tragic, daunting, and hurtful parts of life are life's greatest gifts of inspiration, yet forced pain, which is what asceticism is considered, is held to be inauthentic.

[1:52:70] One with prior knowledge about the Astronist philosophical tradition should know stand and point out that the central aspects and purposes of zoism and The Zoic Order are to practice asceticism, but one must not forget that zoics give up the entirety of their lives to The Cosmos for greater knowledge, greater understanding, and greater appreciation of The Cosmos in the form of Cosmic Devotion which is philosophical by its nature.

[1:52:71] It must also be noted that these specific views of asceticism are held most rigorously by Astronist Mysticism and not the entirety of Astronist Philosophy, though Astronist Mysticism's views on asceticism are still highly regarded and tendenced towards, but essentially zoism is an entirely distinct branch of Astronist philosophical practice that must remain distinct from Astronist Mysticism for zoism is often described as its own distinct philosophy that is still currently rooted in, but is growing out of Astronism.

[1:52:72] There is an existent principle within Astronist Mysticism that also deserves a great deal of contemplation for it should be widely observed and it is henceforth known as the Non-experimentation Principle; this holds that Astronist Mysticism, as distinct from general philosophical enquiry, does not share the ambition of proving one's understandings or beliefs, or even in justifying one's notions about The Cosmos and its progeny, but is instead ambitioned by the sharing of all ideas no matter their correctness in order to lead to greater abundances of new ideas; this may be henceforth described as the Mysticist-Philosopher Divarication.

[1:52:73] One of the most unique aspects of Astronist Mysticism, second only to the introduction of that which is to be known as The Mytra, which shall occur in a couple of insentensation's time, is the depiction of The Five Astronist Characters, as they are known outside Astronist Philosophy, yet still within the Astronist World.

[1:52:74] In no other branch or discipline of Astronist Philosophy do The Five Astronist Characters appear in such clarity, or in such regularity as they do within Astronist Mysticism and it is this fact that the mysticists rejoice over, and it is this fact that shall lead to many grand pieces of art long beyond the moment that these words of The Omnidoxy have been typed.

[1:52:75] Further so, not only are The Five Astronist Characters depicted in order to aid the practice of Astronist Mysticism, but they are considered to be central pillars in aiding the practice, so they do not therefore exist just as some extension, or appendix to these mysticistic practices.

[1:52:76] Due to the anticipated abundance of artpieces created by Astronist mystics, we shall herein and now henceforth establish the branch of Astronist Art known as Astromystic Art, which shall collectively refer to all works of art of Astronist mystics, as well as the artists themselves.

[1:52:77] The reason for the inclusion of The Five Astronist Characters into Astronist Mysticism in such a unique way is brought about by the invocation of these Five Characters into Astronist philosophical contemplation and theory that still does not interfere too greatly with the Misnomenic Principle that structures the entirety of The Omnidoxy, for Astronist Mysticism can be considered a branch of Astronist Philosophy

rather than a core element; this is how we shall rejoice in the wonders of characteral philosophical integration as it shall be known.

[1:52:78] Essentially, this invocation of The Five Astronist Characters involves including these characters in one's contemplations about The Cosmos and other subjects of relevance within Astronist Mysticism and wider Astronist Philosophy from a mysticistic viewpoint.

[1:52:79] Of course, this remains an extremely rare and anomalous practice within Astronist Philosophy that is only to be allowed within Astronist Mysticism as is authorised by the Astronist Tradition, thus making the branch of Astronist Mysticism a unique one indeed.

[1:52:80] One with a sharp mind may now, or may have already pointed towards the irony that can be found in the non-inclusion of The Five Astronist Characters despite the name with which the philosophy is attached to and is derived from; that which is Astronist in human form, especially so as part of The Five Astronist Characters, is not to be made part of Astronist philosophical discourse, with few exceptions, though Astronist Art is the place for which artists are able to embrace all aspects of Astronist characteral depiction and inclusion.

[1:52:81] The Misnomenic Principle, as aforementioned, relates to the notion that The Five Astronist Characters, especially so the central figure from which the name Astronist derives, should not be entangled with Astronist philosophical enquiry so as not to seem as though the Astronist Tradition is enacting idolatry, is deifying, or is raising these characters to a higher state of being beyond that which they are which is essentially fictional, though as we have aforeaffirmed, just because something is not physically real does not mean it isn't powerful in more ways than one.

[1:52:82] For future reference and to explain the name attached to this principle, that which is henceforth known as a misnomen relates to the instance in which something is created, especially something that is written, and is ascribed with a name as derived from a person, an object, or an event, but that from which the name is derived is inacknowledged throughout the entirety of the creation.

[1:52:83] Of course, the most notable example of this is the entitlement of the philosophy associated with The Omnidoxy to be Astronist in character, style, orientation, origination, virtue, and purpose, yet the figure and figures to which these elements must aptly apply and from which the name originates are provided with roles within the philosophical discourse.

[1:52:84] Misnometry is therefore existent at the heart of Astronist Philosophy for there shall always exist a disconnection between Astronist philosophical enquiry and The Five Astronist Characters from which most Astronist philosophical ideas are inspired, but this separation is absolutely necessary for their respective establishments.

[1:52:85] Now, we must press on to the final address of this pneumovological discourse, but we do move on to something that is of immense mystery and confounding, though remains central to Astronist mystical exploration and practice, as well as pneumovological study and contemplation; this, of which I infer, is henceforth known as The Mytra, the philosophy attached to which is henceforth known as mytrinism, and the adherents of which are to be known as mytrinists, mytriners, and mytrinesses.

[1:52:86] The Mytra is best described to exist between The Cosmos and The Chaos as it refers to the entities, elements, and events of microcosmic and macrocosmic scales that are not currently categorisable by the parameters of The Cosmos and The Chaos for they do not suit to either.

[1:52:87] Essentially, The Mytra is the dimension of strange occurrences, unexplained incidents, as well as apparitional and spiritual notions, discussions, and contemplations, and is expected to be described as to encourage the indulgent nature of humanity by feeding into such notions of apparition, personage, hallucination, illusions, and matters of a spiritual nature.

[1:52:88] Astronist Mysticism accepts The Mytra to be part of the Astronist Cosmology, however the wider Astronist Tradition cannot accept such a disruptive notion and therefore, The Mytra remains a pariah, though its presence is not banished, therefore pointing to the relevance of its position.

The Formation of Celestial Entities (Formatology)

[1:53:1] One of the major branches of compendology has been left to be discoursed until now, towards the end of the disquisition, but this does not reflect negatively on its importance for the discipline of formatology remains central to compendological study as it explores the way in which celestials form, the specific procedures involved in different versions of formation, as well as the philosophical conclusions that are derivable from such formational occurrences.

[1:53:2] Formatologists are responsible for contemplating the formations of the celestials of The Cosmos in such a way that links such founded contemplations to other philosophical theories, as well as to other disciplines of Cosmic Philosophy in order to make further conclusions about the general naturity of different celestials, and to make other conclusions about the cosmical system as derived from the formation of celestials.

[1:53:3] The essential concept that all formatologists must address in the initiality of formatological contemplation which is to be henceforth known as The Inimitability of The Cosmos which holds the principle that the formations of the celestials in The Cosmos are so unique and sit upon a level of height and transcendence that they remain impossible to imitate.

[1:53:4] The principle of The Inimitability of The Cosmos also maintains that for human mind that would have to physically witness such formations of cosmic proportion in order to understand, describe, and contemplate them in a way that corresponds to their philosophical endeavours.

[1:53:5] The area of formatology that deals with the motionality of celestials under the influence of the actions of forces is henceforth known as dynamics, and it is this branch of study that from which the instrument of dynamicity is derived and considers celestial formation entirely in relation to the motions involved in the completion of the formational process.

[1:53:6] Growth, development, change, and progression are the four main manifestations of dynamics within the cosmical system, but another key aspect to the study of dynamics is the concept of stimulation in a cosmic philosophical sense.

[1:53:7] In this context, stimulation refers to the encouragement, and arousal of cosmic activity by the actions of cosmic phenomena, as well as the measurement of the development of, or increased activity in the state of animation of a celestial entity as triggered by growth, development, change, and progression of the celestial entity, or the cosmic environment in which it exists.

[1:53:8] There exists a plethora of different types of formations and we shall apply them in relation to their dynamical procedures, the first of which is known as Stellar Formation which relates to the formation of stars in all their different sizes, variations, and circumstances.

[1:53:9] The way by which stars form is dependent upon the collapse and reform of the most dense regions within the molecular clouds of interstellar space in dusty and gassy cosmic environments and are regions of extremely cold temperature.

[1:53:10] The initiation of star formation occurs when the most dense parts of the molecular cloud core under upon and within their own gravity with the core of the cloud collapse before the outer regions due to the greater density in the core.

[1:53:11] After a process that is known as fragmentation occurs, which involves the clumping of dust and gas in less than a parsec of size all by the forces of gravity, with protostars eventually forming from the cloud fragments.

[1:53:12] Protostars go through a series of phases including the simultaneous development of a nebular disk as well as the process of infalling occurs whereby matter increases the size of the protostar by hundreds of factors beyond their originality, with latter procedures of protostar formation consisting of thermonuclear fusion and the production of stellar wind.

[1:53:13] After such processes have occurred, T-Tauri Stars are eventually formed before stars begin to develop into fully matured stars, and some may go on to grow further into being categorised as red giants and even supergiants at the largest end of the spectrum of stellar size.

[1:53:14] But of course, we began our basic outline of star formation with an initiation; one of the questions that formatologists must contemplate in every event of formation no matter the celestial involved is what initiated the initiation; what initiates the gravity to build and build upon the core of the molecular cloud until it begins to collapse?

[1:53:15] From a cosmic devotional perspective, the formation of stars is one of the most wondermentful aspects of cosmic phenomena and activity for it demonstrates a distinct procedure within the cosmical system that is considered, by the Astronist Tradition, to be entirely graceful, majestic, and elegant in a way that demonstrates some Divine power and essence behind such a procedure.

[1:53:16] Another reason for the centrality of star formation in a cosmic devotional context is because star formation is entirely precursory to planetary formation, and therefore The Earth and subsequently humanity are both dependent upon the formation of stars; the entirety of the existence of humanity has been dependent upon the formation of The Sun as a star.

[1:53:17] From the philosophical contemplation of star formation, the Astronist philosophers are able to derive, in addition to that which has already been derived, so much more about our genesis, not only as a species, but also as part of a planetary, and more widely, as part of a star system; both the cosmic event of star formation, and the cosmic entity of molecular clouds are both separate, though crucially linked subjects of such devotion.

[1:53:18] By such notions, we owe our existences to the formation of stars and the cosmic devotions attributed to star formations are just the manifestations of this notion, as is the origination for most other cosmic devotions for they are to be seen as emphasises of a notion manifested in actions and thoughts of devotion.

[1:53:19] Another important notion to propose which is perhaps central to the expected popularity of devotion towards molecular clouds and star formation is due to the fact that a majority of cosmic imageries created by telescopes depicted molecular clouds, also known as star factories, the most one of course is that which is known as The Pillars of Creation, which remains encouraged to be devoted over by the Astronist Tradition.

[1:53:20] The next type of formation is that which is henceforth known as Systemic Formation which relates to the formation of star systems as collectively regarded and all the planets, moons, and astronomical bodies that orbit around a central star are included.

[1:53:21] Another type of formation is that which is henceforth known as Oblivionic Formation which involves the formation of black holes as part of the evolutionary path of stars.

[1:53:22] Planetary Formation, quite self-explanatory, relates to the formation of planets and an extension to which is Lunar Formation which of course relates to the formation of moons, and these two entities remain formationally linked due to the latter relying on the former for its formation.

[1:53:23] The next version of celestial formation involves three distinct, yet fundamentally linked types which include Cometary Formation, Asteroidal Formation, and Meteoric Formation, which are to be contemplated within the same area of formation due to their similarities in naturity, structure, and features.

[1:53:24] An important area of formational contemplation is that which is henceforth known as Nebulaic Formation which of course relates to the contemplation of the formation of nebulas in The Cosmos.

[1:53:25] Clusteral Formation and Stremic Formation are the next two versions of celestial formation that relate to the formation of star clusters and stellar streams respectively, and are to be closely contemplated due to their similarities in characteristics, procedures, and categorisations.

[1:53:26] That which is known as Galactic Formation is the next formational variation to be addressed and it is one of great immensity for it attempts to contemplate the formation of entire galaxies which is no easy feat to philosophically grasp.

[1:53:27] Pulsaric Formation can be described as an extension to Stellar Formation and so may be contemplated within that formational category, but it also commands its own distinct contemplation in relation to dynamics, hence the reason for the insentations that are dedicated to its formational contemplation.

[1:53:28] Quasaric Formation is a major variation of formational contemplation for it attempts to contemplate a relatively unknown celestial and one that is immense in both complexity, and procedures.

[1:53:29] Voidal Formation is a formational variation that focuses on contemplating the formation of voids in The Cosmos which, despite the perceived simplicity of voids, tends to ignite a great deal of complexity, especially so in relation to formational dynamics, yet Voidal Formation is integral to our greater understanding of voids in a wider cosmic philosophical sense.

[1:53:30] Superclusteral Formation is part of the wider Metagalactic Formation category as is Filamental Formation with the former relating to the formation of superclusters of galaxies of billions of years, and the latter relates to the formation of the metagalactic filaments of The Cosmos; again, these are not easy feats to contemplate in relation to dynamics and formation it must be said.

[1:53:31] Filamental Formation is the largest formational procedure of The Cosmos, except for Cosmic Formation itself which is an accumulation of all the previous formational variations, Cosmic Formation can be philosophically contemplated in a distinct way in relation to the entity that is known as The Cosmos in Astronist Philosophy, but it is important that each of the formational variations herein introduced are also included in one's Cosmic Formational contemplations.

[1:53:32] One of the most essential elements to circular and spherical formations in The Cosmos, as well as the major component to the measurement in size of celestials, and the general contouration of a celestial, is that which is known as the radius, the measurement of which in a philosophical context is known as radisity.

[1:53:33] The semistrument of radisity is the measurement of radius in relation to its effects on the celestial formation, its interaction with other celestial entities, its general position and role in The Cosmos, as well as the philosophical derivitions that can be made in relation to shape from the nature of the radisity, and the changing perception one may have of a celestial as caused by its radisity.

[1:53:34] Therefore, radisity remains an imperative semistrument to apply in relation to the formation of celestials as it demonstrates the final version of the fully formed celestial before it begins to degenerate, and disintegrate.

[1:53:35] Generally, according to the formatological principles of the Astronist Tradition, the more definable the radisity of a celestial, the greater knowledge one is expected to gain about its formation, and the nature of the formation, but the most important connection that the application of radisity can be make is the notion of relationship between the celestial and its core.

[1:53:36] One must know the position of the celestial's core in order to measure its radius, and if one cannot measure the radius then one cannot derive an application of radisity

[1:53:37] The amount of radisities that a formatologist is able to form is palpable to their experience in formatological contemplation and study, as well as their ability to imagine radisities and their effects on celestials in the ways aforementioned and the greater the depth of the radisity in the effects of the radius on the celestial, the greater quality the radisity is considered to be.

[1:53:38] Though we do now digress a moment, this is an important aspect of instrumenting that must be herein defined as it applies to all implementations of any instrument or semistrument.

[1:53:39] There exists varying levels of quality of the applications of instruments and semistruments, the study of which is crafted and categorised within the discipline of Instrument Theory, but herein and now it is introduced due to the natural course of ideas in one's mind.

[1:53:40] Foundationally, it can be readily accepted that there exist five different elements that measure the quality of an instrumentation, or a semistrumentation and these include the following:

[1:53:41] Firstly, there is depth; the depth of an instrumentation is characterised by the extent to which it employs knowledge of the celestial, the event, or the general subject of the instrumentation; this is easily generally derivable by the accuracy and quality of the notions put forth; other characteristics of instrumentational depth is the length of the discourse, as well as the complexity of the notions proposed.

[1:53:42] The second measurement of quality for instrumentations is eloquence which involves the general fluency of the words and grammar used in a discourse, the persuasiveness of its notions, as well as the ordering, and the layout of the discourse and the extent of its general readability.

[1:53:43] The third measurement of quality for instrumentation is ingenuity which is the ability to create new ideas derived from the application of an instrument to ordinary

celestials; in this context, ordinary celestials are those subjects which the instrument of study is familiarly applied to rather than one that it is not familiarly applied to which relates to profliferity, which is lattermentioned, and the oppositism of which is henceforthly known as inprofliferity.

[1:53:44] That which is henceforth known as alternity relates to the fourth measurement of quality for instrumentations and embodies the ability to apply an instrument to an unorthodox subject, or to a subject/celestial that the instrument has not yet been applied.

[1:53:45] Fifthly, that which is henceforth known as profliferity is the expected ability to expand upon the rigidity of the definitional version of the instrument in a way that extensively builds upon it without losing its intended purpose.

[1:53:46] An inclination in the context of formatological contemplation relates to the angle between the rotation axis of a disk and our line of sight to see it, typically in reference to an agreed plane, but the contemplation of inclinations in relation to astronomical objects is important to formatological contemplation because formatologists must attempt to derive the effects of the inclination on the behaviour of the object itself, as well as the influence of the celestial formation on the extent of the inclination.

[1:53:47] A major branch of formatology is that which is known as morphology, the term itself being pre-Astronist, but in the context of formatology as part of Astronist Philosophy, deals with the study of the phases of formation; the distinct segments of a celestial formation as broken down into different stages.

[1:53:48] Morphologists of formatology are tasked with contemplating these different stages of celestial formation in order to derive the most important stage in the formational process, the comparison of each stage of the formation to orderity, disorderity, and even the application of other instrument of study to the individual morphological stages.

[1:53:49] Morphological contemplation is therefore essential to a greater understanding of the way by which a celestial formation occurs according to different componental parts.

[1:53:50] Two component concepts existent within the discipline of formatology are starbirth and starburst, which are also two prominent subjects of Cosmic Devotion.

[1:53:51] The first, starbirth, is a colloquial term for stellar formation, and the second, starburst, is a colloquial term for a supernova, and in a cosmic sense relates to the collapse, or death of a star, and its transition into a black hole, or some other substellar state.

[1:53:52] The essential difference in usage between starbirth and starburst, and their respective empular equivalents is that these both have cosmic devotional inferences that must be introduced, or at least referred to whenever, or if ever they are addressed in philosophical contemplations, discourses, or enquiries.

[1:53:53] Starbirth is considered to be the birth of all celestialty in The Cosmos, and therefore the birth of all Cosmic Philosophy and so, all those whom do conduct Cosmic Devotion in whichever form they do practice it, are henceforth expected to devote in some form, at least once, to the instance and phenomena of starbirth for without the birth of stars, The Cosmos would become an horrific emptiness; the greatest void of all voids.

[1:53:54] Starburst, which may also be termed as stardeath, is considered, when paired with starbirth, to complete that which is henceforth known as The Essential Dichotomy which is formed by the birth of stars and the death of stars as the most essential occurrences of The Cosmos.

[1:53:55] Despite starburst not holding the same mystical and devotional weight as its oppisitic counterpart, there is certainly a distinct place for starbursts in Cosmic Devotion for their celestial transitional connotations present a powerful notion, and one that remains rare within Cosmic Philosophy and also one that remains enshrouded by mystery and intrigue due to the little that is truly known about how, and why star do transition into what they do, whether this be a fully fledged black hole, a pulsar, a neutron star, or some other substellar object.

[1:53:56] One of the most important notions of contemplation within formatology is that which is known as holding a state of scalar which relates to having only magnitude and no direction which in an Astronist philosophical and formatological context relates to the same notion but in a purely abstract and metaphorical sense rather than in a physical sense for that is dealt with by scientific studies.

[1:53:57] In Astronist Philosophy, scalar is measured by the semistrument of scalarity which relates the extent of magnitude which, in the context of scalaration, is the size of a celestial entity, and its ability to direct itself, or to be directed in a certain way by external forces, the prominentmost of which is gravity.

[1:53:58] Magnitude, in both a cosmic philosophical and an empular context, may also relate to the measurement of the brightness of stars and so, whenever the application of magnitude is made, the distinction between these two applicative differences must be made.

[1:53:59] Scalaration, due to the fact of its own lack of direction, is considered to be a process and a state of disorderity in relation to its comparison towards cosmicality, and it is considered to be as such by the Astronist Tradition.

[1:53:60] Another area of contemplation for formatologists is that which is massive, as measured by the semistrument of massivity; this relates to the effects of mass on formation, as well as the certain components involved in the formational process that result in a greater, or lesser mass.

[1:53:61] Massivity measures the extent to which the mass of a celestial effects its general behaviour, as well as the way in which it interacts with the celestials surrounding it.

[1:53:62] Formatologists also must contemplate on the notion that the largest an celestial's massivity, the greater their isolation from other celestials, which is derived from the notion that black holes, as the most massive of all entity categorisations are also the most isolated from other celestials; the grounds for the study of the correlation between massivity and isolation in The Cosmos is therefore set and should be addressed by formatologists.

[1:53:63] To make another digression from our current topic, as is becoming a commonality during The Omnidoxy, to a topic that does not necessarily belong within formatology officially, but it shall be introduced herein as part of the natural flow of one's ideas, as has been aforeaffirmed.

[1:53:64] There exists two approaches to the appellations of astronomical objects according to the Astronist Tradition and these two approaches are prosaicism and anti-prosaicism, adherents of which are prosaic in orientation, known as prosaicists, and anti-prosaic in orientation, known as anti-prosaicists respectively.

[1:53:65] The central tenet of prosaicism is characterised by the belief that astronomical objects should be named numerically, such as they exist in pre-Astronist times of astronomical categorisation and appellation, and in non-Astronist organisations, an example of which would be to describe galaxies as Messier 87, Messier 88 and so on and so forth, or to call a quasar HE0450-2958.

[1:53:66] However, in direct oppositism, the tenet of anti-prosaicism holds the belief that astronomical objects must be given specific and unique names without any numerical association whatsoever, and it is this orientation that the Astronist Tradition adamantly aligns itself with.

[1:53:67] The Astronist Tradition accuses the goal of prosaicism of attempting to take away the individuality of each astronomical object for the beauty and individuality that such celestials do naturally exhumate.

[1:53:68] Prosaicism is considered, by the Astronist philosophical viewpoint, to be a staunch rival to the general principles and approaches of the Astronist philosophical tradition towards the perception of cosmical entities and phenomena, as well as existing as a rival to Cosmic Devotion, which emphasises the individuality of cosmic entities and events.

[1:53:69] The Astronist Tradition is therefore staunchly prosaicistic in its orientation which, although the appellation of astronomical objects may seem like a small matter, it forms the foundation of the way by which Astronist Philosophy approaches the perception of celestials in a wider sense; to provide celestials with individual names not only provides individuality, but also demonstrates one's respect of the cosmic entities and events in

subject which is the essential principle of the Astronist Tradition towards the celestials of The Cosmos and it is from this respect that the essence of Cosmic Devotion originates.

[1:53:70] As an extension to our aforescussed topic of massivity, there also exists a semistrument henceforthly known as supermassivity which is tasked with contemplating the extent of massivity that is characteristic of Supermassive Oblivions at the cores of galaxies and quasars.

[1:53:71] The contemplations surrounding that of massivity should therefore also be applied to that of supermassivity, but the oblivionic context of supermassivity must also be remembered, as well as the notions of disorderity, unknownness, chaosity, and universality associated with supermassive celestials such as the supermassive black holes of The Cosmos.

[1:53:72] To further extend the application of supermassivity, formatologists must also take responsibility for contemplating the way by which supermassive objects such as black holes, and quasars form as a distinct formatological area to that of the non-supermassive astronomical objects such as the stars, planets, and nebulae.

[1:53:73] Of course, as another branch of formatology, the study of the formation of supernovae and hypernovae as distinct events, not merely just part of the evolution of stars, is an important area of contemplation to speak lightly of their relevance to our greater philosophical understanding of these.

[1:53:74] That which is known in the context of physics and now herein by the context of Cosmic Philosophy, as part of Cosmic Philosophy, the plerion is the centre of a supernova, or hypernova and it is this that should also be contemplated within the discipline of formatology, but the plerion in its entirety, not just its formation, and by this notion therefore, all plerionic contemplations are henceforth categorised within formatology.

[1:53:75] As this is the first time that the plerions of supernovae and hypernovae are introduced within Cosmic Philosophy, we must also now expresses the importance of the cosmic devotional practices focused on plerions which are considered to be part of the Fulminations of Grace devotion that other cosmic explosions and bursts are also collectively devoted within.

[1:53:76] In the context of formatology, as a discipline within Cosmic Philosophy, as part of Astronist Philosophy, the branches of astrodynamics and cosmodynamics relate to the specific disciplines of the formational dynamics of stars and all other cosmic entities respectively.

[1:53:77] Therefore, astrodynamic theories, concepts, and philosophical contributions specifically address how the dynamics of stars affect formation, and how the dynamics of stars affect their relationships with other celestials, and the wider cosmic environment, as grounded in philosophical abstract and contemplations.

[1:53:78] As a closely associated branch, that which is henceforth known as cosmodynamics, or astrodynamics, deals with all other celestials of The Cosmos, but in this same way, as in addressing how their dynamics affect formation, and how their dynamics affect their other cosmic interactions and relationships and it is towards these specific cosmic contemplations that cosmodynamicists are to be henceforthly focused.

[1:53:79] One of the most intriguing aspects of formatological study is of the formation and occurrences of that which is henceforth known as Cocoon Stars, which is a purely philosophical and Astronist-originative term, but relates to a type of perception of stars that exist within a larger cosmic entity, either for the vast majority of their existences, or for just one period in their lifespan.

[1:53:80] Formatologists are herein directed to study the formations and occurrences of this proposed perspective on a stellar entity, as well as correlations associated with such a perspective, in addition to the fact that stellar cocooning is a pure demonstration of the cosmical system, as well as the animity of The Cosmos, as it explored within Astronist Mysticism.

[1:53:81] But it is in the context of Cosmic Devotion that we see the most attention give to cocoon stars for they are considered, by the Astronist Tradition, to be the most devotive of all stellar perceptions for they demonstrate a clear interaction between a stellar object, and other cosmic entities, as part of The Cosmos.

[1:53:82] Cocoon stars are considered to be purposefully protected from the dauntingly vast Cosmos, as well as being protected from the chaosities that do roam, such as black holes which seek stars to feed upon their grand abundances of energy, with the prominentmost of all cocoon star occurrences existing as those which are known as star factories, or star nurseries within the nebulae of The Cosmos.

[1:53:83] Formatology, as you may well have already observed by the topics aforediscussed, enjoys the inclusion into its discipline of a many grand, yet unusual, rare, theoretical, and philosophically originating celestials, the next one of such characteristic is henceforth known as duopulsar.

[1:53:84] A duopulsar, as its appellation suggests, embodies two pulsars that rotating around each other and so, are gravitationally drawn to one another; this may also be known as a binary pulsar system.

[1:53:85] Formatologists are henceforthly tasked with contemplating on how, and why binary pulsars, or duopulsars as they are known in a cosmic philosophical context are formed, and what effect this binarity holds over the pulsars themselves, as well as the proximate cosmic environment.

[1:53:86] Due to the fact that morphology stands as an official branch of the discipline of formatology as the area of philosophical study and contemplation dealing with phases of formation, and in a wider, of general existence, that which is known as lunation, as a process, as an area of contemplation, and as a distinct devotional subject, is herein and henceforth placed within the branch of morphology within formatology.

[1:53:87] Lunation relates to the philosophical notions, contemplations, and the general study surrounding the identification and analysis of the distinct phases of moons in its primitive sense.

[1:53:88] However, wider lunation, which is henceforth known as Expanded Lunation, also includes all other celestial entities into this contemplative area and studies all of their distinct phases of existence, but the mosthigh of all lunations is that which is henceforth known as Cosmic Lunation and explores the phases of The Cosmos in the context of its consideration as a distinct entity in and of itself.

[1:53:89] The defining characteristics of a phase for lunation are a change in regularity, in activity, in direction, in appearance, in functionality, in orderity, in purposivity, in naturity, and in progression if an entity is considered to have become regressive by cosmic standards.

[1:53:90] Closely associated with the stellar perception known as a cocoon star in the Astronist Tradition, a proplyd is a pre-Astronist and empularic term for a disk of gas and dust that orbits a young star, and it is from this that a planetary system may form.

[1:53:91] Proplyds are the next of the celestial entities that are addressed by formatologists, the specific branch dealing with the contemplations and study of proplyds is henceforth known as proplydics.

[1:53:92] In addition to contemplating proplyds in their general existences as well as their formations, proplydicists are also concerned with creating a philosophy of proplyds, mastering the devotions towards proplyds, as well as contemplating the formation of planetary systems in a wider sense.

[1:53:93] Proplydics may also invoke morphological ideas into its addresses as it may contemplate the variety of phases in the formation, and general functionalities of proplyds, and the procedures involved in the formation of planetary systems.

[1:53:94] Proplydiality relates to the instance of being proplydic in state, or proplydic in character and can be described as a sort of semistrument that measures the extent to which an entity is proplydic.

[1:53:95] To contemplate proplydically is to centralise proplyds in one's cosmic philosophical contemplations, and to devote proplydically is to centralise proplyds in

one's cosmic devotions, both in such a way as to superiorise proplyds as one of the most important elements to the construction of the cosmical system.

[1:53:96] Despite the relative shortness of our introduction to proplydics, we must keep in mind that The Omnidoxy itself is a foundational documentation, upon which much further and greater efforts of philosophical contemplation and contribution shall be made in accordance to the traditions and principles expounded as Astronist, and to the subjects and topics expounded as omnidoxical.

[1:53:97] The final branch of formatological address to be made within this discourse before our discussion on The Plurality of Worlds concept is that which is henceforth known as protology.

[1:53:98] Protology is set to deal with the studies and general philosophical contemplations related to the younger phases of celestial entities, those periods of a celestial's lifespan proceeding their formation yet still in a state of protos which is characterised by the earliest and most primitive manifestations of celestials.

[1:53:99] Protology, in a non-celestial context, may also deal with the primitive and earliest forms of a concept, this specific type of protology being henceforth known as Abstract Protology, and focuses on the original variations of a philosophy, a theory, or the earliest forms, or manifestations of a concept, or set of principles.

[1:53:100] The study and contemplation of protology is therefore an essential part of wider Cosmic Philosophy, and even wider Astronist Philosophy for protology transcends one single discipline, despite its official categorisation and origination existing within formatology.

[1:53:101] We must know from where which something has come in order to understand in a greater way where it is now, and where it is set to go in a futural sense and it is from this principled notion that protologists do gain their inspiration from for the branch of study that they do commit their contemplations towards.

[1:53:102] As aforementioned, the final aspect of formatology that we are to herein introduce is the concept that shall be henceforth known as The Plurality of Worlds; before we do introduce and discuss this concept, one must first understand primarity to the study of formatology as all formatologists are expected to at least consider The Plurality of Worlds concept in all of their formatological conclusions, and notions.

[1:53:103] Essentially, The Plurality of Worlds is a conceptual notion derived from the realities of The Cosmos, and maintains a sense of individuality for each and every planetary celestial in The Cosmos as each and every planet is considered to be characteristically unique to its own existence.

[1:53:104] By this notion, a sense of individualism is granted to each planet of The Cosmos and it is the concept of The Plurality of Worlds that explores the individuality of each of the planets of The Cosmos, but also, it is the penchant of this concept to explore the reasons for a planet's unquity and individuality.

[1:53:105] The concept of The Plurality of Worlds is also closely connected to planetary devotion as a branch of Cosmic Devotion for the providence of individuality to planets is a sign of consideration, respect, and fortitude against those whom wish to collectivise and degrade the planets of The Cosmos to lifeless and characterless spheres of rock which is the exact oppositism to the way by which the Astronist Tradition considers all worlds.

[1:53:106] Those whom adhere to the idea of The Plurality of Worlds understand the essence of what the Astronist Tradition upholds about The Cosmos and the entities that do reside within it; a certain distinct respect of all the celestials, a belief in their animity, a consideration for their individuality, and a perception maintaining the centricity of celestials; cosmocentricity.

[1:53:107] The Plurality of Worlds is considered to be a unique cumulation of the Astronist Tradition's viewpoints, principles, and an embodiment of the personality of that which is Astronist in feeling, in character, and in approach, and so a greater understanding of and belief in The Plurality of Worlds demonstrates an even more refined understanding and belief of Astronism for all the Astronist philosophers and followers.

The Structure of The Cosmos

(Structurology)

[1:54:1] The Astronist Tradition maintains that there exists a certain structure to The Cosmos, as is manifested by the atoms that compound to form the matter that we ourselves interact with in The Cosmos.

[1:54:2] The branch of compendology, and the discipline of Astronist Philosophy to which this discourse is structurology, the studiers of which are henceforth known as structurologists, and they concern themselves with the general frameworks, states, elements, and arrangements that can be found within The Cosmos.

[1:54:3] Structurologists attempt to derive philosophical contemplations, and conclusions from the notions surrounding these derivated structures of The Cosmos, they attempt to compare structures, they attempt to align structures with orderity, disorderity, and other parameters, and they also attempt to draw upon different cosmical structures in order to further the practices of Cosmic Devotion, as well as to generally explore certain phenomena of The Cosmos that is officially characterised within the discipline.

[1:54:4] In The Omnidoxy, formatology and structurology sit after one another and this is by no mistake or coincidence for these two disciplines of Cosmic Philosophy, as part of wider Astronist Philosophy, are demonstrative of similar approaches to cosmical understanding, closely linked areas of philosophical contemplation, as well as many of their concepts being interlinked with each other.

[1:54:5] Of course, the efforts of empiricism, we can surely say that there exists four states of matter; solids, which are measured by solidity; liquids, which are measured by liquidity; gas, which are measured by gesity; and plasma, which are measured by plasmity.

[1:54:6] The quadicity of matter therefore should be contemplated as a central notion to the most basic aspects of structurological study, but the contemplations of each of these four states of matter in a philosophical sense is essential to forming an understanding of The Cosmos, and how its physicality at the most basic level of its overall structure.

[1:54:7] As we begin to embark upon our structurological contemplations, we soon begin to understand the frames of distance in The Cosmos according to their true immensities.

[1:54:8] One of the measures of cosmic distance that humanity has devised is that which is known as a parsec, which is equal to 3.26 lights years in distance; such appellations for cosmic distance are applauded and championed by the Astronist Tradition for these appellations provide the individuality, the respect, and the animity to cosmicities that the Astronist Tradition wholly supports as the core essences of its beliefs and approaches to Cosmic Philosophy.

[1:54:9] The Astronist Tradition, as the Humanic Exploration of The Cosmos does initiate, expects there to be many more appellations of cosmic proximity, disproximity, and distance throughout the many years of sentient exploration of The Cosmos awaiting us; the Astronist Tradition just simply hopes from here henceforth that the Astronist philosophers and followers themselves are the primary contributors to these appellations.

[1:54:10] Introducing cosmic distance with the term parsec acts only as a precursor to our introduction to one of the most important segments to structurological study, and this concept is to be henceforthly known as The Betwixity of The Cosmos, which relates to the distances found between cosmic entities, as well as the distance in general in relation to the structure of The Cosmos, but only from an explorative perspective, or an individual civilisation's perspective, or even as microcosmic as an individual's perspective of cosmic distance, which is likely to result in the popularisation of Cosmic Devotion towards cosmic distance, also known as cosmic betwixity, or simply as betwixity.

[1:54:11] The Betwixity of The Cosmos concept relates to all notions that involve the disproximities of cosmic entities, and attempts to derive hope for the Humanic Exploration of The Cosmos in humanity's futural ability to close these disproximities by the use of technology, philosophical ambition and wonderment, mechanical innovation, and scientific discovery.

[1:54:12] The Betwixity of The Cosmos, despite its official categorisation as a concept, can be more accurately described as an area of study and contemplation within structurology due to the vast amount of philosophical contemplations that can be conducted towards the topic of betwixity.

[1:54:13] Two of the contemplations shall be outlined herein and now, yet the Astronist Tradition maintains there are expected to be many more of those which are to be henceforthly known as betwixials in the future of Astronist Philosophy, especially so just prior and during the Humanic Exploration of The Cosmos.

[1:54:14] The pre-Astronist and non-Astronist originative concept of the Generation Ship refers to the instance in which a spaceship is sent out to The Cosmos during the futural and prophesied Humanic Exploration of The Cosmos, but also the individuals aboard the ship must face the reality that they will now not be able to leave the ship that they have just embarked upon until they have reached the coordinated destination.

[1:54:15] For this reason, and for the extremely long time periods which humanity is currently only capable of travelling through space at due to the primitive speeds of human spacecraft, the individuals aboard the Generation Ship will live and die as we do here upon The Earth, but this will cause a long lineage of generations to form aboard the ship due to the elongated time scales; this means that entire lives of people and their ancestors and descendants will be spent aboard a single spacecraft.

[1:54:16] The notion that there will be a long line of generations is where the term of Generation Ship has been provided its appellation from.

[1:54:17] The fact that the Generation Ship itself exists as a concept is due to that which is henceforth known as Premature Embarkation, which is the launching of a spaceship in space to head towards targeted destination, but typically before a time during which the technology for space exploration hasn't been fully developed to the point at which human spacecraft can travel at practical speeds for quickened space exploration.

[1:54:18] The notion of Premature Embarkation directly relates to the pre-Astronist concept that is known as the Wait Calculation which involves the idea of the launching of spacecraft so early that it takes a multitude of the time for it to reach its destination in relation to spacecraft that are sent after it.

[1:54:19] In such a scenario, the spacecraft sent afterwards would reach the destination a multitude of times quicker than the original spacecraft which would deem all the generations and lives of all the people aboard the original spacecraft, in addition to the sacrifices they have made to have been for nothing.

[1:54:20] The Wait Calculation is of course a fairly depressing and negativistic approach to cosmic exploration, but it nevertheless demonstrates a possibility of the reality of space travel, especially so in the Tempestuous Years, the period, as created by the Astronist Tradition, that encompasses the time in human advancement and civilisation before the advent of practical space travel.

[1:54:21] Structurology is a cross-disciplinary subject; one is able to state this confidently by the notion that structurological Issues of Address can be found in many different disciplines of Astronist Philosophy, and one of these Issues of Address that can be found throughout Astronist Philosophy is that of correlation.

[1:54:22] All forms of correlation in The Cosmos between different entities, parameters, and instruments are officially recognised as part of the discipline of structurology, and so, every instance that a correlation has been inferred to throughout The Omnidoxy and every inference to correlations to be addressed in the future of Astronist philosophical investigation are to be officially disciplinarily categorised within structurology.

[1:54:23] However, structurologists are also concerned with contemplation correlation in a general sense, the issues with correlation in philosophical enquiry, the purpose of correlation in philosophical enquiry, as well as the nature of the conclusions that can be drawn from correlational contemplations.

[1:54:24] Again, this is a topic of discussion and contemplation that structurologists are to be henceforthly tasked with grasping the various different inferences of correlations, as well as the conclusions derived from correlational applications which is considered to be no easy feat by the Astronist Tradition due to the vastity and complexity of the topic, and

the requirement it holds for the individual to hold a broad knowledge of non-structurological topics, in addition to being generally well-experienced in Philosophical Practice.

[1:54:25] In addition to the structures of individual astronomical entities, structurology also concerns itself with various different unorthodox cosmologies as alternative structures to The Cosmos and wider universal and divinical existence, either in opposition to the Astronist Cosmology, or deviating in parts from its tenets.

[1:54:26] The majority of non-Astronist or pre-Astronist cosmologies are addressed with the discipline of comparology because those cosmologies are compared to the Astronist Cosmology within that discipline.

[1:54:27] Originating from Astronist Philosophy, the dichotomical cosmologies of the Extracting Cosmology and the Contracting Cosmology, the former of which relates to the removal of the entity that is known as The Cosmos from the entire cosmology, but also relates to the notion that such which exists within The Cosmos is inevitably destined to exit The Cosmos in a variety of ways such as through oblivions, through collapse and destruction, through evaporation, or through some other form of extraction.

[1:54:28] The latter of which relates to the notion of contraction in The Cosmos, which involves the notion that such existents within The Cosmos are inevitably destined to continue to exist within The Cosmos rather than to be taken out of The Cosmos by some form of extraction; essentially, the Contracting Cosmology holds that The Cosmos exists as an incubator, while the Extracting Cosmology holds The Cosmos to be an excubator; that which entities within can easily or inevitably escape, or be taken out of.

[1:54:29] Further so, the Extracting Cosmology rests upon a sense of vulnerability to the various forms of cosmic extraction for which each and every entity is susceptible to, while the Contracting Cosmology, as the oppositism, rests upon a sense of immunity from cosmic extractions for they do not dominate this cosmology as the incubative functionality of The Cosmos does instead dominate.

[1:54:30] The next of the cosmologies that shall be henceforthly contemplated as part of structurological study is that which is known as the Non-singularity Cosmology which holds that there exists no singularities in The Cosmos which is of course in alignment to the Astronist approach to the discipline of obliology.

[1:54:31] The Astronist Tradition maintains that there cannot exist any singularities in The Cosmos due to singularities exhibiting infiniteness and so singularities do not align with The Cosmos' existential principle of limitation and any singularities must therefore exist outside of The Cosmos.

[1:54:32] Some variations of the Non-singularity Cosmology may also hold that The Big Bang is not an event of singularity, which is often allured to, though not entirely agreed

upon, by the Astronist Tradition, while the Non-singularity Cosmology may also hold that there exists no singularities either within or in connection to neither The Universe, nor The Divine.

[1:54:33] One of the prominentmost aspects of cosmological study within structurology is that which is known as The Creation Problem which remains pre-Astronist in its origination though remains an insoluble aspect of cosmology for scientists to grasp, and therefore, the Astronist Tradition encourages philosophers to tackle the issue with their great minds of imagination, contemplation, and solution.

[1:54:34] The Creation Problem is essentially formed by the notion of whether The Cosmos, its progeny, and all the matter-energy that these entities are made up of do actually hold a temporal origin or not for it remains a notion of logic to state that for a creation to be created there must exist a creating agent, or simply, a cause to creation.

[1:54:35] Structurologists are directed towards the contemplation of this creating agent in order to derive the cause to the creation of The Cosmos, either by some temporal suggestion, or by a spiritual, universal, or divinical notion, either in alignment with the Astronist Cosmology, or not so.

[1:54:36] That which is known as the Cave Dweller Cosmology is the final area of contemplation and approach to cosmologies to be studied within structurology and refers to the first instances of humanity's Cosmic Awareness, as it is known in the Astronist Tradition.

[1:54:37] The Cave Dweller Cosmology, also known as Primitive Cosmology, is characterised by a few different beliefs that cave dwellers and non-civilised humans held about The Cosmos during their periods of existence, some of which can easily be derived as foundational echoes to the Astronist Tradition's beliefs, while others are entirely disjoined to the Astronist Cosmology.

[1:54:38] The first of these characteristics to the Cave Dweller Cosmology is the depiction of The Cosmos in cave art, which is dominated by engravings and other simplistic imageries ascribed to the walls of caves, which remain the earliest of all evidences of human cosmic awareness.

[1:54:39] From our studies of Cave Dweller Cosmology, or Primitive Cosmology, we can derive that which is henceforthly known as The Three Ventures which involve a sequence of three interactions with The Cosmos; looking at, thinking of, and communicating about The Cosmos, and it is from the times of the Cave Dwellers that humans have always interacted with The Cosmos in this way, although after the advent of Astronism, these basic interactions are expected to be furthered and advanced to new heights, but without losing knowledge of where from which cosmic awareness and observation and interaction did originate.

[1:54:40] The Cave Dweller Cosmology can be consider the initiator of humanity's cosmic awareness, and although we may never know the exact instances in which cave dwellers did interact with one another about, or communicate to The Cosmos, we can still derive much from the cave art of these peoples from our ancient past.

[1:54:41] The Cave Dweller Cosmology initiated humanity's cosmic awareness, as has been aforeaffirmed, and within this initiation of cosmic awareness there exists an initiation of cosmic questioning for without posing such questions about The Cosmos, one shall never be prepared to answer them; the Cave Dweller Cosmology, despite its simplicity to the cosmologies succeeding it, remains prominent in that it continues to be the origination point for all those succeeding cosmologies, and from this notion, its importance is retained.

[1:54:42] Sapiens, those with whom pictorial communications of The Cosmos are most associated, held a certain wonder in relation to The Cosmos, and it is these peoples that created the first and most simple pictures of the stars, The Sun, The Moon, the constellations (although they did not know them to be as such), as well as the night sky in a general sense.

[1:54:43] It is from these very first imageries of the proximatemost cosmical progeny that the cosmologists, astronomers, and now the Astronist philosophers shall base their most basic understandings of The Cosmos upon; in even the most complex of the cosmic philosophical contemplations, we can still, without failure or exception, derive these most basic progeny to exist at the most basis of such contemplations for notions and imageries that the cave dwellers did conceive those thousands of years ago still retain their foundational place in cosmic understanding and in humanity's awareness of The Cosmos.

[1:54:44] The most remarkable notion of comparison between the Cave Dweller Cosmology and all the succeeding cosmologies, and even including some parts of the Astronist Cosmology established herein, we all still perceive The Cosmos from the same world, and despite the change of the environment, the circumstances, the knowledge, the tools, and the technologies with which we use to perceive The Cosmos, it remains true that even the most proximate of the cosmical progeny are still above us, superior to us, and do retain a certainty of inundation about them which has formed the foundational characteristics of the anthropic-cosmic relationship that is still prevalent today.

[1:54:45] However, with the creation and establishment of Astronist Philosophy and Cosmology, it is hoped and expected that this perception for humanity of The Cosmos to alter, especially so as we begin to centralised The Cosmos in our thoughts, and it shall be changed forever once the Humanic Exploration of The Cosmos has properly begun, as has been prophesied by the Astronist Tradition.

[1:54:46] The study and contemplation of Cave Dweller Cosmology is part of the study henceforthly known as Cosmic Archaeology, which deals with the different ways in which humanity has perceived The Cosmos throughout the various different periods in its

history, as well as across different civilisations, as being influenced by politics, culture, philosophy, societal structure, and religion.

[1:54:47] Another area of philosophical study and contemplation that structurologists are tasked with focusing on is that of clusters, which is henceforth referred to as the process of clusteration.

[1:54:48] Structurologists must measure clusteration of celestial entities by the semistrument of clusterity, and from these measures, they should derive the effects of clusteration on the behaviours of the celestial in subject, they should contemplate on the correlations of clusterations, and they should attempt to draw conclusions about the relevancy of clusterations in The Cosmos.

[1:54:49] With the inclusion of the study and contemplation of clusteration and clusterity into structurology, the discipline is further expanded, especially so with the addition of the coordination and mapping of clusters in The Cosmos as closely linked to Spacial Cartography, also known as uranography.

[1:54:50] The structurological address of clusters in both their general abstract sense, but also in their cosmological physical sense, is expected to greatly contribute to the popularity of clusters in Cosmic Devotion which is brilliantly positive for the followers of the Astronist Tradition to embrace.

[1:54:51] We shall continue on in our structurological endeavour by conducting a full instrumentation of all relevant instruments of study to clusters in general in The Cosmos, to which structurologists are also tasked with making their own contributions.

[1:54:52] Just a short application of the instrument of abundancy to clusters in The Cosmos derives a great deal of abundance for them, especially so as distinct cosmical progenies in and of themselves for in the vast expanse of The Cosmos, galaxies themselves could be classified as clusters, but this relates to the ambiguity of the definition and classification of clusters.

[1:54:53] But even if we narrow the definition and classification of a cluster to its proper means of a cluster of stars within a wider galaxy, or some other largest cosmic entity, there still exists a great abundancy of clusters, and the Astronist Tradition derives from this to indicate the relevancy of clusters in the wider cosmical structure, but whether the cosmical structure and system is dependent upon clusters for its proper order and functionality is an entirely separate notion that structurologists are tasked with contemplating.

[1:54:54] The application of binarity to clusters is certainly an application of interest for it raises the notion of whether clusters could exist, or indeed do exist in binary systems of orbit with one another; whether this could happen, or is in occurrence is something for innemnic minds to contemplate, but structurologists should attempt to derive

philosophical notions about what the binarity of clusters could mean for their role in The Cosmos.

[1:54:55] A bipolarity can exist in almost every existent entity and clusters are no exception to this statement for there exists two physical bipolarities of clusters; the first exists from one end of the clusteral diameter to the other, and the second exists from the core of the cluster to its periphery.

[1:54:56] The centricity of a cluster is of course its core as its physical centricity, but also there exists the abstract centricity to a cluster which revolves around the notions of purpose that are associated with clusters which involves the organisation and arrangement of stellar progenies.

[1:54:57] We must also apply the instrument of chaosity to clusters despite the Astronist Tradition's belief in the cosmicality of clusters; the chaosity of clusters can be derive by the explosions and cosmical violences involved at the core of star clusters due to the close proximities of the stellar progenies which raise the probability of collision and interference.

[1:54:58] The instrument of study of composity is greatly applicable to and deeply connected with clusters of stars for each of the stars of the cluster is considered a composite part of the whole cluster; in essence, clusters themselves are entirely composite for without their composity, they would not exist therefore they are dependent upon being composite in their natures.

[1:54:59] The application of concentricity to clusters explores whether they would ever be able to become concentric in shape, whether they do already exist concentrically in shape, or they do exist concentrically only in a theoretical sense, despite the general understanding that clusters exist in a state of nonconcentricity.

[1:54:60] The core of a cluster is its most important segment and so the application of corality to clusters is an important one for all clusters must have a core, and by the importance of cores to clusters, we understand the overall importance of cores in The Cosmos, as well as their seemful consistency throughout almost all entities of existence in The Cosmos.

[1:54:61] The Astronist Tradition considers clusters to be highly cosmical in their allegiance and therefore the application of the instrument of cosmicality is aptly conducted for by the completion of such an application, one is able to derive greater notions of contemplation of how cosmicality in general and clusters in a wider sense and their cosmicality.

[1:54:62] The application of the instrument of dyadicity measures the interactive relationship between the different stars as part of the cluster, as well as the relationship between clusters, and the interactions between clusters and non-clusteral entities in The Cosmos.

[1:54:63] When dynamicity is applied to clusters of stars, structurologists must contemplate the ways in which clusters affect change, activity, and the progressions made in The Cosmos, or of a particular cosmical progeny as it required in order to successfully complete a traditional application of the instrument of dynamicity.

[1:54:64] The Astronist Tradition holds that, after even the short introduction to clusteral contemplations in this single discourse, the overall importance of clusters to be of great height due to an accumulation of all the other notions of relevancy concluded after the application of other instruments of study to clusters.

[1:54:65] The application of fundamentality to clusters notionises as to whether clusters play an integral role in the overall functionality of The Cosmos, so contemplates whether clusters are dendural or omnural, the former of which relates to an entity that facilitates only its own functionality, while the latter of which relates to an entity that facilitates the functionality of something greater than, or something external to itself, thus deriving states of and two new semistruments of dendurality and omnurality.

[1:54:66] As is obvious by the name of the instrument, the application of functionality is relates to all investigations and contemplations into the internal functions of star clusters, makes notions about the most important elements and components of cluster functionality, as well as involving the instrument of formity to make conclusions about clusteral functionality in relation to, and being affected by clusteral formation.

[1:54:67] The application of the instrument of futurity to clusters is based around notions of how clusters will either grow or decline in their abundance in the future, whether their role in The Cosmos will change in the future, or whether clusters will either one day disperse so as not to exist, or grow even greater in size and density, and thus causing new issues because of such changes.

[1:54:68] Graduality's application focuses on the process of clusteration, especially in relation to the time that passes during the occurrence of clusteration by different levels of degree in stages until the clusteration is complete and the cluster is fully formed; this entire process and the key phases involved in this process are both contemplated under the guise of structurology.

[1:54:69] The application of innemny to clusters focuses on contemplating the extent to which clusters are empirically understood, and therefore, such innemnic applications to clusters run in parallel to scientific and other empirical discoveries and proven theories made about clusters.

[1:54:70] To apply the instrument of study of inversivity to clusters is to result in that which is known as astrodipersion and has been aforescussed in this discourse for inversivity directs contemplations towards that which is opposite to the subject of the application,

and because clusters are associated with astrocentration, the opposite to this is astrodipersion.

[1:54:71] According to the Astronist Tradition, star clusters do exist in alignment with The Matrix, as it is known in Astronist Philosophy, for clusters are considered to be a positive manifestation of cosmicality and therefore an ally to The Matrix as it commands a strict adherence to that which is cosmical in naturity, and that which is aligned with orderity, rather than disorderity, or any other chaotical influences.

[1:54:72] Motionality, when applied to clusters, attempts to derive the way by which clusters move in relation to the surrounding environment, but also in relation to proximate celestials, and due to the vast majority of clusters following the same motionalities as singular stars, and planets, their naturities can be defined as cosmical, their functionalities as rotational and orbitalational, and their orderities as ordered rather than disordered.

[1:54:73] As has been aforementioned throughout our discussion of clusters within structurology, the Astronist Tradition considers the naturity of clusters to be cosmical rather than chaotical due to their features, and their behaviours which almost always fall in alignment with other firmly cosmical entities, which does stand in their favour for their cosmicality.

[1:54:74] Clusters, of course, rotate as is a common and cosmical motion for almost all astronomical entities, as do the stars within the clusters rotate also so the application of rotality to clusters is a positive application, and even with the application of orbitality, we see clusters are falling in alignment with the universally held notions that planets, stars, and all other astronomical objects do in some form orbit a centrality; for clusters, this is their core, or the point of gravitational attraction that is pulling the cluster into existence.

[1:54:75] Therefore, the applications of both rotality and orbitality to clusters and by extension, also their applications to the process of clusteration, are concluded in positivity rather so attributed to their general naturities, motionalities, and orderities.

[1:54:76] The application of the instrument of primarity to clusters results in the belief that clusters are more important to the cosmical system and structure than any other celestial entity, especially so because of the congregational characteristic of clusters, and therefore, their superiority in size, abundance, and overall dominance, especially due to the fact their gravitational pull is constantly growing the cluster.

[1:54:77] The purposivity of clusters still remains innemnically unknown, as is the same for many purposes to cosmical entities and occurrencial phenomena, yet for clusters we can derive that one of their purposes would be stellar arrangement and organisation in larger groups than singular stars; by this notion, clusters are understood as embodiments of cosmic organisation which further supports the notion of their cosmicality.

[1:54:78] When one applies symbiocity to clusters, the results that they are expected to derive are related to the ways in which stars, as part of the clusters, are interactive with one another in mutuality as the Astronist Tradition considers there to exist a symbiotic relationship between all stars that exist within clusters, and between the stars within the cluster and the cluster itself there exist a sense of symbiocity there too.

[1:54:79] As an extension to the structurological address of clusters, structurology is also concerned with superclusters too, the process associated with which is superclustering, and is to be applied by the semistrument of superclustering, the physical manifestations of which are a large group of galaxy groups as part of that which is known as The Metagalaxy in Astronist Cosmology.

[1:54:80] Structurologists are to concern themselves with superclusters, and are to contemplate superclustering, and are to apply the semistrument of superclustering in the same way by which general clustering is applied, as well as normal clustering is applied.

[1:54:81] The concept of astrodipersion in structurology of Astronist Philosophy relates to the idea that the most fundamental structure of The Cosmos is made up of the stars, and contributes to a dichotomy of stellar proximity and diproximity, the oppositism to astrodipersion being astrocentration.

[1:54:82] Astrodipersion, therefore, is the study and contemplation of group of stars, or a region of stars that are dispersed across a wide range of space, so between each star exists a relatively largest distance.

[1:54:83] Dichotomically, we have astrocentration, which by its appellation, we can derive that it focuses its attention on the concentrated regions and groups of stars, which are not quite clusters, but they are certainly more concentrated than the dispersed stars.

[1:54:84] Astrodipersion and astrocentration form contemplations surrounding the dispersal and concentrations of stars, which is collectively described as Stellar Arrangement, and is a prominent branch of study within the discipline of structurology.

[1:54:85] Astrodipersionists believe that the dispersion of stars is the superior form of Stellar Arrangement due to the fact that such dispersed stars populate the otherwise empty voids of The Cosmos, while astrocentrationists believe, of course, that the concentrated arrangements of stars is the superior form.

[1:54:86] The analysis, the comparison, and the devotion towards concentrated and dispersed arrangements of stars are the three essential parts to how structurologists are expected to approach the study of star positionings in The Cosmos, but purely from a cosmic viewpoint rather than from an Earthian viewpoint so as to confuse this study with the contemplation of constellations.

[1:54:87] A closely connected area of study to Stellar Arrangement is that which is known as the study of interspace; interspace, as is obvious by its appellation, is the space of distance between celestial entities in The Cosmos.

[1:54:88] The measurement of the interspace is so accomplished by the application of the semistrument of interspacity, which attempts to derive non-numerical conclusions about the distances between two or more celestials, as manifested by proximity and disproximity.

[1:54:89] Structurologists are also expected to make correlations between the different levels of interspacity and to apply these towards orderity, disorderity, naturity, and other instruments of study in a coapplicational framework, which involves applications to and from instruments of study.

[1:54:90] Interspatial study and contemplations are therefore expansive by their nature which forges an area of study for structurologists that is certainly vast, and complex, as is similar to the other areas of study within structurology that are fairly philosophically demanding in and of themselves.

[1:54:91] That which is henceforth known as a Universal Horizon is a rare feature of The Cosmos that is entirely philosophical and theoretical in nature and is an occurrence of great cosmic devotion from the opinion of the Astronist Tradition, but what exactly is a universal horizon?

[1:54:92] A universal horizon is the instance in which The Cosmos opens to The Universe, the most commonly understood examples of which according to the Astronist Tradition is at the singularity of a black hole, but perhaps the most prudent of examples is at the Cosmic Periphery, beyond which The Universe is considered to exist.

[1:54:93] Structurologists are herein granted the immense task of contemplating and philosophising about this instance of cosmic-universal change on the cosmic-universal boundary and therefore the concept and entity classification that is henceforthly known as a universal horizon is given sole address to structurology by the Astronist Tradition, as authorised by these words of The Omnidoxy.

[1:54:94] By extension to the Non-singularity Cosmology, those which are termed as non-singularities are determined as such because they replace that which was thought to be a singularity, such as that which exists at the centre of a black hole.

[1:54:95] The essential role of structurologists in relation to these non-singularities is to define what these could be if they are not, indeed, singularities themselves, which is a task of great philosophical measure due to the difficulties involved in first, trying to understand singularities, and secondly trying to replace them with something else that is reasonably suitable as a replacement.

[1:54:96] Structurologists, in addition to all of the topics that we have prescribed to them as part of the duration of this discourse, are also henceforth tasked with contemplating that which is known as redshift which in general philosophical terms is a cause of cosmic perceptual distortion due to both the lack of advancement in our current observational technologies, but is also a phenomenon caused by the structure and distance of the The Cosmos and the celestial entities being observed.

[1:54:97] In the context of physics, that which is known as supersymmetry relates to something different than its meaning in the context of Astronist Philosophy, specifically within Cosmic Philosophy, and relates to the instance of symmetry between at least three cosmic entities, and is an extension to cosmic symmetry, which is the instance of symmetry between only two cosmic entities.

[1:54:98] Cosmic symmetry, and especially supersymmetry, are extremely rare occurrences, and are almost entirely theoretical, philosophical, and devotional in the purpose to their origins, and both of which are officially recognised as topics of contemplation and study within the discipline of structurology.

[1:54:99] Another major area of study within structurology is that which is henceforth known as planetics which deals with the philosophy of planets, the generation contemplations of planets, as well as the development of cosmic devotions towards planets.

[1:54:100] Planetics, also known as the philosophy of planets, as an area of contemplation, encompasses the entirety of the philosophical study, enquiry, and investigation of planets in both their structures, formations, movements, positions, devotions, and natures.

[1:54:101] Even though planetics is officially recognised as a derivation of structurology, it is entirely cross-disciplinary and pervades almost all disciplines of Cosmic Philosophy which further raises the prominence of both structurology as a discipline, as well as planetics as a branch of study.

[1:54:102] The term that is herein introduced as nondiscovery remains ambiguous and almost unclassifiable, but the Astronist Tradition remains firm in its decision to classify the concept, and notion of nondiscovery within structurology, despite the conviction of nondiscovery resting in the idea that discovery should neither be prioritised, and neither should it be considered a virtuous act, a relevant act, or an act of philosophy, which stands in direct and vehement opposition to the Astronist Tradition's conviction.

[1:54:103] Why then must nondiscovery be included within structurological contemplations? The answer to such is fairly simple because the Astronist Tradition's adherence of the Philosophical Spirit so the Tradition must consider that which is so very far removed from its own beliefs and by this principle, structurology is lumped with considering and contemplating nondiscovery.

[1:54:104] The Cosmic Mindstep is the official term for the proclaimed new, and revolutionary change in the human perspective of The Cosmos, and humanity's place within The Cosmos that is characterised by the entire personality and approach of Astronist Philosophy.

[1:54:105] The Cosmic Mindstep is characterised by notions of cosmocentricity, non-anthropicity, as well as the centralisation of philosophy and astronomy in human civilisation; to understand the Cosmic Mindstep is to attempt to understand the entirety of the Astronist philosophical tradition.

[1:54:106] The Cosmic Mindstep relates to a reorientation in the way humanity is to perceive The Cosmos according to the Astronist philosophical tradition's understanding and encouragement of The Cosmos should be perceived, and although the term of the Cosmic Mindstep is perhaps only referred to in passing, the concept that it relates to rests at the heart of what it means to be Astronist in one's philosophical orientation and in one's worldview.

[1:54:107] The Cosmic Mindstep is not just a concept though, it is understood as a conscious action to perceive The Cosmos in the way that the Astronist Tradition has represented it here within these very words of The Omnidoxy.

[1:54:108] The Cosmic Mindstep is a conscious decision to view The Cosmos in an Astronist way, to centre The Cosmos to one's life and in one's beliefs, and to make actions according to these newfound principles of Astronist character, and although the Cosmic Mindstep may not be directly referred to in The Omnidoxy until now of course, it nevertheless remains central to Astronist Philosophy, and practical application and reality of Astronist Philosophy.

[1:54:109] One that understands the Cosmic Mindstep from the definitions and characterisations herein provided, and also provided within The Grand Lexicon of Astronomy, will then be best suited to decipher the numerous references to the Cosmic Mindstep throughout The Omnidoxy.

[1:54:110] The final topic of structurological contemplation is that which is henceforth known as speculatism which establishes the notion of "what if" in The Cosmos and involves the contemplations about the possibility of something that is currently non-existent to indeed exist at some future time.

[1:54:111] Or may relate to the contemplations surrounding the possibility of that which is considered totally obscure, an example speculatistic notion would exist as the following: what would it look like if the planets of The Solar System existed between The Earth and The Moon?

[1:54:112] Speculatist ideas are obviously purely speculative, but the Astronist Tradition maintains the importance of the need for such efforts in Astronist Philosophy as such

speculative notions are statements of philosophical enquiry, and philosophical exploration despite the seemful inutility of such contemplations and notions.

[1:54:113] As is evidenced by the widely scattered topics of structurology that have been outlined within this discourse, the structurological discipline is one of great dispersion, but also one of great vastness by the many different faucets that structurologists are able to contemplate and embark upon in their studies.

[1:54:114] For this reason, structurology remains an especial discipline of Astronist Philosophy.

The Topography of The Cosmos (Cosmotopography)

[1:55:1] The discipline of cosmotopography rests as the last discipline of address during the compendological disquisition of The Omnidoxy, which resides as the formative aspect of Cosmic Philosophy, and wider Astronist Philosophy.

[1:55:2] Cosmotopographical studies deal with the arrangements of the natural physical features of the progenies of The Cosmos, which includes the differences in the geologies of worlds, the general arrangement of the natural physical features of such worlds, in addition to the artificial features of worlds that have been added to it from its inhabitants.

[1:55:3] As well as this, cosmotopography is concerned with the accurate descriptions and the mapping of The Cosmos, and of the individual celestial progenies, or the different regions on such celestials; this branch of cosmotopography is henceforthly known as Spacial Cartography, and alternatively known as uranography, though the latter does have closed connections with siderealism which is the official term encompasses the practices and beliefs within Astronist Mysticism.

[1:55:4] Spacial cartographers, in addition to the mapping of celestial entities and galaxies as well as The Cosmos itself, are also responsible for ascribing appellations to celestial entities, astronomical objects, regions of galaxies, as well as galaxies themselves, and must use their philosophical inspiration, their knowledge of the entity in subject, as well as their own justified ideas in deciding on such appellations.

[1:55:5] A spaciocartographer is considered a great calling and profession by the Astronist Tradition, and one that is of equally great difficulty to master; it is a profession intertwined by scientific knowledge, philosophical ideation, and engineering ability; it must be said herein that the one who can map The Cosmos is the one who can see, know, and feel it in a simultaneity that few others are able to achieve.

[1:55:6] Therefore, cosmotopography deals with individual worlds in addition to larger cosmic entities and their own topographies in the same way, and therefore cosmotopographers must deal with both natural phenomena and artificial manufacturations.

[1:55:7] One of the most important aspects and branches of study and contemplation within cosmotopography is that which is henceforthly known as topocentrics, studiers of which, known as topocentricists, and followers of which, known as topocentrists, do so address the notion of topocentricity, which is manifested and organised within the philosophy of topocentrism.

[1:55:8] Topocentrism is the Astronist Tradition's premier flag of differentiation between Astronism and all pre-Astronist philosophies and religions, and it is also the crucial differentiation from that which is Astronist in worldview, and that which is not.

[1:55:9] Topocentrism maintains the principle that all pre-Astronist and non-Astronist philosophies, as well as the religious traditions, are primarily structured from an Earthly, and subsequently anthropic perspective, and therefore not from the perspective of The Cosmos as a whole, and so that which is topocentric is oppositism to cosmocentricity, which is the concept that the Astronist Tradition aligns itself with, and from which it structures the entirety of its philosophy around.

[1:55:10] Topocentrists hold this principle to be the most important defining aspect of the Astronist approach to all perception due to the topocentricity holding the notion that all other religious and philosophical traditions have structured their worldviews upon an anthropic or an Earthly perspective, instead of a cosmic one, the Astronist Tradition considers cosmocentrism to be the greatest definer and the greatest superioriser of Astronism.

[1:55:11] Astronism prides herself on the fact that she holds unquity in her characteristic of cosmocentricity for she addresses the majority of issues, the wide variety of notions, and most of the relevant philosophical disciplines from a cosmic perspective, and rests her philosophical orientations and narratives on the events, phenomenas, and entities of The Cosmos rather than emphasising the occurrences, stories, and peoples of The Earth and humanity.

[1:55:12] This is not to say that humans, or even The Earth itself are not important in Astronist philosophical interpretation and worldview because they essentially are, but unlike the other major philosophical and religious traditions, Astronism does not base the entirety of its beliefs, principles, eschatology, and its general ideations on human wants and needs, human struggles and difficulties, and neither the issues of just The Earth itself or just human civilisation and society.

[1:55:13] As an extension to cosmotopographical contemplations, it must be herein exclaimed that Astronism is not exclusive and this too remains another of the most important differentiations between the Astronist philosophical tradition and those religious and philosophical traditions that are either pre-Astronist or non-Astronist in characteristics and orientations; essentially, Astronist Philosophy does not proclaim itself to be the one truth, nor does it proclaim to be provider of all the answers.

[1:55:14] The final area of contemplation and study for cosmotopographers is that which is known as Galactic Coordination which involves, as the appellation suggests, finding, contemplating, and structuring the coordinates of The Milky Way galaxy for galactic navigation, which will be essential during the Humanic Exploration of The Cosmos.

[1:55:15] To complete this, a totally new galactic coordination system will need to be devised, the appellations created by spacial cartographers will need to be imputed, and this is why the Astronist Tradition emphasises the essentiality for the encouragement of young people to embark upon careers in spacial technology and engineering because we shall need such professionals if we are going to be able to develop such a complex system.

Sanitology

[2:1:1] The second largest of the inclusive discipline preceding only compendology in size is that which is henceforth known as sanitology, or alternatively known as logicology and is the inclusive discipline assigned to the duodoxical discourse within The Omnidoxo.

[2:1:2] Sanitology encompasses an expansive range of topics, the vastness of which are certainly competitive to those within compendology and therefore it is difficult to accurately and inclusively define logicology and the topics it addresses in a singular definition, however, we must attempt to do so for educative and introductory purposes.

[2:1:3] And so, sanitology is the inclusive discipline within which a vast range of disciplines of study and subdisciplines of study reside, as well as being the foundplace of many schools of thought, orientations, philosophies, and countless concepts and notions that are expected to greatly form and effect the entirety of the Astronist philosophical tradition.

[2:1:4] To organise all of the many topics compiled within sanitology, we can split it into two variations; these are core logicology and peripheral logicology, the former dealing with the Astronist approach to certain essential and fundamental questions in the effort of forming Astronist Logic, while the latter deals with disciplines, concepts, theories, notions, and orientations derived from Astronist Logic, most of which are related to Practical Astronism.

[2:1:5] Despite the appellations provided and their connotations, neither core logicology nor peripheral logicology is more important than the other, but instead, these two derivations of logicology can be differentiated by fundamentality; core logicology deals with the fundamental aspects and peripheral logicology deals with the practical, yet still essential aspects that have been founded upon the fundamental aspects of the former.

[2:1:6] In fact, peripheral logicology takes up the majority of the space within this disquisition due to the complexities and intricacies of the topics it addresses, as well as the abundance of such topics in the disquisition but it is of crucial importance that these topics are addressed with a tone of assertion.

[2:1:7] A great many of the topics addressed in peripheral logicology are of a practical and physical nature with the purpose of direct application to their subject and so therefore accuracy, affirmation, and clarity are the three key personalities to be employed during this disquisition so as not to cause distortion in interpretation or application.

[2:1:8] It is of course in alignment with the Philosophical Spirit to promote interpretationism with regards to abstract notions, concepts, and philosophical theories and enquiries, however, with the physical and practical aspects of Astronism, a

prescriptivist approach is more likely to be encouraged as distortion in application has seen the downfall of many philosophies and ideologies in the past.

The Formation of Astronist Logic (Core Sanitology)

[2:2:1] For any philosophical tradition, there must be an identity of logic established so that those whom address the Astronist philosophical tradition understand its positions on the most fundamental of questions and notions.

[2:2:2] Core Logicology shall address four major topics of logic including the nature of origin, meaning, morality, and destiny, and the Astronist approaches to these different topics in a simplified manner.

[2:2:3] The Astronist Tradition understands all existent entities to hold origination, all except The Divine of course which is infinite in all ways, including in its existence, and therefore holds no origination point.

[2:2:4] However, everything else in existence holds origination, even that which is known as The Universe in the Astronist Cosmology despite its own infinity, yet The Universe does not hold Absolute Infinity like The Divine, instead, The Universe holds Partialist Infinity, known as partialism.

[2:2:5] The nature of cosmic origination is to be in a state of protoism and primitivity and all that exists holds a Course of Existence whereby it develops in size, complexity, and age; all things of existence follow this course for it is inescapable even for The Universe itself.

[2:2:6] It is logical to notionise that all that does exist within The Cosmos does so by the providence of The Cosmos and The Universe beyond it, and The Divine beyond that.

[2:2:7] It is logical to notionise that all that does exist in cosmoses other The Cosmos in which we reside does originate and therefore does exist in a markedly different way to the way in which we originate and exist.

[2:2:8] Cosmic origination and other forms of origination such as those within The Universe in other cosmoses are different in all ways for no two cosmoses remain the same when comparing the originations of the progenies within them.

[2:2:9] It is logical to notionise that each and every cosmos, including The Cosmos in which we reside, originates from The Universe which subsequently derives from The Divine, or The Universe is the product of itself, meaning the belief that The Universe attains Absolute Infinity, as is believed by some orientations within Astronist Philosophy.

[2:2:10] Origination is the cornerstone of existence and leads to notions about the nature of being and existence which demonstrates the borders between logic and ontology as two of the main pre-Astronist philosophical disciplines.

[2:2:11] Meaning is the next major topic of our address in this introductory section our discourse on Core Logicology and can be described in Astronist terms as that which is implied and explicated by a proposition, the existence of an entity, or the occurrence of an event.

[2:2:12] Meaning in Astronist Logic explores the meaning of The Cosmos, the meaning of existence, and the meaning of life, rather than exploring other areas such as the nature, the reason, or the appearance of something which are addressed in other disciplines of philosophy.

[2:2:13] The Astronist Tradition maintains the notion that all things that do exist do so by reason and therefore all things that exist hold meaning to their existence and this is inescapable to nothing, not even The Universe and The Divine themselves for universal meaning and divinical meaning are two areas of Astronist Logic that the Astronist Tradition encourages to vehemently explore due to the complexity of such topics.

[2:2:14] Meaning is therefore the reason, the vocation, and the aim for the existence of something for there exists nothing without meaning and even the quality of infinity cannot escape it.

[2:2:15] In Astronist Logic, meaning is differentiated with purpose, or purposivity as it is instrumentally known; this differentiation is made in that purpose is either self-created, or is applied to something distorted by perception while meaning is the natural essence not put there by the thing itself, nor created by something external, nor is it distorted by perceptions influenced by human mentality.

[2:2:16] Meaning is considered pure while purpose is not; meaning is eternal to the subject and cannot be changed while the purpose of something is forever changing according to the proportional shift in the environment, the surrounding circumstances, and the ambitions of the entity in such.

[2:2:17] Meaning is higher than all other aspects of anything; it resides beyond all else and remains untouched by all other aspects; implications for this can be understood to include the purity of meaning, the divinity of meaning, and the infinity of meaning.

[2:2:18] Meaning can be interpreted just as other aspects of something can also be, but even after one's interpretation has been proposed, there will always stand the Original Meaning, also known as the Divine Meaning, or the Pure Meaning which again, remains untouched and undistorted by interpretation, perception, and opinion.

[2:2:19] Meaning just is that which it exists as and it is only logical to notionise that if we are to truly understand something then we must explore its meaning and we must comprehend it entirely and without adding distortions.

[2:2:20] But finally, we come to that which is henceforth known as the Meaning Paradox because if meaning is divinely ascribed then how can we ascribe a meaning to something? The answer is that we cannot and therefore, we cannot truly know the meaning of anything, we can only derive its purpose the way in which we perceive it according to our own knowledge, ability to understand, and our motivations to depict something in a particular way.

[2:2:21] Morality is the next area that we must address in order to foundate Astronist Logic and consists of notions about that which is considered good or right and that which is considered to be bad or wrong according to the Astronist view.

[2:2:22] Astronist Logic presides over the notion that that which is known as the cause is the main element to morality and it is the cause that the Astronist Tradition centrally concerns itself with during discourses on the subject of morality.

[2:2:23] Each party is said to hold a cause; a goal that they wish to accomplish as part of a campaign for all actions are predicated on a cause, a goal, a motivation for the action conducted.

[2:2:24] For this reason, morality is predicated on a cause and the morality of an action is considered through the scope of the cause and therefore in order to understand the morality of an action, one must first understand the context of the cause within which the action was conducted.

[2:2:25] An act that is morally good can be simply defined as that which does not negatively affect a third party while a morally evil act can be defined as that which does negatively affect a third party.

[2:2:26] However, we must already differentiate a good act from a right act, and an evil act from a wrong act; the right act may be evil, and the wrong act may be good depending on the context.

[2:2:27] A right act and a wrong act are more concerned with the context of the act rather than with the act itself which is left to a good act or an evil act to address; essentially, with a cause to achieve, a wrong act can soon be made right and so easily the opposite way around.

[2:2:28] Whatever act is conducted and no matter its complexity, its context, or its consequences, there remains one natural, uncompromising, and inescapable differentiator between a good act and an act of evil and that rests with the heart and mind.

[2:2:29] When one commits an act, any act, one either retains a warmth to their heart and a solidity in their mind when the good they have committed is good and right and properly conducted, but too, when one feels a coldness in their heart and a chasm in their mind, they know the act they have committed is evil and wrong and not properly conducted.

[2:2:30] It perhaps feels illogical to some to present the greater differentiator of goodness and evility as the heart and the mind working in tandem, and although the feelings in one's heart and the thoughts in one's mind are not so easily defined, when they do occur in the way aforescribed there is no matter to ever forget them.

[2:2:31] Therefore, it is perhaps the greatest nature of humanity to commit acts of goodness and acts of evility for to know the reactions of the heart and mind is to know and to hold the ability to differentiate between that which is morally good and that which is morally not so.

[2:2:32] The final major area of contemplation that we shall address in this introductory piece formulating Astronist Logic is the concept of destiny.

[2:2:33] The nature and orientation of Astronism is so positioned as to embrace notion of destiny, the origins of which rest in the time of formulation of the subject of philosophy itself as considered by the Stoics and the Epicureans.

[2:2:34] The Astronist approach to destiny is characterised by a strong belief in progenial and phenomenal control of the destinies of their inhabitants as formulated by the cosmic structure.

[2:2:35] Further so, the Astronist Tradition considers each of the cosmoses of The Universe to hold different and unconnected courses of destiny, but the Astronist Tradition does not attribute these destinical courses with The Divine, but instead attributes the creation of each cosmos in The Universe to The Divine.

[2:2:36] By this notion, The Divine can be considered the initiator of the destinical course and the finaliser of the destinical course and that which occurs in between is a product of the course of The Cosmos, the progenies and phenomena within it, and the nature of its reality.

[2:2:37] This discipline of study within Astronist Logic is henceforth destinology, the philosophers and scholars of which are to be known as destinologists and are expected to explore, develop, argue, and establish the concepts outlined herein, but also to develop new Astronist variations on approaching the concept of destiny.

[2:2:38] Destinism is an orientation that, in this context, is characterised by a belief in destiny as not simply a concept, but a physical manifestation and controllers of progeny and phenomena in The Cosmos.

[2:2:39] However, adestinism is a contrasting orientation in Astronist Logic holding the notion that destiny is simply a concept and notion formulated by the human mentality and need for purpose; this does not mean to say that they disbelief in destiny, but they

simply do not consider it hold any connection with cosmic, universal, and divinical affairs due to its origins from the human mind.

[2:2:40] For this reason, adestinism is expected to be the most popular choice for Astronists to orient their beliefs around due to the little known and little spoken of Astronist belief in Cosmic Origination which we shall introduce herein due to its relevance and foundations in Astronist Logic.

[2:2:41] Cosmic Origination, also known as cosmoriginism, is the belief that followers of Astronism and those whom described themselves as Astronists or Astronists should only belief and concern themselves with cosmically originating concepts rather than those formed by the human mind.

[2:2:42] Therefore, Astronists should only believe in concepts such as celestial orbitality, rotation, and formation in the cosmical system such as those concepts including destiny, time, the soul, predestination, and even the notion of the existence of a god.

[2:2:43] For this reason, cosmoriginism can quickly hold stances of great controversy as it obliterates all notions, concepts, ideas, and theories that are not cosmically originative such as all things thought of by the wants, needs, and ideas of the human heart and mind.

[2:2:44] Despite the controversiality of cosmoriginism, it acts as an important cornerstone to the formulation of Astronist Logic as it erases the discussion of all non-cosmical concepts and notions which is helpful in some ways, but difficult to accept in others for the concepts erased within cosmorigination have formed many of the philosophical debates throughout the history of philosophy.

[2:2:45] The Astronist Tradition herein identifies there to exist Three Vantages of Logic, as they are to be collectivised and appellated, thus forming the basic foundations of Astronist Logic.

[2:2:46] Logical Consistency, as it is appellated in the Astronist Tradition, refers to the first of these Three Vantages of Logic, and involves the extent to which the proposition entails elements of consistency, rationality, and sound foundedness.

[2:2:47] In this context, that which is known as foundedness involves how a proposition is founded, the circumstances involved in its founding, the individual(s) involved in its founding and their intentions and motivations, as well as all other aspects of the founding of a proposition so as to determine its overall consistency to what logic should be.

[2:2:48] Sensical Adequacy is the second of the Three Vantages of Logic and involves the measurement of the extent to which the proposition stands truth to the standards of sense, the degrees of which are largely innate to us as part of our sentience; for example,

something may be supernatural, but it may also make sense while something may be very well natural, but it can also exhibit nonsense; neither the natural nor the supernatural holds territory over what can be considered sensical.

[2:2:49] Experiential Relevance is the third and final of the Three Vantages of Logic identified by the Astronist Tradition and involves all forms of providing proof through relevant facets of experience and experimentation so as to bolster the logicity of the proposition.

[2:2:50] When Experiential Relevance is conjoined to the two other vantages, this forms a triumviration which can be visualised as three rhabdoids pointed upwards towards one another so as to form a single point.

[2:2:51] These three rhabdoids are representative of the Three Vantages of Logic which point upwards to represent progression and converge to one another at the touching point, known as the Contact Point, in order to represent the completion of logic through unification.

[2:2:52] In addition to this formation of logic, we come to approach some of the most basic questions of existentiality and its discussion is predicated on the following three statement: "Only The Universe Exists", "Both God and The Universe Exist", and "Only God Exists".

[2:2:53] The Astronist Tradition detests perception while also lauding it; the former position is taken because of that which is appellated as Perception's Supersession of Logic which is a concept encapsulated by the idea that perception is the ultimate dictator of logic because of the unique perspectives held by all the different perceivers.

[2:2:54] Perception's Supersession of Logic relates to the dependence of logic upon perception, thus highlighting the most fundamental flaw of logic and therefore demonstrating its failure to become a universality.

[2:2:55] However, this is not postulated herein to deny the excellences of logic for they of course existence in abundance, but the demonstration of logic's dependence upon perception is a demonstration that is to be applied to all other concepts, methods, and systems of human origination for all that is sentient in direct origination remains perceptual in nature.

[2:2:56] It is postulated herein that only those concepts and physicalities which are cosmic, universal, or divine in direct origination can be considered escapable from perception for they do not fundamentally rely upon perception to exist whereas all conceptualisation, of which either faith, logic, or experience are the three principal foundations, remain dependent upon perception.

[2:2:57] By this, I mean that they must be perceived to be known and they must be interpreted to exist rather than purely existing without the need for perceiving or knowing them.

[2:2:58] We introduce Perception's Supersession of Logic in order to highlight the inability of logic to escape from perceptualisation; the process wherein a person perceives something so that they are able to know and understand it, but because of the non-uniformity of sentient minds, each perceptualisation remains different for every individual in every circumstance.

[2:2:59] It is increasingly considered by the Astronist Tradition to be a mistake to notionise that there exists any uniformities in the perception of concepts which demonstrates an interesting aspect of thought for philosophy in a wider sense and the Philosophical Spirit too, which continues to uphold the principle that the individuality of thought, belief, and practice, which are derivations of perception, is essential to remaining philosophical in nature, thus demonstrating an even more proximated coalition between Astronist Philosophy and the Philosophical Spirit.

[2:2:60] One of the main instances of the uniformity of perception is through religion's introduction of notions such as dogma and doctrine in order to instil a commonality amongst adherents.

[2:2:61] The very notion of religious traditions introducing such concepts of dogma and doctrine demonstrates the identification of Perception's Supersession in a wider sense from the very inception of higher levels of belief and knowledge.

[2:2:62] However, as current trends continue, strict adherence to conceptual dogmatism is becoming more and more scarce, thus demonstrating a natural trend directed towards philosophical approaches to knowledge, belief, and the understanding and interpretation of systems; it seems that it is prudent to suggest Perception's Supersession of Dogma in addition to its supersession of logic.

[2:2:63] Returning to focus on knowledge, it is postulated that for something to be known, it must first be perceived, thus notionising that without perception there cannot be knowledge, but if knowledge can only be perceived and perception is based on an individual's ability to think, see, and understand according to their own circumstances and experiences, then this puts into question the entire validity of knowledge itself.

[2:2:64] By this notion, it is postulated that knowledge should henceforth be referred to Perceived Knowledge in order to make the distinction between that which is perceived to be known and that which is known to be known.

[2:2:65] Anyone that stands by any of the derivations of the Perception's Supersession concept is to be henceforth known as perceptionist due to their adherence to perceptionism which is the belief orientation encapsulating the Perception's Supersession

concept and upholds the notion of the superiorisation, centralisation, and domination of perception, especially over logic, knowledge, faith, dogma, and rationality.

[2:2:66] To contemplate further about Perception's Supersession of Logic we must analyse a common definition of what logic is from a perceptionist orientation; "reasoning conducted or assessed according to strict principles of validity," can be considered a basic definition of logic.

[2:2:67] Considering the first word of "reasoning" which requires thinking sensibly and by means of fact, we can say that sensibility is formed through experience which is a direct derivation of perception meanwhile the consideration of something according facts, which are a direct derivation of knowledge which itself is dependent upon the way in which is able to perceive and how they perceive.

[2:2:68] Considering the next two words of "conducted" and "assessed" suggests the analysis of some concept which is wholly dependent upon one's perception of the criteria for the analysis to take place, as well as criteria remaining dependent upon prior knowledge which, as aforeaffirmed, is dependent upon perception.

[2:2:69] The logician's according to "strict principles" is the next element of the definition to be addressed; strictness postulates non-deviation from that which is founded while "principles" are pre-determined elements of knowledge derived from experimentation and experience which are each derivations of perception, thus owing to individual interpretation and non-uniformity.

[2:2:70] Perceptionists consider demand for strictness to be a way of curbing the ability for new forms of validity to be created, thus they are considered to merely be a distortion of logic, and even a disabler of logic for logic is reliant upon new forms of knowledge and experience to formulate its methods; essentially, strictness applied in order to demand authority and to stop deviation through new ideas which is neither philosophical nor progressional.

[2:2:71] Finally, the postulation of "validity" as an element of logic is considered by perceptionism to be formed according to prior knowledge and perception for validity is based purely upon interpretation which is itself a form of perception.

[2:2:72] This perceptionistic analysis of the definition of logic is a prime example of how a concept such as logic can be perceptionised (as distinguished from that which is known as perceptualisation) in according to the perceptionist philosophical approach.

[2:2:73] From the perceptionist viewpoint, logic, due to the supersession of perception over it, is considered to be a branch of perception itself rather than its own discipline of study; perception is not a discipline of study itself but it is considered to encompass the traditional philosophical disciplines of epistemology, aesthetics, ethics, and now logic.

[2:2:74] Before we are graced with the introduction of partitionmentism, we must briefly address that which shall henceforth be appellated as The Perceptual Cosmos as a form of cosmos.

[2:2:75] The Perceptual Cosmos expounds the notion that even The Cosmos itself subject to perception and therefore goes beyond normal measures of perceptuality by notionising that even that which is cosmic in nature is ultimately subject to perception; this is a very that notably is not held by the Astronist Tradition due to its counternotion of the idea that all that is cosmic is transcendent and exempt from sentient perception.

[2:2:76] The Perceptual Cosmos rejects this notion by stating that even those entities of The Cosmos to which we, humanity, exist in subordination to are subject to our own sentient perceptualisations; this is not considered to be a correct notion by the Astronist Tradition due to the very fact of the subordination of humanity to The Cosmos and its progeny and phenomena which is an omnipostulated seen throughout The Cosmos.

[2:2:77] Nevertheless, The Perceptual Cosmos remains a type of cosmos and one that is expected to ignite many interesting metaphilosophical, ontological, and meta-anthropological discussions and concepts.

[2:2:78] The Astronist Tradition acknowledges and accepts the impracticability of the notion of Perception's Supersession of Logic in terms of practical application and for this reason, the Astronist philosophical tradition introduces a form of interpretation that is to be henceforth known as partitionmentism.

[2:2:79] Partitionmentism is herein introduced as a form of interpretation that splits a concept in two categories, the first which refers to its practicality in application, and the second of which relates to its theoretical and philosophical significance.

[2:2:80] The partitionmentist method of interpretational categorisation is formed as a response to the impracticality of certain concepts with the functionality of sentient society and therefore such concepts remain considered in theoretical and hypothetical ways, typically characterised by their oppositions to established methods, or their highlight of issues in pre-existing systems and concepts without offering a fully formed alternative.

[2:2:81] From its origins as a method of interpretation of Perception's Supersession of Logic, partitionmentism is expected to become an important alternative as a method of interpretation as part of Astronist Logic due to its ability to organise postulations according to their practicalities and their philosophicalities.

[2:2:82] Also of particular concern to the core logicologists is the fundamental elements of what an Astronist Society is so to forebear the concerns of the latterdiscoursed and formulation of Astronarianism.

[2:2:83] It is herein maintained that an Astronist Society is an Absolutely Autonomous Culture, as it shall be henceforth appellated so as to clarify that Astronist Culture exists alongside other cultures therefore in many cases it can be classed as a subculture, though it remains autonomous in the sense that it is self-governing and separate from the wider culture of a state, or group of people.

[2:2:84] The Astronist Tradition maintains the belief that the positioning of Astronist Culture to become an heteronomous culture stands in opposition to the Philosophical Spirit because heteronomy is principled on the notion that the Astronist Culture must be governed by something outside of its own influence which is against the Philosophical Spirit because it allows for the distortion of the Astronist Culture by external forces with their own intentions.

[2:2:85] The discipline of study that shall henceforth be known as cosmic anthropology, alternatively known as cosmoanthropology refers to the study and philosophical contemplation of humans in The Cosmos, their relationship to The Cosmos, their role within it, and the future for humanity in The Cosmos.

[2:2:86] As the basis for the foundation of cosmoanthropology, there are herein established The Five Forms of human interaction within The Cosmos which are collectively referred to according to the acronym of RESET which involves human interaction with The Cosmos religio-philosophically, economically, socioculturally, environmentally, and technologically.

[2:2:87] The first of these concerns itself with the religio-philosophical interactions of humanity to The Cosmos which involves all aspects of ideation, thought, belief, practice, faith, understanding, knowledge, and perception directed towards The Cosmos and its progeny and phenomena by humanity in general, as well as by individual humans.

[2:2:88] The second refers to the economical interactions between humanity and The Cosmos which involves all the monetary interactions between humans in The Cosmos, but defined from monetary transactions made on The Earth, as well as relating to the economy of The Cosmos which involves an accumulation of all the production and consumption of goods as defined from those conducted on The Earth itself.

[2:2:89] The third relates to the sociocultural interactions between humanity and The Cosmos which involves a vast plethora of social, cultural, and religious interactions made either beyond The Earth or in regards to The Cosmos in its entirety or to any one or more of its progeny or phenomena.

[2:2:90] The fourth of these concerns itself with the environmental interactions between humanity and The Cosmos which involves the self-ascribed responsibilities held by human civilisation in the protection of The Cosmos and its progeny and phenomena when they are considered in the context of them being environments.

[2:2:91] The fifth and final element of RESET refers to technological reciprocations in occurrence between humanity and The Cosmos which involves The Cosmos, its progeny and phenomena as being the inspirers of technological innovation in the minds of humans, especially through their own natural processes.

[2:2:92] Cosmoanthropological contemplations are vast and remain widespread throughout all discourses of The Omnidoxy making cosmoanthropology crossdisciplinary by its very core nature although it does encompass its own specific concepts despite its pervadation through many differences disciplines of study in Astronist Philosophy.

[2:2:93] One of the most important elements in the entirety of Astronist Philosophy that is present throughout The Omnidoxy, with the ambition of the Astronist Tradition to synonymise it with that which can be described as Astronist, is that which shall be known as Cosmic Culture, or cosmoculture.

[2:2:94] Cosmic Culture is an all-encompassing term that involves all instances of the depiction, mention, or inference of either The Cosmos itself, or one or more of its progeny or phenomena; essentially, Cosmic Culture can be described as a subtype of wider culture is oriented around cosmic affairs, attributes, entities, thoughts, and expressions.

[2:2:95] Meanwhile, that which shall henceforth be known as Cosmic Development, or cosmodevelopment as its alternative appellation, involves the cultivation of the progenies of The Cosmos to meet the needs of humanity; this is closely related to the term henceforth known as anthropisation which is the changing of anything that was once previously unsuitable for or dislikable by the needs, wants, and standards of human civilisation.

[2:2:96] Space Colonisation, which is a lattermentioned term, is a subtype of Cosmic Development for Cosmic Development is not only physical and practical, but it also remains conceptual too which involves the cultivation of The Cosmos philosophically for the purposes of its enculturation, as is spearheaded by Cosmic Philosophy as one of the major Astronist-originated branches of philosophy.

[2:2:97] That which is henceforth known as Cosmic Ethnicity, or as cosmoethnicity, refers to the instance in which one chooses to describe their social and cultural group to be cosmic rather than from an Earth-based cultural group; therefore, a person may describe their ethnicity or heritage as cosmic, or cosmoanthropic.

[2:2:98] Cosmic Ethnicity in the context of it being a branch of cosmoanthropology refers to the interactions between different ethnic groups and traditions on planets other than The Earth as part of space colonies or civilisations.

[2:2:99] Cosmic Gender is the next of the terms to introduce as part of cosmoanthropology and involves the interactions between men and women and other forms of gender identification beyond The Earth in civilisations on other cosmic progeny as a means to

detect how a civilisation is structured according to gender roles, especially so in comparison to those existent on The Earth.

[2:2:100] Outside of the context of Cosmic Gender being a branch of cosmoanthropology, the term also refers to the new genders that humanity is expected to come across as it interacts with non-anthropoc sentient beings on worlds other than The Earth during the Humanic Exploration of The Cosmos; such genders are not expected to be just male and female due to the differences in the evolutionary paths between humanity and other sentient beings.

[2:2:101] Cosmic Society is another wide-ranging term that refers to the entirety of known sentient civilisation beyond The Earth and is, by this term, collectivised into one society as distinct from the society residing on The Earth.

[2:2:102] Similarly, though distinct, is the term of Cosmoanthropic Society refers only to the entirety of civilisations beyond The Earth that are populated by humans with no interactions or populations of non-anthropoc sentient beings.

[2:2:103] Cosmic Race collectively refers to each of the major divisions of populations of civilisations beyond The Earth as primarily defined by physical characteristics and is therefore used as an instrument for demographical studies and projection of different cosmocivilisations according to the physical characteristics of those residing within such societies.

[2:2:104] That which shall henceforth be known as Cosmic Values, which exists as the final entry of the seven main foundations of cosmoanthropology, collectively refers to the general ideas, principles, and ways of life postulated by populations residing on cosmic progeny other than on The Earth, especially in retrojection to the values of The Earth.

[2:2:105] Retrojection, as one of the thousands of new terms introduced within The Omnidoxy, refers to the instance in which a group creates a set of concepts, methods, or principles for the purpose of distinguishing their themselves from the concepts, methods, or principles of another group, especially one that they oppose, hold contention with, or find little in commonality with.

[2:2:106] The Astronist philosophical tradition identifies there to be three main anthropological interactions with The Cosmos on a practical level; these are known as Space Colonisation, Space Transversion, and Space Animation.

[2:2:107] As is perhaps self-evident by their appellations, Space Colonisation involves civilising space, whereas Space Transversion involves travelling through space meanwhile Space Animation involves living in space.

[2:2:108] Planetary habitability is a very important term and area of study within cosmoanthropology because it involves the measurement of the extent to which a planet is

presently, or naturally habitable for human life to survive on permanently without the need to conduct terraforming activities on the planet.

[2:2:109] There are herein introduced Eight Forms of Planetary Habitability, as they are henceforth to be collectivised, the first of which is to be known as anthropoplanetary which refers to the habitability of humans on a planetary as defined from sentoplanetary which refers to the habitability of non-human sentient beings on a particular planet which is further derivated according to the specific capabilities of different sentient species to withstand different environments, thus shifting the habitability of a planet greatly.

[2:2:110] Herein we introduce the prefix of sento- which is used to refer to sentient beings, especially defined from humans meanwhile the prefixes of anthrop- or anthro- are to be used to refer to humans, as is pre-Astronistly established.

[2:2:111] The third of the Eight Forms of Planetary Habitability is that which shall be known as variaplanetary which involves a fluctuating habitability of a planet especially due to the seasonal variations on the planet, some being harsher than others to human or non-anthropocentric sentient life.

[2:2:112] The next of the different planetary habitabilities is that which shall be known as inpermaplanetary which refers to the instance in which a planet is permanently uninhabitable to both humans, sentients, and non-sentients even if terraforming, or another form of planetary transformation was applied; this is typically characteristic of gas planets.

[2:2:113] Oppositely, that which shall henceforth be known as planetary habitability form of permoplanetary refers to the instance in which a cosmic progeny is permanently habitable for either humans, sentients, or non-sentients.

[2:2:114] Meanwhile, that which is to be known as abettoplanetary is a form of planetary habitability that is characterised by the requirement of technological assistance for humans to survive on a planet.

[2:2:115] Oppositely, that form of planetary habitability which shall henceforth be termed as preroplanetary involves the instance in which technological assistance is not required for humans to be able to comfortably survive on a planet.

[2:2:116] The final entry of the Eight Forms of Planetary Habitability is that which shall be known as here on in as asentoplanetary which refers to the instance in which a planet is habitable to a non-sentient species, but is not habitable to a sentient species.

[2:2:117] Therefore, the introduction of the prefix of asento- refers to non-sentient beings and creatures as defined from their sentient counterparts.

[2:2:118] Planets are to be categorised according to these different habitability forms which ultimately determines their habitability for the three major categories of anthropic, non-

anthropic, and non-sentient; such planets are to be listed by The People's United Educational Space Exploration Confederation in one of its catalogues.

[2:2:119] As we now move on to the practice of terraforming, in cosmoanthropological terms, it is defined as the change of a cosmic environment in order to suit either anthropic needs, or sentient needs in a wider non-anthropic context and is therefore considered to be form of anthropisation, or sentientisation, depending on the context of its usage.

[2:2:120] Terraforming is often the most plausible way of transforming a planet that is previously inhabitable to one that is habitable, but terraforming may also involve less drastic measures that can actually be seen on The Earth itself having already been conducted by human civilisation.

[2:2:121] The Astronist philosophical tradition, in addition to its cosmoanthropological definition, also defines terraforming as the change of an environment for means of cultivation or construction, an example of which on The Earth is the use of greenbelt land for the purpose of homebuilding.

[2:2:122] This smaller scale of terraforming activity is henceforth termed as microterraforming, or microterraformation, as a derivation of the term terraformation, as terraforming is officially known.

[2:2:123] Microterraforming has become so commonplace on The Earth that it has now been synonymised with construction in a general sense which leaves terraforming to mean extreme forms of transformation on a planetary or continental scale usually, and not just the change of the land to suit cultivation, but also the change of the climate of the planet in order to suit cultivation.

[2:2:124] The next of the concepts termed in this discourse is survivability which is encapsulated by the idea that "the long-term survival of the human species and the progress of a technological civilisation requires the building of a spacefaring civilisation that utilises the resources of outer space, and that not doing this could lead to human extinction."

[2:2:125] "A related observation is that the window of opportunity for doing this may be limited due to the decreasing amount of surplus resources that will be available overtime as a result of an ever-growing population," which forms a subtype of survivability that is either appellated as emergencial survivability or hypersurvivability.

[2:2:126] The extent to which the leaders of the world are willing to undertake this project with serious measures of implementation designates the extent of their survivability; essentially, the extent to which they want humanity to survive, but also progress in the context of space, or on any progeny, or vessel off-Earth.

[2:2:127] Cosmoanthropology can be described as the study of all aspects of human society in an off-Earth context and for this reason, cosmoanthropological study involves all the different stages of life that every human goes through as well as all the natural processes that are in occurrence all of the time that are often taken for granted, but their natural occurrences may be halted or obstructed due to the environment of space itself, or another cosmic progeny.

[2:2:128] The human biological processes that are of contemplative significance in cosmoanthropology include homeostasis, biological organisation, metabolism, growth, adaptation, response to stimuli (stimulation), reproduction, and interorganism activity, as well as circulation, and digestion.

[2:2:129] In addition to these processes to consider are all the different systems of the human anatomy including the endocrine system, the immune system, the lymphatic system, the muscular system, respiration, urination, the integumentary system, as well as the functionality of organs in general.

[2:2:130] The consideration of all of these elements of medicine, biology, and human anatomy make cosmoanthropology a crossdisciplinary subject as it encompasses these three large branches of study that require professional knowledge and experimentation in order to derive consequences and conclusions which does stray from the philosophical foundations of the subject, however, the pervading nature of cosmoanthropology demonstrates its own importance as a distinct discipline of study within Astronist Philosophy that involves non-philosophical subjects.

[2:2:131] In addition to the address of human biological processes in cosmoanthropology, also involved are the issues relating to human societies but instead applied to the context of space.

[2:2:132] The major problems of humanity address within cosmoanthropology include overconsumption, overexploitation, pollution, deforestation, and biodiversity loss.

[2:2:133] Notably, the process of overpopulation is not considered to be a problem as the Astronist philosophical tradition does not consider there to ever be an instance of overpopulation for the progression of humanity, which links to the Astronist Tradition rejection of abortion.

[2:2:134] Therefore, in an Astronist context, overpopulation is retermed as hyperpopulation and in comparology, involves aspects such as biocapacity, demographic optimisation, waste management, population growth, and land reclamation.

[2:2:135] Cosmocultural relativism in the context of cosmoanthropology involves the idea that a person's beliefs, values, and practices should be understood based on that person's own culture, rather than be judged against the criteria of another and this involves application to The Cosmos in all senses.

[2:2:136] That which is henceforth appellated as cosmokinship refers to the web of social relationships that form an important part of the lives of all humans in civilisations beyond The Earth, although its exact meanings even within this discipline are often debated.

[2:2:137] However, it is generally believed by the Astronist Tradition that cosmokinship involves the combination of the emotional, cultural, and relational commonalities collectivised in a share sense of understanding and unity and therefore remains an important element of study within cosmoanthropology.

[2:2:138] Structural cosmoanthropology is a branch of cosmoanthropology involving the study of the development of cosmoculture is dependent upon deep structures that are existent in all cultures, and consequently, cosmoculture is able to be compared to non-cosmic cultures and still find many commonalities between them; essentially, this branch of cosmoanthropology focuses on the similarities in the internal structures between cosmoculture and other cultures.

[2:2:139] Hyperurbanisation is a cosmoanthropological term involving the process of urbanisation to the point at which the rural parts of planet other than The Earth become less abundant than the urbanised areas.

[2:2:140] Cosmohydrology, similar to hyperpopulation, involves the address of issues including water conflict, water scarcity, water conservation, water management, and irrigation on planets other than The Earth itself.

[2:2:141] In a similar context, that which is known as cosmoagrarianism, which is also known as Farming in The Cosmos and is a branch of study within cosmoanthropology involves agricultural subsidy, animal farming, crop farming, monoculture, nutrient pollution, overgrazing, and plasticulture.

[2:2:142] There exists two other branches of cosmoanthropological study which are to be known as planetary utility and cosmoclimatology which collectively incorporate into their studies the creation of artificial environments, desertification, habitat fragmentation, habitat destruction, land degradation, land pollution, and natural disasters on cosmic progeny other than The Earth itself, especially in relation to how these issues effect or will effect the habitability or accessibility of such progeny to human civility.

[2:2:143] The final element of cosmoanthropology involves the process of stationing which involves the creation of a space habitat in some form, either a space colony, space settlement, space station, or space civilisation which is therefore essential to the categorisation and organisation of civilised habitats beyond The Earth.

[2:2:144] Myself being the writer of The Omnidoxy, I have always remained honest in the disacralisation of The Omnidoxy as it may be perceived in such a way as part of a wider effort to retain philosophical designation for Astronism.

[2:2:145] There perhaps exists no greater contribution from omnidoxicology in this struggle to retain philosophical designation than for the introduction of omnidoxical fallibility which pertains to the principle that neither The Omnidoxy nor Astronist Philosophy, or The Institution is to proclaim that The Omnidoxy is without fault and is therefore not sacred as a result.

[2:2:146] The Omnidoxy is a fallible document like all philosophical documents as distinguished from those of a religious nature which proclaim infallibility; omnidoxical fallibility is encapsulated by the belief orientation that shall henceforth be known as profallibilism which stands in support for the notion of omnidoxical fallibility as a pivotal and defining fact of Astronism as a philosophical tradition rather than that of a religious tradition.

[2:2:147] That which shall henceforth be appellated as The Sentient Bisect is introduced early on in this disquisition of logicology because it remains an efficient tool to designate people's belief orientations, and remains at the heart of how one is to be defined as Astronist (or some other appellation connected to Astronism) and how they are not to be, thus owing to the choice of the word bisect for this concept's appellation.

[2:2:148] The Sentient Bisect staunchly holds that either someone believes in sentient life in The Cosmos, or someone does not believe in sentient life in The Cosmos, the former is Astronist and the latter is anti-Astronist; the harshness and distinctiveness of this bisect is felt the most for those whom are undecided on such a question for it demands their decision to be made in order to be able to align themselves as being adherents of Astronist Philosophy.

[2:2:149] Interestingly, there does exist a distinct simplicity in The Sentient Bisect as a way of determining a person as an Astronist or not and although there is expected to be major oppositions to its implementation, it nevertheless remains an efficient tool in defining people's beliefs and their general orientations.

[2:2:150] The application of The Sentient Bisect is supported by the Astronist Tradition so as to determine the general orientation of an individual as well as the philosophicity of the person because if a person agrees with the notion that there does exist sentient life in The Cosmos, this does not automatically mean they are Astronist nor does it mean to say that they believe in all related concepts, however, it demonstrates their understanding of the question, their contemplation of the question, and their openness in mind to agree with such notions.

[2:2:151] Therefore, the efficiency of The Sentient Bisect cannot be argued with and for this reason, it is supported by the Astronist Tradition, though it is still expected to remain a controversial and troubling aspect of the Tradition for some with expected counterarguments to The Sentient Bisect centred around notions that it defies the principles of the Philosophical Spirit, which the Astronist Tradition wholly denies to be

counterarguments of falsity for it is not accepted that the Bisect is in opposition to the Philosophical Spirit.

[2:2:152] Another core element of logicology involves the discipline of study of proprietology which involves the metaphilosophical concern and issue of proprietorship which, in the context of Astronist Philosophy, relates to the nature of the ownership of Astronism.

[2:2:153] Proprietological issues are addressed not exclusively to this discourse of this disquisition and such addresses may not always be explicitly labelled as proprietological for they are often intertwined into addresses of other natures and topics so it is important that we remain vigilant in our readings so as to pinpoint when proprietological issues are raised.

[2:2:154] Proprietologists are tasked with attempting to understand and interpret according to a framework of concepts the omnidoxical outline of how Astronism is owned, as well as exploring wider metaphilosophical issues such as whether a philosophy in general can or should be owned, as well as the inherent natures of such ownership so as not to compromise with the nature of the philosophy itself.

[2:2:155] According to the orthodoxies of the Astronist philosophical tradition, as outlined by The Omnidoxo as the founding text of the Astronist philosophical tradition, Astronism is herein described as conocial, or lesser known as duonocial or binocial, meaning that it equally belongs to two separate groups in different and uncompromising ways.

[2:2:156] The first of these conocialities is that Astronism is metaphorically owned by all peoples of all worlds through adherence and interpretation meanwhile it is also owned by The Institution of The Philosophy of Astronism through responsible administration, organisation, and representation, and it is via these roles that The Institution herein and henceforth assumes to the status of the Proprietarian of Astronism, as it shall be appellated.

[2:2:157] For something to be nocial, it relates to the ownership of something abstract by a manifested entity, and is commonly used as prefix as it is so introduced herein and that which is known as nociality relates to the state of something abstract being owned by a manifested entity.

[2:2:158] Oppositely, that which is known as inociality refers to the state of something abstract not being owned by a manifested entity and there are many other forms of nociality that are introduced herein, each of which should be philosophically contemplated by the discipline of proprietology.

[2:2:159] That which can be described as internocial, or being in the state of internociality, refers to the instance in which an abstract is owned by two or more manifested entities meanwhile being intranocial, or intranociality involves the instance in which an abstract is

owned from within its own auspices rather than from an external organisation; The Institution of The Philosophy of Astronism maintains that practises intranocialism.

[2:2:160] Alternatively, that which shall be known as supranocial refers to the instance in which an unconnected and indifferent organisation from the philosophy itself manages the philosophy, but does not hold the values and principles of the philosophy at the forefront as it is considered to hold other intentions such as profitability or exposure.

[2:2:161] That which can be described as forenocial is the instance of nociality involving the period of time before a philosophy was owned by some external entity from itself, and is therefore opposite to the period of postnociality which relates to the time after which a philosophy has become inocialised and is no longer owned by some physical entity.

[2:2:162] That which shall be herein and henceforth known as a proprietary proclamation refers to the instance in which an individual, an organisation, or a philosophy itself proclaims to be the owner of a philosophy, or some other abstract; The Institution of The Philosophy of Astronism expresses a proprietary proclamation within The Omnidoxy herein.

[2:2:163] An external entity must conduct a proprietary proclamation in order for it to eventually achieve and be recognised as the proprietor of the philosophy, but it must be maintained that a proprietary proclamation is exactly that, a proclamation and only until one is recognised as the proprietor can they honestly say that the proclamation is fulfilled.

[2:2:164] The period of time between the point of a proprietary proclamation and the fulfilment of such a proclamation through the recognition of the entity as the proprietor is to be known as demiproprietorship, but the essential question remains of who or what conducts the recognising?

[2:2:165] From the perspective of the Astronist philosophical tradition, the responsibility of recognition is left to three groups which will eventually and unanimously reach a Decision of Proprietorship, as it shall be appellated henceforth, for the regions over which their influence spans; these three groups are the Majoritarian Public, the Reigning Government, and the Philosophic Society.

[2:2:166] The Majoritarian Public refers to the majority decision of the public to recognition one potential proprietor of an abstract, which is to be known as an aspirant, through the use of polling and other forms of public address and mass decision-making.

[2:2:167] Meanwhile, the Reigning Government, as it is appellated, refers to the majority decision of parliamentarians on whether the aspirant is the correct proprietor for a philosophy in their country.

[2:2:168] The final of the three groups appellationed as the Philosophic Society refers to the majority decision made regarding the proprietorship of a philosophy by the community of professional philosophers in a country whom hold one vote each regarding the proprietorship of a philosophy; these votes are to be henceforth known as psephes.

[2:2:169] Returning back to the different nocialities, we address that which is known as being renocial/renociality which involves how a philosophy returns to a state of being nocialised which is formed by a process henceforth known as renocialise and renocialisation.

[2:2:170] The process that shall similarly be termed as nocialisation is distinguished as the process in which a philosophy is first owned by a proprietorian whereas renocialisation involves the instance in which a philosophy has already been propried, has become inocialised, and is then later nocialised again through renocialisation.

[2:2:171] Another interesting version of nociality is that which is henceforth known as transnociality, as manifested by the belief of transnocialism which involves the attribution of the title of proprietorian to a transcendent being, or to something that is not manifested in a physical existence, such as a deity.

[2:2:172] Antinocialism is the belief orientation involving notions against any form of ownership of concepts/philosophies/religions; antinocial elements are expected to be existent throughout all areas of the Astronist philosophical tradition from different schools and groups.

[2:2:173] However, Astronism cannot be described as antinocialist because it remains tied to its proprietary proclamation in The Omnidoxy thus demonstrating a very clear understanding of proprietorship of The Philosophy.

[2:2:174] Furthermore, that which is henceforth known as hypernociality, as manifested by the belief orientation of hypernocialism, involves the public advocacy for the ownership of concepts and is opposed to antinocialism.

[2:2:175] There are other forms of nociality that we must also address herein, the first dichotomy involves macronociality and micronociality, as manifested by the belief orientations of macronocialism and micronocialism respectively.

[2:2:176] That which can be described as a macronocial viewpoint refers to the idea that nociality best works on a large scales across the entirety of the philosophy only while that which can be described as a micronocial viewpoint refers to the idea that nociality only works on a small scales and directed towards particular elements of a philosophy rather than across its entirety.

[2:2:177] The next of the nocial dichotomies to be addressed involves the belief orientations of mononocialism and omninocialism, the former of which involves the idea that the

proprietarian of a philosophy owns only the philosophy in its whole representative form, but does not own everything within it and this may also be known as representational socialism.

[2:2:178] Meanwhile, the latter, which can be described as omninoclist in orientation involves the idea that every concept/belief/denomination/school of thought within a philosophy is owned by its proprietor as well as the entirety of the philosophy itself in its representational form; this may also be known as entiretarian socialism.

[2:2:179] Entiretarianism is a wider belief orientation and approach to philosophical understanding that transcends beyond proprietology, yet its origins remain tied to the discipline with its first mention herein.

[2:2:180] Entiretarianism encompasses an approach to anything that takes into the account the entirety as well as everything existent within it; this can be described as taking into consideration that is represented by the whole while also considering the whole itself.

[2:2:181] Entiretarianism is contrasted with that which shall henceforth be known as compositarianism which is entailed by an approach to anything that takes only one or more of its composite elements into account rather than its entirety and everything existent within the entirety.

[2:2:182] Compositarianism and entiretarianism formulate a dichotomy of approaches in the understanding of how something can be viewed, especially within a decision-making context whereby consequences exist for making different decisions.

[2:2:183] It can be generally held that compositarians are interested in specific elements of a something either abstract or manifested rather than the whole

[2:2:184] In a social context, a compositarian approach would be characterised by an indifference to the ownership of the philosophy in its entirety whilst instead focusing on particular elements within it that are considered more important than the whole and they must therefore be propertied.

[2:2:185] An entiretarian approach to sociality would be characterised by an indifference towards the different composite elements within the philosophy with a greater focus on the ownership of the philosophy in its entirety, thus automatically including everything present within it.

[2:2:186] Compositarians are generally expected to accuse entiretarians of being ignorant in their overlooking of the most important elements of something, thus stressing that the ownership of something in its entirety may not be the most efficient approach.

[2:2:187] Oppositely, entiretarians would counternotion this view by stating that compositarians, by focusing on the composite parts of a philosophy, in fact miss out on the

spirit of the philosophy itself which can only be attained through approaching it in an entire way, thus owning the philosophy in its entirety rather than proprieting only the perceived key elements of it.

[2:2:188] Despite entretarianism and compositarianism holding originations herein as part of proprietological theory, they can be and are expected to be applied to a wide variety of circumstances.

[2:2:189] We have mentioned the role and responsibility of the proprietorian throughout our proprietological discussions, and herein we understand that proprietorianship is considered to be a solemn duty by The Institution of The Philosophy of Astronism for it is considered to be integral to philosophical origination, the future of the philosophy, as well as commanded as such by some element of destiny that The Institution is extricably tied to its proprietorian obligations to Astronism.

[2:2:190] The associated belief orientation that is henceforth known as proprietorianism involves the belief that the proprietorian of a philosophy is the most important element of the philosophy, especially when superiorised above the conceptual elements of the philosophy and its adherents.

[2:2:191] Proprietarianism advocates for the notion that the proprietorian of the philosophy should hold considerable sway over all elements of interaction between the philosophy and the wider world externally, as well as issues involved with the philosophy internally.

[2:2:192] Essentially, proprietorianism is a form of managing an organised philosophy that involves the absolute authority of the proprietorian which no other group, organisation, or individual can challenge due to the proprietorian opinion remaining absolute in its decision.

[2:2:193] Oppositely, that which shall henceforth be known as nonproprietarianism is a belief orientation holding that Astronism should not be owned by either The Institution, or its adherents and interpreters; that The Philosophy should remain autonocial meaning that it owns itself, but cannot be owned.

[2:2:194] A nonproprietarian approach to the management of an organised philosophy removes the the role of a proprietorian altogether and considers there to exist no element of authority in the management of a philosophy and that all organised philosophies are to be considered only in that the adherents, the institution, and the philosophy itself coadminister the philosophy rather than one proprietorian monoadministering the philosophy, typically the institution.

[2:2:195] Finally, proprietology is not only of a metaphilosophical concern but also of metareligious concern and interest as the ownership of a religions shares a similar premise to the notion of the ownership of a philosophy for the two, despite their many differences, do share a distinct element of abstractness to their natures.

[2:2:196] For this reason, proprietology, despite its origins within philosophy, particularly Astronist Philosophy, is a discipline that transcends beyond the concern of philosophy alone and poses the question of ownership to all topics, especially those which remain abstract.

[2:2:197] The next area of core logicology that we are to address is appellated as The Repetitions of Our World which essentially holds that everything is repeated including music, films, football games, church services, storytelling etc. due to the inherent nature of humans to enjoy repetition and although Astronist Philosophy supports and assimilates to this notion, it equally stresses the importance of variation, as is encapsulated through the appellated concept of Variated Repetition.

[2:2:198] The Repetitions of Our World as a concept identifies, explores, and discusses the reasons for such repetitions and the level of success that they have achieved, but most importantly concerns itself with the notion that the masses will and currently are understanding such repetitions and are beginning to crave variation in their existences which pertains to many of the discontentments felt in modern society which this concept identifies and attempts to encompass.

[2:2:199] By its very core nature and due to the principles besides which it stands, philosophy is and shall always remain non-repetitive in all accounts which is demonstrated by its motional nature, the fact that it is constantly seeking progression in all ways, and because even the philosophical traditions of the world, especially those of an Astronist origination, are always in a constant shift which is to be known as kinetication.

[2:2:200] Kinetication involves the constant and simultaneous movement of different elements of something, especially something conceptual such as a philosophy and is one of the primarily describers of the processes in constant occurrence within the Astronist philosophical tradition.

[2:2:201] Specifically in Astronist Philosophy, there can exist no greater non-repetitive system of thought for terminologies are in constant movement and creation, the observations of the night sky are in constant change, the progressions involving space knowledge, space exploration, and spaceflight are in complete constancy, as well as the conduct of debates, philosophisations, and new concept developments within the tradition push the entirety of the philosophy along on a constant basis, thus owing to the aforeintroduced process of kinetication.

[2:2:202] As we now move on, we come to the appellated concept henceforth known as The Indivinity of Good & Evil which, by its own nature, is intrinsically connected to the inclusive discipline of contology which is of course latterdisquisitioned because of its ethical focus and is pre-Astronistly known as theodicy.

[2:2:203] The reason for its placement within this discourse is because of its primarily concern beyond the immediate ethical issue being the distinction between that which is Divine and that which is good and evil and the common misorigination of these two separate entities, and how religious traditions have played an immense part in their amalgamation.

[2:2:204] One of the most common arguments against the existence of god is the proposition that if god created nature then why would god create tsunamis if they cause so much destruction; therefore, are tsunamis truly evil?

[2:2:205] To address this notion, the Astronist philosophical tradition creates that which shall henceforth be known and appellated as The Mercilessness of Non-sentience which is also addressed elsewhere in The Omnidoxo though its true origination resides here within this discourse as part of core logicology.

[2:2:206] The concept that is henceforth known and appellated as the Individuality of Mind which involves the essential notion that each sentient mind is unique as demonstrative of the derivated divinity of sentience.

[2:2:207] Due to this understanding of the unique individuality of the sentient mind, the Astronist Tradition considers itself to be a proponent of individualism, as also bolstered by the nature of philosophy itself for it remains a subject, belief system, and practice that holds a premise of individuality at its heart with individual belief, individual practice, and individual thought being three main elements of philosophical individualism according to the Astronist Tradition.

[2:2:208] Identity is the basis for human mutual existence and so by asking the question of Who am I?, one is beginning to explore not only their characteristics placed upon them by the labels of the world, but in a more proactive way, begins to explore how they want to be in the world with the other two questions posing Who am I to others? and Who am I to the world?

[2:2:209] The notion of how one wishes to be present in the world addresses what a person wishes to be to others, to the institutions who govern them, and to the cosmos that surrounds them which in turn leads them to what they want to be to themselves; this is manifested by the creation of their idyllic self, known as a persona.

[2:2:210] The consideration of the self is tandem to the consideration of others so not without regard for those with whom you interact can one understand whom they are for we humans are mouldable beings and then to change ourselves to reflect the qualities of others around us, perhaps creating one of the greatest ironies.

[2:2:211] What a person considers their greatest flaw to be is often the same element of their character that another person considers to be the character that they are most lacking, or the quality of that person that they do most admire.

[2:2:212] As an extension of the initial question of Who am I?, this form of identity questing, as these questions are to be collectively referred to, is provided with the greatest of importance and interest by the Astronist Tradition, and is encapsulated by the question of Who am I to the world?

[2:2:213] Without the understanding of who one is to the world presently, one cannot establish who they wish to be to the world in the future; who one is to the world is primarily established by their thoughts, opinions, actions, and practices that they do project into the world, therefore, to the world, one is seen is the projection of what one wishes.

[2:2:214] This is dissimilar to the nature of the question of Who am I? because there exists no projection of actions and thoughts for one to know who oneself is as one needn't say whom they are to know whom they are.

[2:2:215] The question of Who am I to others? can be seen as a microcosm of Who am I to the world? as the latter also transcends one's lifespan and is often determined after one's corporeal death in their designation as a legend, a hero, a challenger, an artist, or via some other title of identity.

[2:2:216] The exploration of these questions is one of the essential elements to the foundation of core logicology due to the vastity of ideas that such questions do create and according to the perspective of the Astronist philosophical tradition, the understanding of the concept of identity is essential to establishing logic.

[2:2:217] That which is henceforth known as the discipline of study of velocitology deals with the speed of elements and entities within The Cosmos as well as the contemplation of the speed of The Cosmos itself.

[2:2:218] Velocitological issues address the necessity of speed in The Cosmos, as well as remaining concerned with whether light really is the fastest entity in The Cosmos, the relationship between The Cosmos and The Universe through the dynamic of speed, whether speed really is existent in The Universe at all and if the answer remains no to any of these questions, then the velocitologists responsible is to counteract with why.

[2:2:219] The Velocities in The Cosmos is the appellation that collectivises all the different forms of speed present within The Cosmos as manifested by all the different progeny and phenomena and remains the central concept of velocitology and it is from this which all velocitological studies are inspired and conducted.

[2:2:220] One of the main elements of velocitological study and contemplation revolves around the discussion of the different speeds of progeny, and phenomena in The Cosmos and what can be derived from speed, often through the instrument of dynamicity, in order to draw conclusions about the natures of such progeny and phenomena; this places speed

at the forefront of cosmological understanding as the main driver of conclusions about celestials.

[2:2:221] The speeds of both The Expanding Cosmos and The Universe itself are also of concern for velocitologists, especially due to the theory of the acceleration of the former having established itself in recent times which raises velocitological questions including how fast could The Cosmos accelerate before its collapse? Does the infinity of The Universe pertain to the notion that the speeds that The Cosmos can reach are of an infinite nature?

[2:2:222] Another important concept that is introduced under the auspices of the discipline of study of velocitology is that which shall be known as comovement in pertination to the description of The Cosmos and its relationship with the other cosmoses of The Universe.

[2:2:223] To comove relates to the movement of two or more entities in simultaneity, though not necessarily at the same speed, within a set or unset period of time and in a set expanse; comoving is therefore changeable to the circumstances to which it is applied.

[2:2:224] The concept of comovement in a universal and cosmological setting pertains to the idea that The Cosmos itself and all the other cosmoses in The Universe are moving simultaneously in an infinite expanse that is The Universe at infinite speeds without the possibility of encounterment between different cosmoses.

[2:2:225] The concept of comovement is integral to understanding how movement occurs outside of The Cosmos between different cosmoses in their entireties, as well as relating to their non-interaction with each other.

—

[2:2:226] It is the proportional nature of reality that for one to ascend in something, one must simultaneously descend in another.

[2:2:227] Why must my mind wander into the most worrisome of topics?

[2:2:228] Perhaps those questions that are presently perceived to be of the least importance are in fact of the most important nature yet the small-mindedness of the masses in their own worlds do not wish to accept such because it requirements the utility of their mind beyond corporeal and material reality.

—

[2:2:229] Before we move onto the next discourse of this disquisition which is concerned with the introduction of the omnimentioned Philosophical Spirit and the explanation and exploration of what it is, how it influences every aspect of Astronist Philosophy, and why

it is adhered to by the Astronist Tradition especially, we must introduce to final elements of Core Logicology.

[2:2:230] That which shall henceforth be known as contemplationism, alternatively known as contemplatism, is a belief orientation holding that the higher the amount of contemplation that a person conducts the better their philosophicity will be.

[2:2:231] Essentially, contemplationists hold that the vast majority of the people of the world have been distracted from contemplation through the invention of material products, forms of media consumption, and overconsumption in general so as to divert their attentions away from deep contemplations.

[2:2:232] Contemplationism holds contemplation to be a form of artistry that is to be mastered over the course of many years and is considered to be the necessary precursory to the philosophical and occurrological activity of debating and so therefore contemplation rests at the core of what philosophy is.

[2:2:233] Contemplationism insists that contemplation is the fundamental element of practice in philosophy and that contemplation should remain an integral part of one's daily life, especially as a source of reflection, a calming technique, a form of relaxation, and the primary way of mulling which contemplationists insist is something that is not practised enough.

[2:2:234] The final element of core logicology that is to be addressed in this discourse is that which shall henceforth be known as suffocationism, which may also be known as suffocism, as followed by suffocationists, or suffocists.

[2:2:235] Suffocation, in Astronist Philosophy, means anything that limits freedom of thought, action, possibility, or potentiality and it is the belief and goal of suffocists to reduce suffocations in their lives and other people's lives.

[2:2:236] Suffocationism as a belief orientation holds that all limitations of the freedom of thought, action, possibility, or potentiality can and should be removed from one's life in all instances of their occurrence; the state in which one no longer holds any suffocisms in their life is to be known as a state of disencumberment.

[2:2:237] Suffocisms as a collective term relates to suffocations and their elimination from a person's life but suffocationism holds three distinct branches including personal suffocationism, interpersonal suffocationism, and societal suffocationism.

[2:2:238] Once one has eliminated all suffocisms from their life, it is considered by suffocationism to be the duty of successful suffocists, known as victorists, to relieve as many others as possible from their own suffocisms which they may devote their lives to through the forsakement of all their other vocations.

[2:2:239] The exploration of what suffocists achieve and why they are considered to want to achieve such a status of life without suffocisms is explored as a prerological issue because the basic purpose of suffocationism and its practices is to achieve freedom from imposed and self-imposed limitations.

[2:2:240] As the final point about suffocationism, one whom is well-acquainted with the Buddhist philosophical tradition may see many parallels between the philosophy of suffocationism and the elimination of suffocisms and the Buddhist doctrine of one's goal to release themselves from samsara in order to nirvana, but the Astronist philosophical tradition does not include an equivalent to nirvana in its own philosophy because the doctrine of nirvana invokes a belief in the achievement of a transcendent state for corporeal humans.

The Philosophical Spirit

[2:3:1] One of the most important elements of logic that the Astronist Tradition utilises for the purpose of decision-making is that which is henceforth known as the Philosophical Spirit, which is omnimentioned throughout The Omnidoxy, but without proper clarification, the Philosophical Spirit is expected to remain an elusive element of Astronist Logic.

[2:3:2] The Philosophical Spirit holds an intangible omnipresence throughout the entirety of Astronist Philosophy that develops over time according to that which is known as sophulation.

[2:3:3] Sophulation is when a concept or set of principles are developed over the course of their different applications rather than through the systematic listing of such principles; essentially, to be sophulative is to be explained through applications only.

[2:3:4] Sophulationism is the belief orientation associated with sophulation and therefore sophulationists uphold the notion that sophulative approaches to the codification of principles are superior, yet remains opposed to enumerationism which holds that the codification of principles are best conducted through listing the different elements and principles of the system.

[2:3:5] According to the Astronist philosophical tradition, the Philosophical Spirit is intrinsic to all that is philosophical and its remains all-pervading; the Philosophical Spirit holds an alternative appellation of Untold Law because the Spirit aspect of philosophy is both transcendent and underpinning of philosophy that remains ultimately transversive so it cannot be pinned down due to the untold amount of applications to which the Philosophical Spirit associated.

[2:3:6] It is also important to note the loyalty of the Astronist philosophical tradition towards the Philosophical Spirit which is omnireferenced through The Omnidoxy; the Astronist Tradition equates the principles of the Philosophical Spirit with philosophy and that which may be deemed as philosophical in nature, appearance, and function.

[2:3:7] This therefore demonstrates the reason for the Astronist philosophical tradition's loyalty to the Philosophical Spirit; it is primarily based upon the idea that loyalty to the Philosophical Spirit further supports the designation of Astronist Philosophy as a philosophy.

[2:3:8] The cumulation of all the different instances in The Omnidoxy that the Philosophical Spirit has been referenced form the Philosophical Spirit though to fully understand the Philosophical Spirit, one must read and study The Omnidoxy.

[2:3:9] Despite the ultimate fact of the Philosophical Spirit remaining untold, it is best understood as the set of seemingly loose, yet truly interconnected aspects that can be

described as philosophical and characterised by a focus on rationality, fairness, and freedom of thought.

Natural Philosophy (Naturolology)

[2:4:1] The discipline of study that is herein introduced as naturolology forms a major component of Core Logicology and explores all elements of natural existence categorised as either cosmic progeny or cosmic phenomena, or existing as derivations of either, with the former relating to physical entities such as celestials, sentient beings, and environments while the latter relates to the events in occurrence that do not hold a permanent physical existence, but are fundamental to the formation of progeny, as well as to the existence of orders, patterns, and systems in The Cosmos.

[2:4:2] In addition to the contemplation and categorisation of progeny and phenomena, naturolology is herein and henceforth responsible for the contemplation of the nature of nature and what it means for something to be natural in addition to focusing on how something natural can be turned unnatural, as well as the differences between naturality, preternaturality, unnaturality, and supernaturality.

[2:4:3] Therefore, naturolologists hold an important position in how Astronist Logic is formed because they demonstrate how the physical elements of reality are to be interpreted and how such approaches are to be formed, thus forming logical paths for conclusion making.

[2:4:4] Natural Philosophy attempts to understand the world according to the physical elements of reality, as aforementioned, and is designated as a branch of Astronist Philosophy beside Cosmic Philosophy which both remain interconnected to one another.

[2:4:5] Natural Philosophy encompasses the discipline of study of naturolology, as well as instances of reference to the natural, preternatural, unnatural, and supernatural, and all traditions, belief orientations, schools of thought, and practices existent within Astronist Philosophy that take a distinct focus and set of beliefs towards the natural world, as reminiscent and inspired by many of the traditional and pagan religions of different cultures, typically centred on animistic beliefs.

[2:4:6] Naturolology, as aforedefined, involves the contemplation of nature as it is and essentially, the nature of nature in all its aspects and approaches as well as the designation of different natures.

[2:4:7] The definition of that which can be described as natural is the principal contemplation for naturolologists and can be approached according to both a positive and a negative definition; to define these definition types, a positive definition is when something is defined according to what it is meanwhile and oppositely, a negative definition is defined according to what the subject is not.

[2:4:8] Therefore, a positive definition of being natural refers to that which has an origination that is directly from Cosmic Nature and is either a cosmic progeny or cosmic phenomena, with the former of which split into the bands of Cosmic Nature or Organic Nature.

[2:4:9] Cosmic Nature collectivises all cosmic progeny including all elements and celestials beyond the confines of a planet as distinguished from Organic Nature which refers to all entities and elements within a planet, or on a celestial rather than the planet or celestial itself which belongs to the former rather than the latter.

[2:4:10] A negative definition of that which is natural consists of that which does not originate from natural processes and is inside constructed through the use of technological mechanisms, henceforth difference between the process of procreation and the process of manufacturing of products through the use of technology.

[2:4:11] The Astronist Tradition believes and advocates for natural philosophy in a wider sense by focusing on the various forms of natural rather than the manufactured and focuses on the natural philosophy of the past, investigates the reasons for its obscuration, and supports the notion of its rebirth.

[2:4:12] Perhaps one of the main reasons for the obscuration of nature worship and belief came with the focus of large portions of humanity on the purported divine and godly aspects of existence which has been positioned to counteract the veneration and marvel of nature.

[2:4:13] The Astronist philosophical tradition considers its own orientations, beliefs, practices, and internal component to be closer in proximity to nature worship, nature religions, and even to animist ideas.

[2:4:14] Naturologists of the Astronist philosophical tradition categorises nature according to The Bands of Nature which are defined from The Forms of Nature by the notion that nature is divided into different component parts and defines a hierarchy of nature split into aforementioned bands.

[2:4:15] Divine Nature is the appellation for the highest band in the hierarchy of nature and involves all perceived elements of divinity that are present in both the cosmic realms of The Universe and well as within The Universe itself, and beyond The Universe in some way incomprehensible.

[2:4:16] Divine Nature is characterised by a particular transcendence of being beyond the natural laws similar to the lattermentioned Universal Nature, but is defined by the notion of its origination from a singular emanating source.

[2:4:17] Universal Nature is the second highest band of the hierarchy of nature and involves all perceived elements of universality that permeate throughout The Cosmos, yet also transcend beyond it as is described in the Astronist cosmological structure.

[2:4:18] Universal Nature is essentially characterised by infiniteness which is defined from all lower forms of nature which are essentially characterised by limitation; universality refers to that which is infinite in nature.

[2:4:19] Alternatively, Cosmic Nature is the next of The Bands of Nature and is essentially characterised, like all other lower forms of nature, by limitation rather than infiniteness and is manifested by the celestials in The Cosmos in their entirety including planets, stars, and galaxies rather than the elements, progeny and phenomena present within their biospheres.

[2:4:20] Organic Nature, as defined from the former, refers to all forms of limited nature and existence that are manifested as botanic life, anthropic life, and faunal life as essential components of the biospheres of those celestials.

[2:4:21] Inorganic Nature is the lowest and final band of the hierarchy of nature which involves manufactured goods, and all other humanmade substances, including humanmade organics; essentially, anything that has been produced, created, or initiated from derivated progeny like humans through the use of technology and humanmade mechanisms and methodologies.

[2:4:22] This is unlike that which shall be known as methodological nature which is an important term of naturology as it relates to the notion that all forms of nature are perceived to function according to methodologies that are inextricably inherent to their essences and are therefore defined from anthropic methodology which are methodologies of function that are distinguished from those sourced from nature itself.

[2:4:23] The Forms of Nature are a collectivisation of types of nature that are distinct from the aforementioned Bands of Nature as The Forms of Nature are characterised by their focus on how nature is perceived by human sensory experience and may therefore be seen as inferior to the collectivisation of nature according to different bands.

[2:4:24] There are herein identified four Forms of Nature by the Astronist Tradition firstly including that which shall be known and appellated as Naturality which refers to all progeny and phenomena in The Cosmos which are seen, known, and understood by sentient perception and sensory experience.

[2:4:25] The second Form of Nature is that which is henceforth known and appellated as Unnaturality which includes all forms of progeny and phenomena in The Cosmos that are seen, known and misunderstood by sentient perception and sensory experience.

[2:4:26] Meanwhile, the third Form of Nature is to be known and appellated here on in as Preternaturality which refers to all elements of existence outside of The Cosmos that remain unknown and unseen to sentient perception and sensory experience.

[2:4:27] The fourth and final Form of Nature is to be known and appellated henceforth as Supernaturality which refers to all progeny and phenomena that are transiently existent between The Cosmos and beyond The Cosmos and are seen and remaining unknown as well as misunderstood by sentient perception and sensory experience.

[2:4:28] Before our introduction of Natural Philosophy of the Astronist philosophical tradition ends, we must make the distinguishment between nature and the environment which, in a non-philosophical context, are most often synonymised.

[2:4:29] However, in a philosophical context, especially within naturology, it is important to distinguish nature and the environment for the Astronist Tradition considers these two entities to be separate; essentially, nature collectively refers to the entities that exist within the environment rather than referring to the environment itself.

[2:4:30] This can be applied to a variety of different circumstances including in a cosmic circumstance whereby the planets, stars, and galaxies as well as cosmic phenomena such as supernovae and other cosmic processes are collectivised under the term nature while the environment in this context would be space itself.

[2:4:31] Philosophies can be described as nature while the countries, societies, governments, and external circumstances surrounding them can be described as culminating into the environment when ascribed to this definition of the terms.

[2:4:32] Referring back to a cosmic context, those which are known as subenvironments are the environments of celestial entities as distinguished and existent with the wider environment of space and within the natures of space; by this notion, we begin to understand the Astronist approach to understanding the relationships between different entities and environments in The Cosmos.

[2:4:33] Now that we have conducted our introduction of Natural Philosophy which subsequently forms the organisation and foundations of the arrangements of nature, as well as the designations and definitions of different forms of nature, we can now move on to contemplate the processes involved with nature.

[2:4:34] In this section on the discourse focusing on natural processes, we come to address the different processes identified as part of nature which will then either be provided with new defined as applied to a cosmical context with the application of new appellations to such processes.

[2:4:35] The principal process of nature has become evolution which when applied to a cosmical context is everpresent throughout much of The Cosmos and both the progeny and phenomena existent within it.

[2:4:36] We need only point out the processes involved in the formation of stars and later their devolvement into black holes as well as relating to the immense complexities of the formations of galaxies, planets, and even smaller celestials such as moons, asteroids, and comets.

[2:4:37] Nature is in constant movement and constant progression due to evolution, if there didn't exist evolution, nature would truly be a circular entity rather than a linear one and so because of the principle of evolution, the Astronist Tradition premises its cosmology according to a linearity that is not present in cosmologies formed before the discovery and establishment of evolution as a proven scientific process.

[2:4:38] Therefore, all natures are linear by their own naturity due to evolution and even though the Astronist Tradition acknowledges that there does exist cycles in nature, these are considered to only be part of a wider linearity.

[2:4:39] The principle of evolvment therefore rests at the heart of how the Astronist Cosmology perceives the nature of The Cosmos and considers The Cosmos to be on a linear course of existence.

[2:4:40] In a universal and divinical sense, the process of evolution is not considered to exist for the very essences of these two existences are infinite and therefore they do not hold beginnings nor do they hold ends which is the defining existential fact of evolution.

[2:4:41] The next of the natural processes is homeostasis which pertains to regulation and maintenance of a constancy of state which, when applied to the context of The Cosmos, is reappellated as cosmostasis.

[2:4:42] Cosmostasis as a belief and occurrencial process in The Cosmos is not perhaps given the terminological presence that it deserves as it is often outpopulated by other similar terms, but essentially, cosmostasis is the process by which The Cosmos and by extension, the progeny and phenomena present within it, work to maintain consistency in the functions occurring within The Cosmos, especially manifested by progression, balance, reparation, and reconstitution.

[2:4:43] Cosmostasis is the philosophical process of The Cosmos that underpins how The Cosmos remains able to exist as it does; cosmostatic processes are instrumental to the maintenance of the cosmical system and orderity for without these natural processes maintaining The Cosmos as a whole and the progeny and phenomena within it, The Cosmos would not exist as it does in its unquity.

[2:4:44] The main tools that cosmologies are performed under are the laws of gravity, as well as all other forces in The Cosmos including dark energy and dark matter, the true roles of which still remain unknown.

[2:4:45] Cosmic Uniquity, as it is appellationed herein, is the belief that The Cosmos in which we reside is unique from all the other cosmoses of The Universe and remains an important element to how the Astronist Tradition understands the nature of The Cosmos itself.

[2:4:46] The next of the natural processes identified herein is metabolism and in the context of space and The Cosmos refers to the reappellation of astrobolism and involves the metaphysical and metaphorical transformation of energy from either a cosmic progeny or phenomena into something else, for example, using such energy to power a civilisation.

[2:4:47] Astrobolism is characterised by any instance of the reutilisation of a cosmic progeny or phenomena's energy from its utility as part of the progeny and phenomena into a third party.

[2:4:48] The natural process of growth is to be reappellationed to onconisation and, in this context, involves the physical increase in the size of a cosmic progeny or phenomena so that the environment surrounding being fractionally smaller.

[2:4:49] Onconisation is essential to the entirety of cosmic existence as we see the onconisation of The Cosmos through its expansion and the intraonconisations occurring within it which relate to the growth of progeny and phenomena within The Onconising Cosmos, as it shall henceforth be appellationed.

[2:4:50] The next of the natural processes is adaptation and in a spacial context is reappellationed to remodification which refers to the ability of a cosmic progeny or phenomena to change over time in response to the alterations in its surrounding environment which also includes the change in the surrounding progeny and phenomena with which they are coming in contact.

[2:4:51] Remodification is in constant occurrence in The Cosmos and is intrinsic to the notion henceforth known as cosmic survivalism which puts forth the idea that cosmic progeny and phenomena hold a natural instinct to reconstitute themselves after a damaging occurrence through the process of remodification.

[2:4:52] One of the most important of the natural processes that is herein identified is reproduction which the Astronist Tradition considers to be in constant occurrence in The Cosmos, but of course not in the same biological sense as human reproduction.

[2:4:53] Nevertheless, that which is known as Cosmic Reproduction, also to be known as ectypification involves the many instances in which cosmic progeny or phenomena are created in The Cosmos through a wide variety of processes according to different circumstances.

[2:4:54] Hubs of Cosmic Reproduction are nebulae, which are also known as star factories, as they are the principal progeny in which the phenomena of star formation occurs.

[2:4:55] Additionally, the natural process of fermentation is considered to be a derivation of the aforementioned adaptation process, but when applied to a spacial context is to be reappellated to zymification.

[2:4:56] Zymification involves the utility of alternatives by celestial entities as defined by remodification which involves the reconstitution of the cosmic progeny or phenomena in question.

[2:4:57] Zymification involves the utility of external alternatives distinct from the celestial itself rather than the reorganisation or rearrangement as is involved with the process of remodification.

[2:4:58] Germination, as one of the most formative of all natural processes, is another natural process that is to be reappellated to opulation and when applied to a spacial context involves the development of cosmic progeny and phenomena from a seed-like instance and structure.

[2:4:59] Opulation involves the growth of something cosmically small to something cosmically large; theories involving opulation involves the application of that which is henceforth known as Seed Structure to The Cosmos and its progeny and phenomena.

[2:4:60] The Seed Structure refers to how The Cosmos itself, as well as some of its progeny and phenomena originate from cosmic minuteness, or from a somewhat non-existent cosmic state.

[2:4:61] Tropism is another of the natural processes that the Astronist Tradition identifies to be applicable to a cosmical and spacial context and in such a context, tropism is reappellated to redisposition and involves the process of a cosmic progeny or phenomena moving in its physical location in order to suit itself better in a new environment as part of the process of remodification.

[2:4:62] Redisposition involves a celestial entity holding an awareness of the environment in which it resides on a metaphysical level rather than on a perceptual level like all sentient beings experience their own awarenesses and knowledge.

[2:4:63] The process of redisposition closely relates to that which is henceforthly appellated as Nature Knowledge, also known as epistemicity, which involves the notion that The Cosmos, its progeny, and its phenomena hold a metaphysical knowledge and awareness that are not comprehensible by humans due to such Nature Knowledge existing in transcendence beyond human perceptual experience.

[2:4:64] Nature Knowledge can also be understood more easily in a non-cosmical context when applied to plants as they can be comprehended as having knowledge of the environment in which they reside; the fact that plants hold awareness and knowledge according to their adaptation of the environment.

[2:4:65] The third to last natural process that is identified herein is hybridisation which, when applied to a spacial context, is reappellated to cosmoamalgamation involves the process of the combination of two previously distinct cosmical entities combine into a newly formed entity, typically of a progeny as stimulated by the occurrence of phenomena.

[2:4:66] An example of how cosmoamalgamation is in occurrence in The Cosmos is when two planets or moons collide to form one or more newly formed entities, or when two stars collide and combine into one large, newly formed star.

[2:4:67] The penultimate natural process of this discourse is morphogenesis which, in a spacial context, is reappellated to cosmoconfiguration and involves the process of the development of the appearance of cosmic progeny or phenomena and is a process split into exoconfiguration which is the formation of external appearance or endoconfiguration which is the formation of internal appearance.

[2:4:68] Exoconfiguration involves the internal development of the structure and appearance of celestial entities as an overall process and the term that is to be known as perexoconfiguration is when the internal development of the structure and appearance of celestial entities changes from its original state.

[2:4:69] Endoconfiguration involves the external development of the structure and appearance of celestial entities as an overall process and the term that is to be known as perendoconfiguration is when the external development of the structure and appearance of celestial entities changes from its original state.

[2:4:70] Herein we see the first appearances of the prefix perexo- which relates to that which internally changes from its original state in addition to the initial appearance of the prefix perendo- which relates to that which externally changes from its original state.

[2:4:71] Finally, one of the most fundamental of all natural processes is photosynthesis which is reappellated to coalation and in The Cosmos involves the process of all the interactions of a star (astrocoalation) with Organic Nature and it is in this process that we see the dependence of Organic Nature on Cosmic Nature.

[2:4:72] Coalation in a wider sense is any direct interaction between Cosmic Nature and Organic Nature, again with the latter dependent upon the former for either the utility of its energy, or for the need of the presence of the former for the latter to survive in some way without the transference of energy.

[2:4:73] The next segment of this discourse focuses on that which shall henceforth be known as environmentation which involves specific naturological investigations into the nature of different environments and how the environment of something effects how it forms and exists.

[2:4:74] Environmental investigations are important to Natural Philosophy as they form contemplations of environments which makes up one half of all naturological contemplations with the other half focusing on nature itself.

[2:4:75] The principal element of study for environmentation is appellated and henceforth known as The Cosmic Ecosystem which is characterised by understanding that there exists a distinct ecosystem in The Cosmos just like there exists one in nature.

[2:4:76] The Cosmic Ecosystem is distinguished from the the cosmical system by the notion that The Cosmic Ecosystem transcends in contemplation beyond the cosmical system by delving deeper into the interactions, interconnections, and intercommunality of the different progeny and phenomena of The Cosmos while the cosmical system as a term itself relates to the system of functionality in its entirety.

[2:4:77] The spacial environment is encapsulated by one of the lesser existences of the Astronist Cosmology known as The Betwixity and is considered a place of incomprehensible intensity, incompatibility with human biology, but is most importantly considered to be a place of mystery.

[2:4:78] The Spacial Mystery, as it is to be henceforthly known as involves the notion that space can be seen and ventured through, but it can neither ever be truly understood, nor can it be truly known.

[2:4:79] Natural resources are an essential element to all contemplations of the environment and how natural resources involve the process of reservation in the assurance of survival; the reservation of resources of an environment demonstrates an appreciation for the environment and the utilities it holds yet maintains the importance of the preservation of such resources so that these utilities for the purposes of future survival.

[2:4:80] The concept of the wilderness in a spacial context relates to the Astronist notion that the entirety of The Cosmos is an Organised Wilderness as it shall be henceforth appellated.

[2:4:81] Perhaps it is one of the main misconceptions of the Astronist Tradition that it ignores the brutal realities of The Cosmos and replaces them with an idealistic version of The Cosmos as is depicted in art, renditions, and how it is described in the majority of The Omnidoxy; this false understanding of the reality of The Cosmos is to be henceforth known as misconstructionism.

[2:4:82] Astronism is not misconstructionistic at its heart for it does both acknowledge and accept that the realities of The Cosmos are not as they are depicted in art and as they are described in many instances of their characterisation and to any person that accuses Astronism of following misconstructionism, this insentensation should be recounted to them.

[2:4:83] Astronism's understanding of the realities of The Cosmos is encapsulated by its creation of the concept known as Organised Wilderness in relation to The Cosmos, its progeny, and its phenomena hold a immense amount of violence, indifference to death and destruction, as well as the notion that the most beautiful aspects of The Cosmos are the most dangerous which is to be henceforth known as anasimous.

[2:4:84] An anasimous entity, person, animal, or event that is very beautiful yet also dangerous; accelerated anasimousness refers to the instance in which the more beautiful an entity, person, or event is the more dangerous it becomes.

[2:4:85] Organised Wilderness contemplates the notion that although The Cosmos remains organised, it is so equally wild by its nature in the violences that progeny and phenomena, particularly the latter, are dangerous in their occurrences.

[2:4:86] Organised Wilderness acknowledges and accepts the notion that The Cosmos holds a very harsh reality with the vast majority of its environment remaining hostile to the human ability to survive.

[2:4:87] However, the Astronist Tradition underpins this entire notion with an existential and perceptual counternotion that the violences, hostilities, and dangerousness of The Cosmos and its progeny and phenomena are only considered to be as this because they are hostile to the human ability to survive in and around them rather than from a neutral perspective, or from The Cosmos itself and therefore this anthropic perspective cannot be trusted as it is based upon the preconditions and preconceptions of the abilities and knowledges of humans which are themselves fundamentally limited within limitation itself.

[2:4:88] The belief orientation of proidealism pertains to the notion that all Astronist Art, Rendition, and Philosophy that idealistically represents The Cosmos, its progeny, and phenomena are well within their rights to do so without being labeled misconstructionistic because to the perspective of The Cosmos, which when a person takes this perspective it is known as cosmic empathy, the hostilities of The Cosmos are not hostilities.

[2:4:89] The instance in which a change in perspective and therefore a change in perception is occurred is to be henceforth known as a perceptual shift, or a transperception, and the term relating to a change in perspective that shifts away from one's existential perspective such as through cosmic empathy is to be known as a metaperception.

[2:4:90] The Astronist philosophical tradition herein identifies and categorises those which are known as Sentient Presences within the designation of naturology; Sentient Presences relate to the two abilities of a sentient being, especially of a human being in its original context, to be present physically as well as to be present metaphysically.

[2:4:91] The Astronist Tradition herein identifies the first of these Sentient Presences are pre-Astronistly known as locally present which relates to when a person is physically present somewhere; a person that is experiencing this may be known as a metan, metanist, or metanarian, or may be described as metanic.

[2:4:92] Metanarianism, or more briefly known as metanism, is the belief orientation associated with this local presence and holds that physical presence is superior to any form of emotional, mental, or metaphysical presence that is described in personal presence because of the ability to see local presence.

[2:4:93] Meanwhile, the second form of the two Sentient Presences is pre-Astronistly known as personally present which pertains to being present in one's thoughts and emotions or metaphysically present in a place though not being physically there; a person that is experiencing this may be known as an equan, or equanarian, and may be described as equanic.

[2:4:94] That which is known as equanarianism, also known as equanism, refers to the belief orientation associated with this personal presence and holds that emotional, mental, and metaphysical forms of presence are superior to local presence because of their transcendence beyond physicality, as well as because of their unknownness.

[2:4:95] The experience of when someone is physically in a place but is not mentally due to thoughts of a philosophical or cosmic nature is to be known as cosmometanation.

[2:4:96] There are also expected to be instances in which the equanic segment of presence is associated with mystical, divinical, and spiritual circumstances and even the Astronist Tradition does not outrightly support such notions, it does not intend to prevent them from occurring and it cannot physically stop people from taking their own inspirations and interpretations of its ideas and applying them to metaphysical instances associated to a god, or some mystical or spiritual force or faith.

[2:4:97] The next segment of this discourse is that which shall be titled as Human Modifications which principally deals with the anthropic relationship with nature and how it is considered to be entirely built on utility for the benefit of the former as is evidenced by the agriculture as the utility of nature for not only human benefit, but human survival.

[2:4:98] By this notion, we understand that humans and other sentient and non-sentient beings are in some way dependent upon Organic Nature for their survival firstly and their benefit secondly with Cosmic Nature holding a less immediately perceived survival and

benefit for humans, especially when compared to such basic needs such as food, water, and air though these elements exist as derivations of Cosmic Nature because they are components of Organic Nature.

[2:4:99] The notion that sentient beings and non-sentient creatures are wholly dependent upon and inextricably bonded to Organic Nature as a derivation Cosmic Nature is to be henceforth known as depanthropism.

[2:4:100] Within the segment on Human Modifications, we are also tasked with exploring the various different elements of nature religions, specifically in this discourse by covering some of their most common characteristics and assessing the Astronist view of such ideas, thus invoking a sense of comparological investigation into our naturological discourse.

[2:4:101] One of the principal elements of nature religions in their belief in nature and the natural world as an embodiment of divinity, sacredness or spiritual power; in this literal sense and for the majority of its philosophy, Astronism does not considered such views to be varied, or compatible with its philosophy due to the incorporation of sacredness and the centralisation of divinity and spirituality.

[2:4:102] However, the metaphorical notion that nature and the component elements of nature hold some level of divinity is generally a supported notion within Astronist Philosophy due to its creation of that which is known as divine derivation, alternatively known as derivated divinity.

[2:4:103] Divine derivation refers to the notion that Organic Nature, as deriving Cosmic Nature which remains directly Divine, is disproximated from direct divinity, but still retains a derivation of divinity; perhaps this could be described as a diluted form of divinity that is appropriated to lesser entities below those of a Cosmic Nature.

[2:4:104] The second of the most common aspects of nature religions is the fact that they consider the environment to be imbued with spirits and other sacred entities; this is not considered to be in alignment with Astronist understandings regarding nature for such centralisations on spirits and other mythological forms of existence as they are thought to be distractions from cosmic entities, or a general redirection away from cosmocentricity which Astronist Philosophy is primarily defined upon.

[2:4:105] Another typical element of nature religions is their generalised resistance to institutionalisation and legitimisation which is a foreign notion to the Astronist philosophical tradition which is herein founded according to the institutionalisation and institutional management of the concepts of the philosophy.

[2:4:106] Further to this, the legitimisation of Astronism remains an important topic in the promulgation of The Philosophy via The Institution that oversees its furtherance.

[2:4:107] The next aspect of the Astronist Philosophy's position on nature religion(s) is concerned with the holistic concept of reality which the Astronist philosophical tradition is generally dissuaded from as it prioritises the notion of the compositeness of The Cosmos, especially so from the anthropic perspective, yet holistic views on The Cosmos are of course also present within the wide ranging orientations within Astronist Philosophy.

[2:4:108] The concept of individual authority is also given a prominent role within nature religious traditions which is again generally a foreign notion to the Astronist Tradition because of the prominent role that the cosmical order is given and the principle that all entities within The Cosmos must follow this according to their own nature.

[2:4:109] The concept of the emphasis on individual paths in nature religions is, however, more proximate to the views of the Astronist philosophical tradition because of the Astronist notions involving philosophical autonomy that people should always be able to philosophise in their own unique way and hold their own philosophical beliefs distinct from those around them, but nevertheless inspired by the Tradition.

[2:4:110] Similarly associated with the general characteristics of nature religions, especially in comparison to other forms of religious tradition, is the equal value of individuals and groups despite their differences in belief.

[2:4:111] The Astronist Tradition does not take any view on this statement of nature religions as it does not concern concepts or notions and because the equal value of individuals and groups is inherent and intrinsically part of philosophy, as principled by the Philosophical Spirit as so therefore the Astronist Tradition is defaulted to taking this notion as part of its nature.

[2:4:112] Nature religions hold a strong experiential basis to their theologies and involves an emphasis for believers on personal experience for the arbitration of truth and validity which is an aspect of philosophical practice that holds importance to the Astronist philosophical tradition.

[2:4:113] The Astronist Tradition intends to transcend philosophy from its stereotyped conceptuality to a place in which philosophical practices are given equal priority and prominence in their abundance and gravity in Astronist Philosophy.

[2:4:114] Personal experiences in the Astronist philosophical tradition are given much more importance than in other forms of philosophical systems, as well as there existing strong experiential elements to the fundamental practice of The Philosophy.

[2:4:115] Also fundamental to the aspects of nature religion is animism which believes that all natural phenomena, including those which are inanimate, possess spiritual essences.

[2:4:116] The Astronist Tradition is the main proponent of that which shall be known as either cosmic animism, or cosmoanimism, which applies animistic beliefs and notions to

cosmic progeny and phenomena which are all typically collectivised with Astronist Mysticism, also known as mysticalism, or cosmomysticism.

[2:4:117] The fact that in nature religions humans are considered to be equal to animals, plants, and natural forces falls in strong alignment with the Astronist Tradition and its views on the position of humanity and all other sentient beings as existing both a derivations of cosmic progeny, as well as in a subordinated place below The Cosmos and its progeny and phenomena.

[2:4:118] Therefore, by this notion, the Astronist philosophical view holds strong parallels to the inherent worldviews of many nature religions and despite the Astronist Tradition objection to being termed as a neonature philosophy, or neoanimist philosophy, it cannot counterargue with the notion that it isn't a new form of nature philosophy because it centralises itself along the notion that The Cosmos, which is both nature and the environment in simultaneity, is worthy of devotion and is the primary aspect of our existence.

[2:4:119] Furthermore, in Astronist Philosophy, cosmic progeny and phenomena, as aforementioned and herein affirmed are considered superior to humanity of course, which further distances Astronism from the monotheistic religious traditions as well as the majority of philosophical traditions which all pertain the superiority or priority of humans in some greater narrative rather than humanity's subordination.

[2:4:120] Now that we begin end this portion of the discourse of Human Modifications, we come to address the Astronist philosophical viewpoint on totemism, shamanism, Wicca, neopaganism, ancestral worship/veneration of the dead, nature worship, deep ecology, and biocentrism.

[2:4:121] The first of these other forms and elements of nature religion is that which is known as totemism which involves a "system of belief in which humans are said to have kinship or a mystical relationship with a spirit-being, such as an animal or plant. The entity, or totem, is thought to interact with a given kin group or an individual and to serve as their emblem or symbol."

[2:4:122] Astronism, like in many other instances with regards to nature religions and related forms of nature worship, is very moderate and open to accepting such traditional beliefs, though the incorporation of such into its own philosophical system is discouraged by default, if not openly opposed due to such practices and beliefs not remaining suitable to its system of thought.

[2:4:123] However, Astronism generally rejects the notion of totemism in that humans hold a real and mystical relationship with a spirit being as manifested through natural phenomena.

[2:4:124] Despite this, Astronism does not oppose the notion that humans can and do hold kinship with animals, plants, and other natural phenomena, especially those of a cosmic nature, yet the involvement of spiritual and mystical elements is generally rejected outside of Astronist Mysticism and its greater tolerance of such spiritual invocations.

[2:4:125] Furthermore, the notion that totems can serve as emblems of kinship is accepted and supported by Astronist Philosophy, especially Astronist Mysticism, though the worship of totems is less accepted by the former rather than the specific tolerances of the latter.

[2:4:126] Next we come to address shamanism which involves the belief in “a person regarded as having access to and influence on the world of benevolent and malevolent spirits who enters into a trance state during a ritual and practices divination and healing.”

[2:4:127] Astronism rejects shamanism and the claims of shamanists as it raises their individual capacity into transcendent means of ability and knowledge, especially emphasised as extending beyond The Cosmos and its order which is considered to be impossible by the Astronist Tradition.

[2:4:128] For this reason, shamanism, particularly due to the individual proclamations at its centrality, is opposed by Astronism for the very notion that it is considered to be what it expounds; a proclamation and that is all, as are many other religions or aspects of religious tradition when considered by the Astronist philosophical tradition.

[2:4:129] The next of the religious traditions that we shall address in this discourse is Wicca, also known as pagan witchcraft which is characterised by having no central authority, typically oriented towards duotheism, particularly involving the worship of a Goddess and a God.

[2:4:130] “Such deities may be regarded in a henotheistic way, as having many different divine aspects which can in turn be identified with many diverse pagan deities from different historical pantheons.”

[2:4:131] “Broader Wiccan beliefs range from polytheism to pantheism or monism, even to Goddess monotheism. Wiccan celebrations encompass both the cycles of the Moon. Wicca often involves the ritual practice of magic, though it is not always necessary.”

[2:4:132] The Astronist philosophical tradition is diverse by its own nature and so it is very much understanding when approaching similarly broad traditions with their own wide-ranging sets of beliefs by different groups within their tradition.

[2:4:133] The issues addressed by Astronism and Wicca, as well as their philosophical orientations are disparity in almost every way with little to no reference of theological contemplations and considerations within Astronist Philosophy due to the

decentralisation of divinical topics so as to define Astronism towards its philosophical status.

[2:4:134] Despite this disproximation identified between Astronism and Wicca and their established systems of thought, the former, due to its alignment with the Philosophical Spirit, is acknowledging of the beliefs of the latter, especially due to the fact that the Astronist Tradition expects pockets of duotheistic and henotheistic beliefs to be existent within its own vast tradition of philosophical ideas and practices.

[2:4:135] However, Astronism prides itself on the uniqueness of its own originations and does not share any interest or connection to the long history of mythologies, folkloric beliefs, and pagan practices that the Wiccan movement bases itself upon and thus, the disproximity between these two traditions is further widened.

[2:4:136] A related tradition to Wicca is that which is known as neopaganism which again, like many nature religions and offshoots of nature religions, remains diverse in both orthopraxy and orthodoxy pertains to collective practices and collective beliefs respectively.

[2:4:137] When capitalised, The Astronist Tradition considered Paganism, and subsequent neopaganism, to be a religious supraclassification similar to the roles of the terms of Abrahamic and Dharmic which pertain to a large variety of religious traditions existent within them which is fast becoming a consideration held by many religious scholars.

[2:4:138] Neopaganism itself is characterised by polytheism, animism, pantheism, and many rituals, the latter of which are of particular opposition to the Astronist Tradition due to its general disposition oriented away from the conduct of rituals as it retains its status as a philosophy.

[2:4:139] In addition to such concepts and practices, neopaganism involves magic and witchcraft practices and how they play an important part in neopagan practices yet are also considered with suspicion by the Astronist Tradition due to their unfamiliarity with the beliefs and structures of Astronism itself, as well as the Tradition's general refusal to acknowledge or accept proclamations of unattainable knowledge, also known as privileged knowledge, or derogational knowledge which itself may be known as derogationalism.

[2:4:140] From the perspective of the Astronist Tradition, neopaganism is considered to include Wicca, Thelema, Druidism, Gnosticism, Theosophy, Hermeticism, Shamanism, Totemism, and Heathenry, but does not encompass nature religion, or animism which are instead considered to be elements of religious belief, practice, and tradition rather than traditions in their own right.

[2:4:141] A major element of religious and cultural traditions worldwide is that of ancestral worship, also known as the veneration of the dead, which "is based on love and respect

for the deceased and is related to the beliefs that the dead have a continued existence, and may possess the ability to influence the fortune of the living.”

[2:4:142] The essence of the first half of the beliefs of ancestor veneration regarding love and respect for the deceased is accepted and supported by the Astronist Tradition, but the notion that the dead have a continued existence beyond their corporeal death and possess influences on the fortunes of the living is rejected by Astronism.

[2:4:143] This is because such beliefs firstly centralise the notion of spirits which generally remains foreign to Astronist Philosophy as well as the fact that such beliefs involve the elevation of humans to the attainment of derogational knowledge in some form of afterlife, and so ancestor veneration is supportive of the Astronist term aforeintroduced in this discourse as derogationalism.

[2:4:144] From such responses, we can see how the Astronist philosophical tradition’s beliefs and ideas about existential circumstances are fundamentally disproximate and perhaps opposed to those of the ancestral veneration traditions.

[2:4:145] “The goal of ancestor veneration is to ensure the ancestors’ continued well-being and positive disposition towards the living, and sometimes to ask for special favours or assistance.”

[2:4:146] Such goals and purposes for ancestor veneration beliefs and practices are rejected by the Astronist Tradition because of the Tradition indifference to the affairs of spirits due to its decentralisation of spiritual aspects of existence which again demonstrates a divergence from Astronist systems of thought and those involving ancestral veneration and worship, especially by the notion that venerators are encouraged to ask favours and for assistance from such ancestors in their postcorporeal states.

[2:4:147] Finally, “the social or non-religious function of ancestor veneration is to cultivate kinship values, such as filial piety, family loyalty, and continuity of the family lineage.”

[2:4:148] This aspect of ancestor veneration is more acceptable to the Astronist Tradition as the values expounded by its purpose are both understandable, rational, respectable, and without divinical or spiritual proclamations.

[2:4:149] Ancestor veneration in the particular context of China is distinct from its other forms due to its origination and developments therein which pertains to the reason for its distinct from other forms of ancestral worship and veneration practices and beliefs held in other parts of the world.

[2:4:150] Chinese ancestor veneration “revolves around the ritual celebration of the deified ancestors and tutelary deities of people with the same surname organised into lineage societies in ancestral shrines.”

[2:4:151] The consecration of ancestral shrines is not opposed by the Astronist Tradition and neither is the organisation of ancestors and surnames into lineage societies, which remains the most prominent defining aspect of Chinese ancestral veneration.

[2:4:152] "Ancestors, their ghosts, or spirits, and gods are considered part of "this world", that is, they are neither supernatural (in the sense of being outside nature) nor transcendent in the sense of being beyond nature."

[2:4:153] This deeply philosophical element of Chinese ancestral veneration is appropriate to both the acknowledgement and acceptance of the Astronist Tradition and its cosmology, but the question remains posed that if such ghosts, spirits, and gods are not supernatural, or transcendent beyond natural or more importantly to Astronism, beyond cosmicality, then where exactly do these ancestors reside?

[2:4:154] "The ancestors are humans who have become godly beings, beings who keep their individual identities and for this reason, Chinese religion is founded on veneration of ancestors which are believed to be a means of connection to the supreme power of Tian as they are considered embodiments or reproducers of the creative order of Heaven."

[2:4:155] This element of ancestor veneration and worship is not considered to be compatible with the Astronist philosophical tradition and its general orientation and its decentralisation of divinical components.

[2:4:156] Further to this, the cosmology that is described in Chinese ancestral veneration and traditional folk religion is generally not recognised by the Astronist philosophical tradition and therefore it remains difficult for the Tradition to accept the connections made between ancestral veneration and the orders of heaven and the supreme power of Tian.

[2:4:157] "Chinese ancestral veneration also involves the worship of gods that are the generative power and tutelary spirit (genius loci) of a locality or a certain aspect of nature (for example water gods, river gods, fire gods, mountain gods), or of gods that are common ancestors of a village, a larger identity, or of the Chinese nation."

[2:4:158] This aspect of Chinese ancestral religion still remains admissible from the perspective of Astronism especially by the notion of the application of such worship practices to physical manifestations or shared conceptual notions for the purposes of achieving unity amongst a people which remains a very powerful force.

[2:4:159] In the context of Astronist Philosophy, if there is to be any practices or concepts involving one's ancestors, or the ancestors of some other element whether this be a nation, a philosophy, or some other mass guiding force, then this is to be henceforth known as the practice of ancestration, and is encapsulated by the belief orientation of ancestrationism.

[2:4:160] In addition to this, those practices or concepts involving the veneration of the progenitors of lineages is to be henceforth referred to as progenition in Astronist

Philosophy, however, both ancestration and progenition are expected to be used interchangeably.

[2:4:161] The next of the practices involved in various different religious traditions that we should address in this discourse is nature worship which involves “religious, spiritual and devotional practices that focus on the worship of the nature spirits considered to be behind the natural phenomena visible throughout nature.”

[2:4:162] The Astronist philosophical tradition, with the exception of Astronist Mysticism, is fundamentally opposed to the practice of nature worship as this involves the notion that all natural phenomena both of an organic and cosmic nature hold a spiritual and transcendent essence.

[2:4:163] It is important to distinguish that the Astronist philosophical tradition does not remain opposed to the conceptualisation of natural phenomena as holding spiritual or transcendental aspects, but is instead opposed to the worship of such spirits which is considered to be an aspect of religious traditions rather than that of a philosophical nature and so such worship does not figure with the Astronist philosophical system of thought.

[2:4:164] “Common to most forms of nature worship is a spiritual focus on the individual's connection and influence on some aspects of the natural world and reverence towards it.”

[2:4:165] This aspect of nature worship is more acceptable to the Astronist Tradition as it focuses on the individual's perception of The Cosmos and its progeny and phenomena which is something that is characteristic of how Astronists understand and perceive the world.

[2:4:166] Acknowledgement, acceptance, and the advocacy towards the reverence of such practices is considered to be important to the Astronist Tradition and therefore demonstrates how some aspects of nature religions and worship are integrated within Astronist philosophical beliefs, concepts, and practices.

[2:4:167] Further to this, however, the notion of cosmic worship is explicitly rejected by the Astronist Tradition for it does not considered to be The Cosmos to be a god, nor an incarnation of God that is therefore to be worshipped.

[2:4:168] Instead, The Cosmos is to be devoted to in the prescribed ways of wondermentation, adoration, laudation and others for its direct divinity, but The Cosmos and its progeny and phenomena themselves are not actually Divine or godly.

[2:4:169] The Astronist Tradition opposes all instance in which celestial entities, or even The Cosmos in its entirety are deified because the godliness of The Cosmos, its progeny, and phenomena is not proclaimed by Astronism as that would designate it as much more closely as a religion for The Cosmos.

[2:4:170] Deep ecology involves the “promotion of the inherent worth of living beings regardless of their instrumental utility to human needs, plus a radical restructuring of modern human societies in accordance with such ideas.”

[2:4:171] The Astronist philosophical tradition is wholly supportive of the central principle of deep ecology because it prioritises the worth of all sentient and non-sentient beings irrespective of their utility to human needs, thus demonstrating the subordination of humanity below wider Organic and Cosmic Nature.

[2:4:172] “Deep ecology argues that the natural world is a subtle balance of complex inter-relationships in which the existence of organisms is dependent on the existence of others within ecosystems.”

[2:4:173] This is also held as an important notion within Cosmic Philosophy of the Astronist Tradition through the concepts of the cosmical system and cosmical orderity which are both demonstrative of the interconnected natures and functionalities of The Cosmos with codependency striking at the heart of this and forming the foundations of cosmic existence through composite entities forming the entirety.

[2:4:174] “Human interference with or destruction of the natural world poses a threat therefore not only to humans but to all organisms constituting the natural order.”

[2:4:175] This notion within deep ecology is also supported by the Astronist Tradition and forms one of the premises for the establishment of Astronist environmentalism, or Astronist environmental philosophy as it may also be known.

[2:4:176] “Deep ecology's core principle is the belief that the living environment as a whole should be respected and regarded as having certain inalienable legal rights to live and flourish, independent of its instrumental benefits for human use.”

[2:4:177] The subordination of the needs and wants of humanity is undertoned within Astronist Philosophy and its expressed through facets such as Astronist environmentalism and other related forms of philosophy, advocacy, and activism as the Astronist Tradition intends to hold steadfast in its alignment with the principles of deep ecology.

[2:4:178] That which is known as biocentrism involves “an ethical point of view that extends inherent value to all living things and it is an understanding of how the earth works, particularly as it relates to biodiversity” and remains a stance that the Astronist Tradition supports and one that can be founded either explicitly or implicitly in various insensations throughout The Omnidoxo herein.

[2:4:179] “It stands in contrast to anthropocentrism, which centres on the principle of the prioritisation of the value of humans” which is generally opposed to by Astronism due to Astronism’s belief in greater progression being available for those whom are cosmocentric in outlook rather than purely anthropocentric; essentially holding that thinking outwardly

to fulfil the needs of the world rather than the needs of oneself in this context is the subsequent greater fulfiller of oneself.

[2:4:180] “The related term of ecocentrism extends inherent value to the whole of nature” which Astronism is particularly advocative of due to its explicit inclusion of both Organic Nature and Cosmic Nature while biocentrism is generally considered to focus only that which is biological formed and thus is categorised within Organic Nature rather than Cosmic Nature.

[2:4:181] “Biocentric thought and its derivations are all nature based, not human based” which holds resonance for Astronist Philosophy as it sees such thought systems as holding a natural purity that is unattainable by any system of thought or belief that is tainted and distorted by the vices, greeds, and intentions of human and sentient emotion and mentality.

[2:4:182] This of course falls in close relation to Astronist concept of cosmocentrism which Astronist Tradition considers to be an extension of both biocentrism and ecocentrism, but particularly that of the latter, as aforeaffirmed, thus demonstrating a strong connection between Astronist values and principles and those of biocentricity and ecocentricity.

[2:4:183] The final small element of naturology that is to be mentioned in this discourse is that which is known as patterning which refers to all the act of relating patterns in nature to those found in The Cosmos, which is a form of the aforescoursed practice of cosmoapplication

[2:4:184] If something organically natural is applied or compared to something cosmical in nature then that is henceforth known as an enviroapplication, as a derivation of cosmoapplication.

—

[2:4:185] We shall utilise this area of interdiscourse in order to address the notion that The Omnidoxy is to be a global, and universal document available to all peoples in all places, as is reflective of the motto of The People’s Constitutional Company of Jesse Millette, as the closely tied entity to The Institution of The Philosophy of Astronism.

[2:4:186] For this reason, we shall herein list the various different translations of the title of The Omnidoxy in order to demonstrate the goal of The Omnidoxy to become a universally positioned, or omniaccessible document.

[2:4:187] The particular translations singled out herein are due to the major differences in spelling or vocalisation of the title of The Omnidoxy when translated into such languages; the Astronist Tradition expects that these transliterations of The Omnidoxy title to succeed the usage of the title of The Omnidoxy itself in their respective languages, yet The Omnidoxy is also still expected to be known as that in a general sense.

[2:4:188] See below for the list of languages and notice that for some languages, there exists a change in the title of The Omnidoxo ascribed next to each language as separated by a hyphen.

[2:4:188a] Afrikaans - Omnikosmiese

[2:4:188b] Albanian - Omnitraktat

[2:4:188c] Amharic - Omēnīdodi

[2:4:188d] Arabic - Alsaami

[2:4:188e] Armenian - Omniadaran

[2:4:188f] Azerbaijani - Omnidoksi / Omnibilik

[2:4:188g] Basque - Omnikosmiko

[2:4:188h] Belarusian - Omnitraktat

[2:4:188i] Bengali - Ōmaniḍaksi / Omnigrantha

[2:4:188j] Bosnian - Omnirasprava

[2:4:188k] Bulgarian - Kosmicheski / Omnidoksi

[2:4:188l] Catalan - Omnittractat / Omnidoxí

[2:4:188m] Cebuano - Omnikasulatan

[2:4:188n] Chinese - Quánjīng

[2:4:188o] Corsican - Omnucè

[2:4:188p] Croatian - Omnirasprava

[2:4:188q] Czech - Omnipojednání

[2:4:188r] Danish - Omniafhandling

[2:4:188s] Dutch - Omniverhandeling

[2:4:188t] English - Omnidoxy (this is also the worldwide literary name/spelling for the text and is to be used in all scholarly works and other writings when pertaining to the text, but not in all forms of advertising)

[2:4:188u] Esperanto - Omnidoxio

[2:4:188v] Estonian - Omnidoksü

[2:4:188w] Filipino - Omniaklat

[2:4:188x] Finnish - Omniminulle

Equational Philosophy

[2:5:1] A major branch of knowledge within Astronist Philosophy, Equational Philosophy is the expression of philosophical instruments of study by numerical means, especially in the balancing of an equation.

[2:5:2] Equational Philosophy attempts to derive conclusions about philosophical concepts by equating different instruments of study with one another.

[2:5:3] In Equational Philosophy, each instrument of study is assigned a letter, as is lattermentioned in this discourse, and from this letter logarithms, exponentiation, coefficients, variables, and operators are attached, in order to derive the expression.

[2:5:4] Essentially, Equational Philosophy allows us to derive a numerical understanding of the often elaborate philosophical concepts as expressed through insentensations.

[2:5:5] Below are the instruments of study listed as assigned to their alphabetical equivalents in the study of Equational Philosophy.

[2:5:6] The letter 'N' in any equation is represented as an unknown quantity, when expressed as 'Nr' is considered an unknown quantity that is infinitely repeated and also, the letter 'E' is expressed as relating to an entity in an equational subment.

[2:5:6a] Abundancy - A

[2:5:6b] Binarity - B

[2:5:6c] Bipolarity - Bi

[2:5:6d] Calendarity - Ca

[2:5:6e] Centricity - C

[2:5:6f] Chaosity - Ch

[2:5:6g] Composity - Co

[2:5:6h] Concentricity - Con

[2:5:6i] Cosmicality - Cos

[2:5:6j] Criticality - Cr

[2:5:6k] Dyadicity - D

[2:5:6l] Dynamicity - Dy

[2:5:6m] Eternality - Et

[2:5:6n] Extrinsicity - Ex

[2:5:6o] Finiteness - Fi

[2:5:6p] Focality - Fc

[2:5:6q] Formity Fo

[2:5:6r] Fundamentality - Fd

[2:5:6s] Functionality - F

[2:5:6t] Fusionalty - Fus

[2:5:6u] Futurity - Fut

[2:5:6v] Graduality - G

[2:5:6w] Imperativity - I

[2:5:6x] Immemnity - Im

[2:5:6y] Inversity - In

[2:5:6z] Lunarity - L

[2:5:6aa] Matrixity - Ma

[2:5:6ab] Medianity - Me

[2:5:6ac] Motionality - M

[2:5:6ad] Motivity - Mo

[2:5:6ae] Mysteriosity - My

[2:5:6af] Naturity - Na

[2:5:6ag] Orbitality - Or

[2:5:6ah] Orderity - O

[2:5:6ai] Orthogonality - Ort

[2:5:6aj] Planetarity - Pl

[2:5:6ak] Primarity - Pr

[2:5:6al] Progressivity - Pri

[2:5:6am] Purposity - P

[2:5:6an] Rationality - R

[2:5:6ao] Reciprocy - Re

[2:5:6ap] Regressivity - Reg

[2:5:6aq] Rotality - Ro

[2:5:6ar] Sensicality - Se

[2:5:6as] Solarity - S

[2:5:6at] Symbioticity - Sy

[2:5:6au] Synchronocity - Syn

[2:5:6av] Vastity - V

[2:5:7] These alphabetical equivalentents for the instruments of study are also more readily found and accessible in the Chart of Equivalentents as a non-omnidoxical document.

[2:5:8] The initial definitions of each of the instruments of study in Equational Philosophy stand in alignment to their orthodoxical definitions in the Astronist Tradition, but Equational Philosophy allows us to combine these instruments in an infinite amount of amalgams to form newfound concepts.

[2:5:9] A simple equationality in Equational Philosophy is expressed below and is also explained below: $P + O = Na$

[2:5:10] From this equational subment, we can derive that purposivity (P) combined with orderity (O) is equal to, or an expression of, naturity (Na).

[2:5:11] In Equational Philosophy, constants that stand without any baccements are forever singular; in this case, purposivity (P) shall forever refer to just one purpose for one entity.

[2:5:12] The next submentic exemplar is as follows: $P_2 + O_2 = Na_2$

[2:5:13] In Equational Philosophy, logarithms derive the quantity of extringents for the same subject, and in this case, two purpii are derived for one subject.

[2:5:14] From this subment, we can derive that two purpii (P) for the same entity added to two orderities (O) for the same entity is equal to, or an expression of, two naturities (Na) for one entity.

[2:5:15] The next submentic exemplar is as follows: $2P + 2O = 2Na$

[2:5:16] In Equational Philosophy, coefficients derive the amount of entities being submented, or considered, and in this case, the same purpose is derived for two different entities.

[2:5:17] From this subment, we can derive that when two entities with the same purpose (P) and the same orderities (O) are added together, or combined, expressed are two entities with the same naturity (Na).

[2:5:18] In Equational Philosophy, the four operators including addition, or combination (+) depending upon intended expression, subtraction (-), division (\div) do not hold their same definitions as they hold in the discipline of mathematics.

[2:5:19] As derived from the above subment, $2P + 2O \neq 4Na$ but instead $= 2Na$; this is because in Equational Philosophy, + does not constitute addition, but instead combination.

[2:5:20] If we think logically, if something has two purposes and two orderities, that does not conclude that it has four naturities; it has two naturities that are made up of four different elements; two purposivities, or purpii, and two orderities.

[2:5:21] Whether the symbol of + really does constitute addition, or constitutes combination is based upon the expression desired and the nature of the instruments being used to derive such an expression.

[2:5:22] An exemplar of when the symbol of + does constitute addition is expressed in these following subments: $2P + 2P = 4P$ and $5F + 6F = 11Fc$

[2:5:23] From both of these subments, we can derive that if we are dealing with the same instrument of study on the antial side of the subment, and that the instrument of study on the caudal side of the subment is logical, then the symbol of + constitutes addition.

[2:5:24] It is only when we begin to conduct that which is henceforth known as factoration that these subments and their subsequent derivitions become harder for new studiers to grasp.

[2:5:25] Factoration is the ammentation in Equational Philosophy of incorporating more than one baccement and more than one coefficient into the submentic equation, and an exemplar of this is as follows: $2P_2 + 2O_2 = 2Na_4$

[2:5:26] From this subment, we can derive that two entities, each with the same two purposities, combined with the same two entities, each with the same two orderities is equal to, or is an expression of the naturities of two entities, each of which have four purposities and four orderities between them.

[2:5:27] Quantication is the ammentation in Equational Philosophy that stems from the broader Quanticated Equationality branch of Equational Philosophy, and relates to the incorporation of multiple different baccements into the subment for each of the different extringents: $2P_3 + 3O_4 = 3Na$

[2:5:28] From this subment, we can derive there are two entities, each of which have three of the same purpii. Combining this with an extra entity, of which each have four different orderities, we express that there exists three different naturities for each of the three different entities, whilst simultaneously understanding that the orderities and purposities of the entities do overlap according to the number of the logarithm.

[2:5:29] Quanticated equations are very usefully if each of the entities in question has different combinations of orderities and purposities (or whichever instrument of study that one is considering), but quanticated equations do not provide us with a break down of these combinatories for each of the entities in question.

[2:5:30] Therefore, fractionation, or Fractionated Equationalities are herein and henceforth introduced as a more simplified, yet still useful, broken down version of their closely related quanticated counterparts.

[2:5:31] One can see from the equation below that in Fractionated Equations, the symbol of "E" which must be more commonly used in order to differentiate entities from their counterparts.

[2:5:32] We will take the quanticated equation from above and fractionate it as our exemplar of a fractionated equation: $E_1P_3 + E_2P_3 + E_1O_4 + E_2O_4 + E_3O_4 = 3Na$

[2:5:33] But what if the entities have convoluting and overlapping combinations of the extringents? One may ask this, and they are right to do so, and fractionated equations can help solve this query.

[2:5:34] As long as we know the combinations, we can express them; an example of a similar scenario is presented below and the potential combinations are also expressed below in a fractionated equation: $E_1P_2 + E_2P_1 + E_1O_1 + E_2O_2 + E_3O_3 = 3Na$

[2:5:35] From this lengthened fractionated equation, we can differentiate between entities, we can derive each of their individual quantities of different purpii and orderities, and we can also see by how much each of these purpii and orderities of entities overlap with other entities in the equation.

[2:5:36] Equationality does not tell us which orderities and purpii that overlap, nor does it express any context in the scenario other than quantification of entities and their instruments, and it is this Lengthened Fractionated Equation that is the most embenched equation type in the entirety of Equational Philosophy; beyond these equational types, we begin to enter contextual and letter-based concepts rather than strictly numerical functions.

[2:5:37] It is an important rule to observe that differs quite fundamentally from mainstream algebraic and mathematical functions, but in Equational Philosophy, one is always expressed, and never left blank because (P) alone does not denote one entity, or one extrigent, but instead, denotes (P) in an abstract context, without any quantification.

[2:5:38] The next submentic expression derives the role of exponentiation in Equational Philosophy, and for which the concept of entities must be removed from the equation: $P^2 + O^2 = Na^2$.

[2:5:39] In Equational Philosophy, exponents derive the quantity of the differentiations between extringents without any inference to the number of entities; this type of exponentiated equation is also henceforth known as a disentitled equation because any reference to entities, or context is removed.

[2:5:40] The main conclusion that we attempt to derive is that the subment that we have established is both rational and logical, and if we can justify our conclusion according to logical degrees, then we have established that which is henceforth known as a panjection, which is a form of subment that has been logically and rationally justified.

[2:5:41] Oppositely, a subment that has failed to be established through logic and rationality is henceforth known as a disjection; panjections considered collectively are henceforth known as panjecture, and disjections considered collectively are henceforth known as disjecture.

[2:5:42] The official ammentation of the one's attempt to perceive a subment through rationality and logicity is henceforth known as justifying; to justifice is to apply logic and rationality to a particular subment in order to conclude its panjection, or its disjection.

[2:5:43] The official name for this discipline of study is Justifying Theory, in which students contemplate the nature of both panjection and disjection by incorporating a range of ideas about the nature of rationality and logic, and they attempt to measure the credibility of justifying decisions.

Metrical Philosophy

[2:6:1] A major new branch of philosophy established by the Astronist philosophical tradition is that which was alluded to in the previous discourse, but is focused upon in this discourse and it is that which shall be known as Metrical Philosophy.

[2:6:2] Metrical Philosophy involves all aspects of ordinary philosophy that are instead applied according to measurement and is largely metaphilosophical by the nature of the majority of topics it addresses as well as the conclusions it derives.

[2:6:3] Metrical Philosophy remains vital to the development of the Astronist Tradition's approach to metaphilosophy and how philosophy in a practical sense can be measured according to different variables which are aforescoursed within this disquisition.

[2:6:4] Firstly, we shall address what can be measured within Metrical Philosophy, all of which are to be primarily known as themes, but also be known as subjects, which are split into three categories of Philosophy Entirety, Philosophy External, and Philosophy Internal/Partial.

[2:6:5] The category titles themselves are also not to be forgotten as themes for measurement, but they do hold a simultaneous purpose which is to organise the rests of the themes that sit within them.

[2:6:6] The first of these categories is titled Philosophy Entirety which is presently the smallest of the three categories relates to a philosophy, especially Astronist Philosophy, in general terms rather either specifically external or internal terms, an example of which would be to consider measuring Astronism as a whole rather than a specific part within and outside The Philosophy as are addressed by the other two categories.

[2:6:7] The first theme within this category relates to adherents which, uniquely, can also be split into both measuring in its entirety and in terms of its partial/internal sense with the former focusing on measuring the number of adherents of Astronism in its entirety while the latter focuses on measuring the number of adherents of the denominations, schools of thought, and belief orientations within Astronism.

[2:6:8] Further to this, the measurement of adherents does not just end at the measurement of their size in population, but extends much more broadly so as to encompass measurements of adherent distribution across geographical areas, measurements of all demographic and psychographic characteristics such as age, gender, occupation, education, ambitions, and lifestyles, as well as the measurement of the testimonies and anecdotes from adherents regarding how being adherents of the philosophy has improved their lives so as to produce conclusions regarding adherent happiness levels, and other personal and more qualitative than quantitative research.

[2:6:9] In addition to the measurements of adherents in these ways outlined, the Philosophy Entirety category also includes the measurement of documents which involves the production of statistics regarding both The Grand Centrality and The Omnidoxy within it, as well as other recognised books and documents of importance to the Astronist philosophical tradition.

[2:6:10] Measurements of documents are expected to involve a mixture of qualitative and quantitative results to be used for different circumstances, however, both of which remain useful to researchers.

[2:6:11] The next of the categories is to be known as Philosophy External which itself is subject to thematic experiment, as well as encompassing several themes, but definitionally Philosophy External focuses on the elements effecting or being effected by Astronism that reside outside of its internal vicinity.

[2:6:12] The first of the themes of this category relates to the institution that manages and oversees the philosophy and primarily measures

[2:6:13] The second of the themes of this category relates to the organisations external to the institution itself such as partner organisations including non-institutionally funded societies of the philosophy, or corporate organisations which are typically measured according to

[2:6:14] The third of the themes of this category is classified as relating to philosophical buildings and therefore holds a naological theme with the most common of measurements consisting of the number of visitors of a philosophical building across a period, or the measurement of the dimensions of such buildings.

[2:6:15] An important theme of this category measures fellow philosophies distinct in both orientation and origination from the philosophy in question which are to be commonly measured according to a comparison of adherent populations, qualitative measures of concepts, as well as measurements of the numbers of denominations, schools of thought, and belief orientations within such philosophies.

[2:6:16] Similarly, religions and cults, as the next of the thematic measurements, are grouped together and measured according to a comparison of adherent populations, qualitative measures of concepts, as well as measurements of the numbers of denominations, schools of thought, and belief orientations within such philosophies.

[2:6:17] Ideologies, also similar to the former, are measured in relation to the amount of countries that they hold a strong influence or presence in as well as the qualitative measure of the contents of the ideology and how this differs in comparison to other ideologies.

[2:6:18] The Cultural/Political/Social Influence of a philosophy as a triad of measurements collectivised into one for the purposes of organisation are the seventh form of measurement within the category of Philosophy External.

[2:6:19] These are measured equally across each of the three subthemes according to the context of such subthemes, but beginning with the Cultural Influence of the philosophy, this is measured by the extent to which the philosophy is depicted or represented in art, media, film, television, and the extent of its influence in enterprise.

[2:6:20] Meanwhile, the Political Influence of the philosophy is measured in relation to the extent to which the philosophy is represented by its adherents or institutions/organisations in parliament or the extent to which the philosophy inspires political parties, especially those formed in the name of the philosophy.

[2:6:21] Finally, the Social Influence of the philosophy is measured according to the extent to which the philosophy holds an influence over the social interactions between people in a society, as measured by the extent to which the population gather for social or occurrological activities for the purposes of philosophy, or for philosophising such as engaging with debates.

[2:6:22] Eighthly, the philosophical interpretations are the final thematic measurement within the category of Philosophy External and refers to the interpretations of the philosophy, either in its entirety or a specific element of it, and is measured by the extent to which certain interpretations hold a commonality, or the extent to which they form correlations with other characteristics, such as certain interpretations correlating with certain age groups, locations, ethnicity or other characteristics.

[2:6:23] The third and final category of measurement within Metrical Philosophy is to be known as Philosophy Internal, or as Philosophy Partial, with the former expected to taken leadership in popularity of usage.

[2:6:24] This category of measurement, as subject to thematic experiment itself of course, involves focusing on the internal elements of a philosophy to measure which includes the philosophy's schools of thought, denominations, belief orientations, as well as its concepts, theories, and notions, the final three of which are collectivised under one aspect of measurement.

[2:6:25] Schools of thought are typically to be measured according to their qualitative attributes such as by investigating the contents of beliefs that make them into a school, as well as quantitative attributes such as the amount of people adhered to that school in a particular country, or worldwide, or finally, the variations of the school of thought across different groups and countries.

[2:6:26] Denominations are expected to be most commonly measured by their qualitative attributes such as by investigating the elements of their beliefs that make them into a

distinct denomination, as well as quantitative attributes such as the amount of people adhered to that denomination in a particular country, or worldwide, or finally, the variations of the denomination across different groups and countries, known as intradenomination.

[2:6:27] Belief orientations are to be measured according to their qualitative attributes such as by investigating the contents of beliefs that make them into an orientation, as well as quantitative attributes such as the amount of people adhered to that belief orientation in a particular country, or worldwide, or finally, the variations of the orientation of belief across different groups and countries.

[2:6:28] Concepts/theories/notions are collectivised in this instance and are to be measured according to their qualitative attributes such as by investigating the contents of the concept/theory/notion, as well as quantitative attributes such as the amount of people that have taken a liking to the concept/theory/notion in a particular country, or amongst a particular group, or finally, the variations of the concept across different groups and countries which has close links to interpretational measurement.

[2:6:29] Now that we have discovered what can be measured and what it can be measured according to, we can now create categories for how these themes can be measured, this forming six different categories that are herein introduced.

[2:6:30] The first of these categories is characterised by type which involves measurements between different themes, thus forming what shall be known as thematic measurement.

[2:6:31] The second of these categories is characterised by the measurement of potency which refers to the effects on the individual rather than the society, or anything beyond the individual and their personal needs, wants, and interactions with the theme which in turn formulates that which shall henceforth be known as potential measurement.

[2:6:32] The third of these categories is characterised by the measurement of magnitude which, in this context, refers to the effects on society, or something beyond the individual as defined from the former category, which in turn formulates that which shall henceforth be known as magnitudinal measurement.

[2:6:33] The fourth of these categories is characterised by the measurement of unit which involves all types of numerically based measurement and is therefore to be known here on in as numerical measurement.

[2:6:34] The fifth of these categories is characterised by the measurement of uncertainty which, in this context, refers to the measurement of the trustworthiness of the theme as well as the question posed and is to be known as fiduciary measurement.

[2:6:35] The sixth and final of these categories is characterised by the measurement of level which, in this context, refers to measurement as a taxonomy for the methodological

character of a comparison therefore pertaining to the measurement of themes in their different forms.

[2:6:36] This particular category is split in two halves and so can either be approached according to intrathematic measurement which is measurement between different forms/ levels of the same theme or interthematic which is measurement between different forms/ levels of different themes.

[2:6:37] By outlining these different forms of measurement and categories, we have formed the foundations of Metrical Philosophy and it is important to note that the investigations which are conducted within Metrical Philosophy all stay with the designation of logicology.

[2:6:38] Metrical Philosophy is of particular importance to the researching aspects of wider Astronist Philosophy because without the measurement of various elements within philosophy, we remain somewhat blind to their actual values which is something that is perhaps lacking in philosophy in a general sense which pertains to a metaphilosophical issue.

[2:6:39] Nevertheless, Metrical Philosophy is herein introduced and shall be henceforth established as the main way to measure elements of a philosophy within in qualitative and quantitative forms.

[2:6:40] Metrical Philosophy, primarily due to the practices within it, is expected to hold a pervading role in many other disciplines of Astronist Philosophy with one of the main disciplines of its influence being Philosophical Science, or Experimental Philosophy as it is also known which is introduced in the next discourse.

Philosophical Science

[2:7:1] The vast majority of the contents in relation to the topic of this discourse is not present in *The Omnidoxo*, as is evidential to the fact that this discourse is one of the shortest, if not the shortest of all the discourses in *The Omnidoxo* as it consists of only five insentensations.

[2:7:2] This is because it does not feel appropriate to explore in-depthly the subject of Philosophical Science, also known as Experimental Philosophy, that is best placed in a non-omnidoxical document.

[2:7:3] For this reason, this discourse simply introduces and outlines what Philosophical Science is and how it is to be used and how it fits in with the Astronist philosophical tradition.

[2:7:4] Philosophical Science is a discipline of study within Astronist Philosophy dealing with the experimentation of philosophical concepts/theories by the use of variables to measure outcomes without actually applying the concept/theory.

[2:7:5] Philosophical Science is founded only according to one principle; that the experimentation of a concept is only conducted for purposes of societal or philosophical betterment and that all conclusions made are based upon innemnic, unbiased, and majoritarian facts, votes and decisions respectively so as not to create a mechanism for distortion.

Flipping The Table Theory

[2:8:1] The Astronist philosophical tradition is blessed with having a long line of theories and concepts that have directly originated from its tradition rather than being inherited and reappellated, as is the case for many of the other religious and philosophical traditions, but not for the Astronist Tradition.

[2:8:2] One of these unique theories shall be henceforth known as Flipping The Table Theory which, in the context of the development of philosophies, religions, ideologies, and politics, refers the primary intention of a philosopher, theologian, ideologist, or politician to completely overturn the present structure, normalities, orders, and systems of whichever area they work in.

[2:8:3] The Flipping The Table Theory is the prerogative of the Astronist Tradition, as well as being characteristic of many other individuals and the movements and systems that they have founded.

[2:8:4] The Astronist Tradition maintains that the Flipping The Table Theory is the primary driver of that which is describes as the Gyration Order which encapsulates the notion that there exists a distinct pattern in the development of ideas and the establishment of systems, their rise to prominence and dominance, and their eventual decline and replacement by newly founded ideas and systems.

[2:8:5] The instance in which a system or set of ideas is replaced from the prominence and dominance stage is most often initiated by some form of Flipping The Table Theory.

[2:8:6] The execution of the Flipping The Table Theory can be conducted in a wide plethora of ways from political campaigning, to violent overthrows, revolutions, wars, gradual adherent growth, as well as by gaining the support or sponsorship from the government, or other powerful individuals, groups, or organisations, all of which are acceptable depending on the context and the extent of the repressiveness or outdatedness of the established system.

[2:8:7] Flipping The Table Theory demands the leaders and thinkers of nations to form new systems in an attempt to steer towards social change and the Astronist Tradition continues its belief that this theory is integral to how change is made in relation to established systems and how they are overthrown.

[2:8:8] If a society is to change, the Astronist Tradition continues in its position to say that some element of Flipping The Table Theory, in whatever form, must be incorporated into the process of social change either in a political, philosophical, or religious context.

[2:8:9] The Flipping The Table Theory is introduced herein and is propounded henceforth which, despite the complexity of the consequences once invoked it may produce,

highlights a simple principle that societal change must come with the overthrow of the present system.

Variables of Experiment

[2:9:1] The need for the establishment of a set of variables has come to my attention to introduce here within this discourse so as to development extra tools of measurement that are expected to both complement the standard instruments of study omnimentioned, as well as remain important elements of how philosophies and their concepts, theories, and all their other aspects can be statistically measured.

[2:9:2] In this discourse we shall identify a collection of different variables inspired by appellation and definition from mainstream science and medicine and each of these variables will be applied to a context of philosophy beginning with categorical variables.

[2:9:3] Categorical Variable - a variable that can take on one of a limited, and usually fixed number of possible characteristics that can be related to a philosophy, concept, or belief orientation by assigning each measured subject to a particular group or nominal category on the basis of an amalgamation of its qualitative property.

[2:9:4] Confounding Variable - extra variables that have a hidden effect on the experimental results which, in a philosophical context, take the form of the various different ways in which a philosophy may be applied and the implications from each application which may well deviate greatly from the philosophy as it exists at its conceptual level.

[2:9:5] Continuous Variable - an infinite number of values like time and weight and in the context of philosophy primarily relates to interpretations, of which there is no end as each individual is expected to hold distinct interpretations of a philosophy, concept, or belief orientation according to their own knowledge, experience, interaction, and understanding of the measured subject.

[2:9:6] Control Variable - a factor in an experiment which be held constant, an example of which in the context of philosophy are the basic beliefs held by the philosophy that are expounded by the institution or society that manages the philosophy which are not expected to change.

[2:9:7] Dependent Variable - the outcome of an experiment as the independent variable is changed, an example of which in a philosophical context is a concept and its relationship to its interpreter wherein the concept is dependent upon the interpreter's interpretation of the concept which therein forms the result or conclusion.

[2:9:8] Discrete Variable - one that can only take a certain number of values, an example of which is a religious doctrine which should only be interpreted as the religious authority or institution exactly ascribes it.

[2:9:9] Independent Variable - that which is not affected by anything that the researcher does, an example of which in the context of philosophy relates to the surrounding

environment and circumstances of the society in which a philosophy resides due to its held status of externality from the philosophy itself and all of the philosophy's internal elements.

[2:9:10] Measurement Variable - this form of variability has a specific number associated with it and is characterised by examples such as the number of adherents of the philosophy in general or of a particular belief orientation, or the number of concepts within a philosophy, or the number of concepts/theories prioritised by a school of thought.

[2:9:11] Nominal Variable - also known as categorical variables.

[2:9:12] Ordinal Variable - a variable that results in the creation of a clear order of the subjects involved according to some measure, an example of which is a ranked variable which is lattermentioned.

[2:9:13] Qualitative Variable - a variable that cannot be counted which are plentiful in the context of a philosophy, examples of which pertain to concepts and their measure, as well as interpretations of theories or belief orientations held as part of a philosophy.

[2:9:14] Quantitative Variable - a variable that can be counted which are less plentiful than their qualitative counterparts, yet still remain abundant with some examples consisting of adherent population, number of concepts, number of institutions, number of countries with a varied presence of the philosophy, amongst others that are able to be counted.

[2:9:15] Random Variable - associated with random processes and give numbers to outcomes of random events which relates to unforeseen events and elements in occurrence to or in relation to a philosophy.

[2:9:16] Ranked Variable - a type of ordinal variable where the data is put into places of 1st, 2nd, 3rd, 4th etc. an example of which includes the denominations, schools of thought, or belief orientation ranked according to the number of adherents of such elements.

[2:9:17] Ratio Variable - similar to interval variable, but has a meaningful zero value and is exemplified by some measurement of two elements of a philosophy such as the comparison of the influence that a belief orientation holds over a school of thought or denomination, typically formed by the number of adherents of such a belief orientation.

[2:9:18] Active Variable - a variable that is able to be manipulated by the researcher and in the context of philosophy refers to how the researcher may impose their interpretation of a concept during its measurement, thus manipulating the variable; there are differing degrees in which subjects are susceptible to manipulation.

[2:9:19] Binary Variable - a variable that can only take on two values such as yes/no responses which is perhaps most commonly exemplified through the question of whether a person is an adherent of a philosophy or are not.

[2:9:20] Covariate Variable - similar to an independent variable, has an effect on the dependent variable but is usually not the variable of interest, an example of which would be when a concept is investigated and the environment and circumstances surrounding such a concept, but the environment is not the area of interest for the investigation.

[2:9:21] Endogenous Variable - similar to dependent variables, they are affected by other variables in the system.

[2:9:22] Exogenous Variable - variables that affect others in the system such as an interpreted concept as distinct from a concept alone, the former of which can be described as the exogenous variable.

[2:9:23] Explanatory Variable - when a variable is independent, it is not affected at all by any other variables and when a variable isn't independent for certain, it's an explanatory variable; this is can be applied to the context of philosophy by the notion that the researcher may not be able to tell if the environment or the circumstances surrounding the philosophy haven't been impacted by the philosophy in their own formation which would render them a dependent variable.

[2:9:24] Extraneous Variable - a variable that is not intentionally being studied in the experiment, but is nevertheless address as an appendage and this may be applied to a philosophical context by the notion that a concept may be investigated and by the experiment of such a concept, there is a new aspect of the concept discovered or an existing element of the concept is better understood.

[2:9:25] Interval Variable - a meaningful measurement between two variables such as a concept and the philosophy from which it originates, or an interpretation derived from a concept, or theory.

[2:9:26] Intervening Variable - a variable that is used to explain the relationship between variables such as the investigation between how a concept and philosophy interact, or how one belief orientation interacts with another orientation.

[2:9:27] Latent Variable - can't be measured or observed directly such as one's interpretation of a concept, or philosophy and how they explicitly feel and think of that subject.

[2:9:28] Manifest Variable - can be directly observed or measured such as the measurement of the attendance of a philosophical building across a period of time, or the growth of adherents of a philosophy, school of thought, denomination, or belief orientation across a timescale.

[2:9:29] Manipulated Variable - another name for an independent variable.

[2:9:30] Mediating Variable - variables that explain how the relationship between variables happens such as the exploration of the history between a philosophy and its concepts so as to make conclusions about how their present relationship has developed.

[2:9:31] Nuisance Variable - an extraneous variable that increases variability overall, such as the introduction of a new concept or aspect of a concept after the investigation of the concept, thus causing a change in the amount of concepts within a philosophy, or changing the perception of the philosophy, school of thought, or belief orientation to which the new concept belongs.

[2:9:32] Polychotomous Variable - variables that can have more than two values, an example of which in the context of philosophy is the instance in which the adherents of a philosophy are measured according to the amount of adherents that have joined across a measured period as well as the amount of adherents that have left across the same measured period; this would create a Polychotomous Variable.

[2:9:33] Now that we have covered each of the most pertinent forms of variability and have applied their definitions to the context of a philosophy and the elements forming a philosophy (in the Astronist style), we can move onto the final segment of this discourse.

[2:9:34] Forming the final segment of this discourse is our introduction of the that shall henceforth be known as reactivity which refers to the extent to which a subject changes according to a change in the variables that affect it.

[2:9:35] When we apply reactivity to a philosophy, we attempt to understand the extent to which that philosophy, concept, school of thought, denomination, or belief orientation changes when variable extents are applied which involves variables of interpretation, circumstance, environment, conceptualisation, and application.

[2:9:36] A philosophy or any of the elements within it are said to hold a high reactivity when they are easily changed even by a small change in the variables surrounding them meanwhile a low reactivity occurs when a change, even perhaps a large change in the surrounding variables of the subject, is applied but there is little reaction from the subject.

[2:9:37] Furthermore, a positive reactivity refers to the instance in which a philosophy or any of the elements within it experience a change that enhances how the subject is either perceived, interacted with, developed in the sense of its logicity and complexity, or if it experiences an upsurge in the extent of its power of influence or its ability to impart knowledge and initiate cognition.

[2:9:38] In addition and oppositely, a negative reactivity refers to the instance in which a philosophy or any of the elements within it experience a change that is detrimental to

either how that subject is perceived, interacted with by people or external institutions, developed in the sense of its logicality and complexity, as well as a decline in the extent of its power of influence or its ability to impart knowledge and initiate cognition.

[2:9:39] An example of the reactivity within an Astronist philosophical context is manifested as the measurement of a theory, such as the aforementioned Flipping The Table Theory, and the extent to which this theory is changeable from its original state when variables are changed around it.

The Formation of Practical Astronism (Peripheral Sanitology)

[2:10:1] We now come to the second of the two major branches of logicology and this is henceforth known as Peripheral Sanitology, also known as logicology which, as aforeaffirmed, deals with the practical applications of Astronism, as well as its physical manifestations in the world, as well as the Astronist Tradition's attitudes to non-philosophical topics.

[2:10:2] We must be attuned to exploring and developing the practical, real-world, and physical aspects of something abstract if we are to apply it to the world in the way we have envisioned it.

[2:10:3] By this principle therefore, we must address many of the issues collectivised under Practical Astronism which discussed herein as part of Peripheral Logicology as derivations of that which is considered logical to do in a practical, physical, and real-world context.

[2:10:4] The full development of Practical Astronism is essential to the furtherance of Astronism for without the practical and physical manifestations of the concepts, principles, theories, and notions that we have addressed within all of the disquisition of The Omnidoxy, they will remain forever just that; abstractions without physical manifestations or real-world results.

[2:10:5] In addition, in this discourse, expect to hear in a much greater abundance the non-Astronist and pre-Astronist philosophies, ideologies, and religious traditions of The Earth, including references to historical, political, and economic instances and events as references and comparisons.

Orthopraxy & Orthodoxy

[2:11:1] Within peripheral logicology, the question of orthopraxy and orthodoxy is raised and their rivalry in importance when presented in simultaneity with each other, the former of which relating to practice and the latter relating to theory.

[2:11:2] The pressing question to address here is whether Astronism is naturally structured and tendenced towards its practice, henceforth known as orthopraxis, or towards its theory, known as orthodoxis.

[2:11:3] A philosophy that emphasises orthopraxy is characterised by a distinct focus on the ways in which the philosophy is practised and the various methods, activities, and techniques involved in its practices.

[2:11:4] However, a philosophy that emphasises orthodoxy is characterised by a distinct focus on the theoretical aspects of the philosophy rather than its real world applications or practices, and concerns itself only with its concepts and the perfecting of such concepts.

[2:11:5] Astronism can be considered both as its adherents are expected to perfect practice and perfect concepts in parallel, however, if we were to designate The Philosophy as one of these then the correct would be to describe Astronism as an orthopraxic philosophy.

[2:11:6] The concepts of Astronism are of course central, however, the real, physical practices of The Philosophy are of even greater significance due to philosophical experience, devotion, occurrological activities, and argumentation forming the most pertinent aspects of the physical manifestation of The Philosophy.

[2:11:7] Astronism remains and shall always remain a visual philosophy for to experience Astronism in its truest of forms is to look up at the night sky, to observe the cosmic progeny and phenomena, to practice devotion to such magnificent entities, and in the debating halls wherein the concepts of abstraction become concepts of physicality as they then mean something to the group debating.

[2:11:8] Grasping this understanding about Astronism and its manifestations leads us to solidifying the notion that The Philosophy exists in prominence to emphasise orthopraxy and the physical manifestations of itself in order to inspire orthodoxy as better practice of its concepts.

[2:11:9] Comprehending this aspect of Astronism attains a knowledge of how to The Philosophy works in its natural structure which is unique to all other philosophical and religious traditions and should be compared to them in order to reveal such differentiations.

The Controversies of Praxology

[2:12:1] In close proximity to notions about orthopraxy comes the time to introduce the discipline of study of praxology which involves the study of the way in which adherents of Astronism are expected to practice or act.

[2:12:2] In and of itself, praxology is a controversial discipline to be established herein as Astronism is not and has never been designed to manage every aspect of the daily lives of those whom adhere to it unlike the way in which the religious traditions are designed.

[2:12:3] However, the contradiction here is that we will not outline what is considered a right habit or a wrong habit within The Omnidoxy for such regulations are characteristics of religious instruction and tradition.

[2:12:4] To all the habits considered vices, such as the consumption of alcohol, the taking of drugs, and the smoking of cigarettes, the Astronist Tradition considers that even though one may conduct such habits, The Cosmos will still continue to function, The Earth will continue to rotate and orbit The Sun, and all the rest of the people of the world will continue to live on.

[2:12:5] Essentially, the conduction of such vical habits is not going to affect any of the functionalities of The Cosmos and its progeny and phenomena; the only thing that this will affect is the person conducting such vices and the people around them.

[2:12:6] The Astronist Tradition condemns the notion that these vices are needed for cosmic devotion and philosophical experience for they are not; we have within us what we need to feel and conduct such devotions and to fully embrace such experiences.

[2:12:7] It is the nature of the human mind and heart to want to escape from the world and although Astronarianism addresses this, asks why this is, and attempts to present an alternative solution to the conduct of such vices, we must accept that there will always be those with dependable minds whom will rely on such worldly habits to guide them through their lives.

[2:12:8] In introducing praxology, we shall not say herein that the Astronist Tradition condemns the conduct of these aforementioned vices for in just saying so, the people will not listen for if they have not listened to the religious traditions then we should not expect them to listen to the philosophical traditions.

[2:12:9] Therefore, we can define the discipline of praxology to be one of personalism and individuality; if one individual considers the vices to be wrong and to be an obstacle in their path then they will not conduct such, but if an individuals considers the opposite then they cannot and will not be stopped for that is their nature.

[2:12:10] Instead, what we shall say is that the Astronist Tradition does not agree with such vices and certainly does not condone such vices, but we shall not say that just because this is so that the person reading or following must conduct themselves in the same way; again, Astronism is not regulated as a religion is and there are no sins and there are no virtues to adhere to.

[2:12:11] Praxology is defined by one of the rare application of relativism employed in Astronism whereby acts of virtue and acts of vice are designated as such by the individual rather than in absolute terms; this does not mean to say that Astronism supports notions of anarchy and non-regulation, but it instead keeps Astronism firmly within the auspices of being a philosophy rather than a religion as we can soon stray into religious territory when speaking of the discipline of praxology.

[2:12:12] However, this is different for Astronarianism as that is defined as an ideology separate from Astronism which is a philosophy; ideology is defined by the imposition of regulation and so, Astronarianism is designed and tasked with the imposition of the beliefs within Astronism, as well as some unique Astronarian principles.

[2:12:13] Furthermore, a branch of praxology also relates to the proper conductation of occurrological activities such as the preferred ways in which cosmic devotions are to be practiced, the ways in which philosophical experiences could be found, and the varying ways in which astronomical activities and philosophical debates are to be conducted; all of these are considered in the books titled the *Manual for Cosmic Devotion* and *The Enchiridion of Occurrological Activities*.

[2:12:14] Praxological study, contemplation, and discussion is founded here in The Omnidoxy in a small and vague form, but it is expected to be one of the most hotly debated topics as it is expected to define the way in which people considered something to be Astronist in character and practice.

[2:12:15] Furthererso, The Institution of The Philosophy of Astronism should be herein warned of the dangers surrounding praxology as it directly relates to the practice of Astronism which could so easily be distorted from the way and principles of the Philosophical Spirit.

[2:12:16] Two of the main pre-Astronist examples of Philosophical Distortion are socialism and communism which were distorted from their originalities into versions such as Stalinism, Maoism and Marxism-Leninism; this does not mean to say these versions are wrong, but that these applications resulted in the changing of the principles of the original philosophies.

Aniconism in Astronism

[2:13:1] That which is known as aniconism is the opposition to the depiction of particular subjects, examples of which are most prominent in religious traditions such as in the Islamic religious tradition whereby depictions of living beings are forbidden with outbursts of aniconistic tendencies in the history of the Christian religious tradition.

[2:13:2] To avoid defying these aniconistic traditions, the Astronist Tradition develops Astronist versionised artforms such as Astro-Islamic Art which avoids the depiction of living beings by enjoying the depiction of cosmic entities.

[2:13:3] However, in the context of Astronism, there exist very few examples of an aniconistic tradition or regulation due to the openness of the principles of the Philosophical Spirit, however, the Astronist Tradition does condemn any depiction deifying one or all of The Five Astronist Characters.

[2:13:4] This does not mean to say that The Five Astronist Characters should not be depicted as icons or figures of highness, but the Astronist Tradition maintains that there exists a distinct line between depiction and deification, and even the depiction of The Five Astronist Characters for the purposes of devotion is also condemned.

[2:13:5] This is the only instance of aniconism in Astronism due to the embracing nature of Astronist Art and other forms of visual and artistic expression of Astronist Philosophy.

[2:13:6] Overall, aniconism is not philosophical by its nature and can be described as a non-philosophical concept that holds religious roots rather than philosophical roots so its prevalence within the Astronist philosophical tradition is somewhat limited.

The Oppositions to the Astronist Identity

[2:14:1] The Astronist Identity is an accumulative appellation for all of the principles, concepts, notions, and statements made from within Astronism and by extension, Astronarianism if we are discuss the Astronist Identity, which is different context to Astronism itself.

[2:14:2] Particularly in this discourse, we shall address those which are collectively appellated and known as The Oppositions to Astronist Identity; these are the elements of people, or objects, or notions that the Astronist Identity is not in agreement or alignment with due to the nature of the subject; these may also be known as Astronist Oppositisms.

[2:14:3] The first of these are the philistine peoples as philosophised in philistinism which relates to a person that is indifferent or even hostile to arts, cultural topics, and the Astronist Tradition includes within this both philosophy and astronomy as artistic and cultural subjects.

[2:14:4] These are peoples that care not for the treasures of intellectuality either because they fear they cannot compete with higher intelligence, or they simply do not find the value in the more creative aspects of being.

[2:14:5] Either way, the Astronist Tradition opposes philistinism and considers philistines to be all those whom oppose the reascension of philosophy, the integration of astronomy into every day life, the return of ostentation in art away from the hideosities of modernism, and the championing of all the arts and artforms.

[2:14:6] It is the appropriate ambition of the Astronist Tradition to eradicate all forms of philistinism and to enlighten all philistines to the joys of art, culture, philosophy, and astronomy as philistinism is considers to be a major obstacle in the progression of humanity to higher levels of creative and technological advancement.

[2:14:7] The Astronist Tradition considers all people to be philistines that do not regularly engage with the creative aspects of their personality and it is philistinism that the Astronist Tradition identifies to be the greatest of all regressions and the Astronist Tradition accuses philistinism of trivialising the masses of our civilisation.

[2:14:8] Philistines are all non-Astronist because to be Astronist is to hold a deep appreciation for that which is creatively inspired as all that has been derived from the imagination is considered to be approved cosmically and it is believed that there exists a sense of divinity in the human mind during the process of the creation of ideas to which philistines are opposed when the idea is in relation to something more than a triviality.

[2:14:9] The Astronist Tradition takes philistinism very seriously and considers any retraction from one's appreciation of the creative world to be a philistine act.

[2:14:10] The Astronist Tradition accepts that there will be those whom do not share the interest of art and other cultural topics, however, the public focus on trivial topics is considered to be philistine.

[2:14:11] The next of the oppositisms to the Astronist Identity is that which is known as obscurantism which involves the act of deliberately preventing the facts of something from being publicly known on a mass level for the benefit of one's own cause.

[2:14:12] Again, the Astronist Tradition accuses obscurantist tendencies of being of the major obstacles to the construction of a society in which people are satisfied with their existences because in current societies, the realities are obscured to the point at which people are not understanding of what is real and what is not.

[2:14:13] Iconism is clearly not real and that is why it works well in forms of mass public art, however, what has been created are forms of art close to reality that are disguising themselves as part of the actual reality.

[2:14:14] Obscurantism is so prevalent in today's civilisation that we have reached the point at which we do not know what is obscured and we do not know what is the truth of certain events because those whom control what we see hold cultural, philosophical, and ideological agendas for their and their ally's benefit.

[2:14:15] The Astronist Tradition accepts that obscurantism is so far engrained in our civilisation that we may not ever be able to eradicate it and so therefore we must stand in solidarity with what we do believe; we must answer obscurantism with an even greater understanding of what the Astronist Identity is.

[2:14:16] In a world of obscurantists, we must know whom we are for if our understanding of ourselves is not held in absolute terms then such identities face existence in a world that will obscure them at any rate; we Astronists must be ever so more solidified in that which we stand for and we must fight to disseminate our standing for all of the peoples of the world to see, know, understand, and join with.

[2:14:17] Religious fundamentalism is the next of the oppositisms of the Astronist Identity, but this should really be widened in its definition to fundamentalism in general due to the three characteristics of fundamentalism; narrowness in thought, regressiveness in action, and ignorance in sight.

[2:14:18] Each of these aspects of fundamentalism in any of its contextualisations are in staunch oppositism to the principles of the Philosophical Spirit and in addition, the entire purpose of philosophy in a wider sense.

[2:14:19] Fundamentalism is of course existent in all forms of thought and ideation, and although it should be allowed theoretically, it should certainly not be allowed to flourish

in any sense for the flourishing of fundamentalism comes with results of regression like no other thoughtpath can provide.

[2:14:20] There will always be those people whom wish to adhere to the fundamentals of something for they gain a sense of belonging, tradition, and inner structure from such a type of adherence and this is something that again, the Astronist Tradition must accept for that is the nature of some minds.

[2:14:21] However, such should remain contained for it is mass fundamentalism that is preventable and it is this that will cause the greatest of damages to the civilisation in subject.

[2:14:22] Fundamentalism is a danger to the minds of humanity and although it will always exist in some form, its suppression is essential but its eradication is both unrealistic and against the principles of the Philosophical Spirit itself because it would be wrong to stop thought no matter its orientation, however as aforeaffirmed, it is the flourishing of fundamentalism that the Astronist Tradition opposes.

[2:14:23] Something else stands in opposition to the Astronist Identity is that which is known as Doublespeak in the context of philosophical debates which involves the deliberate obscuration of language in order to confuse other debaters, or to distort one's use of language in a way that seemingly orients them in a way that isn't true to reality.

[2:14:24] The essential issue with doublespeak is its grounding in deception and it is a tactic of philosophical debate that is disagreeable with the Astronist approach to argumentation in addition to the Astronist Identity.

[2:14:25] The Astronist Tradition cannot allow the use of doublespeak as its use is expected to deteriorate the proper practice of philosophical argumentation; the use of deceptive tactics is not permitted in Astronist philosophical debates; all such acts must not be allowed to fester and must not be allowed to infiltrate the practice of philosophical argumentation for if we let this happen then we damn ourselves to the deterioration of debate.

[2:14:26] The practice of doublespeak encourages the invasion of political debate into philosophical debate, but the two must remain distinct, the former of which remains deceptive by its nature and the latter of which remains dignified by its nature without any ill-practices.

[2:14:27] The next of the oppositisms to the Astronist Identity is that which is known as paternalism; this orientation supports the notion that those in positions of authority control and restrict the movements, beliefs, general freedoms, and progressions of those subordinate to them.

[2:14:28] The Astronist Identity and the wider Astronist Culture believes in the freedom of those in subordinate positions to claim the metaphorical ladder of life to reach the top and it also supports the notion that those at the top of such a ladder must allow for new, fresh, and young people to follow in their footsteps and reach the top of the ladder too.

[2:14:29] The notions of paternalism prevent this from happening for the superiors restrict the inferiors by this orientation and prevent them from progressing and rising to heights new; this stands in opposition to the Astronist Identity and the general Astronist approach to life for paternalism is considered to be narrow, self-centred, and not of openthought culture.

[2:14:30] The Astronist Tradition opposes all forms of paternalism in every aspect that its ugly head may rise and it does exist in many forms; in government, in business, and in the societal structure.

[2:14:31] Barbarism is the next form of opposition to the Astronist Identity form barbarism is characterised by a absence of culture, philosophical identity, and civilisation in general, and it is the Astronist Tradition notion of dominationism that supports the notion that the pluralism of culture will lead to the deterioration of culture which will eventually end in barbarism.

[2:14:32] Barbarism means for a society to exist without culture because identity of the society has deteriorated to the point at which it not longer exists; there are many ways to reach the endpoint of barbarism with the most prominent of which identified by the Astronist Tradition as the pluralisation of civilisational culture.

[2:14:33] Barbarism may also exist in a temporary form during the process of a cultural change, typically as part of a political, cultural, or philosophical revolution; this is period in which a society holds an unstable culture for a short time during the cultural shift; the Astronist Tradition tolerates this form of barbarism as it exists as part of a wider process.

[2:14:34] Other than this particularity, the Astronist Tradition does not support any form of barbarism as that is seen as the endpoint in the deterioration of a society wherein the citizens are forced to live in a society that doesn't know the direction in which it is striving, and nor does it realise what its identity is.

[2:14:35] The next of the oppositisms to the Astronist Identity is that which is known as the quality of unculturedness; this is characterised by an individual or a group that are not aware, are not interested, or are not supportive of the cultural aspects of a society.

[2:14:36] Closely related to philistinism, unculturedness is distinguished by its opposition to the cultural aspects of a society; there is no interest shown in how the culture of the society has developed, how the visual expressions of culture are created and maintained, and there is no motivation or spark of inspiration within such people to contribution to the culture of the society.

[2:14:37] Unculturedness is a stage in the pluralisation of society and is a product of the inferiorisation of culture in the education system, and in wider societal settings; unculturedness is a characteristic of unknownness in one's own cultural identity.

[2:14:38] It must be clarified that the Astronist Tradition does not support the pluralisation of society, but the Astronist point of view stresses extreme caution as the pluralisation of a society can soon turn to the deterioration of a society.

[2:14:39] Societal and cultural pluralism are characterised by the ghettoisation of cultures within the borders of a nation state; a nation state isn't enough to bind the people together; a nation state that is segregated by ghettos of culture is an empty state without any solidarity.

[2:14:40] The Astronistic approach attempts to fuse the principles of pluralism with the establishment of a national culture; the balance of the parameters of this is a temperamental task indeed and one that Astronist philosophers are vocated to addressing.

[2:14:41] Essentially though, unculturedness can be considered the precursory warning sign to the cultural and societal breakdown.

[2:14:42] The third to last opposition to the Astronist Identity is that which is known as anti-culture; this is characterised by the belief that all culture is divisive and that it should be erased from societal existence; essentially, the less cultural signifiers there are the greater happiness, contentment, and freedom citizens will have.

[2:14:43] Astronists that hold such views are of course pariahs to the Astronist Tradition and are known as Astronist pariahs, or Anticulturists, as followers of anticulturism, however, within Astronist Philosophy this orientation remains in existence due to the Astronist adherence to the Philosophical Spirit.

[2:14:44] All notions of anti-culture are opposed by the Astronist Tradition due to the Tradition's disagreement with the barbarism which is considered to be the endpoint of anticulturism.

[2:14:45] The Astronist Tradition cannot align itself with anticulturism because that does not stand in alignment with the Astronist Identity, and nor does that support notions about the establishment of the Astronist Culture.

[2:14:46] That which is popularly known as hedonism is the second to last oppositism to the Astronist Identity due to the hedonist ambition of achieving pleasure as is considered to be the most important aspect of one's life.

[2:14:47] The Astronist Identity opposes this ambition due to the fact that the Astronist Tradition considers such an ambition to be narrow in thought and unrealistic in the

realities of the world; the Astronist Tradition insists that the sole pursuit of pleasure is the fault of cultural deterioration which in turn insists that with cultural deterioration comes dissatisfaction with one's identity which leads to one thinking that the pursuit of one's pleasure through materialism is the most important aspect of societal life.

[2:14:48] Pleasure would not be the most important aspect of people's lives if they were satisfied with their lives and with the way in which their society is structured and their culture is identified.

[2:14:49] By this notion therefore hedonism isn't required in a society that is structured in a way that cultural and philosophical identity are prioritised so as to avoid cultural escapism through drugs and others forms; if one is already satisfied with their identity, they needn't conduct hedonistic acts in order to achieving their happiness and pleasure.

[2:14:50] The final aspect of oppositism to the Astronist Identity is that which is known as vulgarity; in this context, vulgarity is identified by the breakdown and deterioration of culture to the point at which supposed creatives have to resort to the depiction of subjects that lack sophistication and exist without meaning, an example of which in today's present societal culture is postmodernism.

[2:14:51] Vulgarity is not particularly in relation to a subject as it may be confused with, such as the depiction of sex, profanity, violence, and a general insincerity, but instead it relates to a general inmeaning to the creation of an artpiece, the lack of direction for a philosophy, and the utility of pornography for mass public consumption so as to escape from the lack of lust in their sexual pleasures; this relates to the process in which sex is no longer a sacred act as it once was.

[2:14:52] Vulgarity relates to the utility of such artistic subjects for the purpose of escapism but with the purpose of art in general to inspire, it is difficult to pinpoint the point at which some artpiece is used for inspiration or escapism.

[2:14:53] The use of vulgarity in works of art displayed in public spaces isn't in alignment with the Astronist idea about art; vulgar expressions are not to be glorified and that is what the Astronist Tradition disagrees with.

[2:14:54] To conclude, each of these oppositism hold no hierarchy of importance in comparison to one another, but instead hold equal measures of opposition to the Astronist Identity, and each of which are philosophically contemplated in the discipline of oppositology.

Astronist Archives

[2:15:1] One of the most important practices as part of Astronist Philosophy and wider Astronist Culture is archiving; therefore, it is only prudent and logical to introduce this practice of archiving in this discourse as part of The Omnidoxy during the process of the establishment of its practice.

[2:15:2] The People's Constitutional Company of Jesse Millette and The Institution of The Philosophy of Astronism, as two of the largest institutions within the Astronist Confederation, are responsible for propounding the practice of archiving, each of which addressing different types of subjects to archive.

[2:15:3] The archive of The People's Constitutional Company of Jesse Millette is concerned with the business practices of The Company and involves the archiving of all files in relation to the practical running of The Company.

[2:15:4] However, it is the Astronist Archives of The Institution of The Philosophy of Astronism that hold greater relevance in this particular discourse; this archive is set to record historical events within the auspices of the Astronist World from the inception of the culture henceforth.

[2:15:5] In addition, The Omnidoxy establishes herein that the Astronist Archives will contain maps of space, star systems, and even the entirety of The Milky Way upon their completion, known as astromaps or cosmomaps.

[2:15:6] Furthermore, it will contain all philosophical essays, journals, enchiridions, and other forms of books and writings in relation to Astronist Philosophy, in addition to also housing all post-Astronist books and journals on the topic of astronomy, cosmology, and spaciology.

[2:15:7] Further to this, all spaciological engineering and technological documents shall be stored in the archive while also encompassing all records of interactions between the Astronist World and other 'worlds' in relation to culture and philosophy over the course of the Astronist history.

[2:15:8] One unique section of archival subjects of major importance are the details of the geographies, sentiences, cultures, climates, environments, histories, and all other aspects of planets other than The Earth in the galaxy, and if applicable, their zoological, botanical, anthropological, societal, and species differences.

[2:15:9] The biographies of prominent Astronists and the extolled peoples are also to be kept in the Astronist Archives with great importance placed on the preservation of history from an Astronist perspective for the Astronist Tradition holds herein that history is so very quickly and easily change by those whom hold causes to change it to suit their own individual campaigns.

The Music of the Astronists

(Tunology)

[2:16:1] Now has come the time to address one of the most creative and formative areas of the Astronist Culture and that is Astronist Music, the discipline of study addressing such is henceforth known as tunology.

[2:16:2] Despite tunology existing officially as a discipline of study of Astronist Philosophy having being introduced here within *The Omnidoxy*, it also exists outside of Astronist Philosophy within the auspices of Astronist Music, thus making it a translocational discipline; a type of discipline of study that exists within Astronist Philosophy, but is also categorised within a non-philosophical subject.

[2:16:3] Definitionally, tunology is the discipline of study dealing with Astronist Music, its terminologies, methods, techniques, the organisation of Astronist musical pieces, and the general features of Astronist compositions as well as involving the relations between Astronist Music within the context of philosophy, especially utilities of music in the context of philosophical enquiry, and experience.

[2:16:4] Tunology, as discipline, can be split into two forms to match with its translocational nature; the first form of which is henceforth known as compositional tunology, also known as Astronist composition theory, which involves the musical subject of Astronist Music rather than the part of tunology considered with the philosophical side of music and it is this form that is to be introduced herein but must more widely considered in other works specifically addressing Astronist Music outside the auspices of Astronist Philosophy.

[2:16:5] The second form of which is henceforth known as philosophical tunology, also known as Astronist musicology which, as its name suggests, deals with the philosophical aspects of Astronist music as applied to Astronist philosophical notions, and it is this form of tunology that will be discussed within this discourse of *The Omnidoxy*.

[2:16:6] But before we delve into the depths of philosophical tunology and begin to outline Astronist music terminology, discuss the importance of music in philosophy amongst other topics, we must first address the structure and approach of Astronist music.

[2:16:7] Astronist Music as a creative area can be split into two portions; the first of these is known as the Astronist Musical Tradition which relates to studying the features of Astronist music pieces, and the second of which is known as the Astronist Compositional Tradition which relates to studying the process of composition involved with the construction of an Astronist musical piece, as first employed by the music tradition's founder, Cometan, the mononym for Brandon Taylorian used in music, art, poetry and other similar art forms other than literature (mostly) and philosophy.

[2:16:8] Discussed within tunology in general is that which is known as Piece Structure as a branch of the discipline which involves the study of the features of Astronist musical pieces in order to derive conclusions about the structure of such pieces and the compositional process that has been employed in order to formulate such a structure for a musical piece.

[2:16:9] Within the branch of tunology dealing with Piece Structure, we come to the notion that the Astronist approach to musical composition is of an entirely creative accord with its nature characterised by ignorance to rules and regulations set forth by non-Astronist composers, not as means to suggest their incorrectness, but as a means to foundate a new way of composition stylised towards an Astronist way including method and technique based entirely on creativity.

[2:16:10] So what, if there are no rules, does constitute and characterise an Astronist piece?

[2:16:11] The answer to such a notion is that Astronist pieces of music share the theme of The Cosmos at their centre, as well as being characterised by the non-following of rules and purely by creative means.

[2:16:12] The Astronist musical approach is not constrained by a set of bars for each segment of the piece but is instead governed by that which is created naturally and not by the course of rules and regulatory notions of composition; one can always say that to be Astronist or Astronist in music is to enjoy the creative wellspring that is paired with freedom that the other traditions and period sadly could not enjoy to such an extent.

[2:16:13] An example of this freedom is characterised by the instance in which one completes the final bar of a musical piece before reaching the end, or a later part of the musical piece of where one has reached up to; this is a practice in Astronist Music known as crowning and is a demonstration of creative flow as one is not constricted by the chronology of composition.

[2:16:14] This instance, of course, is pre-Astronist, but it is herein that we place a term to this practice and we emphasise it as an important practice of demonstrating a composer's creative freedom.

[2:16:15] This practice is characterised by the infilling of the vacant section between the end and where composer left off before skipping to the end; the essentiality of this is that such a practice is creatively driven.

[2:16:16] Following the Astronist compositional method, the composer would endeavour to conduct crowning rather than be bound to the traditional chronological schema of composition while the alternative is to take a creative approach to the infilling of a piece structure, known as the process of infillation.

[2:16:17] That which is known as the process and feature of extremation in the context of Astronist Music is the frequent utility of very high and very low areas of the piano rather than using the central portion, especially so when the composer moves from a high areas to low areas successively.

[2:16:18] The practice of modulation in Astronist Music is given high consideration indeed for the modulating is considered to be a great creative act and one that fits in with the Astronist way of musical composition; for this reason, the study and measurement of the presence of modulations in Astronist Music is an important area to contemplate with the practice of modulation expected and wished to be one of the characteristics of an Astronist musical piece.

[2:16:19] Despite the Astronist musical tradition's embracement of all that is creative, there exists resistance to the act of improvisation according to some opinions; the Astronist musical tradition demands order in music just as much as any other tradition and this means playing music according to that which has been written.

[2:16:20] However, in the context of composition, the Astronist musical tradition embraces the notion of improvisational composition as a means of pure creativity and is classed as a philosophical experience; the instance in which a composer gains a momentum in the flow of his composing due to a train of ideas that the composer must make notations of; this philosophical experience is henceforth known as a composure.

[2:16:21] What some within the Astronist tradition may oppose to is the improvisation of music playing and composition combined which could result in disordered musical pieces and is not considered a substantial creative act like improvisation in composition alone.

[2:16:22] The Astronist musical tradition embraces that which is known as the Computational Method of composition which is characterised by the usage of technologies such as softwares in the composition of musical pieces; the Partial Computational Method and the Full Computational Method relate to varied levels of the utility of the Computational Method.

[2:16:23] The topic of Astronist Music also deals with the exploration of the musical tradition through a computational lens and analyses the philosophical implications and affects in the application of the Computational Method.

[2:16:24] The Astronist musical tradition perceives the computational approach to the composition of music pieces to be an alternative platform for philosophical experiences through composition and embraces the vast amounts of musical genres that are derivable from the Computational Method.

[2:16:25] The Astronist musical tradition is also anticipatory of all the spacial themed music pieces that are expected to be created from the application of the Computational

Method and it is this specific genre that Astronist Music intends to expand in addition to the non-computational and traditional variations of music piece composition.

[2:16:26] The core foundations of the Astronist musical tradition rest with the instrument of the piano, but there exists a great wave of encouragement towards the notion that Astronist musical pieces should be constructed via all instruments rather just be piano, however, the piano shall always remain at the foundations of the Astronist musical style.

[2:16:27] The arrangement of Astronist musical pieces should be conducted according to the expectation that all such pieces will eventually be recreated and rearranged from the application of alternative instruments.

[2:16:28] The Astronist musical tradition considers this omni-instrumental outlook to be one of the greatest signatories of how the musical tradition can expand upon its identity, develop its musical pieces to heights new, and establish new identities and styles within the auspices of the tradition.
